Preface

Purpose of this document

This document is intended for users of "FUJITSU Software Enterprise Postgres" (hereafter referred to as "FUJITSU Enterprise Postgres"), and explains how to read the manuals.

Structure of this document

The structure and content of this manual is shown below.

Chapter 1 How to Read the Manuals

This section explains the notational conventions in FUJITSU Enterprise Postgres manuals.

Chapter 2 Trademarks

This section explains the trademarks.

Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 How to Read the Manuals

The FUJITSU Enterprise Postgres manuals use certain notational conventions and rules. Pay attention to these conventions and rules when reading the FUJITSU Enterprise Postgres manuals.

1.1 Intended Products

The manuals apply to the following products:
- FUJITSU Enterprise Postgres Advanced Edition
- FUJITSU Enterprise Postgres Standard Edition

1.2 Abbreviations of Manual Titles

The following tables list abbreviations of the titles of manuals for FUJITSU Enterprise Postgres as they appear in the manuals.

<table>
<thead>
<tr>
<th>Formal manual title</th>
<th>Abbreviation in FUJITSU Enterprise Postgres manuals</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Release Notes</td>
<td>Release Notes</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres General Description</td>
<td>General Description</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Installation and Setup Guide for Client</td>
<td>Installation and Setup Guide for Client</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Installation and Setup Guide for Server Assistant</td>

1.3 System of Manuals and How to Use the Manuals

This section describes the system of manuals for FUJITSU Enterprise Postgres.
### 1.3.1 System of Manuals

**FUJITSU Enterprise Postgres manuals**

The table below shows the manuals on FUJITSU Enterprise Postgres.

<table>
<thead>
<tr>
<th>Use/Purpose</th>
<th>Manual title</th>
<th>Content</th>
<th>When to read</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deciding whether to upgrade the product.</td>
<td>Release Notes</td>
<td>Overview of upgraded features and incompatibility information.</td>
<td>When learning about features upgraded from earlier versions and incompatibility information.</td>
</tr>
<tr>
<td>Acquiring an overview of the product and the basic information required for work and operation.</td>
<td>General Description</td>
<td>Description of all available functions associated with each intended purpose or use, and screenshots of operations.</td>
<td>When learning basic information and restrictions that system engineers and operators must know to actually operate the product.</td>
</tr>
<tr>
<td>Installing and setting up FUJITSU Enterprise Postgres correctly to enable its use.</td>
<td>Installation and Setup Guide for Server</td>
<td>Procedure for installing and setting up FUJITSU Enterprise Postgres.</td>
<td>When installing and setting up FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>Installing the FUJITSU Enterprise Postgres client function correctly to enable its use.</td>
<td>Installation and Setup Guide for Client</td>
<td>Installing the FUJITSU Enterprise Postgres client function.</td>
<td>When installing the FUJITSU Enterprise Postgres client function.</td>
</tr>
<tr>
<td>Installing and setting up the FUJITSU Enterprise Postgres Server Assistant.</td>
<td>Installation and Setup Guide for Server Assistant</td>
<td>Procedure for installing and setting up the FUJITSU Enterprise Postgres Server Assistant.</td>
<td>When installing and setting up the FUJITSU Enterprise Postgres Server Assistant.</td>
</tr>
<tr>
<td>Operating and managing FUJITSU Enterprise Postgres.</td>
<td>Operation Guide</td>
<td>Description of the tasks required in FUJITSU Enterprise Postgres management and operation.</td>
<td>When learning how to operate and manage the databases.</td>
</tr>
<tr>
<td>Performing switchover using database multiplexing mode.</td>
<td>Cluster Operation Guide (Database Multiplexing)</td>
<td>Description of the tasks required for database multiplexing operation.</td>
<td>When using database multiplexing mode to create operating environment for switchover and perform it.</td>
</tr>
<tr>
<td>Performing failover using PRIMECLUSTER.</td>
<td>Cluster Operation Guide (PRIMECLUSTER)</td>
<td>Description of how to set up failover and perform operations using PRIMECLUSTER.</td>
<td>When performing failover using PRIMECLUSTER.</td>
</tr>
<tr>
<td>Applications using the interface provided by FUJITSU Enterprise Postgres.</td>
<td>Application Development Guide</td>
<td>Procedure for creating an application using embedded SQL, JDBC driver, ODBC</td>
<td>When developing an application using the interface provided by FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>Use/Purpose</td>
<td>Manual title</td>
<td>Content</td>
<td>When to read</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------</td>

<tr>
<td>Learning the syntax of the Npgsql API.</td>
<td>Npgsql API Reference</td>
<td>Description of the syntax of the Npgsql API.</td>
<td>When learning the syntax of the Npgsql API.</td>
</tr>
<tr>
<td>Learning the meaning of the terms of FUJITSU Enterprise Postgres.</td>
<td>Glossary</td>
<td>Description of the terms used in the FUJITSU Enterprise Postgres manuals.</td>
<td>When checking the meaning of terms used in the FUJITSU Enterprise Postgres manuals.</td>
</tr>
<tr>
<td>Referring to messages from FUJITSU Enterprise Postgres and taking measures for them.</td>
<td>Messages</td>
<td>Description of each message and description of any measures to be taken for it.</td>
<td>When finding out the specific measures for dealing with messages from FUJITSU Enterprise Postgres.</td>
</tr>
</tbody>
</table>

**PostgreSQL manual**

The table below shows the manual on PostgreSQL-compatible features.

<table>
<thead>
<tr>
<th>Use/Purpose</th>
<th>Manual title</th>
<th>Content</th>
<th>When to read</th>
</tr>
</thead>
<tbody>
<tr>
<td>Learning about PostgreSQL features.</td>
<td>PostgreSQL Documentation</td>
<td>Official PostgreSQL documentation. Explains all features officially supported by the relevant version of PostgreSQL.</td>
<td>When learning how to use PostgreSQL.</td>
</tr>
</tbody>
</table>

**1.3.2 Documentation Road Map**

This section provides a documentation roadmap, broken down by user role.

**Database administrator**

The database administrator is a user who performs FUJITSU Enterprise Postgres installation and setup, and who operates and monitors the database.

Refer to the manuals in the table below, according to purpose:
Purpose | Manual name
---|---
Required reading | To learn about upgraded features and incompatibility information
 | Release Notes
To read an overview of the software | General Description
To perform installation and setup | Installation and Setup Guide for Server
 | Cluster Operation Guide (Database Multiplexing)
 | Cluster Operation Guide (PRIMECLUSTER)
 | Connection Manager User's Guide
To install the Server Assistant | Installation and Setup Guide for Server Assistant
To operate and monitor | Operation Guide
 | Security Operation Guide
 | Cluster Operation Guide (Database Multiplexing)
 | Cluster Operation Guide (PRIMECLUSTER)
 | Reference
Using Connection Manager features | Connection Manager User's Guide
Reference | Messages
 | Glossary
Refer to as required | To learn about PostgreSQL features
 | PostgreSQL Documentation

**Application developer**

The application developer is a user who defines the database and develops applications.

Refer to the manuals in the table below, according to purpose:

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Manual name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required reading</td>
<td>To learn about upgraded features and incompatibility information</td>
</tr>
<tr>
<td>Release Notes</td>
<td></td>
</tr>
<tr>
<td>To read an overview of the software</td>
<td></td>
</tr>
<tr>
<td>General Description</td>
<td></td>
</tr>
<tr>
<td>To perform installation and setup</td>
<td></td>
</tr>
<tr>
<td>Installation and Setup Guide for Client</td>
<td></td>
</tr>
<tr>
<td>To define a database</td>
<td></td>
</tr>
<tr>
<td>Operation Guide</td>
<td></td>
</tr>
<tr>
<td>To develop applications</td>
<td></td>
</tr>
<tr>
<td>Application Development Guide</td>
<td></td>
</tr>
<tr>
<td>Java API Reference</td>
<td></td>
</tr>
</tbody>
</table>
1.4 Notational Conventions in the Manuals

Manual titles and product names in the manual are abbreviated.

This section explains the notational conventions for abbreviations and platform-specific information in the manuals.

1.4.1 Platform-specific Information

Even manuals whose title has a platform name contain content common to all the platforms supported by FUJITSU Enterprise Postgres. In such cases, the platform-specific information is marked as shown below. Refer to only the necessary information.

Linux

Indicates content concerning Linux.

Windows(R)

Indicates content concerning Windows(R).

1.4.2 Abbreviation of Product Names

The following table lists abbreviations of the names of products related to FUJITSU Enterprise Postgres as they appear in the manuals.

<table>
<thead>
<tr>
<th>Formal name</th>
<th>Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Solaris 10 and Oracle Solaris 11</td>
<td>Solaris</td>
</tr>
<tr>
<td>Red Hat(R) Enterprise Linux(R) 7</td>
<td>Linux</td>
</tr>
<tr>
<td>Red Hat(R) Enterprise Linux(R) 8 and SUSE Linux Enterprise Server 12</td>
<td></td>
</tr>
<tr>
<td>Red Hat(R) Enterprise Linux(R) 7</td>
<td>RHEL7</td>
</tr>
<tr>
<td>Red Hat(R) Enterprise Linux(R) 8</td>
<td>RHEL8</td>
</tr>
<tr>
<td>SUSE Linux Enterprise Server 12</td>
<td>SLES 12</td>
</tr>
<tr>
<td>Windows(R) 8.1, Windows(R) 8.1 Pro and Windows(R) 8.1 Enterprise</td>
<td>Windows(R) 8.1</td>
</tr>
<tr>
<td>Windows(R) 10 Home, Windows(R) 10 Education, Windows(R) 10 Pro and Windows(R) 10 Enterprise</td>
<td>Windows(R) 10</td>
</tr>
<tr>
<td>Microsoft(R) Windows Server(R) 2012 Datacenter, Microsoft(R) Windows Server(R) 2012 Standard,</td>
<td>Windows Server(R) 2012</td>
</tr>
<tr>
<td>Formal name</td>
<td>Abbreviation</td>
</tr>
<tr>
<td>----------------------------------------------------------------------------</td>
<td>---------------------------------------------------</td>
</tr>
<tr>
<td>Microsoft(R) Windows Server(R) 2012 Essentials and Microsoft(R) Windows Server(R) 2012 Foundation</td>
<td></td>
</tr>
<tr>
<td>Microsoft(R) Windows Server(R) 2012 R2 Datacenter, Microsoft(R) Windows Server(R) 2012 R2 Standard, Microsoft(R) Windows Server(R) 2012 R2 Essentials and Microsoft(R) Windows Server(R) 2012 R2 Foundation</td>
<td>Windows Server(R) 2012 R2</td>
</tr>
<tr>
<td>Java(TM) 2 Runtime Environment, Standard Edition and Java(TM) Runtime Environment</td>
<td>JRE</td>
</tr>
</tbody>
</table>
### 1.4.3 FUJITSU Enterprise Postgres Conventions

The naming conventions for the FUJITSU Enterprise Postgres product names and functions used in the FUJITSU Enterprise Postgres manuals are shown below.

#### 1.4.3.1 Server

The names used in the manuals in explanations regarding FUJITSU Enterprise Postgres functions are shown below.

<table>
<thead>
<tr>
<th>Product name</th>
<th>Name used in manuals</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Advanced Edition (64bit)</td>
<td>64-bit product</td>
</tr>
<tr>
<td>and</td>
<td></td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Standard Edition (64bit)</td>
<td></td>
</tr>
</tbody>
</table>

#### 1.4.3.2 Client

The names used in the manuals in explanations regarding FUJITSU Enterprise Postgres client functions are shown below.

<table>
<thead>
<tr>
<th>Product name</th>
<th>Name used in manuals</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Client (64bit)</td>
<td>64-bit product</td>
</tr>
<tr>
<td>[W] FUJITSU Enterprise Postgres Client (32bit)</td>
<td>32-bit product</td>
</tr>
</tbody>
</table>

### 1.4.4 Symbol Convention

The symbols shown below are used in the manuals.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| [ ]    | These symbols indicate characters displayed in a window or dialog box or keyboard keys.  
       | Examples: [Setting] dialogue box, [File] menu, [Item name], [OK] button, [Enter] key. |

### 1.5 Notes about Manuals

This section contains notes about the FUJITSU Enterprise Postgres operating environments and manuals.

- Images in figures

  The FUJITSU Enterprise Postgres manuals contain figures showing printouts for FUJITSU Enterprise Postgres to provide the reader an idea of what the printouts look like, but since the figures are only examples, they are incomplete.
- Explanatory examples

Most of the examples of databases in the FUJITSU Enterprise Postgres manuals are modeled after inventory control databases of retail stores. The design and contents of the databases in the examples are fictitious and do not represent any real database.

- UNIX release version number

This system conforms to UNIX System V Rel4.2MP.
Chapter 2 Trademarks

- Internet Information Services, Microsoft, MS, MS-DOS, Windows, Windows Server, Visual Basic, Visual Studio and Microsoft .NET Framework are registered trademarks or trademarks of Microsoft Corporation in the U.S. and/or other countries.

- Oracle and Java are registered trademarks of Oracle Corporation and its subsidiaries and affiliated companies in the U.S. and other countries. Product and company names mentioned in this manual are the trademarks or registered trademarks of their respective owners.

- Linux(R) is a registered trademark of Linus Torvalds in the U.S. and other countries.

- Red Hat, RPM, and all Red Hat-based trademarks and logos are registered trademarks or trademarks of Red Hat, Inc. in the U.S. and other countries.

- SUSE and the SUSE logo are registered trademarks of SUSE LLC in the United States and other countries.

- UNIX is a registered trademark of Open Group in the U.S. and other countries.

- Interstage, Systemwalker, PRIMECLUSTER, and FUJITSU Software Enterprise Postgres are trademarks or registered trademarks of Fujitsu Limited.

Other product and company names mentioned in this manual are the trademarks or registered trademarks of their respective owners.
Glossary
Preface

Purpose of this document
This document explains FUJITSU Enterprise Postgres terminology.

Intended readers
This document is aimed at all users of FUJITSU Enterprise Postgres.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Glossary ................................................................................................................................................................................... 1

Index ....................................................................................................................................................................................... 4
Glossary

**Arbitration command**
A user exit (user command) called when an abnormality is detected using operating system/server heartbeat monitoring in database multiplexing mode.

**Arbitration server**
A dedicated server on which the Server Assistant program is installed.

**Archive log**
Contains the history of updates made to the database, and is used during recovery.

**Backup data storage destination**
The directory that stores the backup data.

**Client command**
A command that is executed from the client machine and used. Also known as a client application.

**Connection Manager**
The replication operation to continue without knowing where the application is connected.
The Connection Manager feature improves the availability.

**Data storage destination**
The directory that stores the database clusters.

**Database cluster**
The database storage area on the database storage disk. Database clusters are a collection of databases managed by an instance.

**Data masking**
A feature that can change the returned data for queries generated by applications, to prevent exposing actual data.

**Database multiplexing**
Mechanism in which a database is made redundant on multiple servers, by transferring transaction logs (WAL) via the network to enable application jobs to be continued.

**Database superuser**
A user defined in the database with access privileges for all database objects.

**Encoding**
Indicates the character set.

**Fencing**
A process that isolates a database server with an unstable status from the cluster system in database multiplexing mode. This process is implemented as a fencing command.

**Fencing command**
A user exit (user command) that implements fencing in database multiplexing mode.
Global Meta Cache
The Global Meta Cache feature caches the information about system catalogs (catalog meta cache) in shared memory. The catalog meta cache on shared memory is called the Global Meta Cache (GMC).

Instance
A series of server processes for managing database clusters.

Instance administrator
The OS user account that owns the database cluster files and operates the database server processes.

Instance name
Indicates the instance name.

Local Meta Cache Limit
The ability to limit the size by removing the Local Meta Cache that has not been accessed for a long time.
Local Meta Cache is a meta cache (system catalog and table definition information) held in local memory.

Masking policy
A method of changing data under specific conditions when it is returned for a query from an application. You can configure masking target, masking type, masking condition and masking format.

Mirrored transaction log
The log that mirrors the transaction log at the backup data storage destination.

Mirroring Controller arbitration process
A process that performs arbitration and fencing on the arbitration server.

Mirroring Controller monitoring process
A process that performs heartbeat monitoring of the Mirroring Controller process. If the Mirroring Controller process returns no response or is down, the Mirroring Controller monitoring process is restarted automatically.

Mirroring Controller process
A process that performs operating system/server and process heartbeat monitoring and disk abnormality monitoring between database servers. Additionally, the process issues arbitration requests to the arbitration server and executes arbitration commands.

Pgpool-II connection pooling
The connection pooling feature of Pgpool-II supported by FUJITSU Enterprise Postgres.
This feature maintains the connection established with the database server and reuses that connection each time a new connection with the same properties (user name, database, and protocol version) arrives. By reducing the connection overhead for the database server, throughput of the whole system is improved.

Pgpool-II failover
The automatic failover feature of Pgpool-II supported by FUJITSU Enterprise Postgres.
If any of the database servers crashes or can no longer be reached, this feature disconnects the server and continues operation on the remaining servers. The streaming replication feature of PostgreSQL is combined with Pgpool-II to achieve a high-availability system.

Pgpool-II load balancing
The load balancing feature of Pgpool-II supported by FUJITSU Enterprise Postgres.
This feature distributes reference queries to multiple database servers, improving throughput of the whole system. The database multiplexing feature or PostgreSQL streaming replication feature is combined with Pgpool-II to reduce the load on the database server.
Pgpool-II server
A server for using the failover, connection pooling, and load balancing features of Pgpool-II. It is a dedicated server that has a server program installed for using these features.

Primary server
The server that processes the main database jobs during multiplexed database operation.

Server Assistant
A feature that objectively determines the status of database servers as a third party, and if necessary, isolates affected databases if the database servers are unable to accurately ascertain their mutual statuses in database multiplexing mode, such as due to a network error between database servers, or server instability.

Server Assistant program
A program to be installed on the arbitration server.

Server command
A command used on the database server. Also known as a server application.

Standby server
A server that generates a replicated database synchronized with the primary server, and that can run as an alternative server in case the primary server fails during multiplexed database operation.

State transition command
A user exit (user command) called when Mirroring Controller performs a state transition of a database server in database multiplexing mode. State transition commands include the post-switch command, pre-detach command, and post-attach command.

Transaction log
Contains the history of updates made to the database by transactions. Also known as the WAL (Write-Ahead Log).

Transaction log storage destination
The directory that stores the transaction log.

VCI (Vertical Clustered Index)
An index with columnar data structure suitable for aggregation.

WAL (Write-Ahead Log)
Has the same meaning as 'transaction log'.

WebAdmin program
A GUI-based program installed on a database server or a dedicated WebAdmin server, used to manage database instances.

WebAdmin server
By using the WebAdmin program on a different server to the database server, instances on multiple database servers can be managed from a dedicated WebAdmin server on which the WebAdmin program is installed.

General Description
Preface

Purpose of this document
This document explains the FUJITSU Enterprise Postgres concepts to those who are to operate databases using it.
This document explains the features of FUJITSU Enterprise Postgres.

Intended readers
This document is intended for people who are:
- Considering installing FUJITSU Enterprise Postgres
- Using FUJITSU Enterprise Postgres for the first time
- Wanting to learn about the concept of FUJITSU Enterprise Postgres
- Wanting to see a functional overview of FUJITSU Enterprise Postgres

Readers of this document are also assumed to have general knowledge of:
- Computers
- Jobs
- Linux
- Windows(R)

Structure of this document
This document is structured as follows:
Chapter 1 FUJITSU Enterprise Postgres Basics
Explains the features of FUJITSU Enterprise Postgres.

Appendix A List of Features
Lists the main features provided by FUJITSU Enterprise Postgres.

Appendix B OSS Supported by FUJITSU Enterprise Postgres
Explains the OSS supported by FUJITSU Enterprise Postgres.

Appendix C Features that can be Used on Servers Other than the Database Server
Explains features that can be used on servers other than the database server.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 FUJITSU Enterprise Postgres Basics

FUJITSU Enterprise Postgres maintains the operating methods, interfaces for application development and SQL compatibility of PostgreSQL, while providing expanded features for enhanced reliability and operability.

This chapter explains the functionality extended by FUJITSU Enterprise Postgres.

Refer to "Appendix A List of Features" for feature differences between editions.

Additionally, FUJITSU Enterprise Postgres supports various open source software (OSS). Refer to "Appendix B OSS Supported by FUJITSU Enterprise Postgres" for information on OSS supported by FUJITSU Enterprise Postgres.

FUJITSU Enterprise Postgres has the following features:

- **Flexible database recovery**
  Not only does FUJITSU Enterprise Postgres recover data to its most recent form when a failure occurs, which is essential for databases, but it can also recover to any point in time. Additionally, backup/recovery can be performed using any copy technology.

- **Simple GUI-based installation and operation management**
  FUJITSU Enterprise Postgres uses GUI to simplify cumbersome database operations, and allows databases to be used intuitively.

- **High reliability by using database multiplexing**
  Database multiplexing protects important data and enables highly reliable database operation.

- **High reliability by using the failover feature integrated with the cluster software**
  FUJITSU Enterprise Postgres links with PRIMECLUSTER, thereby allowing highly reliable systems to be achieved by using failover.

- **Seamless migration from Oracle databases**
  FUJITSU Enterprise Postgres provides a compatibility feature with Oracle databases that localizes the correction of existing applications and allows easy migration to FUJITSU Enterprise Postgres.

- **Linkage with integrated development environment**
  FUJITSU Enterprise Postgres links with Visual Studio, thereby allowing a standard framework to be used to create applications.

- **Storage Data Protection using Transparent Data Encryption**
  Information can be protected from data theft by encrypting data to be stored in the database.

- **Data masking for improved security**
  The data masking feature changes the returned data for queries from applications, to prevent exposing actual data. This improves security for handling confidential data such as personal information.

- **Audit logs for improved security**
  Audit logs can be used to counter security threats such as unauthorized access and misuse of privileges for the database.
- Enhanced query plan stability
  The following features can control SQL statement query plans:
  - Optimizer hints
  - Locked statistics
  These features are used for curbing performance deterioration caused by changes in SQL statement query plans, such as with mission-critical jobs that emphasize performance stability over improved SQL statement processing performance.

- Increased aggregation performance using the in-memory feature
  The following features help speed up scans even when aggregating many rows.
  - Vertical Clustered Index (VCI)
  - In-memory data

- High-speed data load
  Data from files can be loaded at high speed into FUJITSU Enterprise Postgres tables using the high-speed data load feature.

- High availability by using Connection Manager
  With the Connection Manager features, replication operation can be continued without being aware of the connection destination of the applications.

- Memory usage reduction using Global Meta Cache
  The Global Meta Cache feature loads some of meta cache information in shared memory. This reduces overall system memory usage.

- Memory usage reduction using Local Meta Cache Limit
  Reduce memory consumption by limiting the metacache that is kept in local memory.

### 1.1 Flexible Database Recovery

Threats such as data corruption due to disk failure and incorrect operations are unavoidable in systems that use databases. The ability to reliably recover corrupted databases without extensive damage to users when such problems occur is an essential requirement in database systems.

FUJITSU Enterprise Postgres provides the following recovery features that flexibly respond to this requirement:

- Media recovery, which recovers up to the most recent point in time
- Point-in-time recovery, which can recover up to a specific point in time
- Backup/recovery that can integrate with various copy technologies

#### Media recovery, which recovers up to the most recent point in time

When a disk failure occurs, media recovery can recover data to how it was immediately before the failure.

In order to recover the database, FUJITSU Enterprise Postgres accumulates a history of database update operations, such as data additions and deletions, as an update log.

FUJITSU Enterprise Postgres retains a duplicate (mirror image) of the update log after backup execution on the data storage destination and on the backup data storage destination. Therefore, the data on one disk can be used to recover to the most recent state of the database even if a disk failure has occurred on the other.

Media recovery is executed using either a GUI tool provided with FUJITSU Enterprise Postgres (WebAdmin) or server commands.
Recovery using WebAdmin requires less time and effort, since WebAdmin automatically determines the scope of the operation.

---

**Information**

Recovery using WebAdmin requires less time and effort, since WebAdmin automatically determines the scope of the operation.

---

**Failure occurs on either disk**

![Diagram showing data recovery process](image)

**Can recover to most recent state from either disk**

---

**Point-in-time recovery, which can recover up to a specific point in time**

Point-in-time recovery can be used to recover a database that has been updated by an incorrect operation, for example, by specifying any date and time before the incorrect operation.

Point-in-time recovery is executed using FUJITSU Enterprise Postgres server commands.

---

**Backup/recovery that can integrate with various copy technologies**

It is possible to back up to the backup data storage destination, or to any backup destination using any copy technology implemented by user exits.

For example, by using the high-speed copy feature of the storage device, the processing time for backup of large databases can be greatly reduced.
1.2 Simple GUI-Based Installation and Operation Management

FUJITSU Enterprise Postgres provides WebAdmin, which is a GUI tool for a range of tasks, from database installation to operation management. This allows the databases to be used simply and intuitively.

WebAdmin can be used for FUJITSU Enterprise Postgres setup, creating and monitoring a streaming replication cluster, database backups, and for recovery. Depending on the configuration, WebAdmin can be used to manage FUJITSU Enterprise Postgres instances in a single server, or instances spread across multiple servers.

- Setup
  To perform setup using WebAdmin, you must create an instance. An instance is a set of server processes that manage a database cluster (database storage area on the data storage destination disk). Instances can be created easily and with only minimal required input, because the tool automatically determines the optimal settings for operation.

- Database backup/recovery
  Database backup and recovery can be performed using simple GUI operations.
  In particular, FUJITSU Enterprise Postgres can automatically identify and isolate the location of errors. This simplifies the recovery process and enables faster recovery.

