FUJITSU Enterprise Postgres for Kubernetes is an enterprise platform for provisioning and managing your data on the OpenShift Container Platform.

- Hybrid, platform-independent, multi-cloud database
- Fast-paced, business-ready database that integrates container operation (operational automation) technology for rapid development-to-production deployments with fast-evolving, open PostgreSQL
- Leverages open container technology to enable a cloud shift without being tied to a cloud vendor
- Reduced operational load on the Database Administrator with containerized database - Focus on application development and migration (upper layer development) for faster DX

- Easy to find - easy to use - full-featured
- Multiple versions, multiple namespaces

- Deploy across platforms with consistent data and security

- Operator Lifecycle Manager

- Simple setup
- GUI or command line interface
- Integration into DevOps environment

- Solution assurance with quality development and technical collaboration with IBM and Red Hat
- Certified by Red Hat for OpenShift
- Multi-arc container Operator – supports X86 and IBM LinuxONE™

- High Availability - pre-configured, high available PostgreSQL cluster - automated failover, manual switchover, auto recovery
- Load Balancing - Optimize the use of available resources with pgPool-II
- Backup/Restore - scheduled backup available with Point-in-time-recovery (PITR)