In addition, FUJITSU Enterprise Postgres provides the following expanded features in pgAdmin:

- NCHAR type
- Expanded trigger definition
  - REPLACE feature
  - Function call feature

1.3 High Reliability with Database Multiplexing

It is vital for systems that use databases to protect data from damage or loss caused by a range of factors such as hardware and software errors. Database multiplexing protects important data and enables highly reliable database operation.
FUJITSU Enterprise Postgres not only mirrors a database using the PostgreSQL streaming replication feature, but also provides simplified switchover and standby disconnection features as well as a feature to detect faults in elements that are essential for the continuity of database process, disk, network, and other database operations.

Even if a switchover is performed, the client automatically distinguishes between the primary and standby servers, so applications can be connected transparently regardless of the physical server.

The Mirroring Controller option enables the primary server (the database server used for the main jobs) to be switched automatically to the standby server if an error occurs in the former.

In addition, by using the data on the standby server, reference jobs such as data analysis and form output can be performed in parallel to the jobs on the primary server.

**Operation using the arbitration server**

Mirroring Controller may not be able to correctly determine the status of the other server if there is a network issue between database servers or a server is in an unstable state. As a result, both servers will temporarily operate as primary servers, so it may be possible to perform updates from either server.

The Server Assistant is a feature that objectively checks the status of database servers as a third party and isolates (fences) unstable servers in such cases.

In database multiplexing mode, the Server Assistant is made available by adding a new server (arbitration server) on which the Server Assistant is installed. Using an arbitration server can prevent the issue mentioned above (both servers temporarily operating as primary servers) and enables highly reliable operation.
1.4 High Reliability Using Failover Integrated with the Cluster Software

If the system stops, services are interrupted until recovery is complete. In large-scale systems, the interruption takes longer, and may cause significant disruption for many people receiving the services.

In FUJITSU Enterprise Postgres, the failover feature integrated with the cluster software can minimize the system stoppage time when an issue occurs.

Medical accounting system

Some hospitals with a large number of patients manage and operate the various data required for accounting in a database. If this accounting system stops and takes several minutes to recover, it is expected that this will have a significant impact.

But if failover is applied to this kind of system and an issue occurs on the operating server, it is quickly switched and the standby server takes over operation, so that services are provided without interruption.

The example below illustrates a medical accounting system using failover.
1.5 Seamless Migration from Oracle Databases

FUJITSU Enterprise Postgres supports Orafce, to provide compatibility with Oracle databases. Using the compatibility feature reduces the cost of correcting existing applications and results in easy database migration.

See

Refer to "Compatibility with Oracle Databases" in the Application Development Guide for information on compatible features.

1.6 Linkage with Integrated Development Environment

You can link with Microsoft Visual Studio to create application. And, you can automatically generate applications to access database resources by linking to Visual Studio.

Relationship between .NET Framework and FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres provides .NET Data Provider, which is an interface for ADO.NET of .NET Framework. This enables you to select FUJITSU Enterprise Postgres as the connection destination database of ADO.NET and use the intuitive and efficient application development features of Visual Studio.
1.7 Storage Data Protection Using Transparent Data Encryption

The encryption of data to be stored in a database is essential under the following encryption requirements of PCI DSS (Payment Card Industry Data Security Standard), the data security standard of the credit industry:

- Confidential information (such as credit card numbers) can be encrypted.
- The encryption key and data are managed as separate entities.
- The encryption key is replaced at regular intervals.

To satisfy these requirements, FUJITSU Enterprise Postgres provides a transparent data encryption feature. Note that PostgreSQL uses an encryption feature called pgcrypto, which can also be used in FUJITSU Enterprise Postgres, but requires applications to be modified. Therefore, we recommend using FUJITSU Enterprise Postgres's transparent data encryption feature.

See Refer to "Protecting Storage Data Using Transparent Data Encryption" in the Operation Guide for information on stored data encryption.
1.8 Data Masking for Improved Security

FUJITSU Enterprise Postgres provides a data masking feature that protects data to maintain security of data handled in systems.

The data masking feature changes the returned data for queries from applications and makes it available for reference without exposing the actual data.

For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

Also, the data changed by the data masking feature can be transferred to a test database so that users who perform testing or development can reference the data. As production data should not be used in a test or development environment because of the risk of data leakage, this feature enables data that is similar to actual production data to be safely used in those environments.

See
Refer to "Data Masking" in the Operation Guide for information on data masking.

1.9 Security Enhancement Using Audit Logs

Details relating to database access can be retrieved in audit logs. The audit log feature can be used to counter security threats such as unauthorized access to the database and misuse of privileges.

In PostgreSQL, logs output as server logs can be used as audit logs by using the log output feature. There are, however, logs that cannot be analyzed properly, such as SQL runtime logs, which do not output the schema name. Additionally, because the output conditions cannot be specified in detail, log volumes can be large, which may lead to deterioration in performance.

The audit log feature of FUJITSU Enterprise Postgres enables retrieval of details relating to database access as an audit log by extending the feature to pgaudit. Additionally, audit logs can be output to a dedicated log file or server log. This enables efficient and accurate log monitoring.
1.10 Enhanced Query Plan Stability

FUJITSU Enterprise Postgres estimates the cost of query plans based on SQL statements and database statistical information, and selects the least expensive query plan. However, like other databases, FUJITSU Enterprise Postgres does not necessarily select the most suitable query plan. For example, it may suddenly select an unsuitable query plan due to changes in the data conditions.

In mission-critical systems, stable performance is more important than improved performance, and changes in query plans case to be avoided. In this situation, the following features can stabilize query plans:

- Optimizer hints
  You can use pg_hint_plan to specify a query plan in each individual SQL statement.
- Locked statistics
  You can use pg_dmbs_stats to lock statistical information per object, such as a database, schema, or table.

See
Refer to “Optimizer Hints” in the Application Development Guide for information on optimizer hints.
Refer to “Locked Statistics” in the Application Development Guide or information on locked statistics.

Note
Use the features provided when FUJITSU Enterprise Postgres is installed for optimizer hints and locked statistical information. FUJITSU Enterprise Postgres does not support other similar open-source features.

1.11 Increased Aggregation Performance Using the In-memory Feature

FUJITSU Enterprise Postgres provides the in-memory feature, which uses columnar index and memory-resident data. This reduces disk I/Os and enhances aggregation performance.

Note
This feature can only be used in Advanced Edition.

Columnar index

Many aggregation processes may require a large portion of data in a particular column. However, traditional row data structure reads unnecessary columns, resulting in inefficient use of memory and CPU cache, and slower processing. FUJITSU Enterprise Postgres provides a type of columnar index, VCI (Vertical Clustered Index). This addresses the above issues, and enhances aggregation performance.

VCI provides the following benefits:
- Minimizes impact on existing jobs, and can perform aggregation using job data in real time.
- Provided as an index, so no application modification is required.
- Stores data also on the disk, so aggregation jobs can be quickly resumed using a VCI even if a failure occurs (when an instance is restarted).
- If the amount of memory used by VCI exceeds the set value, aggregation can still continue by using VCI data on the disk.

It also provides the features below:

- **Disk compression**
  Compresses VCI data on the disk, minimizing required disk space. Even if disk access is required, read overhead is low.

- **Parallel scan**
  Enhances aggregation performance by distributing aggregation processes to multiple CPU cores and then processing them in parallel.

**In-memory data**

The following features keep VCI data in memory and minimize disk I/Os on each aggregation process.

- **Preload feature**
  Ensures stable response times by loading VCI data to memory before an application scans it after the instance is restarted.

- **Stable buffer feature**
  Reduces disk I/Os by suppressing VCI data eviction from memory by other job data.

**Purposes of this feature**

This feature has a data structure that can efficiently use the newly added resources, and aims to enhance the existing aggregation processing in normal operations to be faster than parallel scan. It shares the same purpose of enhancing aggregation performance with the parallel scan feature that is provided separately, but differs in that it speeds up nightly batch processes by utilizing available resources.

**VCI architecture**

This section briefly explains VCI architecture as it contains basic terminology required, for example, when setting parameters.

Update and aggregation operations to enable real time use of job data are described.

VCI has write buffer row-based WOS (Write Optimized Store) in addition to the columnar data structure ROS (Read Optimized Store). Converting each update into a columnar index has a significant impact on the update process response times. Therefore, data is synchronously reflected to the row-based WOS when updating. After a certain amount of data is stored in WOS, the ROS control daemon asynchronously converts it to ROS. As above, the entire VCI is synchronized with the target table column, minimizing update overhead.

The same scan results can be obtained without a VCI by using WOS in conjunction with ROS. More specifically, WOS is converted to Local ROS in local memory for each aggregation process, and aggregated with ROS.
1.12 High-Speed Data Load

High-speed data load executes COPY FROM commands using multiple parallel workers. Because conversion of data from the external file to the appropriate internal format, table creation, and index creation are performed in parallel, it is possible to load large volumes of data at high speed.

Note

This feature is available only in the Advanced Edition.

Architecture of high-speed data load

High-speed data load is required for parameter setting and resource estimation, so a brief description of its architecture is provided below.

High-speed data load uses a single backend process collaborating with multiple parallel workers to perform data load in parallel. Data is exchanged between the backend process and parallel workers via shared memory message queues. The backend process distributes the loaded data of external files to multiple parallel workers. Each parallel worker then converts the data loaded from the shared memory message queue into the appropriate internal format, and inserts it into the table. If the table has indexes, their keys are extracted and inserted into the index page.
1.13 High availability by using Connection Manager

The Connection Manager provides the following features. You can use these features to increase system availability.

**Heartbeat monitoring feature**

Detects kernel panics between the server running the client and the server running the instance, physical server failures, and inter-server network link downs, and notifies the client or instance. The client is notified as an error event through the SQL connection, and the instance will be notified in the form of a force collection of SQL connections with clients that are out of service.

**Transparent connection support feature**

When an application wants to connect to an instance of an attribute (Primary/Standby) configured with replication, it can do so without knowing which server the instance is running on.

**Information**

The available client drivers for Connection Manager are libpq (C language library) and ECPG (embedded SQL in C).

Refer to the Connection Manager User's Guide for details.

1.14 Memory Usage Reduce with Meta cache Reduction and Limit

When executing SQL, you must refer to the definition of the table or index you want to access. These definitions are cached in the local memory of the backend process separately from the shared memory buffer of the database on shared_buffers because they are referenced each time SQL is executed. The direct definition is a tuple of system catalogs. The cache for this tuple is called "Catalog Cache". A structure that makes the definition easy to use is called a "Relations Cache". And in FUJITSU Enterprise Postgres, these two are collectively called "Meta Cache".

The meta cache will be kept indefinitely for performance reasons. In a large database, a single backend process accesses a large number of tables and so on, which results in a large meta-cache for the backend process. As a result, the sum of the local memory of the backend process may exceed the realistic memory size.

On the other hand, the feature to reduce the meta cache for the entire instance by sharing the meta cache between backend processes is the Global Meta Cache feature. The current Global Meta Cache feature only shares the catalog cache. Therefore, the metacache in Global Meta Cache now refers to the catalog cache.

What you still cannot share using the current Global Meta Cache feature and need to keep in local memory is the information (Meta cache header) and relation cache to access Global Meta Cache in shared memory. If you do not use the Global Meta Cache feature, keep the catalog and relation caches in local memory. The meta cache held in local memory is called the "Local Meta Cache". The feature to limit the size of a Local Meta Cache by removing it if it has not been accessed for a long time is the Local Meta Cache limit feature.

The Global Meta Cache feature and the Local Meta Cache limit feature can be used together to provide the strictest control over memory consumption. Of course, you can use only one or the other.
However, the Global Meta Cache feature has several percent overhead to access shared memory. The Local Meta Cache limit feature also causes the overhead of reholding the metacache because it may discard the previously held metacache. Therefore, consider using these features when your estimates do not allow for memory consumption.

### 1.14.1 Memory Usage Reduction Using Global Meta Cache

The Global Meta Cache feature cache the meta cache in shared memory. The meta cache on shared memory is called the Global Meta Cache (GMC).

Without this feature, the meta cache was cached in per-process memory. Therefore, there was a problem increase in memory usage in environments with large databases and large numbers of connections. The Global Meta Cache feature enables sharing of meta caches on shared memory, thereby reducing overall system memory usage.

**Note**

This feature is available only in the Advanced Edition.

**Meta cache**

Processing a query involves parsing the query, creating the plan, executing the plan, and so on. PostgreSQL process accesses the system catalog to perform these steps. Once accessed, the system catalog tuples are cached in per-process memory. The direct definition is one tuple of system catalogs. Each process performs faster query processing by searching the meta cache instead of searching for the required tuples in the system catalog each time.

The meta cache usage increases in proportion to the number of tables and columns accessed. It is cached on a per-process basis, so the system's overall meta cache usage increases in proportion to the number of connections.

**Architecture of Global Meta Cache feature**

Describes the architecture of the Global Meta Cache feature.

When the GMC feature is on, the per-process meta cache is cached in the GMC area on shared memory. Reference to the GMC area and process-specific work information is cached in the memory of each process. PostgreSQL process searches the meta cache for each process and accesses the GMC based on the reference information. If there is no reference information in the process's memory, it searches the GMC area. If the GMC area also does not have a corresponding meta cache, it accesses the system catalog to create meta cache.

Also, sharing the meta cache does not cause any loss of data consistency. If the system catalog or table definition changes while a transaction is running, the cache deletion or creation does not affect outside of the process running the transaction.
After the transaction commits, the GMC area cache is deleted or created. If other transactions are referencing the cache when GMC is tried to be deleted, the deletion is deferred until there are no more references. After a commit, a new transaction sees the new cache instead of the old one.

See

Global Meta Cache feature is disabled by default. Refer to “Global Meta Cache” in the Operation Guide for information how to decide whether introduce it or not and usage.

1.14.2 Memory Usage Reduction Using Local Meta Cache Limit

Local Meta Cache Limit feature limits the size of a Local Meta Cache by removing it if it has not been accessed for a long time.

Of the definitions that SQL accesses, the main factors that make the Local Meta Cache bloat are tables and indexes. In addition, table column definitions are also maintained as a catalog cache.

For example, in a system where one long-lived connection is shared by various businesses, one connection (that is, backend process) will access many tables. If there are 3,000 such connections, and each connection accesses a table of 50,000, the total amount of memory consumed by the 3,000 backend processes may be a few terabytes.

In such a case, using this feature may reduce it to about several tens of gigabytes.

Note

This feature is available only in the Advanced Edition.

Architecture of Local Meta Cache Limit feature

When this feature is enabled, the caching strategy is to keep the cache as long as possible within the specified upper limit. If holding a new cache exceeds the limit, consider locality of reference and delete the cache from the one with the longest unreferenced time.

However, because the cache used by active transactions cannot be deleted, if a transaction uses a large number of caches, the cache may be held above the limit. In this case, delete the cache at the end of the transaction.

See

Local Meta Cache limit feature is disabled by default. Refer to “Local Meta Cache Limit” in the Operation Guide for information how to decide whether introduce it or not and usage.
## Appendix A List of Features

The following table lists the main features provided by FUJITSU Enterprise Postgres.

Appendix C Features that can be Used on Servers Other than the Database Server

This chapter explains the configuration and operating environment of features to be installed and used on servers other than the database server when used in conjunction with the FUJITSU Enterprise Postgres database server.

In this chapter, FUJITSU Enterprise Postgres programs are referred to as server programs.

Below are features to be installed and used on servers other than the database server:

- WebAdmin
- Server Assistant
- Pgpool-II (failover, connection pooling, and load balancing)

C.1 WebAdmin

If there is only one database server, WebAdmin is normally installed on the same server as the database (the WebAdmin program can be installed at the same time as the server program).

If there are multiple database servers, database server instances can be managed collectively if a dedicated WebAdmin server is used. In this case, the WebAdmin program is installed on the WebAdmin server, and the server program and WebAdmin program are installed on the database server.

See

- Refer to "1.2 Simple GUI-Based Installation and Operation Management" for information on WebAdmin.
- Refer to "Determining the Preferred WebAdmin Configuration" in the Installation and Setup Guide for Server for information on the server configuration when using WebAdmin.
- Refer to "Required Operating System" in the Installation and Setup Guide for Server for information on the operating environment of WebAdmin.

C.2 Server Assistant

To use the Server Assistant, the Server Assistant program is installed on a dedicated server (arbitration server).

See

- Refer to "Overview of Database Multiplexing Mode" in the Cluster Operation Guide (Database Multiplexing) for information on the Server Assistant and the server configuration.
- Refer to "Required Operating System" in the Installation and Setup Guide for Server Assistant for information on the operating environment of the Server Assistant.

C.3 Failover, Connection Pooling, and Load Balancing Features of Pgpool-II

Pgpool-II is software that is placed between the database server and database client to relay the connection.

Pgpool-II provides the failover, connection pooling, and load balancing features for use during streaming replication.
Failover

In PostgreSQL, a database can be made redundant (building a high availability system) using synchronous streaming replication.

If the database server of either the primary server or standby server fails or is no longer accessible when using synchronous streaming replication, jobs will stop.

Failover monitors the status of each database and automatically disconnects the server when an error occurs. As a result, jobs can continue uninterrupted on the remaining server.

Connection pooling

This feature maintains (pools) the connection established with the database server, and reuses that connection each time a new connection with the same properties (user name, database, and protocol version) arrives.

Connection pooling reduces the connection overhead for the database server, improving throughput of the whole system.

Load balancing

This feature distributes reference queries to multiple database servers, improving throughput of the whole system.

By combining load balancing with the FUJITSU Enterprise Postgres database multiplexing feature or the PostgreSQL streaming replication feature, load on the database server is reduced.
See

- Refer to "System configuration when using Pgpool-II" in the Installation and Setup Guide for Server for information on the server configuration when using Pgpool-II.

- Refer to "Required Operating System" in the Installation and Setup Guide for Server for information on the operating environment of Pgpool-II.

*1 The arbitration server used during database multiplexing has been omitted from this document.

Release Notes

Linux >

Windows >
Preface

Purpose of this document
This document provides release information for FUJITSU Enterprise Postgres.

Structure of this document
This document is structured as follows:

Chapter 1 New Features and Improvements
Explains the new features and improvements in this version.

Chapter 2 Compatibility Information
Provides information regarding compatibility.

Chapter 3 Program Updates
Explains updates incorporated in this version.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue date and version
Edition 1.0: April 2021

## Chapter 3 Program Updates

............................................................................................................................................... 21
Chapter 1 New Features and Improvements

This chapter explains FUJITSU Enterprise Postgres new features and improvements added in this version.

Table 1.1 New features and improvements

<table>
<thead>
<tr>
<th>Version and level</th>
<th>Classification</th>
<th>Feature</th>
<th>Provided in AE</th>
<th>Provided in SE</th>
</tr>
</thead>
<tbody>
<tr>

</table>

1.1 Features Added in 13

This section explains new features and improvements in FUJITSU Enterprise Postgres 13.

1.1.1 Application Development

This section explains the new features and improvements related to application development:
- Support for OpenJDK

1.1.1.1 Support for OpenJDK

In the FUJITSU Enterprise Postgres client environment, in addition to the Oracle JDK or JRE that we have guaranteed so far, we also guarantee the behavior when using OpenJDK.

See

Refer to “Related Software” in the Installation and Setup Guide for Client for details.

1.1.2 OSS

This section explains the new feature related to OSS:
- PostgreSQL rebase
- Update of OSS provided

1.1.2.1 PostgreSQL Rebase

The PostgreSQL version that FUJITSU Enterprise Postgres is based on is 13.1.

See

1.1.2.2 Update of OSS Provided

The OSS provided by FUJITSU Enterprise Postgres have been updated.
See

Refer to "OSS Supported by FUJITSU Enterprise Postgres" in the General Description for details.
# Chapter 2 Compatibility Information

This chapter explains incompatible items and actions required when migrating from an earlier version to FUJITSU Enterprise Postgres 13. Check compatibility before migrating and take the appropriate action.

## 2.1 Installation/Setup Incompatibility

<table>
<thead>
<tr>

Y: Incompatibility exists  
N: Incompatibility does not exist

### 2.1.1 Removing Operating System Support for Client Feature

**Incompatibility**

In FUJITSU Enterprise Postgres 13 or later, the following operating systems have been removed.

- SLES 12 SP4 or earlier

**Action method**

None.

### 2.1.2 Removing Operating System Support for Server Feature

**Incompatibility**

In FUJITSU Enterprise Postgres 13 or later, the following operating systems have been removed.

- SLES 12 SP4 or earlier

**Action method**

None.
### 2.1.3 Changing kernel parameter settings when an instance is created with WebAdmin

**Incompatibility**

For FUJITSU Enterprise Postgres 13 and later, changes kernel parameter settings for WebAdmin instance creation.

#### FUJITSU Enterprise Postgres 12 or earlier

<table>
<thead>
<tr>
<th>Kernel Parameters</th>
<th>Value</th>
<th>Calculated Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHMMAX</td>
<td>If $\text{currentValue} &lt; \text{calculatedValue}$, configure the calculated value</td>
<td>$((1800 + 270 \times \text{max_locks_per_transaction}) \times \text{max_connections} + (1800 + 270 \times \text{max_locks_per_transaction}) \times \text{autovacuum_max_workers} + (770 + 270 \times \text{max_locks_per_transaction}) \times \text{max_prepared_transactions} + \text{shared_buffer}) + (16 \times 1024 \times 1024) + (770 \times 1024)) \times 1.05$</td>
</tr>
<tr>
<td>SHMALL</td>
<td>Specify $\text{currentValue} + \text{calculatedValue}$</td>
<td>$\left(\frac{\text{SHMMAX}}{\text{PAGESIZE}}\right) + 1$</td>
</tr>
<tr>
<td>SEMMNI</td>
<td>Specify $\text{currentValue} + \text{calculatedValue}$</td>
<td>$\text{ceil}\left(\frac{\text{max_connections} + \text{autovacuum_max_workers} + 4}{16}\right)$</td>
</tr>
<tr>
<td>SEMMNS</td>
<td>Specify $\text{currentValue} + \text{calculatedValue}$</td>
<td>$\text{ceil}\left(\frac{\text{max_connections} + \text{autovacuum_max_workers} + 4}{16}\right) \times 17$</td>
</tr>
</tbody>
</table>

#### FUJITSU Enterprise Postgres 13 or later

<table>
<thead>
<tr>
<th>Kernel Parameters</th>
<th>Value</th>
<th>Calculated Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHMMAX</td>
<td>Do not change value</td>
<td>-</td>
</tr>
<tr>

<tr>
<td></td>
<td>$\text{ceil}\left(\frac{\text{max_connections} + \text{autovacuum_max_workers} + \text{max_worker_processes} + 5}{16}\right)$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- For Fujitsu Enterprise Postgres 12 and later instances:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$\text{ceil}\left(\frac{\text{max_connections} + \text{autovacuum_max_workers} + \text{max_wal_senders} + \text{max_worker_processes} + 5}{16}\right)$</td>
<td></td>
</tr>
<tr>
<td>SEMMNS</td>
<td>Specify $\text{currentValue} + \text{calculatedValue}$</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>- For instances of FUJITSU Enterprise Postgres 9.5 to 11:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$\text{ceil}\left(\frac{\text{max_connections} + \text{autovacuum_max_workers} + \text{max_worker_processes} + 5}{16}\right) \times 17$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- For Fujitsu Enterprise Postgres 12 and later instances:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$\text{ceil}\left(\frac{\text{max_connections} + \text{autovacuum_max_workers} + \text{max_worker_processes} + 5}{16}\right)$</td>
<td></td>
</tr>
<tr>
<td>Kernel Parameters</td>
<td>Value</td>
<td>Calculated Value</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------</td>
<td>------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>max_wal_senders +</td>
</tr>
<tr>
<td></td>
<td></td>
<td>max_worker_processes + 5) / 16) * 17</td>
</tr>
</tbody>
</table>

**Action method**

None.

### 2.1.4 Removing Operating System Support for Client Feature

**Incompatibility**

In FUJITSU Enterprise Postgres 12 or later, the following operating systems have been removed.

- Windows(R) 7
- Windows Server(R) 2008
- RHEL6

Also, the 32 bit Linux client can no longer be installed because RHEL 6 has been removed from the operating system.

**Action method**

None.

### 2.1.5 Removing Operating System Support for Server Feature

**Incompatibility**

In FUJITSU Enterprise Postgres 12 or later, the following operating systems have been removed.

- RHEL6

**Action method**

None.

### 2.1.6 Changing the Way OSS is Set Up

**Incompatibility**

FUJITSU Enterprise Postgres 12 or later do not place OSS extension modules in the executable directory. The OSS extension modules must be placed in the executable directory when you set up OSS.

**Action method**

None.

### 2.1.7 Modifying Pgpool-II Installation Handling

**Incompatibility**

For FUJITSU Enterprise Postgres 12 or later, Pgpool-II is not automatically installed when you install the server. Therefore, if you want to take advantage of Pgpool-II, install it separately from the server installation.

The extension modules required for the database server are shipped with the server program. You should set up Pgpool-II on the database server side, even if Pgpool-II is to be used on a different server than the database server.

2.1.8 Changing Core and Log File Paths when Instance is Created with WebAdmin

Incompatibility
In FUJITSU Enterprise Postgres 12 or later, change the core and log file paths when creating an instance in WebAdmin.

FUJITSU Enterprise Postgres 11 or earlier
Log File Path: /var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log
Core File Path: /var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core
version: product version_edition_architecture
[Example]
Log File Path: /var/tmp/fsep_110_AE_64/naomi_myinst27599/log
Core File Path: /var/tmp/fsep_110_AE_64/naomi_myinst27599/core

FUJITSU Enterprise Postgres 12
Log File Path: /var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log
Core File Path: /var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core
version: product version_WA_architecture
[Example]
Log File Path: /var/tmp/fsep_120_WA_64/naomi_myinst27599/core
Core File Path: /var/tmp/fsep_120_WA_64/naomi_myinst27599/log

Action method
None.

2.1.9 Renaming WebAdmin Services

Incompatibility
In FUJITSU Enterprise Postgres 12 or later, change the service name registered when you set up WebAdmin.

FUJITSU Enterprise Postgres 11 or earlier
fsep_xSPz_edition_64_WebAdmin_Port1
fsep_xSPz_edition_64_WebAdmin_Port2

FUJITSU Enterprise Postgres 12 or later
fsep_xSPz_WA_64_WebAdmin_Port1
fsep_xSPz_WA_64_WebAdmin_Port2

Action method
None.

2.1.10 Changing the Features Targeted for Installation in a 64-bit Environment
Incompatibility

32 bit Linux client can no longer be installed on RHEL7 in FUJITSU Enterprise Postgres 10 or later.

Note: 32 bit Linux client can install on RHEL6 in FUJITSU Enterprise Postgres 11 or earlier.

Action method

None.

2.1.11 Changing the Access Permissions of the Windows Client Installation Folder

Incompatibility

When changed for install folder the Windows client from default, the access permissions of the installed files and folder changes to read and execute.

The above changes apply to non-administrators.

This incompatibility occurs with all supported Windows client operating systems. Refer to "Required Operating System" in the Installation and Setup Guide for Client for information on the operating environment.

Action method

This change was made simply to enhance security, therefore, no action is normally required.

However, if existing access permissions are required, this change can be reverted by running installDir\setup\revert_cacls.bat as an administrator after installation.

2.1.12 Changing the WebAdmin Installation Method

Incompatibility

In FUJITSU Enterprise Postgres 9.6 or later, WebAdmin is not installed automatically during server installation. Therefore, install WebAdmin separately.

Action method

None.

2.2 Application Migration Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Change the &quot;elif&quot; Statement Behavior in ecobpg</td>
<td>Y</td>
</tr>
<tr>
<td>Changed to Error when Running an Operator or Function that Returns non Data Types for Masking Type</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the method of specifying the application connection switch feature</td>
<td>Y</td>
</tr>
<tr>
<td>PostgreSQL compatibility of embedded SQL applications in C and COBOL</td>
<td>Y</td>
</tr>
<tr>
<td>Changing Vertical Clustered Index (VCI)</td>
<td>Y</td>
</tr>
<tr>
<td>Changing how to use the features compatible with Oracle databases</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists
2.2.1 Change the "elif" Statement Behavior in ecobpg

Incompatibility

The "elif" statement now works correctly with FUJITSU Enterprise Postgres 13.

FUJITSU Enterprise Postgres 12 or earlier

The decision of the "elif" statement is made whether or not the "ifdef/ifndef" condition is met.

[Example]

000000 EXEC SQL ifdef DEF1 END-EXEC.
000000 Operation (1).
000000 EXEC SQL elif DEF2 END-EXEC.
000000 Operation (2).
000000 EXEC SQL else END-EXEC.
000000 Operation (3).

If "DEF1" and "DEF2" are true, both "Operation (1)" and "Operation (2)" are executed.

FUJITSU Enterprise Postgres 13 or later

If the condition "ifdef/ifndef" is met, the judgment of the "elif" statement is not enforced.

[Example]

000000 EXEC SQL ifdef DEF1 END-EXEC.
000000 Operation (1).
000000 EXEC SQL elif DEF2 END-EXEC.
000000 Operation (2).
000000 EXEC SQL else END-EXEC.
000000 Operation (3).

If "DEF1" and "DEF2" are true, only "Operation (1)" is executed.

Action method

Check your existing application and fix the elif statement to work correctly.

2.2.2 Changed to Error when Running an Operator or Function that Returns non Data Types for Masking Type

Incompatibility

In FUJITSU Enterprise Postgres 12, changed to error when running an operator or function that returns non Data Types for Masking type.

FUJITSU Enterprise Postgres 11 or earlier

In the following cases, the operator or function in 3) may be executed without masking.

This is an incorrect result because the data containing the masking column is performed without masking.

1) Create a Masking policy. and
2) Execute a SELECT statement. and
3) Execute an operator or function in the SELECT statement of 2). and
4) The operator or function argument of 3) includes a subquery. and
5) The operator or function argument of 3) contains the column to be protected created in 1). and
6) The operator or function of 3) returns a type not listed in "Data Types for Masking" in "Operation Guide".
FUJITSU Enterprise Postgres 12 or later

Operator or function results of 3) in the following error.

ERROR:  The output data type is incompatible with the confidential policy.
HINT:  Data type of the result value(s) produced by expression/function using confidential columns
is not supported by Data masking module. Consider removing confidential columns from such
expressions/functions.

This is correct because the operator or function returns a data type not listed in "Data Types for Masking" in "Operation Guide".

Action method

Do one of the following to ensure that the results are identical to those of FUJITSU Enterprise Postgres 11 and earlier:
1) Modify the Masking policy to prevent masking from being performed for the user executing the SQL.
2) Modify SQL to not use operators or functions that return types not listed in "Data Types for Masking" in "Operation Guide".

2.2.3 Changing the Method of Specifying the Application Connection Switch Feature

Incompatibility

The target server specified using the application connection switch feature is changed to the same name as that of PostgreSQL.

Action method

Use the FUJITSU Enterprise Postgres 10 or later client to execute applications that have the target server specified as the application
connection switch feature after changing the target server and specified value as listed below and recompiling.

Specified name of the target server

<table>
<thead>
<tr>
<th>Usage target</th>
<th>Before correction</th>
<th>After correction</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC driver</td>
<td>No change</td>
<td></td>
</tr>
<tr>
<td>ODBC driver</td>
<td>TargetServer</td>
<td>target_session_attrs</td>
</tr>
<tr>
<td>.NET Data Provider</td>
<td>target_server</td>
<td>TargetServerType</td>
</tr>
<tr>
<td>Connection service file</td>
<td>target_server</td>
<td>target_session_attrs</td>
</tr>
<tr>
<td>Library (libpq) for C</td>
<td>target_server</td>
<td>target_session_attrs</td>
</tr>
<tr>
<td>Environment variable (PGXTARGETSERVER)</td>
<td></td>
<td>Environment variable (PGTARGETSESSIONATTRS)</td>
</tr>
<tr>
<td>Embedded SQL</td>
<td>target_server</td>
<td>target_session_attrs</td>
</tr>
<tr>
<td>psql</td>
<td>Environment variable (PGXTARGETSERVER)</td>
<td>Environment variable (PGTARGETSESSIONATTRS)</td>
</tr>
</tbody>
</table>

Specified value for the target server

<table>
<thead>
<tr>
<th>Server selection order</th>
<th>JDBC driver</th>
<th>.NET Data Provider</th>
<th>Other driver</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Before</td>
<td>After</td>
<td>Before</td>
</tr>
<tr>
<td></td>
<td>correction</td>
<td>correction</td>
<td>correction</td>
</tr>
<tr>
<td>Primary server</td>
<td>No change</td>
<td>primary</td>
<td>primary</td>
</tr>
<tr>
<td>Standby server</td>
<td>No change</td>
<td>-</td>
<td>slave</td>
</tr>
<tr>
<td>Priority given to a standby server</td>
<td>No change</td>
<td>prefer_standby</td>
<td>preferSlave</td>
</tr>
<tr>
<td>Any</td>
<td>No change</td>
<td>-</td>
<td>any</td>
</tr>
</tbody>
</table>
2.2.4 PostgreSQL Compatibility of Embedded SQL Applications in C and COBOL

Incompatibility

Embedded SQL applications in C and COBOL that were compiled with FUJITSU Enterprise Postgres 9.6 or earlier cannot be used in the FUJITSU Enterprise Postgres 10 client.

Action method

Use the FUJITSU Enterprise Postgres 10 or later client to execute the applications only after recompiling them with the FUJITSU Enterprise Postgres 10 or later client.

2.2.5 Changing Vertical Clustered Index (VCI)

Incompatibility

The functions below have been added to the functions for which VCI is not used.

<table>
<thead>
<tr>
<th>Type</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/time functions</td>
<td>age(timestamp)</td>
</tr>
<tr>
<td></td>
<td>current_date</td>
</tr>
<tr>
<td></td>
<td>current_timestamp</td>
</tr>
<tr>
<td></td>
<td>current_time</td>
</tr>
<tr>
<td></td>
<td>localtime</td>
</tr>
<tr>
<td></td>
<td>localtimestamp</td>
</tr>
<tr>
<td>Session information</td>
<td>current_user</td>
</tr>
<tr>
<td>functions</td>
<td>current_role</td>
</tr>
</tbody>
</table>

Action method

To use VCI, specify the second argument when using the age function, and specify other functions as subqueries.

[Example]

Before: select age(column A), current_date from table

After: select age(column A, now()), (select current_date) from table

2.2.6 Changing how to Use the Features Compatible with Oracle Databases

Incompatibility

In FUJITSU Enterprise Postgres 9.6 or later, to use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

```
CREATE EXTENSION oracle_compatible
```

Action method

None.

2.3 Operation Migration Incompatibility
<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing the Value of the Category Column in the pg_settings view</td>
<td>N</td>
</tr>
<tr>
<td>Changing pgx_stat_lwlock of the Statistics View</td>
<td>N</td>
</tr>
<tr>
<td>Changing the Behavior of pgx_rcvall</td>
<td>Y</td>
</tr>
<tr>
<td>Mirroring Controller no longer retries to monitor database processes when they are detected as down</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the Name and Parameter Name of the Mirroring Controller Post-Promote Command</td>
<td>N</td>
</tr>
<tr>
<td>Changing Mirroring Controller User Command Input Values</td>
<td>N</td>
</tr>
<tr>
<td>Changing the maximum number of connections per server</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the encryption settings using the ALTER TABLESPACE statement</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the default configuration of the cluster system using database multiplexing</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the default operation when mc_ctl command options are omitted</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the connection settings when Mirroring Controller connects to an instance</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the status display of the Mirroring Controller server</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the operation when the synchronous_standby_names parameter is changed during database multiplexing operation</td>
<td>Y</td>
</tr>
<tr>
<td>Changing masking policy definition for unsupported data types</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists  
N: Incompatibility does not exist

### 2.3.1 Changing the Value of the Category Column in the pg_settings view

**Incompatibility**

For FUJITSU Enterprise Postgres 13, change the value of the category column in the pg_settings view.

**FUJITSU Enterprise Postgres 12 or earlier**

<table>
<thead>
<tr>
<th>Original value</th>
<th>wrong value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preset Options</td>
<td>Fujitsu Enterprise Postgres Parameters</td>
</tr>
<tr>
<td>Customized Options</td>
<td>Preset Options</td>
</tr>
<tr>
<td>Developer Options</td>
<td>Customized Options</td>
</tr>
</tbody>
</table>

This is an incorrect result because it is different from the original value.

**FUJITSU Enterprise Postgres 13 or later**

The correct value is the category column in the pg_settings view.

**Action method**

Replaces the category column in the pg_settings view with the values before migration, so that the results are the same as before migration.
### 2.3.2 Changing pgx_stat_lwlock of the Statistics View

**Incompatibility**

In FUJITSU Enterprise Postgres 13, change the wait event name displayed in the lwlock_name column of the statistics view pgx_stat_lwlock.

Wait Event Name

<table>
<thead>
<tr>
<th>FUJITSU Enterprise Postgres 12 or earlier</th>
<th>FUJITSU Enterprise Postgres 13</th>
</tr>
</thead>
<tbody>
<tr>
<td>clog (*1)</td>
<td>XactBuffer</td>
</tr>
<tr>

*1) Events added in FUJITSU Enterprise Postgres 9.6.
*2) Events added in FUJITSU Enterprise Postgres 10.
*3) Events added in FUJITSU Enterprise Postgres 11.
*4) Events added in FUJITSU Enterprise Postgres 12.
2.3.3 Changing the Behavior of pgx_rcvall

Incompatibility

In FUJITSU Enterprise Postgres 13, change the pgx_rcvall command to fail if the -e option of the pgx_rcvall command specifies a future time or if the -n option specifies a list appointment that does not exist.

FUJITSU Enterprise Postgres 12 or earlier

All archived WALs are applied for recovery if the -e option of the pgx_rcvall command specifies a time in the future, or if the -n option specifies a list appointment that does not exist.

FUJITSU Enterprise Postgres 13 or later

The pgx_rcvall command fails if the -e option of the pgx_rcvall command specifies a time in the future, or if the -n option specifies a list appointment that does not exist.

Action method

Specify recovery objectives correctly, if necessary.

2.3.4 Mirroring Controller no Longer Retries to Monitor Database Processes when they are Detected as Down

Incompatibility

For the FUJITSU Enterprise Postgres Mirroring Controller, change the heartbeat monitoring of the database process so that it does not retry monitoring when it detects down.

Action method

None.

2.3.5 Changing the Name and Parameter Name of the Mirroring Controller Post-Promote Command

Incompatibility

In the FUJITSU Enterprise Postgres 12 Mirroring Controller, change the name of the post-promote command, which is the state transition command, and the parameter name in the server configuration file that specifies the post-promote command.

FUJITSU Enterprise Postgres 11 or earlier

- Command Name
  post-promote command
- The parameter name in the server configuration file that specifies the post-promote command
  post_promote_command

FUJITSU Enterprise Postgres 12 or later

- Command Name
  post-switch command
- The parameter name in the server configuration file that specifies the post-promote command
  post_switch_command
The post_promote_command parameter in the server configuration file continues to be available in FUJITSU Enterprise Postgres 12 or later. If specified in the server configuration file, it acts as a post-switch command. You cannot specify the post_promote_command and post_switch_command parameters at the same time.

### 2.3.6 Changing Mirroring Controller User Command Input Values

**Incompatibility**

Arguments (Fixed value: primarycenter) have been added to the following user commands:

- Fencing command of the database server
- Arbitration command
- Post-switch command
- Pre-detach command
- Post-attach command

**Action method**

If you are checking the number of arguments in a user command, increase the number of arguments by one.

### 2.3.7 Changing the Maximum Number of Connections per Server

**Incompatibility**

The maximum number of connections per server is changed from 262,143 to 65,535.

**Action method**

None.

### 2.3.8 Changing the Encryption Settings Using the ALTER TABLESPACE Statement

**Incompatibility**

The ALTER TABLESPACE statement can be used to change the tablespace encryption settings if data is not stored in the tablespace.

**Action method**

None.

### 2.3.9 Changing the Default Configuration of the Cluster System Using Database Multiplexing

**Incompatibility**

In FUJITSU Enterprise Postgres 10, a split brain will not occur if heartbeat monitoring using an admin network times out, so the default is changed to a system configuration requiring an arbitration server acting as a third party.

**FUJITSU Enterprise Postgres 9.6 or earlier**

A cluster system comprises two database servers.

**FUJITSU Enterprise Postgres 10 or later**

By default, a cluster system comprises two database servers and an arbitration server.
**Action method**

If selecting the same system configuration as that in FUJITSU Enterprise Postgres 9.6 or earlier, set the parameters below in the server configuration file to perform automatic degradation unconditionally when a heartbeat abnormality is detected during OS/server heartbeat monitoring.

- Parameter: heartbeat_error_action
- Value: fallback

**2.3.10 Changing the Default Operation when mc_ctl Command Options are Omitted**

**Incompatibility**

In FUJITSU Enterprise Postgres 10, the default operation when the mc_ctl command options below are omitted has been changed:

- The -f option during start mode
- The -w option during start mode

**FUJITSU Enterprise Postgres 9.6 or earlier**

- If the -f option is omitted, automatic switching and disconnection immediately after the startup of Mirroring Controller will not be enabled.
- If the -w option is omitted, the system will not wait for operations to finish.

**FUJITSU Enterprise Postgres 10 or later**

- Even if the -f option is omitted, automatic switching and disconnection immediately after the startup of Mirroring Controller will be enabled.
- Even if the -w option is omitted, the system will wait for operations to finish.

**Action method**

If selecting the same operation as that in FUJITSU Enterprise Postgres 9.6 or earlier, take the action below when executing start mode of the mc_ctl command.

- If the -f option is omitted, specify the -F option.
- If the -w option is omitted, specify the -W option.

**2.3.11 Changing the Connection Settings when Mirroring Controller Connects to an Instance**

**Incompatibility**

In FUJITSU Enterprise Postgres 10, Mirroring Controller changes the connection setting below when connecting to an instance to detect failure of each database element.

- Application name

**FUJITSU Enterprise Postgres 9.6 or earlier**

- The application name is an empty string.

**FUJITSU Enterprise Postgres 10 or later**

- The application name is 'mc_agent'.

**Action method**

There is no method for changing the application name.
Therefore, if there is an application that identifies a database connection session of Mirroring Controller with the application name being an empty string, modify the process so that identification is performed using 'mc_agent'.

### 2.3.12 Changing the Status Display of the Mirroring Controller Server

**Incompatibility**

In FUJITSU Enterprise Postgres 10, the condition for displaying an abnormality for the process (WAL receive process) that receives transaction logs has been changed in regard to the server status display performed in status mode of the mc_ctl command of Mirroring Controller.

- Role of the applicable server (host_role): standby (standby)
- Display item: DBMS process status (db_proc_status)
- Display content: abnormal (abnormal process name)

The applicability for incompatibility is determined based on whether 'wal_receiver' is included in the abnormality process name.

**FUJITSU Enterprise Postgres 9.6 or earlier**

Displays an abnormality when Mirroring Controller detects that the WAL send process has stopped.

**FUJITSU Enterprise Postgres 10 or later**

Displays an abnormality when Mirroring Controller detects that a streaming replication connection has not been established with the primary server using the WAL receive process.

**Action method**

If there is an application that determines the WAL receive process status from the display content retrieved using status mode of the mc_ctl command, modify as below to determine at the same level of accuracy as previously. However, this is not recommended due to incompatibilities accompanying the improvement in accuracy.

- If 'wal_sender' is included in the abnormal process name displayed in the 'abnormal' db_proc_status item of the 'primary' host_role, it is determined that an abnormality has occurred in the WAL receive process.
- If 'wal_sender' is not included in the abnormal process name displayed in the 'abnormal' db_proc_status item of the 'primary' host_role, it is determined that an abnormality has not occurred in the WAL receive process.

### 2.3.13 Changing the Operation when the synchronous_standby_names Parameter is Changed during Database Multiplexing Operation

**Incompatibility**

In FUJITSU Enterprise Postgres 9.6 or earlier, Mirroring Controller periodically accesses the database to retrieve the synchronous_standby_names parameter value using the SHOW command, and automatically recovers if changes are detected, in case the user accidentally changes the synchronous_standby_names parameter in postgresql.conf during database multiplexing mode. However, because this process uses the CPU of the database server for redundancy and SQL statements are executed with high frequency, these processes are not executed by default in FUJITSU Enterprise Postgres 10.

**FUJITSU Enterprise Postgres 9.6 or earlier**

Mirroring Controller checks if the synchronous_standby_names parameter in postgresql.conf has been mistakenly changed by the user.

**FUJITSU Enterprise Postgres 10 or later**

By default, Mirroring Controller does not check if the synchronous_standby_names parameter in postgresql.conf has been mistakenly changed by the user.

**Action method**

If selecting the same operation as that in FUJITSU Enterprise Postgres 9.6 or earlier, set the parameter below in the server definition file.

- Parameter: check_synchronous_standby_names_validation
- Value: 'on'
2.3.14 Changing Masking Policy Definition for Unsupported Data Types

Incompatibility

The data masking feature of FUJITSU Enterprise Postgres is updated so that an error occurs when a masking policy is defined for a column of an unsupported data type (array type or timestamp with timezone type).

FUJITSU Enterprise Postgres 9.5

The definition of a masking policy for a column of array type or timestamp with timezone type ends normally, but an error occurs when accessing a column of a table for which the policy is defined.

FUJITSU Enterprise Postgres 9.6 or later

An error occurs when defining a masking policy for a column of array type or timestamp with timezone type.

Action method

If a policy that was defined in FUJITSU Enterprise Postgres 9.5 includes masking of a column of an unsupported data type (array type or timestamp with timezone type), perform one of the following in FUJITSU Enterprise Postgres 9.6 or later:

- Ignore the error if the masking policy contains columns of only these data types, or delete the policy with the pgx_drop_confidential_policy system administration function.
- If the masking policy target contains columns of these data types and a supported data type, delete the problematic columns with the pgx_alter_confidential_policy system function.

2.4 JDBC Drive Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing the targetServerType Value</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists
N: Incompatibility does not exist

2.4.1 Changing the targetServerType Value

Incompatibility

In FUJITSU Enterprise Postgres 13, the value of targetServerType specified in the connection string was changed. Therefore, the previously used values are no longer available.

Action method

If you specified a value for targetServerType, change the value as follows:

Table 2.1 Specified values for the target server

<table>
<thead>
<tr>
<th>Server Selection Order</th>
<th>FUJITSU Enterprise Postgres 12 or earlier</th>
<th>FUJITSU Enterprise Postgres 13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Server</td>
<td>master</td>
<td>primary</td>
</tr>
<tr>

</tr>
<tr>
<td>Changing the Server Explorer View in Visual Studio</td>
<td>Y</td>
</tr>
<tr>
<td>Integration with .NET Data Provider</td>
<td></td>
</tr>
</tbody>
</table>

Y: Incompatibility exists
N: Incompatibility does not exist

### 2.5.1 Changing the TargetServerType Value

**Incompatibility**

In FUJITSU Enterprise Postgres 13, the value of TargetServerType specified in the connection string was changed. Therefore, the previously used values are no longer available.

**Action method**

If you specified a value for TargetServerType, change the value as follows:

<table>
<thead>
<tr>
<th>Table 2.2 Specified values for the target server</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Server Selection Order</strong></td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres 9.6 or earlier</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres 10/11/12</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres 13</td>
</tr>
<tr>
<td>Primary Server</td>
</tr>
<tr>
<td>Standby Server</td>
</tr>
<tr>
<td>Prefer Standby Server</td>
</tr>
<tr>
<td>Any</td>
</tr>
</tbody>
</table>

### 2.5.2 Changing the Server Explorer View in Visual Studio Integration with .NET Data Provider

**Incompatibility**

FUJITSU Enterprise Postgres 10 or later, the following changes occur when you view database resources in Server Explorer.

- "Schema Name.Table Name" display under the Tables folder.
- The Indexes folder is not displayed.
- The Triggers folder does not displayed.
- The Sequences folder is not displayed.
- The Procedures folder does not displayed.

**Action method**

None.

### 2.6 oracle_fdw Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing the Oracle Client Version</td>
<td>N</td>
</tr>
</tbody>
</table>

- 18 -
2.6.1 Changing the Oracle Client Version

Incompatibility
FUJITSU Enterprise Postgres 12 change the version of the Oracle client used to build oracle_fdw to 11.2.

Action method
Use Oracle client version 11.2 or later.
Also, if a file named libclntsh.so.11.1 does not exist in OCI library, create a symbolic link named libclntsh.so.11.1.

2.7 pgaudit Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing to Print Extra NEW and OLD Values in the Audit Log when the Trigger Function Executes</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists
N: Incompatibility does not exist

2.7.1 Changing to Print Extra NEW and OLD Values in the Audit Log when the Trigger Function Executes

Incompatibility
In FUJITSU Enterprise Postgres 13, the trigger function additionally outputs NEW and OLD values to the audit log when the pgaudit.log_parameter is set to on.
FUJITSU Enterprise Postgres 12 or earlier
The following (18) does not output the values of New, OLD.

[Example]
AUDIT: SESSION,WRITE,2020-09-03 07:07:39 UTC,
(1) (2) (3) [local],9775,psql,k5user,postgres,1/536,1,2,INSERT,,
(4) (5) (6) (7) (8) (9) (10)(11)(12)(13) TABLE,public.trig_audit, ,
(14) (15) (16)
"INSERT INTO trig_audit SELECT 'U', now(), user, OLD.*, NEW.*",
(17) trig_audit AFTER ROW UPDATE 92027 trig_test trig_test public 0 f aaaa
(18)

FUJITSU Enterprise Postgres 13 or later
New, OLD values are printed.

[Example]
AUDIT: SESSION,WRITE,2020-09-03 07:07:39 UTC,
[local],9775,psql,k5user,postgres,1/536,1,2,INSERT,,TABLE,public.
trig_audit,,
"INSERT INTO trig_audit SELECT 'U', now(), user, OLD.*, NEW.*", 
Action method

If you are using an application that works by monitoring the string that the trigger function prints to the audit log, modify the application to work with the NEW and OLD values.
Chapter 3 Program Updates

For program fix information, see "Program Updates".
Preface

Purpose of this document
This document provides release information for FUJITSU Enterprise Postgres.

Structure of this document
This document is structured as follows:

Chapter 1 New Features and Improvements
Explains the new features and improvements in this version.

Chapter 2 Compatibility Information
Provides information regarding compatibility.

Chapter 3 Program Updates
Explains updates incorporated in this version.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue date and version

| Edition 1.0: April 2021 |

</table>

1.1 Features Added in 13

This section explains new features and improvements in FUJITSU Enterprise Postgres 13.

1.1.1 Application Development

This section explains the new features and improvements related to application development:
- Support for OpenJDK

1.1.1.1 Support for OpenJDK

In the FUJITSU Enterprise Postgres client environment, in addition to the Oracle JDK or JRE that we have guaranteed so far, we also guarantee the behavior when using OpenJDK.

See

Refer to “Related Software” in the Installation and Setup Guide for Client for details.

1.1.2 OSS

This section explains the new feature related to OSS:
- PostgreSQL rebase
- Update of OSS provided

1.1.2.1 PostgreSQL Rebase

The PostgreSQL version that FUJITSU Enterprise Postgres is based on is 13.1.

See

1.1.2.2 Update of OSS Provided

The OSS provided by FUJITSU Enterprise Postgres have been updated.
Refer to "OSS Supported by FUJITSU Enterprise Postgres" in the General Description for details.
Chapter 2 Compatibility Information

This chapter explains incompatible items and actions required when migrating from an earlier version to FUJITSU Enterprise Postgres 13. Check compatibility before migrating and take the appropriate action.

2.1 Installation/Setup Incompatibility

<table>
<thead>
<tr>

</tbody>
</table>

Y: Incompatibility exists
N: Incompatibility does not exist

2.1.1 Removing Operating System Support for Client Feature

Incompatibility
In FUJITSU Enterprise Postgres 13 or later, the following operating systems have been removed.
- SLES 12 SP4 or earlier

Action method
None.

2.1.2 Removing Operating System Support for Client Feature

Incompatibility
In FUJITSU Enterprise Postgres 12 or later, the following operating systems have been removed.
- Windows(R) 7
- Windows Server(R) 2008
- RHEL6

Also, the 32 bit Linux client can no longer be installed because RHEL 6 has been removed from the operating system.

Action method
None.
2.1.3 Removing Operating System Support for Server Feature

**Incompatibility**

In FUJITSU Enterprise Postgres 12 or later, the following operating systems have been removed.
- Windows Server(R) 2008

**Action method**

None.

2.1.4 Changing the Way OSS is Set Up

**Incompatibility**

FUJITSU Enterprise Postgres 12 or later do not place OSS extension modules in the executable directory. The OSS extension modules must be placed in the executable directory when you set up OSS.

**Action method**

None.

2.1.5 Changing Core and Log File Paths when Instance is Created with WebAdmin

**Incompatibility**

In FUJITSU Enterprise Postgres 12 or later, change the core and log file paths when creating an instance in WebAdmin.

FUJITSU Enterprise Postgres 11 or earlier

Log File Path: `userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\log`

Core File Path: `userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\core`

version: product version_edition_architecture

[Example]

Log File Path: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_110_AE_64\myinst27599\log`

Core File Path: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_110_AE_64\myinst27599\core`

FUJITSU Enterprise Postgres 12

userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\log

Core File Path: `userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\core`

version: product version_WA_architecture

[Example]

Log File Path: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_120_WA_64\myinst27599\log`

Core File Path: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_120_WA_64\myinst27599\core`

**Action method**

None.

2.1.6 Renaming WebAdmin Services
Incompatibility
In FUJITSU Enterprise Postgres 12 or later, change the service name registered when you set up WebAdmin.

FUJITSU Enterprise Postgres 11 or earlier
fsep_xSPz_edition_64_WebAdmin_Port1
fsep_xSPz_edition_64_WebAdmin_Port2

FUJITSU Enterprise Postgres 12 or later
fsep_xSPz_WA_64_WebAdmin_Port1
fsep_xSPz_WA_64_WebAdmin_Port2

Action method
None.

2.1.7 Changing the Features Targeted for Installation in a 64-bit Environment

Incompatibility
32 bit Linux client can no longer be installed on RHEL7 in FUJITSU Enterprise Postgres 10 or later.
Note: 32 bit Linux client can install on RHEL6 in FUJITSU Enterprise Postgres 11 or earlier.

Action method
None.

2.1.8 Changing the Access Permissions of the Windows Client Installation Folder

Incompatibility
When changed for install folder the Windows client from default, the access permissions of the installed files and folder changes to read and execute.
The above changes apply to non-administrators.
This incompatibility occurs with all supported Windows client operating systems. Refer to "Required Operating System" in the Installation and Setup Guide for Client for information on the operating environment.

Action method
This change was made simply to enhance security, therefore, no action is normally required.
However, if existing access permissions are required, this change can be reverted by running installDir\setup\revert_cacls.bat as an administrator after installation.

2.1.9 Changing the WebAdmin Installation Method

Incompatibility
In FUJITSU Enterprise Postgres 9.6 or later, WebAdmin is not installed automatically during server installation. Therefore, install WebAdmin separately.

Action method
None.
## 2.2 Application Migration Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Change the &quot;elif&quot; Statement Behavior in ecobpg</td>

<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists  
N: Incompatibility does not exist

### 2.2.1 Change the "elif" Statement Behavior in ecobpg

#### Incompatibility

The "elif" statement now works correctly with FUJITSU Enterprise Postgres 13.

**FUJITSU Enterprise Postgres 12 or earlier**

The decision of the "elif" statement is made whether or not the "ifdef/ifndef" condition is met.

[Example]

000000 EXEC SQL ifdef DEF1 END-EXEC.  
000000 Operation (1).  
000000 EXEC SQL elsif DEF2 END-EXEC.  
000000 Operation (2).  
000000 EXEC SQL else END-EXEC.  
000000 Operation (3).  

If "DEF1" and "DEF2" are true, both "Operation (1)" and "Operation (2)" are executed.

**FUJITSU Enterprise Postgres 13 or later**

If the condition "ifdef/ifndef" is met, the judgment of the "elif" statement is not enforced.

[Example]

000000 EXEC SQL ifdef DEF1 END-EXEC.  
000000 Operation (1).  
000000 EXEC SQL elsif DEF2 END-EXEC.  
000000 Operation (2).  
000000 EXEC SQL else END-EXEC.  
000000 Operation (3).  

If "DEF1" and "DEF2" are true, only "Operation (1)" is executed.

#### Action method

Check your existing application and fix the elif statement to work correctly.
2.2.2 Changed to Error when Running an Operator or Function that Returns non Data Types for Masking Type

**Incompatibility**

In FUJITSU Enterprise Postgres 12, changed to error when running an operator or function that returns non Data Types for Masking type.

**FUJITSU Enterprise Postgres 11 or earlier**

In the following cases, the operator or function in 3) may be executed without masking.

This is an incorrect result because the data containing the masking column is performed without masking.

1) Create a Masking policy. and
2) Execute a SELECT statement. and
3) Execute an operator or function in the SELECT statement of 2). and
4) The operator or function argument of 3) includes a subquery. and
5) The operator or function argument of 3) contains the column to be protected created in 1). and
6) The operator or function of 3) returns a type not listed in "Data Types for Masking" in "Operation Guide".

**FUJITSU Enterprise Postgres 12 or later**

Operator or function results of 3) in the following error.

```
ERROR:  The output data type is incompatible with the confidential policy.
HINT:  Data type of the result value(s) produced by expression/function using confidential columns
is not supported by Data masking module. Consider removing confidential columns from such
expressions/functions.
```

This is correct because the operator or function returns a data type not listed in "Data Types for Masking" in "Operation Guide".

**Action method**

Do one of the following to ensure that the results are identical to those of FUJITSU Enterprise Postgres 11 and earlier:

1) Modify the Masking policy to prevent masking from being performed for the user executing the SQL.
2) Modify SQL to not use operators or functions that return types not listed in "Data Types for Masking" in "Operation Guide".

2.2.3 Removing UTL_FILE for Oracle Database Compatibility Features

**Incompatibility**

In FUJITSU Enterprise Postgres 12, remove the Oracle database compatibility UTL_FILE.

**Action method**

None.

2.2.4 Changing the Method of Specifying the Application Connection Switch Feature

**Incompatibility**

The target server specified using the application connection switch feature is changed to the same name as that of PostgreSQL.

**Action method**

Use the FUJITSU Enterprise Postgres 10 or later client to execute applications that have the target server specified as the application connection switch feature after changing the target server and specified value as listed below and recompiling.
2.2.5 PostgreSQL Compatibility of Embedded SQL Applications in C and COBOL

Incompatibility

Embedded SQL applications in C and COBOL that were compiled with FUJITSU Enterprise Postgres 9.6 or earlier cannot be used in the FUJITSU Enterprise Postgres 10 client.

Action method

Use the FUJITSU Enterprise Postgres 10 or later client to execute the applications only after recompiling them with the FUJITSU Enterprise Postgres 10 or later client.

2.2.6 Changing Vertical Clustered Index (VCI)

Incompatibility

The functions below have been added to the functions for which VCI is not used.
<table>
<thead>
<tr>
<th>Type</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>localtimestamp</td>
<td></td>
</tr>
<tr>
<td>Session information functions</td>
<td>current_user</td>
</tr>
<tr>
<td></td>
<td>current_role</td>
</tr>
</tbody>
</table>

**Action method**

To use VCI, specify the second argument when using the age function, and specify other functions as subqueries.

**[Example]**

Before: select age(column A), current_date from table  
After: select age(column A, now()), (select current_date) from table

### 2.2.7 Changing how to Use the Features Compatible with Oracle Databases

**Incompatibility**

In FUJITSU Enterprise Postgres 9.6 or later, to use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

```sql
CREATE EXTENSION oracle_compatible
```

**Action method**

None.

### 2.3 Operation Migration Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing the Value of the Category Column in the pg_settings view</td>
<td>N</td>
</tr>
<tr>
<td>Changing pgx_stat_lwlock of the Statistics View</td>
<td>N</td>
</tr>
<tr>
<td>Changing the Behavior of pgx_rcvall</td>
<td>Y</td>
</tr>
<tr>
<td>Mirroring Controller no longer retries to monitor database processes when they are detected as down</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the Name and Parameter Name of the Mirroring Controller Post-Promote Command</td>
<td>N</td>
</tr>
<tr>
<td>Changing Mirroring Controller User Command Input Values</td>
<td>N</td>
</tr>
<tr>
<td>Changing the maximum number of connections per server</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the encryption settings using the ALTER TABLESPACE statement</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the default configuration of the cluster system using database multiplexing</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the default operation when mc_ctl command options are omitted</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the connection settings when Mirroring Controller connects to an instance</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the status display of the Mirroring Controller server</td>
<td>Y</td>
</tr>
</tbody>
</table>
### Changing the value of the category column in the `pg_settings` view

**Incompatibility**

For FUJITSU Enterprise Postgres 13, change the value of the category column in the `pg_settings` view.

**FUJITSU Enterprise Postgres 12 or earlier**

<table>
<thead>
<tr>
<th>Original value</th>
<th>wrong value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preset Options</td>
<td>Fujitsu Enterprise Postgres Parameters</td>
</tr>
<tr>
<td>Customized Options</td>
<td>Preset Options</td>
</tr>
<tr>
<td>Developer Options</td>
<td>Customized Options</td>
</tr>
</tbody>
</table>

This is an incorrect result because it is different from the original value.

**FUJITSU Enterprise Postgres 13 or later**

The correct value is the category column in the `pg_settings` view.

**Action method**

Replaces the category column in the `pg_settings` view with the values before migration, so that the results are the same as before migration.

### Changing `pgx_stat_lwlock` of the Statistics View

**Incompatibility**

In FUJITSU Enterprise Postgres 13, change the wait event name displayed in the `lwlock_name` column of the statistics view `pgx_stat_lwlock`.

**Wait Event Name**

<table>
<thead>
<tr>
<th>FUJITSU Enterprise Postgres 12 or earlier</th>
<th>FUJITSU Enterprise Postgres 13</th>
</tr>
</thead>
<tbody>
<tr>

</table>

*1) Events added in FUJITSU Enterprise Postgres 9.6.
*2) Events added in FUJITSU Enterprise Postgres 10.
*3) Events added in FUJITSU Enterprise Postgres 11.
*4) Events added in FUJITSU Enterprise Postgres 12.

**Action method**

None.

### 2.3.3 Changing the Behavior of pgx_rcvall

**Incompatibility**

In FUJITSU Enterprise Postgres 13, change the pgx_rcvall command to fail if the -e option of the pgx_rcvall command specifies a future time or if the -n option specifies a list appointment that does not exist.

**FUJITSU Enterprise Postgres 12 or earlier**

All archived WALs are applied for recovery if the -e option of the pgx_rcvall command specifies a time in the future, or if the -n option specifies a list appointment that does not exist.

**FUJITSU Enterprise Postgres 13 or later**

The pgx_rcvall command fails if the -e option of the pgx_rcvall command specifies a time in the future, or if the -n option specifies a list appointment that does not exist.
2.3.4 Mirroring Controller no Longer Retries to Monitor Database Processes when they are Detected as Down

Incompatibility

For the FUJITSU Enterprise Postgres Mirroring Controller, change the heartbeat monitoring of the database process so that it does not retry monitoring when it detects down.

Action method

None.

2.3.5 Changing the Name and Parameter Name of the Mirroring Controller Post-Promote Command

Incompatibility

In the FUJITSU Enterprise Postgres 12 Mirroring Controller, change the name of the post-promote command, which is the state transition command, and the parameter name in the server configuration file that specifies the post-promote command.

FUJITSU Enterprise Postgres 11 or earlier

- Command Name
  post-promote command
- The parameter name in the server configuration file that specifies the post-promote command
  post_promote_command

FUJITSU Enterprise Postgres 12 or later

- Command Name
  post-switch command
- The parameter name in the server configuration file that specifies the post-promote command
  post_switch_command

Action method

The post_promote_command parameter in the server configuration file continues to be available in FUJITSU Enterprise Postgres 12 or later. If specified in the server configuration file, it acts as a post-switch command. You cannot specify the post_promote_command and post_switch_command parameters at the same time.

2.3.6 Changing Mirroring Controller User Command Input Values

Incompatibility

Arguments (Fixed value: primarycenter) have been added to the following user commands:

- Fencing command of the database server
- Arbitration command
- Post-switch command
- Pre-detach command
- Post-attach command
Action method
If you are checking the number of arguments in a user command, increase the number of arguments by one.

2.3.7 Changing the Maximum Number of Connections per Server

Incompatibility
The maximum number of connections per server is changed from 262,143 to 65,535.

Action method
None.

2.3.8 Changing the Encryption Settings Using the ALTER TABLESPACE Statement

Incompatibility
The ALTER TABLESPACE statement can be used to change the tablespace encryption settings if data is not stored in the tablespace.

Action method
None.

2.3.9 Changing the Default Configuration of the Cluster System Using Database Multiplexing

Incompatibility
In FUJITSU Enterprise Postgres 10, a split brain will not occur if heartbeat monitoring using an admin network times out, so the default is changed to a system configuration requiring an arbitration server acting as a third party.

FUJITSU Enterprise Postgres 9.6 or earlier
A cluster system comprises two database servers.

FUJITSU Enterprise Postgres 10 or later
By default, a cluster system comprises two database servers and an arbitration server.

Action method
If selecting the same system configuration as that in FUJITSU Enterprise Postgres 9.6 or earlier, set the parameters below in the server configuration file to perform automatic degradation unconditionally when a heartbeat abnormality is detected during OS/server heartbeat monitoring.

- Parameter: heartbeat_error_action
- Value: fallback

2.3.10 Changing the Default Operation when mc_ctl Command Options are Omitted

Incompatibility
In FUJITSU Enterprise Postgres 10, the default operation when the mc_ctl command options below are omitted has been changed:

- The -f option during start mode
- The -w option during start mode
FUJITSU Enterprise Postgres 9.6 or earlier
- If the -f option is omitted, automatic switching and disconnection immediately after the startup of Mirroring Controller will not be enabled.
- If the -w option is omitted, the system will not wait for operations to finish.

FUJITSU Enterprise Postgres 10 or later
- Even if the -f option is omitted, automatic switching and disconnection immediately after the startup of Mirroring Controller will be enabled.
- Even if the -w option is omitted, the system will wait for operations to finish.

Action method
If selecting the same operation as that in FUJITSU Enterprise Postgres 9.6 or earlier, take the action below when executing start mode of the mc_ctl command.
- If the -f option is omitted, specify the -F option.
- If the -w option is omitted, specify the -W option.

2.3.11 Changing the Connection Settings when Mirroring Controller Connects to an Instance

Incompatibility
In FUJITSU Enterprise Postgres 10, Mirroring Controller changes the connection setting below when connecting to an instance to detect failure of each database element.
- Application name

FUJITSU Enterprise Postgres 9.6 or earlier
- The application name is an empty string.

FUJITSU Enterprise Postgres 10 or later
- The application name is 'mc_agent'.

Action method
There is no method for changing the application name.
Therefore, if there is an application that identifies a database connection session of Mirroring Controller with the application name being an empty string, modify the process so that identification is performed using 'mc_agent'.

2.3.12 Changing the Status Display of the Mirroring Controller Server

Incompatibility
In FUJITSU Enterprise Postgres 10, the condition for displaying an abnormality for the process (WAL receive process) that receives transaction logs has been changed in regard to the server status display performed in status mode of the mc_ctl command of Mirroring Controller.
- Role of the applicable server (host_role): standby (standby)
- Display item: DBMS process status (db_proc_status)
- Display content: abnormal (abnormal process name)
  The applicability for incompatibility is determined based on whether 'wal_receiver' is included in the abnormality process name.

FUJITSU Enterprise Postgres 9.6 or earlier
Displays an abnormality when Mirroring Controller detects that the WAL send process has stopped.
FUJITSU Enterprise Postgres 10 or later

Displays an abnormality when Mirroring Controller detects that a streaming replication connection has not been established with the primary server using the WAL receive process.

Action method

If there is an application that determines the WAL receive process status from the display content retrieved using status mode of the mc_ctl command, modify as below to determine at the same level of accuracy as previously. However, this is not recommended due to incompatibilities accompanying the improvement in accuracy.

- If ‘wal_sender’ is included in the abnormal process name displayed in the ‘abnormal’ db_proc_status item of the ‘primary’ host_role, it is determined that an abnormality has occurred in the WAL receive process.
- If ‘wal_sender’ is not included in the abnormal process name displayed in the ‘abnormal’ db_proc_status item of the ‘primary’ host_role, it is determined that an abnormality has not occurred in the WAL receive process.

2.3.13 Changing the Operation when the synchronous_standby_names Parameter is Changed during Database Multiplexing Operation

Incompatibility

In FUJITSU Enterprise Postgres 9.6 or earlier, Mirroring Controller periodically accesses the database to retrieve the synchronous_standby_names parameter value using the SHOW command, and automatically recovers if changes are detected, in case the user accidentally changes the synchronous_standby_names parameter in postgresql.conf during database multiplexing mode. However, because this process uses the CPU of the database server for redundancy and SQL statements are executed with high frequency, these processes are not executed by default in FUJITSU Enterprise Postgres 10.

FUJITSU Enterprise Postgres 9.6 or earlier

Mirroring Controller checks if the synchronous_standby_names parameter in postgresql.conf has been mistakenly changed by the user.

FUJITSU Enterprise Postgres 10 or later

By default, Mirroring Controller does not check if the synchronous_standby_names parameter in postgresql.conf has been mistakenly changed by the user.

Action method

If selecting the same operation as that in FUJITSU Enterprise Postgres 9.6 or earlier, set the parameter below in the server definition file.

- Parameter: check_synchronous_standby_names_validation
- Value: ‘on’

2.3.14 Changing Masking Policy Definition for Unsupported Data Types

Incompatibility

The data masking feature of FUJITSU Enterprise Postgres is updated so that an error occurs when a masking policy is defined for a column of an unsupported data type (array type or timestamp with timezone type).

FUJITSU Enterprise Postgres 9.5

The definition of a masking policy for a column of array type or timestamp with timezone type ends normally, but an error occurs when accessing a column of a table for which the policy is defined.

FUJITSU Enterprise Postgres 9.6 or later

An error occurs when defining a masking policy for a column of array type or timestamp with timezone type.

Action method

If a policy that was defined in FUJITSU Enterprise Postgres 9.5 includes masking of a column of an unsupported data type (array type or timestamp with timezone type), perform one of the following in FUJITSU Enterprise Postgres 9.6 or later:
- Ignore the error if the masking policy contains columns of only these data types, or delete the policy with the `pgx_drop_confidential_policy` system administration function.
- If the masking policy target contains columns of these data types and a supported data type, delete the problematic columns with the `pgx_alter_confidential_policy` system function.

### 2.4 JDBC Drive Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing the targetServerType Value</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists  
N: Incompatibility does not exist

#### 2.4.1 Changing the targetServerType Value

**Incompatibility**

In FUJITSU Enterprise Postgres 13, the value of targetServerType specified in the connection string was changed. Therefore, the previously used values are no longer available.

**Action method**

If you specified a value for targetServerType, change the value as follows:

**Table 2.1 Specified values for the target server**

<table>
<thead>
<tr>
<th>Server Selection Order</th>
<th>FUJITSU Enterprise Postgres 12 or earlier</th>
<th>FUJITSU Enterprise Postgres 13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Server</td>
<td>master</td>
<td>primary</td>
</tr>
<tr>
<td>Standby Server</td>
<td>slave</td>
<td>secondary</td>
</tr>
<tr>
<td>Prefer Standby Server</td>
<td>preferSlave</td>
<td>preferSecondary</td>
</tr>
<tr>
<td>Any</td>
<td>any</td>
<td>any</td>
</tr>
</tbody>
</table>

### 2.5 .NET Data Provider Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
<th>Pre-migration version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9.5</td>
</tr>
<tr>
<td>Changing the targetServerType Value</td>
<td>Y</td>
</tr>
<tr>
<td>Changing the Server Explorer View in Visual Studio Integration with .NET Data Provider</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists  
N: Incompatibility does not exist

#### 2.5.1 Changing the TargetServerType Value

**Incompatibility**

In FUJITSU Enterprise Postgres 13, the value of TargetServerType specified in the connection string was changed. Therefore, the previously used values are no longer available.
Action method

If you specified a value for TargetServerType, change the value as follows:

Table 2.2 Specified values for the target server

<table>
<thead>
<tr>
<th>Server Selection Order</th>
<th>FUJITSU Enterprise Postgres 9.6 or earlier</th>
<th>FUJITSU Enterprise Postgres 10/11/12</th>
<th>FUJITSU Enterprise Postgres 13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Server</td>
<td>primary</td>
<td>master</td>
<td>primary</td>
</tr>
<tr>
<td>Standby Server</td>
<td>-</td>
<td>slave</td>
<td>standby</td>
</tr>
<tr>
<td>Prefer Standby Server</td>
<td>prefer_standby</td>
<td>preferSlave</td>
<td>preferStandby</td>
</tr>
<tr>
<td>Any</td>
<td>-</td>
<td>any</td>
<td>any</td>
</tr>
</tbody>
</table>

2.5.2 Changing the Server Explorer View in Visual Studio Integration with .NET Data Provider

Incompatibility

FUJITSU Enterprise Postgres 10 or later, the following changes occur when you view database resources in Server Explorer.

- “Schema Name/Table Name” display under the Tables folder.
- The Indexes folder is not displayed.
- The Triggers folder does not displayed.
- The Sequences folder is not displayed.
- The Procedures folder does not displayed.

Action method

None.

2.6 pgaudit Incompatibility

<table>
<thead>
<tr>
<th>Item</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing to Print Extra NEW and OLD Values in the Audit Log when the Trigger Function Executes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Pre-migration version</th>
<th>9.5</th>
<th>9.6</th>
<th>10</th>
<th>11</th>
<th>12</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Incompatibility exists
N: Incompatibility does not exist

2.6.1 Changing to Print Extra NEW and OLD Values in the Audit Log when the Trigger Function Executes

Incompatibility

In FUJITSU Enterprise Postgres 13, the trigger function additionally outputs NEW and OLD values to the audit log when the pgaudit.log_parameter is set to on.

FUJITSU Enterprise Postgres 12 or earlier

The following (18) does not output the values of New, OLD.

[Example]
**FUJITSU Enterprise Postgres 13 or later**

New, OLD values are printed.

*Example*

```
AUDIT: SESSION,WRITE,2020-09-03 07:07:39 UTC,
[local],9775,psql,k5user,postgres,3/536,1,2,INSERT,,TABLE,public.trig_audit,,
"INSERT INTO trig_audit SELECT 'U', now(), user, OLD.*, NEW.*",
trig_audit AFTER ROW UPDATE 92027 trig_test trig_test public 0 f aaaa
```

**Action method**

If you are using an application that works by monitoring the string that the trigger function prints to the audit log, modify the application to work with the NEW and OLD values.

Installation and Setup Guide for Server

Linux >

Windows >
Installation and Setup Guide for Server (Linux)
Preface

Purpose of this document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Linux platform.
This document describes how to install and set up "FUJITSU Enterprise Postgres".

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres.
Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Linux

Structure of this document
This document is structured as follows:
Chapter 1 Overview of Installation
Describes the installation types and procedures
Chapter 2 Operating Environment
Describes the operating environment required to use FUJITSU Enterprise Postgres
Chapter 3 Installation
Describes how to perform a new installation of FUJITSU Enterprise Postgres
Chapter 4 Setup
Describes the setup to be performed after installation
Chapter 5 Uninstallation
Describes how to uninstall FUJITSU Enterprise Postgres
Appendix A Recommended WebAdmin Environments
Describes the recommended WebAdmin environment.
Appendix B Setting Up and Removing WebAdmin
Describes how to set up and remove WebAdmin
Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters
Describes characters that are not allowed in WebAdmin.
Appendix D Configuring Parameters
Describes FUJITSU Enterprise Postgres parameters.
Appendix E Estimating Database Disk Space Requirements
Describes how to estimate database disk space requirements
Appendix F Estimating Memory Requirements
Describes the formulas for estimating memory requirements
Appendix G Quantitative Limits
Describes the quantity range
Appendix H Configuring Kernel Parameters

Describes the settings for kernel parameters

Appendix I Determining the Preferred WebAdmin Configuration

Describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration

Appendix J System Configuration when using Pgpool-II

Describes the system configuration when using Pgpool-II.

Appendix K Supported contrib Modules and Extensions Provided by External Projects

Lists the PostgreSQL contrib modules and the extensions provided by external projects supported by FUJITSU Enterprise Postgres.

Appendix L Procedure when Modifying the Oracle JRE Installation

Describes the procedures to follow when modifying the Oracle JRE installation.

Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that can be Installed

Each FUJITSU Enterprise Postgres feature is installed on the machine that was used to build the database environment. The following table shows the relationship between the product to be installed and the features that can be installed.

<table>
<thead>
<tr>
<th>Feature that can be installed</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic feature (server feature, client feature)</td>
<td>AE SE</td>
</tr>
<tr>
<td></td>
<td>Y Y</td>
</tr>
</tbody>
</table>

Y: Can be installed

1.2 Installation Types

The following installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, FUJITSU Enterprise Postgres is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

FUJITSU Enterprise Postgres products can be installed on the same server if the product version (indicated by "x" in "x SPz") is different from that of any version of the product that is already installed.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.

Note

If you have antivirus software installed, the server may crash, fail to start, or stop responding, during installation or when starting up after installation. Set scan exception settings for the installation directory and resource allocation directory so that the files in these directories are not scanned for viruses.
1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In the interactive mode installation, the installation state of FUJITSU Enterprise Postgres is determined automatically. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
- Multi-version installation

1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres.
Chapter 2 Operating Environment

This chapter describes the operating environment required to use FUJITSU Enterprise Postgres.

See

Refer to "Operating Environment" in the Installation and Setup Guide for Client when installing the FUJITSU Enterprise Postgres client feature at the same time.

2.1 Required Operating System

One of the operating systems shown below is required in order to use FUJITSU Enterprise Postgres.

- RHEL7.2 or later minor version
- RHEL8.1 or later minor version
- SLES 12 SP5

Note

SLES 12 cannot be used if performing failover operation integrated with PRIMECLUSTER.

Information

- The following packages are required for operations on RHEL7.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>alsa-lib</td>
<td>-</td>
</tr>
<tr>
<td>audit-libs</td>
<td>-</td>
</tr>
<tr>
<td>dstat</td>
<td>Required when using parallel scan.</td>
</tr>
<tr>
<td>gdb</td>
<td>Required to run FJQSS.</td>
</tr>
<tr>
<td>glibc</td>
<td>-</td>
</tr>
<tr>
<td>glibc.i686</td>
<td>-</td>
</tr>
<tr>
<td>iputils</td>
<td>Required for Mirroring Controller.</td>
</tr>
<tr>
<td>libgcc</td>
<td>-</td>
</tr>
<tr>
<td>libicu</td>
<td>Provides collation support.</td>
</tr>
<tr>
<td>libmemcached</td>
<td>Install 50.x.</td>
</tr>
<tr>
<td>libsqlnix</td>
<td>Required for sepgsql.</td>
</tr>
<tr>
<td>libstdc++</td>
<td>-</td>
</tr>
<tr>
<td>libtool-ldl</td>
<td>Required when using ODBC drivers.</td>
</tr>
<tr>
<td>llvm</td>
<td>Version 10.0.x of llvm is required to run SQL with runtime compilation (just-in-time compilation). Install the package that contains libLLVM-10.so. For example, the “llvm-toolset-10.0-llvm-libs” published in Red Hat Developer Tools and Red Hat Software Collections includes libLLVM10.so.</td>
</tr>
</tbody>
</table>
FUJITSU Enterprise Postgres uses runtime compilation by default. If you do not want to use runtime compilation, turn off the jit parameter in postgresql.conf. You do not need to install llvm if you turn off the jit parameter.

Failure to install llvm without turning off the jit parameter may result in an error when executing SQL. For more information about runtime compilation, see "Just-in-Time Compilation (JIT)" in "PostgreSQL Documentation".

### ncurses-libs
- Required when using PAM authentication.

### perl-libs
- Required when using PL/Perl.
  - Install 5.16.

### python3
- Required when using PL/Python based on Python 3.
  - Install 3.6.x

### redhat-lsb
- Required when using Pgpool-II.

### sysstat
- Required when using FJQSS. Set up the sar command after installation.

### tcl
- Required when using PL/Tcl.
  - Install 8.5.

### unzip
- Required when using Pgpool-II.

### xz-libs
- Provides collation support.
  - Install 60.x.

### zlib
- Required for sepgsql.

---

The following packages are required for operations on RHEL8.

### Package name

<table>
<thead>
<tr>

### 2.2 Related Software

The following table lists the software required to use FUJITSU Enterprise Postgres.
Table 2.1 Related software

<table>
<thead>
<tr>
<th>No.</th>
<th>Product name</th>
<th>Version</th>
<th>FUJITSU Enterprise Postgres product name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PRIMECLUSTER (*1)</td>
<td>4.5A10 (*1)</td>
<td>Y</td>
<td>Mandatory when performing failover operation integrated with PRIMECLUSTER.</td>
</tr>
</tbody>
</table>

*1: The applicable products are shown below:
- PRIMECLUSTER Enterprise Edition
- PRIMECLUSTER HA Server

The following table lists servers that can be connected to the FUJITSU Enterprise Postgres client feature.

Table 2.2 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td>Linux</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

2.3 Excluded Software

This section describes excluded software.

FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres cannot be installed if all the following conditions are met:
- The product version (indicated by "x" in "x SPz") of the product to be installed is the same as that of the installed product
- The editions are different

Example

In the following cases, FUJITSU Enterprise Postgres cannot be installed as an exclusive product:
- The installed product is FUJITSU Software Enterprise Postgres Standard Edition (64bit) 13
- The product to be installed is FUJITSU Software Enterprise Postgres Advanced Edition (64bit) 13

Other products

There are no exclusive products.

2.4 Required Patches

There are no required patches.

2.5 Hardware Environment

The following hardware is required to use FUJITSU Enterprise Postgres.
**Memory**

At least 512 MB of memory is required.

**2.6 Disk Space Required for Installation**

The following table shows the disk space requirements for new installation of FUJITSU Enterprise Postgres. If necessary, increase the size of the file system.

### RHEL

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space (Unit: MB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 2 (*1) +1 (*2)</td>
</tr>
<tr>
<td>/opt</td>
<td>106 (*1) +1 (*2)</td>
</tr>
<tr>
<td>Installation destination of the server</td>
<td>475</td>
</tr>
<tr>
<td>Installation destination of WebAdmin</td>
<td>495</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>131</td>
</tr>
<tr>
<td>Installation destination of Pgpool-II</td>
<td>14</td>
</tr>
</tbody>
</table>

*1: Required for the installation of the Uninstall (middleware) tool.

*2: Required for the installation of FJQSS.

### SLES

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space (Unit: MB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 2 (*1) +1 (*2)</td>
</tr>
<tr>
<td>/opt</td>
<td>2 (*1) +1 (*2)</td>
</tr>
<tr>
<td>Installation destination of the server</td>
<td>216</td>
</tr>
<tr>
<td>Installation destination of WebAdmin</td>
<td>482</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>125</td>
</tr>
<tr>
<td>Installation destination of Pgpool-II</td>
<td>12</td>
</tr>
</tbody>
</table>

*1: Required for the installation of the Uninstall (middleware) tool.

*2: Required for the installation of FJQSS.

**2.7 Supported System Environment**

This section describes the supported system environment.

**2.7.1 TCP/IP Protocol**

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

**Note**

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.
## 2.7.2 File System

All file systems with a POSIX-compliant interface are supported.

However, for stable system operation, the disk where the database is deployed must use a highly reliable file system. Consider this aspect when selecting the file system to be used.

The recommended file system is "ext4".

## 2.8 PostgreSQL Version Used for FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres is based on PostgreSQL 13.1.

## 2.9 Notes on Using Streaming Replication

To use streaming replication, build the primary server and all standby servers using the same FUJITSU Enterprise Postgres version (*1).

*1: The product version is indicated by "x" in the notation "x SPz".

---

**Note**

Streaming replication cannot be used in combination with Open Source PostgreSQL.
Chapter 3 Installation

This chapter explains each of the installation procedures of FUJITSU Enterprise Postgres.

3.1 Pre-installation Tasks

Check the system environment below before installing FUJITSU Enterprise Postgres.

Check the disk space

Ensure that there is sufficient disk space to install FUJITSU Enterprise Postgres.

Refer to "2.6 Disk Space Required for Installation" for information on the required disk space.

Reconfigure the disk partition if disk space is insufficient.

Set JAVA_HOME (SLES 12 only)

Ensure that Oracle JRE 8 is installed, and export the JAVA_HOME environment variable.

```
#export JAVA_HOME="oracleJre8InstallDir"
```

Refer to "Appendix L Procedure when Modifying the Oracle JRE Installation" for information on modifying Oracle JRE after installation.

Check the installed products and determine the installation method

Using the operation shown below, start Uninstall (middleware), and check the installed products.

Example

```
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. productName
2. productName
3. productName
4. productName
5: productName

Type [number] to select the software you want to uninstall.
[number,q]
=>q

Exiting Uninstaller.
```

If FUJITSU Enterprise Postgres is already installed, determine which installation method to use:

- Reinstallation
- Multi-version installation

Remove applied updates

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

Note

If a product is installed without removing applied updates, the following problems will occur:
Performing reinstallation

If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed. Perform reinstallation after removing the update.

1. Display the applied updates

   Execute the following command to display the applied updates:

   ```
   # /opt/FJSVfupde/bin/uam showup
   ```

2. Remove the updates

   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.

   ```
   # /opt/FJSVfupde/bin/uam remove -i update-number
   ```

Determine the preferred WebAdmin configuration

Starting with FUJITSU Enterprise Postgres 9.5, WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

Refer to "Appendix I Determining the Preferred WebAdmin Configuration" for details.

Determining the Pgpool-II System Configuration

The system configuration when using Pgpool-II is as follows:

- Place on database server
- Place on application server
- Place on dedicated server

Refer to "Appendix J System Configuration when using Pgpool-II".

3.2 Installation in Interactive Mode

Install according to the following procedure:

Note

- The following characters can be used as input values:
  - Alphanumeric characters, hyphens, commas and forward slashes
- When reinstalling the product, back up the following folder in which the WebAdmin instance management information is stored:

  `webAdminInstallFolder/data/fepwa`

  Follow the procedure below to perform the backup:

  1. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following folder:

```
webAdminInstallFolder/data/fepwa
```

Replace the above folder with the backed up folder when the reinstallation is complete.

---

**Point**

For installation in interactive mode, default values are set for the installation information. The following settings can be changed for a new installation or a multi-version installation:

- Installation directory
- WebAdmin setup information, if WebAdmin is selected

To change the port number, confirm that it is an unused port number between 1024 and 32767.

---

1. **Stop applications and programs**

   If the installation method is the following, all applications and programs that use the product must be stopped:

   - Reinstallation

   Before starting the installation, stop the following:

   - Applications that use the product
   - Instance
   - Web server feature of WebAdmin

   Execute the `WebAdminStop` command to stop the Web server feature of WebAdmin.

   **Example**

   If WebAdmin is installed in `/opt/fsepv<x>webadmin`:

   ```
   # cd /opt/fsepv<x>webadmin/sbin
   # ./WebAdminStop
   ```

   - Mirroring Controller

   Execute the `mc_ctl` command with the stop mode option specified and stop the Mirroring Controller.

   **Example**

   ```
   $ mc_ctl stop -M /mcdir/inst1
   ```

   - pgBadger
   - Pgpool-II

2. **Change to the superuser**

   Run the following command to switch to the superuser on the system.

   ```
   $ su -
   Password:******
   ```

3. **Mount the DVD drive**

   Insert the server program DVD into the DVD drive, and run the command given below.

   **Example**

   ```
   # mount -t iso9660 -r -o loop /dev/dvd /media/dvd
   ```
Here /dev/dvd is the device name for the DVD drive (which may vary depending on your environment), and /media/dvd is the mount point (which may need to be created before calling the command).

**Note**

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

### 4. Run the installation

Execute the following command:

**Example**

```
# cd /media/dvd
# ./install.sh
```

In the example above, /media/dvd is the DVD mount point.

### 5. Select the product for installation

The list of installation target products is displayed.

Type the number for the product to be installed, or "all", and press Enter.

**Information**

- The FUJITSU Enterprise Postgres server component and WebAdmin can be installed on the same machine by selecting the "FUJITSU Enterprise Postgres server component" and the "WebAdmin component".

- Pgpool-II to be installed on the same server as the database server, you can install it on the same machine by selecting "FUJITSU Enterprise Postgres Server Component" and "Pgpool-II component". Pgpool-II to be installed on the same server as the application server, or on a dedicated server that is different from the database server and application server, see "Appendix J System Configuration when using Pgpool-II".

- If the selected product has been installed, a window for selecting reinstallation or multi-version installation is displayed for each product. Follow the on-screen instructions to select the installation method.

### 6. Check the settings

The window for checking the installation information is displayed.

Type "y" and press Enter to start the installation.

To change the settings, type "c", press Enter, and follow the on-screen instructions. This option is not displayed if there is no information that can be modified.

If you have not set up WebAdmin during installation, refer to "Appendix B Setting Up and Removing WebAdmin" for details.

### 7. Check the changed settings

If the installation information has been modified, the new installation information is displayed.

Type "y" and press Enter to start the installation.

To change the settings again, type "c" and press Enter.

### 8. Display the installation status

When the installation is started, the installation status is displayed.

Note that even if WebAdmin setup fails, the process will continue.

If the following message is displayed, manually execute WebAdmin setup after installation is completed.

Refer to "B.1 Setting Up WebAdmin" for information on the WebAdmin setup procedure.
Starting setup.
Setting up WebAdmin.
ERROR: WebAdmin setup failed.

9. Finish the installation

When the installation is complete, a message is displayed showing the status. If installation was successful, a message like the one shown below is displayed:

Installed successfully.

Note

If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.

3.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:

- New installation
- Multi-version installation

See

Refer to the FUJITSU Enterprise Postgres product website for information on installation in silent mode, such as the installation parameters and error messages.

The installation procedure is described below.

1. Change to the superuser

Run the following command to switch to the superuser on the system.

$ su -
Password:******

2. Mount the DVD drive

Insert the server program DVD into the DVD drive, and run the command given below.

Example

# mount -t iso9660 -r -o loop /dev/dvd /media/dvd

Here /dev/dvd is the device name for the DVD drive (which may vary depending on your environment), and /media/dvd is the mount point (which may need to be created before calling the command).

Note

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.
3. Create an installation parameters CSV file

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

<table>
<thead>
<tr>
<th>sectionName, parameterName, value</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName, parameterName, value</td>
</tr>
<tr>
<td>:</td>
</tr>
</tbody>
</table>

**Information**

The template for the installation parameters CSV file is "mountPoint/sample/sample.csv".

4. Run the installation

Execute the following command:

**Example**

```bash
# cd /media/dvd
# ./silent.sh /home/work/inspara.csv
```

In the example above, /media/dvd is the DVD mount point, and /home/work/inspara.csv is the installation parameter CSV.

If the installer ends in an error, a message is output to the log file and return values are returned.
Chapter 4 Setup

This chapter describes the setup procedures to be performed after installation completes.

4.1 Operating Method Types and Selection

This section describes how to operate FUJITSU Enterprise Postgres.

There are two methods of managing FUJITSU Enterprise Postgres operations - select one that suits your purposes:

The Operation Guide describes the operating method using WebAdmin, and the equivalent operating method using the server commands.

Simple operation management using a web-based GUI tool (WebAdmin)

Suitable when using frequently used basic settings and operations for operation management.

This method allows you to perform simple daily tasks such as starting the system before beginning business, and stopping the system when business is over, using an intuitive operation.

Usage method

Usage is started by using WebAdmin to create the instance.

By using an external scheduler and the pgx_dmpall command, periodic backups can be performed, which can then be used in recovery using WebAdmin.

Note

Do not use a server command other than pgx_dmpall and pgx_keystore or a server application. Operation modes that use server commands and server applications cannot be used in conjunction with WebAdmin. If used, WebAdmin will not be able to manage the instances correctly.

In addition, to perform a backup by copy command from the pgx_dmpall command, select the operating method using the server commands.

Refer to Reference and the PostgreSQL Documentation for information on server commands and server applications.

Advanced operation management using server commands

When operating in a system that is automated by operation management middleware (Systemwalker Centric Manager, for example), this method allows you to use more detailed settings and operations and perform higher level operation management.

An overview of the operating method using the GUI, and its relationship with the operating method using the server commands, are shown below.

Refer to the Operation Guide for details.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>
<td>Creating an instance WebAdmin is used.</td>
<td>The configuration file is edited directly using the initdb command.</td>
</tr>
<tr>
<td></td>
<td>The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Creating a standby instance WebAdmin is used.</td>
<td>A standby instance is created using the pg_basebackup command.</td>
</tr>
<tr>
<td></td>
<td>WebAdmin performs a base backup of the source instance and creates a standby instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Changing the configuration files WebAdmin is used.</td>
<td>The configuration file is edited directly.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The pg_ctl command is used.</td>
</tr>
<tr>
<td></td>
<td>Starting and stopping an instance WebAdmin is used.</td>
<td></td>
</tr>
<tr>
<td>Operation</td>
<td>Operation with the GUI</td>
<td>Operation with commands</td>
</tr>
<tr>
<td>----------------------------</td>
<td>--------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Creating a database</td>
<td>This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement.</td>
<td></td>
</tr>
<tr>
<td>Backing up the database</td>
<td>WebAdmin, or the pgx_dmpall command, is used.</td>
<td>It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed.</td>
</tr>
<tr>
<td>Database recovery</td>
<td>WebAdmin is used.</td>
<td>To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used.</td>
</tr>
<tr>
<td>Monitoring</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Database errors</td>
<td>The status in the WebAdmin window can be checked. (*1)</td>
<td>The messages that are output to the database server log are monitored (*1)</td>
</tr>
<tr>
<td>Disk space</td>
<td>The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. (*1)</td>
<td>This is monitored using the df command of the operating system, for example. (*1)</td>
</tr>
<tr>
<td>Connection status</td>
<td>This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application.</td>
<td></td>
</tr>
</tbody>
</table>

*1: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

See

Refer to “Periodic Operations” and “Actions when an Error Occurs” in the Operation Guide for information on monitoring and database recovery.

4.2 Preparations for Setup

This section describes the preparation required before setting up FUJITSU Enterprise Postgres.

4.2.1 Creating an Instance Administrator

Decide which OS user account will be assigned the instance administrator role. You can assign it to a new user or to an existing one, but you cannot assign it to the OS superuser (root).

The following example shows an OS user account with the name “fsepuser” being assigned the instance administrator role.

Example

```
# useradd fsepuser
# passwd fsepuser
```

**Note**

The following note applies if using WebAdmin for operations:

- If the password is changed for the user account of the instance administrator, set the changed password using ALTER ROLE WITH ENCRYPTED PASSWORD. This will encrypt the password with the default MD5 algorithm. To encrypt the password with the SCRAM-SHA-256 algorithm, set the password encryption parameter to "scram-sha-256" using SET password_encryption = 'scram-sha-256' prior to using the ALTER ROLE function.
4.2.2 Preparing Directories for Resource Deployment

Prepare the directories required when creating instances.

Considerations when deploying resources

The disk configuration on the resource deployment destination is important, because it affects not only recovery following disk corruption, but normal operation as well. The points for determining the disk configuration are as follows:

1. If the backup data storage destination and the data storage destination are both lost, it will not be possible to recover the data, so deploy them to separate disks.
2. To shorten the recovery time following a single disk fault, deploy the system disk and data storage destination to separate disks.
3. The backup data storage destination requires at least double the capacity of the data storage destination, so deploy it to the disk with the most space available.
4. When large amounts of data are updated, the write-to load for the data storage destination, transaction log storage destination, and backup data storage destination (mirrored transaction log) will also be great. For this reason, deploy them to separate disks, out of consideration for performance.

Note

When using the volume manager provided by the operating system, be aware of which physical disk the file system has been created on, for example, by deploying the data storage destination and the backup data storage destination to separate disks.

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.
### Resource and Role

<table>
<thead>
<tr>
<th>Resource</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>The area where the database is stored. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster. Specify a space other than that under the database cluster.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Stores log information in preparation for a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
<tr>
<td>Archive log</td>
<td>Stores log information for recovery</td>
</tr>
<tr>
<td>Mirrored transaction log (mirrored WAL)</td>
<td>Enables a database cluster to be restored to the state immediately before an error even if both the database cluster and transaction log fail when performing backup/recovery operations using the pgx_dmpall command or WebAdmin.</td>
</tr>
<tr>
<td>Corefile</td>
<td>FUJITSU Enterprise Postgres process corefile output when an error occurs with a FUJITSU Enterprise Postgres process.</td>
</tr>
</tbody>
</table>

### Examples of disk deployment

The following are examples of disk deployment:

<table>
<thead>
<tr>
<th>Number of disks</th>
<th>Disk</th>
<th>Deployment</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Backup data storage destination</td>
</tr>
<tr>
<td>2</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Backup data storage destination</td>
</tr>
</tbody>
</table>

### Proposal for disk deployment using WebAdmin

To generate an instance using WebAdmin, we recommend an optimum deployment that takes into account the status of all disks at the time of instance generation, and items 1 to 3 in the "Considerations when deploying resources” subheading above, based on the limitations below (note that a different deployment can also be specified):

- The mount point does not include national characters
- The instance administrator has the proper permissions to read and write on the mount point

### Preparing directories

The directories to be prepared depend on the way that you create the instances.

The following shows the directories that need to be prepared:

<table>
<thead>
<tr>
<th>Directory to be prepared</th>
<th>Using WebAdmin</th>
<th>Using the initdb command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data storage destination</td>
<td>Y (*1)</td>
<td>Y</td>
</tr>
<tr>
<td>Backup data storage destination</td>
<td>O (*1) (*4)</td>
<td>O</td>
</tr>
</tbody>
</table>
**Directory to be prepared**

<table>
<thead>
<tr>
<th>Transaction log storage destination</th>
<th>Using WebAdmin</th>
<th>Using the initdb command</th>
</tr>
</thead>
<tbody>
<tr>
<td>O (*1) (+2)</td>
<td></td>
<td>O</td>
</tr>
<tr>
<td>Corefile output destination</td>
<td>N (+3)</td>
<td>O</td>
</tr>
</tbody>
</table>

Y: Required
O: Optional
N: Not required

*1: WebAdmin automatically creates a directory

*2: The default is to create in a directory in the data storage destination. When it is necessary to distribute the I/O load for the database data and the transaction log, consider putting the transaction log storage destination on a different disk from the data storage destination.

*3: The corefile path is as follows:

```
/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core
```

**version**: product version_WA_architecture

Note: The product version is normally the version of WebAdmin used to create the instance. For example, WebAdmin 13 allows a user to create a FUJITSU Enterprise Postgres 9.6 instance on a database server having WebAdmin 9.6. In this case, because WebAdmin 9.6 is used to create the instance, the product version will be “96”.

**instanceAdminUser**: operating system user name

**PortNumber**: port number specified when creating the instance

Example:

```
/var/tmp/fsep_130_WA_64/naomi_myinst27599/core
```

Note that resources placed in `/var/tmp` that have not been accessed for 30 days or more will be deleted by the default settings of the operating system. Consider excluding them from deletion targets or changing the output destination in the operating system settings.

To change the output destination, configure the `core_directory` and the `core_contents` parameters in `postgresql.conf`. Refer to “Parameters” in the Operation Guide for information on the settings for these parameters.

*4: This directory is required when instance backup is enabled.

---

**Note**

- The directories must meet the following conditions:
  - The directory owner must be the OS user account that you want to be the instance administrator
  - The directory must have write permission
  - The directory must be empty
  - It is not possible to use a directory mounted by NFS (Network File System) when using WebAdmin.

---

Example

The following example shows the OS superuser creating `/database/inst1` as the directory for storing the database data and changing the owner of the directory to the OS user account “fsepuser”.

```
# mkdir -p /database/inst1
# chown -R fsepuser:fsepuser /database/inst1
# chmod 700 /database/inst1
```

---

**4.2.3 Estimating Resources**

Estimate the resources to be used on the FUJITSU Enterprise Postgres.

Refer to "Appendix E Estimating Database Disk Space Requirements" for information on estimating database disk space requirements.
Refer to "Parameters automatically set by WebAdmin according to the amount of memory" when creating multiple instances with WebAdmin.

Refer to "Appendix F Estimating Memory Requirements" when creating instances with the initdb command, to estimate memory usage.

### 4.2.4 Configuring Corefile Names

If a process crashes, a corefile for the process will be generated by the operating system. If a corefile is generated with the same name as an existing corefile generated for a different process, the newly-generated corefile will overwrite the previously dumped corefile. To prevent this, configure a unique corefile name for each crash by appending the process ID, program name, and datetime.

Corefile names can be configured using the "kernel.core_pattern" and "kernel.core_uses_pid" kernel parameters. Refer to the "man page" in "core(5)" for information on how to use these parameters.

Note that with regard to the location for storing corefiles, the operating system settings take precedence over the core_directory parameter of postgresql.conf.

If you specify systemd-coredump as the core_pattern, the core file is not placed in the location specified by the core_directory parameter. See the systemd-coredump (8) man page for the location of core files.

Use coredumpctl to retrieve core files. For more information about using coredumpctl, see the coredumpctl (1) man page.

### 4.3 Creating Instances

There are two methods that can be used to create an instance:

- 4.3.1 Using WebAdmin
- 4.3.2 Using the initdb Command

#### Creating multiple instances

Multiple instances can be created.

The memory allocated needs to be adjusted when multiple instances are created with WebAdmin (refer to "Parameters automatically set by WebAdmin according to the amount of memory" for details).

#### Features that cannot be set up using WebAdmin

The "Storage data protection using transparent data encryption" feature cannot be set up using WebAdmin.

To set up this feature in an instance created by WebAdmin, perform the additional setup tasks detailed in "Storage Data Protection using Transparent Data Encryption" in the Operation Guide.

**Note**

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.

- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.

- Databases with the names 'template0' and 'template1' are automatically created when an instance is created. These databases are used as the templates for databases created later. Furthermore, a default database with the name 'postgres' is automatically created, which will be used with FUJITSU Enterprise Postgres commands. It is important that you do not delete these databases created by default.

#### 4.3.1 Using WebAdmin

This section describes how to create an instance using WebAdmin.

WebAdmin must be set up correctly before it can be used. Refer to "B.1 Setting Up WebAdmin" for details. Additionally, if WebAdmin needs to be configured to use an external repository database, refer to "B.3 Using an External Repository for WebAdmin" for details.
It is recommended to use the following browsers with WebAdmin:
- Internet Explorer 11
- Microsoft Edge (Build41 or later)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different. Configure your browser to allow cookies and pop-up requests from the server on which FUJITSU Enterprise Postgres is installed. Refer to "Appendix A Recommended WebAdmin Environments" for information on how to change the pop-up request settings and other recommended settings.

**Note**

- WebAdmin does not run in Windows(R) safe mode.
- If the same instance is operated from multiple WebAdmin windows, it will not work correctly.
- If the same instance is operated from multiple WebAdmin versions, it will not work correctly. Always use the latest version of WebAdmin for instance operations.
- For efficient use of WebAdmin, it is recommended not to use the browser [Back] and [Forward] navigation buttons, the [Refresh] button, and context-sensitive menus, including equivalent keyboard shortcuts.
- Copying and pasting the WebAdmin URLs are not supported. Additionally, bookmarking of WebAdmin URLs is not supported.
- It is recommended to match the language between the instance server locale and WebAdmin.
- WebAdmin supports only two languages: English and Japanese.
- It is recommended to change the WebAdmin language setting from the instance details page only.
- It is recommended to operate WebAdmin using the WebAdmin launcher.
- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.
- If the browser was not operated for a fixed period (about 30 minutes), the session will time out and the login page will be displayed again for the next operation.
- Port access permissions
  - If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions.
  - Consider the security risks carefully when opening ports.
- When creating or importing an instance in WebAdmin, set the log_directory parameter in postgresql.conf to '/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log'. Note that resources placed in /var/tmp that have not been accessed for 30 days or more will be deleted by the default settings of the operating system. Therefore, consider excluding instances created using WebAdmin from deletion targets in the operating system settings if you need to stop those instances for a long time.

### 4.3.1.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

**Startup URL for WebAdmin**

In the browser address bar, type the startup URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- **hostNameOrIpAddress**: Host name or IP address of the server where WebAdmin is installed.
- **portNumber**: Port number of WebAdmin. The default port number is 27515.
The startup URL window shown below is displayed. From this window you can log in to WebAdmin or access the product documentation.

Logging in to WebAdmin

Click [Launch WebAdmin] in the startup URL window to start WebAdmin and display the login window. Enter the instance administrator user ID (operating system user account name) and password, and log in to WebAdmin. User credential (instance administrator user ID and password) should not contain hazardous characters. Refer to "Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters".

4.3.1.2 Creating an Instance

This section describes how to create an instance.

Information

WebAdmin calculates values using the formula indicated in "Managing Kernel Resources" under "Server Administration" in the PostgreSQL Documentation, and configures these in the kernel parameters. Refer to "Appendix H Configuring Kernel Parameters" for information on configuring parameter names. Refer to "Appendix D Configuring Parameters" for information on the postgresql.conf values required to derive the set values.

1. Start WebAdmin, and log in to the database server.

2. In the [Instances] tab, click .
3. Enter the information for the instance to be created.

Enter the following items:

- [Configuration type]: Whether to create a standalone instance or an instance that is part of a cluster.

- [Server product type]: Sets which of the following instances to create:
  - FUJITSU Enterprise Postgres 9.5 Instances
  - FUJITSU Enterprise Postgres 9.6 Instances
  - FUJITSU Enterprise Postgres 10 Instances
  - FUJITSU Enterprise Postgres 11 Instances
  - FUJITSU Enterprise Postgres 12 Instances
  - FUJITSU Enterprise Postgres 13 Instances

  The default is "FUJITSU Enterprise Postgres 13".

  WebAdmin can create and manage instances compatible with the following, but new functionality in FUJITSU Enterprise Postgres 13 may not support the instance or it may be disabled.

  - FUJITSU Enterprise Postgres 9.5
  - FUJITSU Enterprise Postgres 9.6
  - FUJITSU Enterprise Postgres 10
  - FUJITSU Enterprise Postgres 11
  - FUJITSU Enterprise Postgres 12

- [Location]: Whether to create the instance in the server that the current user is logged into, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.

- [Instance name]: Name of the database instance to manage

  The name must meet the conditions below:

  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters
- [Instance port]: Port number of the database server
- [Data storage path]: Directory where the database data will be stored
- [Backup]: Whether to enable or disable the WebAdmin backup feature. The default is "Enabled". Select "Disabled" to disable all backup and restore functionality for the instance. If "Enabled" is selected, enter the following item:
  - [Backup storage path]: Directory where the database backup will be stored
- [Transaction log path]: Directory where the transaction log will be stored
- [Encoding]: Database encoding system
- [WAL file size]: Allow the WAL file size to be set when creating an instance. The default is 16 MB if the field is blank. The size specified must be a power of 2 between 1 and 1024. This option is not available for standby instances.

If "Remote" is selected for [Location], enter the following additional items:
- [Host name]: Name of the host where the instance is to be created
- [Operating system credential]: Operating system user name and password for the remote machine where the instance is to be created
- [Remote WebAdmin port for standalone]: Port in which WebAdmin is accessible in the remote machine

**Note**

- Refer to "4.2.2 Preparing Directories for Resource Deployment" - "Considerations when deploying resources" for information on points to consider when determining the data storage path, backup storage path, and transaction log path.

- The following items can be modified after the instance has been created. These items cannot be modified on instances that have compatibility with FUJITSU Enterprise Postgres 9.5.
  - Instance name
  - Port number
  - Backup storage path

Refer to "Editing instance information" for details.

- Do not specify directories that include symbolic link or multibyte characters when specifying the data storage destination or backup data storage destination.

- In the instance that is created using WebAdmin, the locale of the character set to be used in the database, and the locale of the collating sequence, are fixed using C.

- For enhanced security, WebAdmin encrypts the superuser password using SCRAM-SHA-256 authentication for all FUJITSU Enterprise Postgres 10 or later instances. The client/driver must therefore support SCRAM-SHA-256 authentication if they need to connect to FUJITSU Enterprise Postgres 10 or later instances created by WebAdmin with superuser credentials.

- Host name and Operating system credential (Operating system user name and password) should not contain hazardous characters. Refer to "Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters".

4. Click ✅ to create the instance.

If the instance is created successfully, a message indicating the same will be displayed.
5. The instance will be started when it is created successfully.

6. Back up the basic information that was set

Back up the WebAdmin management information periodically to ensure operational continuity when a fault occurs on the system disk. Follow the procedure below to perform the backup.

a. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.

b. Back up the following directory:

   webAdminInstallDir/data/fepwa

4.3.1.3 Changing Instance Settings

You can change the information that is set when an instance is created.

Change the following settings to suit the operating and management environment for FUJITSU Enterprise Postgres.

- Instance configuration
  - Character encoding
  - Communication
  - SQL options
  - Memory
  - Streaming replication

- Changing client authentication information

- Editing instance information

Information

These settings are the same as the parameters that can be set in the files shown below. Refer to "Appendix D Configuring Parameters" for information on the equivalence relationship between the item name and the parameter.

- postgresql.conf
- pg_hba.conf
The files shown below can also be modified directly, however if a parameter not described in "Appendix D Configuring Parameters" was edited by mistake, WebAdmin may not run correctly.

- postgresql.conf
- pg_hba.conf

Instance configuration
1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click Ξ.
3. Click Ξ to change the configuration.
4. Click Ξ to save your changes.

See

Select a client-side encoding system that can be converted to/from the database encoding system. Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the PostgreSQL Documentation for information on the encoding system combinations that can be converted.

Changing client authentication information
1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click Ξ.
   Click Ξ to register new authentication information.
   To change authentication information, select the information, and then click Ξ.
   To delete authentication information, select the information, and then click Ξ.

Note

When creating the instance, do not delete the entry below, because it is a connection required for WebAdmin to monitor the operational status of the database:
Type=local, Database=all, User=all, and Method=md5

Editing instance information
Use the [Edit instance] page to modify the following items for an instance:
- Instance name
- Port number
- Backup storage path
1. In the [Instances] tab, click Ξ. The [Edit instance] page is displayed.
2. Modify the relevant items.
   If [Backup storage path] is changed, [Backup management] is enabled. Select the required option:
   Retain existing backup: Create a backup in [Backup storage path] and retain the existing backup in its original location.
Copy existing backup to new path: Copy the existing backup to [Backup storage path]. A new backup will not be created. The existing backup will be retained in its original location.

Move existing backup to new path: Move the existing backup to [Backup storage path]. A new backup will not be created.

Remove existing backup: Create a backup in [Backup storage path]. The existing backup will be removed.

3. Click ✅ to save your changes.

**Note**

- The [Edit instance] page is also displayed when the user selects 'Navigate to the "Edit instance" page' from the [Anomaly Error] dialog box. Refer to "Anomaly Detection and Resolution" in the Operation Guide for information on what takes place when an anomaly is detected.

- When [Instance name] or [Instance port] is modified, the log_directory and core_directory parameters in postgresql.conf are updated. Also, the specified directories are created if they do not exist.

Refer to “4.3.1.4 Importing Instances” for information on the format of these directories.

### 4.3.1.4 Importing Instances

Instances can be created using WebAdmin, or via the command line using the initdb command. Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin.

This section explains how to import command line instances into WebAdmin.

1. In the [Instances] tab, click 🔄 The [Import instance] page is displayed.

2. Enter the information for the instance being imported. Refer to “4.3.1.2 Creating an Instance” for information on the items that need to be entered.

3. Click ✅ to import the instance.

**Note**

- Importing neither starts nor stops the instance.

- The following restrictions apply to instance import:
  - Any instance already managed by WebAdmin cannot be imported again.
  - The postgresql.conf file must be located in the same directory as [Data storage path].
  - Read/write permissions are required for [Data storage path].
  - The location specified in postgresql.conf for the following files must not have been changed:
    - hba_file
    - ident_file
  - If the instance is part of a cluster that is monitored by Mirroring Controller, WebAdmin will be unable to detect the Mirroring Controller settings.
  - Instances making use of Mirroring Controller functionality should not be imported, because subsequent operations on those instances may cause unexpected and undesirable side-effects.
  - It is not possible to import and operate an instance that uses a directory mounted by Network File System (NFS).
  - You must make the following changes to the parameters in postgresql.conf prior to importing the instance in WebAdmin.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The port parameter should be uncommented.</td>
</tr>
</tbody>
</table>
The log_directory and core_directory parameters in postgresql.conf are updated during import. Also, the specified directories are created if they do not exist.

The format of these directories is as follows:

```
log_directory: '/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log'
core_directory: '/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core'
```

- **version**: product version_WA_architecture
- **instanceAdminUser**: operating system user name
- **PortNumber**: port number specified when creating the instance

Examples:

```
log_directory: '/var/tmp/fsep_130_WA_64/naomi_myinst27599/log'
core_directory: '/var/tmp/fsep_130_WA_64/naomi_myinst27599/core'
```

- When a standby instance is imported, a valid entry, using the IP address of the standby instance, must exist in the pg_hba.conf file of the master instance to allow the standby instance to connect to the master instance.
- When a standby instance is imported, the value for "host" in the primary_conninfo parameter of postgresql.auto.conf should match the host name of the master instance.
- When a standby instance is imported, you cannot specify "passfile" in the primary_conninfo parameter of postgresql.auto.conf. Be sure to specify "password".
- Instances created by other operating systems cannot be imported.
- If a FUJITSU Enterprise Postgres 10 or later instance is being imported while it is running, WebAdmin will encrypt the superuser password using SCRAM-SHA-256 authentication.

### 4.3.2 Using the initdb Command

This section describes the procedure to create an instance using the initdb command.

**Note**

If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

### 4.3.2.1 Editing Kernel Parameters

Refer to "Appendix H Configuring Kernel Parameters" prior to editing these settings.

After the settings are complete, check the command specifications of the relevant operating system and restart the system if required.

### 4.3.2.2 Creating an Instance

Create an instance, with the database cluster storage destination specified in the PGDATA environment variable or in the -D option. Furthermore, the user that executed the initdb command becomes the instance administrator.

**Note**

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- If creating multiple instances, ensure that there is no duplication of port numbers or the directories that store database clusters.

See Refer to "initdb" in "Reference" in the PostgreSQL Documentation for information on the initdb command.

The procedure to create an instance is described below.

1. Use the OS user account that you want as the instance administrator.

Connect with the server using the OS user account that you want as the instance administrator.

You cannot use the OS superuser (root).

The following example shows the OS superuser connected to the server being changed to the OS user account "fsepuser".

Example

```bash
# su fsepuser
```

2. Configure the environment variables

Configure the environment variables in the server with the newly created instance.

Set the following environment variables:

- **PATH environment variables**
  
  Add the installation directory "/bin".

- **MANPATH environment variables**
  
  Add the installation directory "/share/man".

- **LD_LIBRARY_PATH environment variables**
  
  Add the installation directory "/lib".

Example

The following example configures environment variables when the installation directory is "/opt/fsepvxserver64".

Note that "<x>" indicates the product version.

```
sh, bash
$ PATH=/opt/fsepvxserver64/bin:$PATH ; export PATH
$ MANPATH=/opt/fsepvxserver64/share/man:$MANPATH ; export MANPATH
$ LD_LIBRARY_PATH=/opt/fsepvxserver64/lib:$LD_LIBRARY_PATH ; export LD_LIBRARY_PATH

csh, tcsh
$ setenv PATH /opt/fsepvxserver64/bin:$PATH
$ setenv MANPATH /opt/fsepvxserver64/share/man:$MANPATH
$ setenv LD_LIBRARY_PATH /opt/fsepvxserver64/lib:$LD_LIBRARY_PATH
```

3. Create a database cluster

Create the database cluster with the initdb command, specifying the storage destination directory.

Specify the transaction log storage destination and the locale setting option as required.

Example

```
$ initdb -D /database/inst1 --waldir=/transaction/inst1 --lc-collate="C" --lc-ctype="C" --encoding=UTF8
```
Point

In some features, instance names are requested, and those names are required to uniquely identify the instance within the system. These features allow names that conform to WebAdmin naming conventions, so refer to the following points when determining the names:

- Maximum of 16 characters
- The first character must be ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

Note

- To balance I/O load, consider deploying the transaction log storage destination to a disk device other than the database cluster storage destination and the backup data storage destination.
- Specify "C" or "POSIX" for collation and character category. Performance deteriorates if you specify a value other than "C" or "POSIX", although the behavior will follow the rules for particular languages, countries and regions. Furthermore, this may need to be revised when running applications on systems with different locales. For example, specify as follows:

  initdb --locale="C" --lc-messages="C"
  initdb --lc-collate="C" --lc-cctype="C"

- Specify the same string in the LANG environment variable of the terminal that starts FUJITSU Enterprise Postgres as was specified in lc-messages of initdb (lc_messages of postgresql.conf). If the same string is not specified, messages displayed on the terminal that was started, as well as messages output to the log file specified in the -l option of the pg_ctl command or the postgres command used for startup, may not be output correctly.

- Specify an encoding system other than SQL_ASCII for the database. If SQL_ASCII is used, there is no guarantee that the encryption system for data in the database will be consistent, depending on the application used to insert the data.

See

Refer to "Locale Support" in "Localization" in "Server Administration" in the PostgreSQL Documentation for information on locales.

4. Set port number.

Specify a port number in the port parameter of postgresql.conf. Ensure that the specified port number is not already used for other software. If a port number is not specified, "27500" is selected.

Register the specified port numbers in the /etc/services file if WebAdmin is used to create other instances. WebAdmin uses the /etc/services file to check if port numbers specified as available candidates have been duplicated.

Register any name as the service name.

5. Set the corefile output destination.

Specify the output destination of the corefile, which can later be used to collect information for investigation, by setting the core_directory and core_contents parameters of postgresql.conf.

See

Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

6. Set the backup storage destination.

Specify the backup data storage destination and other backup settings when backup is to be performed as a provision against database errors.
7. Start an instance.

Start with the start mode of the pg_ctl command.

If either of the following conditions are met, the message "FATAL: the database system is starting up(11189)" may be output.

- An application, command, or process connects to the database while the instance is starting
- An instance was started without the -W option specified

This message is output by the pg_ctl command to check if the instance has started successfully. Therefore, ignore this message if there are no other applications, commands, or processes that connect to the database.

Example

```bash
$ pg_ctl start -D /database/inst1
```

---

**See**

Refer to "Backup Methods" in the Operation Guide for information on specifying backup settings.

---

**Note**

If the -W option is specified, the command will return without waiting for the instance to start. Therefore, it may be unclear as to whether instance startup was successful or failed.

---

### 4.4 Configuring Remote Connections

This section describes the settings required when connecting remotely to FUJITSU Enterprise Postgres from a database application or a client command.

#### 4.4.1 When an Instance was Created with WebAdmin

**Settings related to connection**

The default is to accept connections from remote computers to the database.

Change "listen_addresses" in postgresql.conf to modify the default behavior.

Refer to "Appendix D Configuring Parameters" for information on postgresql.conf.

**Client Authentication Information settings**

The following content is set by default when WebAdmin is used to create an instance.

- Authentication of remote connections from local machines is performed.

When changing Client Authentication Information, select [Client Authentication] from [Setting], and then change the settings.

#### 4.4.2 When an Instance was Created with the initdb Command

**Connection settings**

The default setting only permits local connections from the client to the database. Remote connections are not accepted.

Change "listen_addresses" in postgresql.conf to perform remote connection.
All remote connections will be allowed when changed as shown below.

Example

```
listen_addresses = '*'
```

Also, configure the parameters shown below in accordance with the applications and number of client command connections.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
</tr>
</thead>
<tbody>
<tr>
<td>superuser_reserved_connections</td>
<td>Number of connections reserved for database maintenance, for example backup or index rebuilding. If you need to simultaneously perform a large number of processes that exceed the default value, change this value accordingly.</td>
</tr>
</tbody>
</table>
| max_connections                 | Set the value as:

```
numberOfSimultaneousConnectionsToInstance + superuser_reserved_connections
```

**Client authentication information settings**

When trying to connect from a client to a database, settings are required to determine whether the instance permits connections from the client - if it does, then it is possible to make settings to determine if authentication is required.

See

Refer to "The pg_hba.conf File" in "Server Administration" in the PostgreSQL Documentation for details.

**4.5 Other Settings**

This section describes settings that are useful for operations.

**4.5.1 Error Log Settings**

This section explains the settings necessary to monitor errors in applications and operations, and to make discovering the causes easier.

Make error log settings only when instances are created with the initdb command.

When creating instances with WebAdmin, these settings are already made and hence do not need to be set.

Furthermore, some parameters are used by WebAdmin, and if changed, may cause WebAdmin to no longer work properly. Refer to "Appendix D Configuring Parameters" for details.

Note

Set the output destination for the system log to the server log so that it cannot be viewed by administrators of other instances.

Application errors are output to the system log or server log. The output destination directory for the system log and server log should have access permissions set so that they cannot be viewed by people other than the instance administrator.

Edit the following parameters in postgresql.conf:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>How to enable the settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>syslog_ident</td>
<td>Used to specify labels to attach to messages, so that these can be identified when output to the system log if more than one FUJITSU Enterprise Postgres is used.</td>
<td>reload option of the pg_ctl mode</td>
</tr>
<tr>
<td>logging_collector</td>
<td>Specify &quot;on&quot; to ensure that messages are output by FUJITSU Enterprise Postgres to the server log file. The server log file is created in the log directory in the database cluster.</td>
<td>restart option of the pg_ctl mode</td>
</tr>
</tbody>
</table>
4.5.2 Configuring Automatic Start and Stop of an Instance

You can automatically start or stop an instance when the operating system on the database server is started or stopped. Use the following procedure to configure automatic start and stop of an instance.

Note that, if an instance is started in a failover operation, the cluster system will control the start or stop, therefore this feature should not be used. Also, when performing database multiplexing, refer to “Enabling Automatic Start and Stop of Mirroring Controller and Multiplexed Instances” in the Cluster Operation Guide (Database Multiplexing).

Note that "<x>" in paths indicates the product version.

You should wait for time correction, network setup, and so on.

1. Create a unit file

   Copy the unit file sample stored in the directory below, and revise it to match the target instance.

   fujiitsuEnterprisePostgresInstallDir/share/fsepsvoi.service.sample

   Example

   In the following example, the installation directory is "/opt/fsepv<x>server64", and the instance name is "inst1".

   ```bash
   # cp /opt/fsepv<x>server64/share/fsepsvoi.service.sample /usr/lib/systemd/system/
   fsepsvoi_inst1.service
   ```

   Revise the underlined portions of the options below in the unit file.

<table>
<thead>
<tr>
<th>Section</th>
<th>Option</th>
<th>Specified value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Description</td>
<td>FUJITSU Enterprise Postgres</td>
<td>Specifies the feature overview.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>instanceName</strong></td>
<td></td>
</tr>
<tr>
<td>Section</td>
<td>Option</td>
<td>Specified value</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>----------</td>
<td>---------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Service</td>
<td>ExecStart</td>
<td>/bin/bash -c 'installDir/bin/pgx_symstd start installDir dataStorageDestinationDir'</td>
<td>Command to be executed when the service is started.</td>
</tr>
<tr>
<td></td>
<td>ExecStop</td>
<td>/bin/bash -c 'installDir/bin/pgx_symstd stop installDir dataStorageDestinationDir'</td>
<td>Command to be executed when the service is stopped.</td>
</tr>
<tr>
<td></td>
<td>ExecReload</td>
<td>/bin/bash -c 'installDir/bin/pgx_symstd reload installDir dataStorageDestinationDir'</td>
<td>Command to be executed when the service is reloaded.</td>
</tr>
<tr>
<td>User</td>
<td>User</td>
<td></td>
<td>OS user account of the instance administrator.</td>
</tr>
<tr>
<td>Group</td>
<td>Group</td>
<td></td>
<td>Group to which the instance administrator user belongs.</td>
</tr>
</tbody>
</table>

*1: The instance name should be as follows:

If WebAdmin is used to create the instance: `instanceName`

If the initdb command is used to create the instance: `nameThatIdentifiesTheInstance`

The naming conventions for the instance name or for identifying the instance are as follows:

- Up to 16 bytes
- The first character must be an ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

2. Enable automatic start and stop

As the OS superuser, use the systemctl command to enable automatic start and stop.

```
# systemctl enable fsepsvoi_inst1.service
```

### 4.5.3 Settings when Using the Features Compatible with Oracle Databases

To use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

```sql
CREATE EXTENSION oracle_compatible;
```

Features compatible with Oracle databases are defined as user-defined functions in the "public" schema created by default when database clusters are created, so they can be available for all users without the need for special settings.

For this reason, ensure that "public" (without the double quotation marks) is included in the list of schema search paths specified in the `search_path` parameter.

There are also considerations for use the features compatible with Oracle databases. Refer to "Precautions when Using the Features Compatible with Oracle Databases" in the Application Development Guide for details.

### 4.6 Integration with Message-Monitoring Software

To monitor messages output by FUJITSU Enterprise Postgres using software, configure the product to monitor SQLSTATE, instead of the message text - this is because the latter may change when FUJITSU Enterprise Postgres is upgraded.

Configure FUJITSU Enterprise Postgres to output messages in a format that can be read by the message-monitoring software by specifying "%e" in the `log_line_prefix` parameter of `postgresql.conf` to output the SQLSTATE value.

A setting example is shown below - it outputs the output time, executing host, application name, and user ID, in addition to the SQLSTATE value.
Example

```plaintext
log_line_prefix = '%e: %t [%p]: [%l-1] user = %u, db = %d, remote = %r app = %a '
```

See

Refer to "What To Log" in the PostgreSQL Documentation for information on how to configure the settings.

### 4.7 Setting Up and Removing OSS

This section explains how to set up OSS supported by FUJITSU Enterprise Postgres.

If you want to use OSS supported by FUJITSU Enterprise Postgres, follow the setup procedure.

If you decide not to use the OSS supported by FUJITSU Enterprise Postgres, follow the removing procedure.

To build and use OSS obtained from the web, etc., instead of OSS supported by FUJITSU Enterprise Postgres, see "4.7.10 Build with PGXS".

Information

- In this section, the applicable database that enables the features of each OSS is described as "postgres".
- Execute CREATE EXTENSION for the "template1" database also, so that each OSS can be used by default when creating a new database.

Refer to "OSS Supported by FUJITSU Enterprise Postgres" in the General Description for information on OSS other than those described below.

#### 4.7.1 oracle_fdw

##### 4.7.1.1 Setting Up oracle_fdw

1. Add the path of the OCI library to the environment variable. The available version of the OCI library is 11.2 or later. Add the installation path of the OCI library to the LD_LIBRARY_PATH environment variable.

2. As superuser, run the following command:

   ```bash
   $ su -
   Password:******
   # cp -r /opt/fsepv<x>server64/OSS/oracle_fdw/* /opt/fsepv<x>server64
   ```

3. If a file named libclntsh.so.11.1 does not exist in your OCI library, create a symbolic link with the name libclntsh.so.11.1 to libclntsh.so.xx.1 (xx is the version of the OCI library).

   ```bash
   # ln -s libclntsh.so.12.1 libclntsh.so.11.1
   ```

4. Restart FUJITSU Enterprise Postgres.

5. Execute CREATE EXTENSION for the database that will use this feature. Use the psql command to connect to the "postgres" database.

   ```bash
   postgres=# CREATE EXTENSION oracle_fdw;
   CREATE EXTENSION
   ```

Information

- If the OCI library is not installed on the server, install it using the Oracle client or Oracle Instant Client. Refer to the relevant Oracle manual for information on the installation procedure.
- If the version of the OCI library is updated, change the path of the OCI library in the LD_LIBRARY_PATH environment variable to the updated path. Also, re-create the symbolic link named libclntsh.so.11.1 if necessary.

**Note**

This feature cannot be used on instances created in WebAdmin. It can only be used via server commands.

### 4.7.1.2 Removing oracle_fdw

1. Execute DROP EXTENSION for the database that will use this feature.
   
   Add the psql command to connect to the "postgres" database.
   
   ```
   postgres=# DROP EXTENSION oracle_fdw CASCADE;
   DROP EXTENSION
   ```

2. As superuser, run the following command:

   ```
   $ su -
   Password:******
   # rm -rf /opt/fsepv<x>server64/filesCopiedDuringSetup
   ```

**Information**

The files copied during setup can be checked below.

```
# find /opt/fsepv<x>server64/OSS/oracle_fdw
```

### 4.7.2 pg_bigm

#### 4.7.2.1 Setting Up pg_bigm

1. Set the postgresql.conf file parameters.
   
   Add "pg_bigm" to the shared_preload_libraries parameter.

2. As superuser, run the following command:

   ```
   $ su -
   Password:******
   # cp -r /opt/fsepv<x>server64/OSS/pg_bigm/* /opt/fsepv<x>server64
   ```

3. Restart FUJITSU Enterprise Postgres.

4. Execute CREATE EXTENSION for the database that will use this feature.
   
   Use the psql command to connect to the "postgres" database.
   
   ```
   postgres=# CREATE EXTENSION pg_bigm;
   CREATE EXTENSION
   ```

#### 4.7.2.2 Removing pg_bigm

1. Execute DROP EXTENSION for the database that will use this feature.
   
   Use the psql command to connect to the "postgres" database.
   
   ```
   postgres=# DROP EXTENSION pg_bigm CASCADE;
   DROP EXTENSION
   ```
2. As superuser, run the following command:

```
$ su -
Password:******
# rm -rf /opt/fsepv<x>server64/filesCopiedDuringSetup
```

Information

The files copied during setup can be checked below.

```
# find /opt/fsepv<x>server64/OSS/pg_bigm
```

3. Set the postgresql.conf file parameters.
   Delete "pg_bigm" to the shared_preload_libraries parameter.

4. Restart FUJITSU Enterprise Postgres.

4.7.3 pg_hint_plan

4.7.3.1 Setting Up pg_hint_plan

1. Set the postgresql.conf file parameters.
   Add "pg_hint_plan" to the "shared_preload_libraries" parameter.

2. As superuser, run the following command:

```
$ su -
Password:******
# cp -r /opt/fsepv<x>server64/OSS/pg_hint_plan/* /opt/fsepv<x>server64
```

3. Restart FUJITSU Enterprise Postgres.

4. Run CREATE EXTENSION for the database that uses this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

```
postgres=# CREATE EXTENSION pg_hint_plan;
CREATE EXTENSION
```

See

Refer to "Optimizer Hints" in the Application Development Guide for details.

4.7.3.2 Removing pg_hint_plan

Note

Unsetting pg_hint_plan will cause hints registered in the hint_plan.hints table to be lost. Therefore, it is recommended that pg_dump back up the hint_plan.hints table for each database if it is likely that pg_hint_plan will be used again later.

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```
postgres=# DROP EXTENSION pg_hint_plan CASCADE;
DROP EXTENSION
```
2. As superuser, run the following command:

```bash
$ su -
Password:******
# rm -rf /opt/fsepv<x>server64/filesCopiedDuringSetup
```

**Information**

The files copied during setup can be checked below.

```bash
# find /opt/fsepv<x>server64/OSS/pg_hint_plan
```

3. Set the postgresql.conf file parameters.
   Delete "pg_hint_plan" to the shared_preload_libraries parameter.

4. Restart FUJITSU Enterprise Postgres.

### 4.7.4 pg_dbms_stats

#### 4.7.4.1 Setting Up pg_dbms_stats

1. Set the postgresql.conf file parameter.
   Add "pg_dbms_stats" to the "shared_preload_libraries" parameter.

2. As superuser, run the following command:

```bash
$ su -
Password:******
# cp -r /opt/fsepv<x>server64/OSS/pg_dbms_stats/* /opt/fsepv<x>server64
```

3. Restart FUJITSU Enterprise Postgres.

4. Run CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

   ```sql
   postgres=# CREATE EXTENSION pg_dbms_stats;
   CREATE EXTENSION
   ```

**See**

Refer to "Optimizer Hints" in the Application Development Guide for details.

#### 4.7.4.2 Removing pg_dbms_stats

**Note**

Unsetting pg_dbms_stats causes statistics managed by pg_dbms_stats to be lost. Therefore, it is recommended that you back up each table in the dbms_stats folder of each database in binary format if you may want to use pg_dbms_stats again later.

```sql
postgres > # COPY <dbms_stats Schema's table name> TO '<Filename>' FORMAT binary;
```

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

   ```sql
   postgres=# DROP EXTENSION pg_dbms_stats CASCADE;
   DROP EXTENSION
   ```
2. As superuser, run the following command:

```
$ su -
Password:******
# rm -rf /opt/fsepv<server64>/filesCopiedDuringSetup
```

**Information**

The files copied during setup can be checked below.

```
# find /opt/fsepv<server64>/OSS/pg_dbms_stats
```

3. Set the postgresql.conf file parameters.
   Delete "pg_dbms_stats" to the shared_preload_libraries parameter.

4. Restart FUJITSU Enterprise Postgres.

### 4.7.5 pg_repack

#### 4.7.5.1 Setting Up pg_repack

1. As superuser, run the following command:

```
$ su -
Password:******
# cp -r /opt/fsepv<server64>/OSS/pg_repack/* /opt/fsepv<server64>
```

2. Execute CREATE EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```
postgres=# CREATE EXTENSION pg_repack;
CREATE EXTENSION
```

#### 4.7.5.2 Removing pg_repack

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```
postgres=# DROP EXTENSION pg_repack CASCADE;
DROP EXTENSION
```

2. As superuser, run the following command:

```
$ su -
Password:******
# rm -rf /opt/fsepv<server64>/filesCopiedDuringSetup
```

**Information**

The files copied during setup can be checked below.

```
# find /opt/fsepv<server64>/OSS/pg_repack
```
4.7.6 pg_rman

4.7.6.1 Setting Up pg_rman

1. As superuser, run the following command:

```bash
$ su -
Password:******
# cp -r /opt/fsepv<x>server64/OSS/pg_rman/* /opt/fsepv<x>server64
```

2. Restart FUJITSU Enterprise Postgres.

**Information**

Before initialization of the backup catalog, it is recommended to set the parameters below in postgresql.conf. Refer to the pg_rman manual (http://ossc-db.github.io/pg_rman/index-ja.html) for details.

- log_directory
- archive_mode
- archive_command

**Note**

This feature cannot be used on instances created in WebAdmin. It can only be used via server commands.

4.7.6.2 Removing pg_rman

1. As superuser, run the following command:

```bash
$ su -
Password:******
# rm -rf /opt/fsepv<x>server64/ filesCopiedDuringSetup
```

**Information**

The files copied during setup can be checked below.

```bash
# find /opt/fsepv<x>server64/OSS/pg_rman
```

2. Restart FUJITSU Enterprise Postgres.

4.7.7 pg_statsinfo

4.7.7.1 Setting Up pg_statsinfo

1. Set the postgresql.conf file parameters.

   - Add "pg_statsinfo" to the shared_preload_libraries parameter.
   - Specify the log file name for the log_filename parameter.

2. As superuser, run the following command:

```bash
$ su -
Password:******
# cp -r /opt/fsepv<x>server64/OSS/pg_statsinfo/* /opt/fsepv<x>server64
```
3. Restart FUJITSU Enterprise Postgres.

**Information**

Note that pg_statsinfo forcibly overwrites the settings below.

- **log_destination**
  - "csvlog" is added and "stderr" is deleted.
- **logging_collector**
  - "on" is set.

**Note**

This feature cannot be used on instances created in WebAdmin. It can only be used via server commands.

### 4.7.7.2 Removing pg_statsinfo

1. As superuser, run the following command:

```bash
$ su -
Password:******
# rm -rf /opt/fsepv<x>server64/filesCopiedDuringSetup
```

**Information**

The files copied during setup can be checked below.

```bash
# find /opt/fsepv<x>server64/OSS/pg_statsinfo
```

2. Set the `postgresql.conf` file parameters.
   - Delete "pg_statsinfo" to the `shared_preload_libraries` parameter.
   - Delete the log file name for the `log_filename` parameter.

3. Restart FUJITSU Enterprise Postgres.

### 4.7.8 pgBadger

#### 4.7.8.1 Setting Up pgBadger

1. Set the `postgresql.conf` file parameters.
   - Set the parameters so that the information required for analysis is output to the server log.
   - Refer to "Documentation" in the pgBadger website (https://pgbadger.darold.net/) for details.
   - The pgBadger material is stored under `/opt/fsepv<x>server64/OSS/pgbadger`.

2. Restart FUJITSU Enterprise Postgres.

#### 4.7.8.2 Removing pgBadger

1. Set the `postgresql.conf` file parameters.
   - Restores information you specified during Setup.

2. Restart FUJITSU Enterprise Postgres.
4.7.9 Pgpool-II

4.7.9.1 Setting Up Pgpool-II

1. As superuser, run the following command:

```bash
$ su -
Password:******
# cp -r /opt/fsepv<x>server64/OSS/Pgpool-II/* /opt/fsepv<x>server64
```

2. Execute CREATE EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```sql
postgres=# CREATE EXTENSION pgpool_recovery;
CREATE EXTENSION
```

3. Set the postgresql.conf file parameters.
   Specify the path to pg_ctl for the pgpool.pg_ctl parameter.

4. Restart FUJITSU Enterprise Postgres.

---

Note

The online recovery feature of Pgpool-II cannot be used on instances created in WebAdmin. It can only be used via server commands.

---

4.7.9.2 Removing Pgpool-II

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```sql
postgres=# DROP EXTENSION pgpool_recovery CASCADE;
DROP EXTENSION
```

2. As superuser, run the following command:

```bash
$ su -
Password:******
# rm -rf /opt/fsepv<x>server64/filesCopiedDuringSetup
```

---

Information

The files copied during setup can be checked below.

```bash
# find /opt/fsepv<x>server64/OSS/Pgpool-II
```

3. Set the postgresql.conf file parameters.
   Delete the pg_ctl path for the pgpool.pg_ctl parameter.

4. Restart FUJITSU Enterprise Postgres.

4.7.10 Build with PGXS

Many PostgreSQL extensions are built using a build base for extensions called PGXS. Building with PGXS also generates files related to llvm. Depending on which version of llvm you are using, follow these steps:

---

4.7.10.1 Using the Default Version of llvm

The default version of llvm is described in "2.1 Required Operating System". If you want to use the default version of llvm, use the OSS documentation to build and install OSS.
4.7.10.2 Using a Non-Default Version of llvm

1. As superuser, copy the Makefile.global corresponding to the version of llvm you want to use. The following is an example of using version 9 of llvm. Makefile.global is overwritten when an emergency fix is applied or removed from Fujitsu Enterprise Postgres, this procedure should be performed each time a build is performed.

```
$ su -
Password:******
# cp /opt/fsepv<x>server64/lib/pgxs/src/Makefile.global-vsn9 /opt/fsepv<x>server64/lib/pgxs/src/Makefile.global
```

2. Follow the OSS documentation to build and install OSS.

3. As superuser, run the following command:. The following is an example of using version 9 of llvm:

```
$ su -
Password:******
# mv /opt/fsepv<x>server64/lib/bitcode/<OSS名>* /opt/fsepv<x>server64/lib/bitcode-vsn9/
```

4.7.10.3 Without llvm

If you do not use llvm, use the with _llvm = no option when performing the build, as shown below. For other options, follow the OSS documentation.

```
# make USE_PGXS=1 with_llvm=no
```

4.8 Deleting Instances

This section explains how to delete an instance.

- 4.8.1 Using WebAdmin
- 4.8.2 Using Server Commands

**Note**

- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.
- If you have set automatic start and stop of the instance, execute the following commands to disable the script and cancel registration.

```
systemctl disable nameOfUnitFileThatPerformsAutomaticStartAndStop
rm /usr/lib/systemd/system/nameOfUnitFileThatPerformsAutomaticStartAndStop
```

**Example**

```
# systemctl disable fsepsvoi_inst1.service
# rm /usr/lib/systemd/system/fsepsvoi_inst1.service
```

4.8.1 Using WebAdmin

This section explains how to delete an instance using WebAdmin.

Use the following procedure to delete an instance.

1. Stop the instance

   In the [Instances] tab, select the instance to stop and click "Stop".
2. Back up files.
   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and
   the transaction log storage destination.

3. Delete the instance
   In the [Instances] tab, select the instance to delete and click 

Note
Deleting an instance deletes only the following lowest-level directories. If they are not required, delete them manually.
- Data storage destination
- Backup data storage destination
- Transaction log storage destination (if different from the data storage destination)

4.8.2 Using Server Commands
This section explains how to delete an instance using server commands.
Use the following procedure to delete an instance.

1. Stop the instance
   Execute the stop mode of the pg_ctl command.
   An example is shown below:
   Example

   ```
   $ pg_ctl stop -D /data/inst1
   ```

2. Back up files.
   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and
   the transaction log storage destination.

3. Delete the instance
   Use a standard UNIX tool (the rm command) to delete the following directories:
   - Data storage destination
   - Backup data storage destination
   - Transaction log storage destination (if a directory different from the data storage directory was specified)
Chapter 5 Uninstallation

This chapter describes the procedure for uninstalling FUJITSU Enterprise Postgres.

5.1 Uninstallation in Interactive Mode

Uninstall according to the following procedure:

Note that "xSPz" in sample windows indicates the version and level of products to uninstall and "<x>" in paths indicates the product version.

Note
- All files and directories in the installation directory are deleted during uninstallation. If user files have been placed in the installation directory, back them up before uninstallation if necessary.
- On SLES 12, before uninstallation, ensure that Oracle JRE 8 is installed, and export the JAVA_HOME environment variable.

```
#export JAVA_HOME="oracleJre8InstallDir"
```

- To reinstall FUJITSU Enterprise Postgres after it was uninstalled, and reuse an instance that was already created so that it can be managed from WebAdmin, back up the directory shown below in which the WebAdmin instance management information had been defined before uninstalling FUJITSU Enterprise Postgres, and then restore the backed up directory to its original location once FUJITSU Enterprise Postgres has been reinstalled.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following directory:

   `webAdminInstallDir/data/fepwa`

Information

If an error occurs while the product is being uninstalled, refer to "Uninstall (middleware) Messages" in the FUJITSU Enterprise Postgres product website, and take the required action.

1. Delete the operation information

If the FUJITSU Enterprise Postgres operation information has been registered in the operating system or another middleware product, for example, then it must be deleted. Cases in which deletion is required are as follows:

- For a cluster system using failover operation integrated with PRIMECLUSTER, stop the cluster applications and delete the cluster application resources and FUJITSU Enterprise Postgres resources. Refer to the Cluster Operation Guide (PRIMECLUSTER) and PRIMECLUSTER Installation and Administration Guide for details.

- If you have set automatic start and stop of the instance, execute the following commands to disable the script and cancel registration.

```
systemctl disable nameOfUnitFileThatPerformsAutomaticStartAndStop
rm /usr/lib/systemd/system/nameOfUnitFileThatPerformsAutomaticStartAndStop
```

Example

```
# systemctl disable fsepsvoi_inst1.service
# rm /usr/lib/systemd/system/fsepsvoi_inst1.service
```

2. Stop applications and programs

Before starting the uninstallation, stop the following:
- Applications that use the product

- Instance

Using WebAdmin

In the [Instances] tab, select the instance to stop and click.

Using server commands

Execute the pg_ctl command in stop mode.

```
$ /opt/fsepv<server64>/bin/pg_ctl stop -D /database/inst1
```

- Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

**Example**

If WebAdmin is installed in /opt/fsepv<webadmin>:

```
# cd /opt/fsepv<webadmin>/sbin
# ./WebAdminStop
```

- Mirroring Controller

Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

**Example**

```
$ mc_ctl stop -M /mcdir/inst1
```

- pgBadger

- Pgpool-II

### 3. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
```

Password:******

### 4. Start the Uninstall (middleware)

Execute the following command:

```
# /opt/FJSVcir/cimanager.sh -c
```

### 5. Select the software

Type the number for the product to be uninstalled, and press Enter.

### 6. Start the uninstallation

To start the uninstallation, type "y" and press Enter.

To display the list of products again, type "b" and press Enter.

### 7. Finish the uninstallation

Upon successful completion, the window below is displayed.

The installation directory may remain after uninstallation. If it is not required, delete it.

Uninstalling...

```
productName is being uninstalled now.
```
The following products have been uninstalled successfully: `productName`

Uninstallation of "productName" has completed successfully.

Exiting Uninstaller.

## 5.2 Uninstallation in Silent Mode

Uninstall according to the following procedure:

**Note**

- All files and directories in the installation directory are deleted during uninstallation. If user files have been placed in the installation directory, back them up before uninstallation if necessary.

- On SLES 12, before uninstallation, ensure that Oracle JRE 8 is installed, and export the JAVA_HOME environment variable.

```bash
#export JAVA_HOME="oracleJre8InstallDir"
```

- To reinstall FUJITSU Enterprise Postgres after it was uninstalled, and reuse an instance that was already created so that it can be managed from WebAdmin, back up the directory shown below in which the WebAdmin instance management information had been defined before uninstalling FUJITSU Enterprise Postgres, and then restore the backed up directory to its original location once FUJITSU Enterprise Postgres has been reinstalled.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following directory:

   ```bash
   webAdminInstallDir/data/fepwa
   ```

**See**

Refer to the FUJITSU Enterprise Postgres product website for information on uninstallation in silent mode, such as the error messages.

### 1. Delete the operation information

If the FUJITSU Enterprise Postgres operation information has been registered in the operating system or another middleware product, for example, then it must be deleted. Cases in which deletion is required are as follows:

- For a cluster system using failover operation integrated with PRIMECLUSTER, stop the cluster applications and delete the cluster applications resources and FUJITSU Enterprise Postgres resources. Refer to the Cluster Operation Guide (PRIMECLUSTER) and PRIMECLUSTER Installation and Administration Guide for details.

- If you have set automatic start and stop of the instance, execute the following commands to disable the script and cancel registration.

```bash
systemctl disable nameOfUnitFileThatPerformsAutomaticStartAndStop
rm /usr/lib/systemd/system/nameOfUnitFileThatPerformsAutomaticStartAndStop
```

**Example**

```bash
# systemctl disable fsepsvoi_inst1.service
# rm /usr/lib/systemd/system/fsepsvoi_inst1.service
```
2. Stop applications and programs

Before starting the uninstallation, stop the following:

- Applications that use the product
- Instance

**Using WebAdmin**

In the [Instances] tab, select the instance to stop and click ![Stop button].

**Using server commands**

Execute the `pg_ctl` command with the stop mode option specified.

```
$ /opt/fsepv<server64>/bin/pg_ctl stop -D /database/inst1
```

- Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

**Example**

If WebAdmin is installed in /opt/fsepv<webadmin>:

```
# cd /opt/fsepv<webadmin>/sbin
# ./WebAdminStop
```

- Mirroring Controller

Execute the `mc_ctl` command with the stop mode option specified and stop the Mirroring Controller.

**Example**

```
$ mc_ctl stop -M /mcdir/inst1
```

- pgBadger
- Pgpool-II

3. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

4. Run the uninstallation

Execute the command below.

The installation directory may remain after uninstallation. If it is not required, delete it.

**Example**

```
# /opt/fsepv<server64>/setup/suninst.sh
```

In the example above, /opt/fsepv<server64>/setup is the name of the installation directory in which the server product is installed.

```
# /opt/fsepv<webadmin>/setup/suninst.sh
```

In the example above, /opt/fsepv<webadmin>/setup is the name of the installation directory in which the WebAdmin is installed.

```
# /opt/fsepv<pgpool-II>/setup/suninst.sh
```

In the example above, /opt/fsepv<pgpool-II>/setup is the name of the installation directory in which the Pgpool-II is installed.
Appendix A  Recommended WebAdmin Environments

This appendix describes the recommended WebAdmin environment. The following explanation is based on the assumption that Internet Explorer 11 or later is used unless otherwise stated.

A.1 Recommended Browser Settings

- Use a display resolution of 1280 x 768 or higher, and 256 colors or more.
- Select [View] >> [Text size] >> [Medium].
- Select [View] >> [Zoom] >> [100%].
- Click [Tools] >> [Internet options] >> [General] >> [Fonts], and then:
  - Set [Webpage font] to [Times New Roman].
  - Set [Plain text font] to [Courier New].

A.2 How to Set Up the Pop-up Blocker

If the Pop-up Blocker is enabled, use the procedure below to configure settings to allow pop-ups from the server where FUJITSU Enterprise Postgres is installed.

1. Click [Tools] >> [Internet options], and then select the [Privacy] tab.
   If [Turn on Pop-up Blocker] is not selected, the Pop-up Blocker feature will not operate, and therefore steps below are not required.
2. Click [Settings].
3. In the [Pop-up Blocker Settings] window, enter in the [Address of website to allow] the URL of the server where FUJITSU Enterprise Postgres is installed, and then click [Add].
4. Click [Close].
5. In the [Internet Options] window, click [OK].
Appendix B Setting Up and Removing WebAdmin

This appendix describes how to set up and remove WebAdmin.

Note that "<x>" in paths indicates the product version.

B.1 Setting Up WebAdmin

This section explains how to set up WebAdmin.

B.1.1 Setting Up WebAdmin

Follow the procedure below to set up WebAdmin.

1. Change to the superuser
   Acquire superuser privileges on the system.
   **Example**
   
   ```
   $ su -
   Password:******
   ```

2. Set up WebAdmin
   Set up WebAdmin.
   **Example**
   
   If WebAdmin is installed in /opt/fsepv<x>webadmin:
   
   ```
   # cd /opt/fsepv<x>webadmin/sbin
   # ./WebAdminSetup
   ```

3. Specify the port number
   Specify the following port numbers to be used in WebAdmin.
   Refer to the "/etc/services" file and only change to a different port number if there is overlap with a port number from another service.
   Make a note of the port number for the Web server, because it will be required for starting the WebAdmin window.

<table>
<thead>
<tr>
<th>Item</th>
<th>Value (recommended value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web server port number</td>
<td>27515</td>
</tr>
<tr>
<td>enter port number of Web Server (default: 27515):</td>
<td></td>
</tr>
<tr>
<td>WebAdmin internal port number</td>
<td>27516</td>
</tr>
<tr>
<td>enter Internal port number for WebAdmin (default: 27516):</td>
<td></td>
</tr>
<tr>
<td>WebAdmin automatic start</td>
<td>y</td>
</tr>
<tr>
<td>Start WebAdmin automatically when system starting? [y,n] (default: y)</td>
<td></td>
</tr>
</tbody>
</table>

   **Web server port number**
   Specify a numeric value from 1024 to 32767 for the port number to be used for communication between the Web browser and the Web server.
   The Web server port number will be registered as a port number with the following service name in the "/etc/services" file.
   
   fsep_130_WA_64_WebAdmin_Port1

   **WebAdmin internal port number**
   Specify a numeric value from 1024 to 32767 for the port number to be used for communication between the Web server and the WebAdmin runtime environment.
The WebAdmin internal port number will be registered as a port number with the following service name in the /etc/services file.

fsep_130 WA_64 WebAdmin_Port2

WebAdmin automatic start
Select whether or not to start WebAdmin when the machine is started.

Note

- Unused port numbers
  Irrespective of the information specified in the "/etc/services" file, unused port numbers in the OS and other products can sometimes be automatically numbered and then used, or port numbers specified in environment files within products may also be used. Check the port numbers used by the OS and other products, and ensure that these are not duplicated.

- Access restrictions
  Prevent unauthorized access and maintain security by using a firewall product, or the packet filtering feature of a router device, to restrict access to the server IP address and the various specified port numbers.

- Port access permissions
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

- Changing port numbers
  When using WebAdmin in multiserver mode, it is recommended not to change WebAdmin ports after creating instances. Otherwise, the created instances may not be accessible through WebAdmin after the port is changed.

B.1.2 Starting the Web Server Feature of WebAdmin
Follow the procedure below to start the Web server feature of WebAdmin.

1. Change to the superuser
   Acquire superuser privileges on the system.
   
   Example
   ```
   $ su -
   Password:******
   ```

2. Start the Web server feature of WebAdmin
   Execute the WebAdminStart command to start the Web server feature of WebAdmin.
   
   Example
   ```
   If WebAdmin is installed in /opt/fsepv<x>webadmin:
   # cd /opt/fsepv<x>webadmin/sbin
   # ./WebAdminStart
   ```

B.1.3 Stopping the Web Server Feature of WebAdmin
Follow the procedure below to stop the Web server feature of WebAdmin.

1. Change to the superuser
   Acquire superuser privileges on the system.
   
   Example
   ```
   $ su -
   Password:******
   ```
2. Stop the Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

Example

If WebAdmin is installed in /opt/fsepv<x>webadmin:

```bash
# cd /opt/fsepv<x>webadmin/sbin
# ./WebAdminStop
```

**Note**

- For efficient operation of WebAdmin, it is recommended that the Web server feature be stopped only during a scheduled maintenance period.
- When WebAdmin is used to create and manage instances in a multiserver configuration, the Web server feature must be started and running on all servers at the same time.

**B.2 Removing WebAdmin**

This section explains how to remove WebAdmin.

This removal procedure stops WebAdmin and ensures that it no longer starts automatically when the machine is restarted.

1. Change to the superuser

Acquire superuser privileges on the system.

Example

```bash
$ su -
Password:******
```

2. Remove WebAdmin setup

Execute the WebAdminSetup command to remove WebAdmin setup.

Example

If WebAdmin is installed in /opt/fsepv<x>webadmin:

```bash
# cd /opt/fsepv<x>webadmin/sbin
# ./WebAdminSetup -d
```

**B.3 Using an External Repository for WebAdmin**

WebAdmin can be configured to use an external database, where it can store the various metadata information it uses. WebAdmin will use this database as a repository to store the information it uses to manage all the created instances. This can be a FUJITSU Enterprise Postgres database or an Open Source PostgreSQL V9.2 or later database.

Using an external database as a WebAdmin repository provides you with more flexibility in managing WebAdmin. This repository can be managed, backed up and restored as needed using pgAdmin or command line tools, allowing users to have greater flexibility and control.

Follow the procedure below to set up the repository.

1. Start WebAdmin, and log in to the database server.
2. Click the [Settings] tab, and then click in the [WebAdmin repository configuration] section.

3. Enter the following items:
   - [Host name]: Host name of the database server
   - [Port]: Port number of the database server
   - [Database name]: Name of the database
   - [User name]: User name to access the database
   - [Password]: Password of the database user

   **Note**
   - Database type
     It is recommended to use a FUJITSU Enterprise Postgres database as a repository. A compatible PostgreSQL database can also be used as an alternative.
   - It is recommended to click [Test connection] to ensure that the details entered are valid and WebAdmin is able to connect to the target database.
   - Host name, Database name, User name, Password should not contain hazardous characters. Refer to "Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters".

4. Click to register the repository details.
Note

- Once the repository is set up, it can be changed any number of times by the user logged into WebAdmin. When a repository is changed:
  - It is recommended to preload the backup into this database.
  - If the data is not preloaded, WebAdmin will create a new repository.
- The database repository can be set up even after WebAdmin was already used to create instances. In that scenario, the instances already created are retained and can continue to be operated on.
- If the instance used as a repository is stopped, WebAdmin will be unusable. For this reason, it is recommended to be familiar with starting an instance from the command line. If the instance is stopped for any reason, start it from the command line and WebAdmin will be usable again.

B.4 Using the WebAdmin Auto-Refresh Feature

The WebAdmin auto-refresh feature automatically refreshes the operating status of all instances in the Instance list at the specified interval. It also refreshes the details of the selected instance.

Follow the procedure below to configure the auto-refresh options.

1. Click the [Settings] tab, and then click in the [User preferences] section.
2. Enter the following items:
   - [Auto-refresh instance]: To use the auto-refresh feature, select "Enabled". The default is "Disabled".
   - [Refresh interval (seconds)]: Number of seconds between each refresh. This is a countdown timer, which is reset every time the instance status is refreshed by any operation. Specify a value from 30 to 3600 (seconds). The default is 30.
3. Click to save the auto-refresh settings.

Note

- Auto-refresh will run only if the [Instances] page is displayed and no user-initiated operation is in progress.
- A text indicator, which is independent of auto-refresh, is displayed at the top of the Instance list. It is dynamically updated to display when the page was last refreshed.
Appendix C  WebAdmin Disallow User Inputs Containing Hazardous Characters

WebAdmin considers the following as hazardous characters, which are not allowed in user inputs.

| (pipe sign)
& (ampersand sign)
; (semicolon sign)
$ (dollar sign)
% (percent sign)
@ (at sign)
' (single apostrophe)
" (quotation mark)
\' (backslash-escaped apostrophe)
\* (backslash-escaped quotation mark)
<> (triangular parenthesis)
() (parenthesis)
+ (plus sign)
CR (Carriage return, ASCII 0x0d)
LF (Line feed, ASCII 0x0a)
, (comma sign)
\ (backslash)
Appendix D Configuring Parameters

WebAdmin operates and manages databases according to the contents of the following configuration files:

- **postgresql.conf**
  Contains various items of information that define the operating environment of FUJITSU Enterprise Postgres.

- **pg_hba.conf**
  Contains various items of information related to client authentication.

These configuration files are deployed to a data storage destination. Data is written to them when the instance is created by WebAdmin and when settings are changed, and data is read from them when the instance is started and when information from the [Setting] menu is displayed.

Direct editing of each configuration file is possible with a text editor.

See

Refer to "Server Configuration" and "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on the parameters.

Note

WebAdmin checks for port number and backup storage path anomalies when various operations are performed. An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of the corresponding parameter in postgresql.conf. Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.

**postgresql.conf**

Parameters that can be changed in WebAdmin

The postgresql.conf parameters that can be changed in WebAdmin are shown below:

<table>
<thead>
<tr>
<th>Section</th>
<th>WebAdmin item</th>
<th>postgresql.conf file parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Character encoding</td>
<td>Character set</td>
<td>client_encoding</td>
</tr>
<tr>
<td></td>
<td>Message locale</td>
<td>lc_messages</td>
</tr>
<tr>
<td>Communication</td>
<td>Max connections</td>
<td>max_connections</td>
</tr>
<tr>
<td>SQL options</td>
<td>Transform NULL format</td>
<td>transform_null_equals</td>
</tr>
<tr>
<td></td>
<td>Date output format</td>
<td>DateStyle (*1)</td>
</tr>
<tr>
<td></td>
<td>Interval output format</td>
<td>IntervalStyle</td>
</tr>
<tr>
<td></td>
<td>Number of digits for floating values</td>
<td>extra_float_digits</td>
</tr>
<tr>
<td></td>
<td>Transaction isolation levels</td>
<td>default_transaction_isolation</td>
</tr>
<tr>
<td></td>
<td>Currency format</td>
<td>lc_monetary</td>
</tr>
<tr>
<td></td>
<td>Date and time format</td>
<td>lc_time</td>
</tr>
<tr>
<td>Memory</td>
<td>Sort memory (KB)</td>
<td>work_mem</td>
</tr>
<tr>
<td></td>
<td>Shared buffers (KB)</td>
<td>shared_buffers</td>
</tr>
<tr>
<td>Streaming replication</td>
<td>WAL level</td>
<td>wal_level</td>
</tr>
</tbody>
</table>
### Information

- Calculate the maximum number of connections using the formula below:

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + 3 \quad \text{(*1)}
\]

*1: 3 is the default number of connections required by the system.

Calculate the maximum number of connections using the following formula when changing `superuser_reserved_connections` (connections reserved for use by the superuser) in `postgresql.conf`.

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + \text{superuser_reserved_connections}
\]

- Also check if the memory used exceeds the memory installed (refer to "Parameters automatically set by WebAdmin according to the amount of memory").

- When modifying "Shared buffers" or "Max connections", edit the kernel parameter. Refer to "Appendix H Configuring Kernel Parameters", and "Managing Kernel Resources" in "Server Administration" in the PostgreSQL Documentation for details.

**Parameters set by WebAdmin**

The following `postgresql.conf` parameters are set by WebAdmin during instance startup (they will be ignored even if specified in `postgresql.conf`):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>listen_addresses</td>
<td>*</td>
</tr>
<tr>
<td>log_destination</td>
<td>'stderr,syslog'</td>
</tr>
<tr>
<td>logging_collector</td>
<td>on</td>
</tr>
<tr>
<td>log_line_prefix</td>
<td>'%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a'</td>
</tr>
<tr>
<td>log_filename (*1) (*2)</td>
<td>'logfile-%a.log'</td>
</tr>
<tr>
<td>log_file_mode</td>
<td>0600</td>
</tr>
<tr>
<td>log_truncate_on_rotation</td>
<td>on</td>
</tr>
<tr>
<td>log_rotation_age</td>
<td>1d</td>
</tr>
</tbody>
</table>

*1: The server logs are split into files based on the day of the week, and are rotated after each week.

*2: If the date changes while the instance is stopped, old logs are not deleted and continue to exist. Manually delete old logs that are no longer required to release disk space.

---

<table>
<thead>
<tr>
<th>Section</th>
<th>WebAdmin item</th>
<th>postgreSQL.conf file parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Maximum WAL senders</td>
<td>max_wal_senders</td>
</tr>
<tr>
<td></td>
<td>WAL save size (MB)</td>
<td>wal_keep_size</td>
</tr>
<tr>
<td></td>
<td>Hot standby</td>
<td>hot_standby</td>
</tr>
<tr>
<td></td>
<td>Synchronous standby names</td>
<td>synchronous_standby_names</td>
</tr>
<tr>
<td></td>
<td>WAL receiver timeout (ms)</td>
<td>wal_receiver_timeout</td>
</tr>
</tbody>
</table>

---

*1: If you specify "Postgres" as the output format, dates will be output in the "12-17-1997" format, not the "Wed Dec 17 1997" format used in the PostgreSQL Documentation.
### Parameters automatically set by WebAdmin according to the amount of memory

The `postgresql.conf` parameters automatically set according to the amount of installed memory, during the creation of instances by WebAdmin, are shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30% of the machine's installed memory</td>
</tr>
<tr>
<td>work_mem</td>
<td>30% of the machine's installed memory / max_connections / 2</td>
</tr>
<tr>
<td>effective_cache_size</td>
<td>75% of the machine's installed memory</td>
</tr>
<tr>
<td>maintenance_work_mem</td>
<td>10% of the machine's installed memory / (1 + autovacuum_max_workers)</td>
</tr>
</tbody>
</table>

*1: The value will be capped at 2097151 KB.

When determining the values to be configured in the above parameters, you must take into account any anticipated increases in access volume or effects on performance during business operations, such as the number of applications and commands that will access the instance, and the content of processes. Also, note that in addition to FUJITSU Enterprise Postgres, other software may be running on the actual database server. You will need to determine the degree of priority for the database and other software, as well as the memory allocation size.

WebAdmin automatically configures complex parameter settings such as those mentioned above, based on the size of the internal memory of the machine. This enables maximum leverage of the machine memory to facilitate resistance against fluctuations during business operations.

Accordingly, the effects of the above-mentioned factors must be estimated and taken into account when determining and configuring parameter values, so that memory resources can be effectively allocated among other software or instances, and so that adverse effects can be mutually avoided. Refer to "Memory" in "Resource Consumption", and "Planner Cost Constants" in "Query Planning", under "Server Administration" in the PostgreSQL Documentation for information on parameter values and required considerations.

Parameters values can be modified using the WebAdmin [Setting] menu, or edited directly using a text editor.

If adding an instance, determine the parameter values, including for existing instances, and make changes accordingly.

---

#### See

Kernel parameters need to be tuned according to the parameters being changed. Refer to "Appendix H Configuring Kernel Parameters", and "Managing Kernel Resources" in "Server Administration" in the PostgreSQL Documentation for information on tuning kernel parameters.

---

#### Note

- Do not directly edit the following `postgresql.conf` parameters with a text editor, otherwise WebAdmin may not work properly if you make a mistake:
  - archive_mode
  - archive_command
  - wal_level
  - log_line_prefix
  - log_destination
  - logging_collector
  - log_directory
  - log_file_mode
  - log_filename
- log_truncate_on_rotation
- log_rotation_age

- You must take care with the following parameter:
  - superuser_reserved_connections
    Set it to a number that includes the 3 connections required in WebAdmin (the default is 3).

----------

**pg_hba.conf**

Refer to "Client Authentication" in “Server Administration” in the PostgreSQL Documentation for information on content that can be configured in pg_hba.conf.

**Note**

- Configure the instance administrator permissions in the "local" connection format settings. WebAdmin may not work properly if permissions are not configured.

- If you specify an item or value that cannot be set by WebAdmin when editing the pg_hba.conf file with a text editor, it will not be possible to reference that line from WebAdmin.
Appendix E  Estimating Database Disk Space Requirements

This appendix describes how to estimate database disk space requirements.

E.1 Estimating Table Size Requirements

The following tables provide the formulas for estimating table size requirements.

Table E.1 Estimation formula when the record length is 2032 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Record length</td>
<td>$27(+1) + \text{NULL map} + \text{OID} + \text{column data}$</td>
</tr>
<tr>
<td></td>
<td>\text{NULL map: Number of columns / 8 }(*2)</td>
</tr>
<tr>
<td></td>
<td>\text{OID: 4}</td>
</tr>
<tr>
<td></td>
<td>\text{Column data: Sum of column lengths}</td>
</tr>
<tr>
<td></td>
<td>*1: Record header section</td>
</tr>
<tr>
<td></td>
<td>*2: Round the result up to the next integer.</td>
</tr>
<tr>
<td></td>
<td>- Because the column data is placed in boundaries of 8 bytes, you need to make an</td>
</tr>
<tr>
<td></td>
<td>adjustment so that the sum of the record header section, NULL map and OID is a multiple</td>
</tr>
<tr>
<td></td>
<td>of 8.</td>
</tr>
<tr>
<td></td>
<td>For example, if the calculated length is $27 + 1/8$ (rounded up) + 0 = 28 bytes, add</td>
</tr>
<tr>
<td></td>
<td>4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- Because the data of each column is placed in boundaries of the defined data type,</td>
</tr>
<tr>
<td></td>
<td>take the boundary of each data type into account for the length of the column data.</td>
</tr>
<tr>
<td></td>
<td>For example, the length of the column data in the table below will not be the sum of</td>
</tr>
<tr>
<td></td>
<td>the data types, which is 37 bytes, but will instead be 64 bytes following boundary</td>
</tr>
<tr>
<td></td>
<td>adjustment.</td>
</tr>
<tr>
<td></td>
<td>Definition: create table tb1(c1 char(1), c2 long, c3 int, c4 box)</td>
</tr>
<tr>
<td></td>
<td>Estimation: CHAR type 1 byte + boundary adjustment of 7 bytes for LONG type 8 bytes</td>
</tr>
<tr>
<td></td>
<td>+ LONG type 8 bytes + INT type 4 bytes + boundary adjustment of 12 bytes for BOX type</td>
</tr>
<tr>
<td></td>
<td>32 bytes + BOX type 32 bytes = 64 bytes</td>
</tr>
<tr>
<td></td>
<td>- Because each record is placed in boundaries of 8 bytes, you need to make an</td>
</tr>
<tr>
<td></td>
<td>adjustment so that the length of the column data is a multiple of 8.</td>

<tr>
<td></td>
<td>- If the calculated record length exceeds 2,032 bytes, the variable length data in the</td>
</tr>
<tr>
<td></td>
<td>record might be compressed automatically. If so, use the estimation formulas in</td>
</tr>
<tr>
<td></td>
<td>“Table E.2 Estimation formula when the record length exceeds 2032 bytes” to estimate</td>
</tr>
<tr>
<td></td>
<td>the table size.</td>
</tr>
<tr>
<td>(2) Page size requirement</td>
<td>$8192 (+1) \times \text{fillfactor}(*2) - 24 (*3)$</td>
</tr>
<tr>
<td></td>
<td>*1: Page length (8192)</td>
</tr>
<tr>
<td></td>
<td>*2: Value of the fillfactor specified in the table definitions (if omitted, 100%)</td>
</tr>
<tr>
<td></td>
<td>*3: Page header (24)</td>
</tr>
<tr>
<td></td>
<td>- The calculated (2) page size requirement will be rounded down to the nearest integer.</td>
</tr>
<tr>
<td>(3) Number of records per page</td>
<td>$(2) \text{Page size requirement} / ((1) \text{record length} + 4 (*1))$</td>
</tr>
<tr>
<td></td>
<td>*1: Pointer length (4)</td>
</tr>
<tr>
<td></td>
<td>- The result will be rounded down to the nearest integer.</td>
</tr>
</tbody>
</table>
Table E.2 Estimation formula when the record length exceeds 2032 bytes

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5) Amount of space</td>
<td>Total number of records x (1) record length x safety factor (*1)</td>
</tr>
<tr>
<td></td>
<td>*1: Specify 2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>- This is the safety factor assumed if vacuuming is performed for garbage collection in tables and indexes.</td>
</tr>
</tbody>
</table>

E.2 Estimating Index Size Requirements

This section provides the formulas for estimating index size requirements.

FUJITSU Enterprise Postgres provides six index types: B-tree, Hash, GiST, GIN, SP-GiST, and VCI. If you do not specify the index type in the CREATE INDEX statement, a B-tree index is generated.

The following describes how to estimate a B-tree index. Refer to "E.7 Estimating VCI Disk Space Requirements" for information on how to estimate VCI.

A B-tree index is saved as a fixed-size page of 8 KB. The page types are meta, root, leaf, internal, deleted, and empty. Since leaf pages usually account for the highest proportion of space required, you need to calculate the requirements for these only.

Table E.3 Estimation formula when the key data length is 512 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Entry length</td>
<td>8 (*1) + key data length (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: Entry header</td>
</tr>
<tr>
<td></td>
<td>*2: The key data length depends on its data type (refer to &quot;E.3 Sizes of Data Types&quot; for details).</td>
</tr>
<tr>
<td></td>
<td>Because each entry is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the key data is a multiple of 8. For example, if the calculated length is 28 bytes, add 4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- If the key data length exceeds 512 bytes, key data may be automatically compressed. In this case, use the estimation formula given in &quot;Table E.4 Estimation formula when the key data length exceeds 512 bytes&quot; to estimate the key data length.</td>
</tr>
<tr>
<td>(2) Page size requirement</td>
<td>8192 (*1) × fillfactor (*2) - 24 (*3) - 16 (*4)</td>
</tr>
<tr>
<td></td>
<td>*1: Page length (8192)</td>
</tr>
<tr>
<td></td>
<td>*2: Value of the fillfactor specified in the index definitions (if omitted, 90%)</td>
</tr>
<tr>
<td></td>
<td>In the case of indexes of primary key constraints and unique constraints, the value of the fillfactor specified for each constraint in the table definitions (if omitted, 90%)</td>
</tr>
<tr>
<td></td>
<td>*3: Page header (24)</td>
</tr>
<tr>
<td></td>
<td>*4: Special data (16)</td>
</tr>
</tbody>
</table>
### Table E.4 Estimation formula when the key data length exceeds 512 bytes

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5) Space requirement</td>
<td>Total number of records x key data length x compression ratio (*1) / usage rate (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: The compression ratio depends on the data value, so specify 1.</td>
</tr>
<tr>
<td></td>
<td>*2: Specify 0.7 or lower as the usage rate.</td>
</tr>
</tbody>
</table>

### E.3 Sizes of Data Types

This section lists the sizes of the data types.

#### E.3.1 Sizes of Fixed-Length Data Types

The following table lists the sizes of fixed-length data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMALLINT (INT2)</td>
<td>2</td>
</tr>
<tr>
<td>INTEGER (INT4)</td>
<td>4</td>
</tr>
<tr>
<td>BIGINT (INT8)</td>
<td>8</td>
</tr>
<tr>
<td>REAL</td>
<td>4</td>
</tr>
<tr>
<td>DOUBLE PRECISION</td>
<td>8</td>
</tr>
<tr>
<td>SERIAL (SERIAL4)</td>
<td>4</td>
</tr>
<tr>
<td>BIGSERIAL (SERIAL8)</td>
<td>8</td>
</tr>
<tr>
<td>MONEY</td>
<td>8</td>
</tr>
<tr>
<td>FLOAT</td>
<td>8</td>
</tr>
<tr>
<td>FLOAT (1-24)</td>
<td>4</td>
</tr>
<tr>
<td>FLOAT (25-53)</td>
<td>8</td>
</tr>
<tr>
<td>TIMESTAM...</td>
<td>8</td>
</tr>
<tr>
<td>TIMESTAM...</td>
<td>8</td>
</tr>
<tr>
<td>DATE</td>
<td>4</td>
</tr>
<tr>
<td>TIME WITHOUT TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>TIME WITH TIME ZONE</td>
<td>12</td>
</tr>
</tbody>
</table>
### E.3.2 Sizes of Variable-Length Data Types

The following table lists the sizes of variable-length data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Length of size portion + 12 + 16 x number of vertices</td>
<td>1) When carrying out division, round to the next integer.</td>
</tr>
<tr>
<td>polygon</td>
<td>Length of size portion + 36 + 16 x number of vertices</td>
<td>2) If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes.</td>
</tr>
<tr>
<td>decimal</td>
<td>Length of size portion + 2 + (integer precision / 4 + decimal precision / 4) x 2</td>
<td>3) The number of bytes per character depends on the character set (refer to &quot;E.3.4 Number of Bytes per Character&quot; for details).</td>
</tr>
<tr>
<td>bytea</td>
<td>Length of size portion + real data length</td>
<td></td>
</tr>
<tr>
<td>character varying(n),</td>
<td>Length of size portion + number of characters x number of bytes per character</td>
<td></td>
</tr>
<tr>
<td>varchar(n)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>character(n), char(n)</td>
<td>Length of size portion + n x number of bytes per character</td>
<td></td>
</tr>
<tr>
<td>text</td>
<td>Length of size portion + number of characters x number of bytes per character</td>
<td></td>
</tr>
</tbody>
</table>

**Example of estimation when array data is "ARRAY[[1,2,3],[1,2,3]]"**

- Number of dimensions: 2
- INTEGER data size: 4
- Total size = 1 + 12 + 8 x 2 + 6 x 4 = 53

### E.3.3 Sizes of Array Data Types

The following table lists the sizes of array data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Length of size portion + 12 + 8 x number of dimensions + data size of each item</td>
<td>If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Example of estimation when array data is &quot;ARRAY[[1,2,3],[1,2,3]]&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Number of dimensions: 2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>INTEGER data size: 4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Total size = 1 + 12 + 8 x 2 + 6 x 4 = 53</td>
</tr>
</tbody>
</table>
E.3.4 Number of Bytes per Character

The following table lists the number of bytes per character.
The given values relate to the common character sets EUC-JP and UTF8.

<table>
<thead>
<tr>
<th>Character type</th>
<th>Character set</th>
<th>Number of bytes per character</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>
<td>EUC_JP</td>
<td>1</td>
</tr>
<tr>
<td>Halfwidth katakana</td>
<td>EUC_JP</td>
<td>2</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>EUC_JP</td>
<td>2</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>EUC_JP</td>
<td>3</td>
</tr>
<tr>
<td>ASCII</td>
<td>UTF8</td>
<td>1</td>
</tr>
<tr>
<td>Halfwidth katakana</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
</tbody>
</table>

E.4 Estimating Transaction Log Space Requirements

This section provides the formula for estimating transaction log space requirements.

\[
\text{Transaction log space requirements} = \text{max_wal_size}
\]

However, if the update volume is extremely high (for example, due to a large data load and batch processing), disk writing at a checkpoint may not be able to keep up with the load, and a higher number of transaction logs than indicated here may temporarily be accumulated.

E.5 Estimating Archive Log Space Requirements

This section explains how to estimate archive log space requirements.
The archive log is an archive of the transaction logs from the time of a previous backup to the present, so it fluctuates depending on the backup period and the content of update transactions.
The longer the backup period and the more update transactions, the greater the space required for the archive log.
Therefore, measure the actual archive log space by using a test environment to simulate backup scheduling and database update in a real operating environment.

E.6 Estimating Backup Disk Space Requirements

This section provides the formula for estimating backup disk space requirements.

\[
\text{Backup disk space requirements} = \text{size of the database cluster} \times 2 + \text{transaction log space requirements} + \text{archive log space requirements}
\]

Note

If the pgx_dmpall command performs a backup using a user exit, the backup disk size differs according to the database resources targeted for backup and the copy method.

E.7 Estimating VCI Disk Space Requirements

This section provides the formula for estimating VCI disk space requirements.

\[
\text{Disk space} = (\text{number of rows in tables}) \times (\text{number of bytes per row}) \times (\text{compression ratio}) + \text{(WOS size)}
\]
Number of bytes per row

\[
\text{Number of bytes per row} = \left( 19 + \frac{\text{number of columns specified in CREATE INDEX}}{8} + \frac{\text{number of bytes per single column value}}{8} \right) \times 1.1
\]

Note: Round up the result to the nearest integer.

Compression ratio

Specify a value between 0 and 1. Since compression ratio depends on the data being compressed, use actual data or test data that simulates it, then compare the value with the estimation result. As a guide, the compression ratio measured with the Fujitsu sample data is shown below:

- Data with high degree of randomness (difficult to compress): Up to approximately 0.9 times.
- Data with high degree of similarity (easy to compress): Up to approximately 0.5 times.

WOS size

\[
\text{WOS size} = \frac{\text{number of WOS rows}}{185} \times 8096
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Note

VCI does not support retrieval of disk space usage using the database object size function `pg_indexes_size`. To find out the actual total VCI disk space, check the disk space of the storage directory using an OS command or other method.
Appendix F  Estimating Memory Requirements

This appendix explains how to estimate the memory.

F.1  FUJITSU Enterprise Postgres Memory Requirements

This section describes the formulas for estimating FUJITSU Enterprise Postgres memory requirements.

Use the following formula to obtain a rough estimate of memory required for FUJITSU Enterprise Postgres:

\[
\text{fujitsuEnterprisePostgresRequiredMemory} = \text{sharedMemoryAmount} + \text{localMemoryAmount}
\]

Shared memory amount

Refer to “Shared Memory and Semaphores” under "Server Administration" in the PostgreSQL Documentation for information on shared memory. If you enable the Global Meta Cache feature, you must also add the value of pgx_global_metacache. Refer to "Parameters" in the Operation Guide for the setting values.

However, note that if instances have been created using WebAdmin, the parameters below will be configured automatically when the instances are created. Take this into account when calculating the shared memory size.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30 percent of the internal memory of the machine.</td>
</tr>
<tr>
<td>max_connections</td>
<td>100</td>
</tr>
<tr>
<td>max_prepared_transactions</td>
<td>100</td>
</tr>
</tbody>
</table>

Local memory amount

\[
\text{localMemoryAmount} = \text{processStackArea} + \text{memoryUsedInDbSessionsThatUseTempTables} + \text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} + \text{memoryUsedInMaintenanceOperations} + \text{baseMemoryUsedInEachProcess} + \text{memoryUsedPreparingForDataAccess}
\]

Process stack area

\[
\text{processStackArea} = \text{max_stack_depth} \times (\text{max_connections} + \text{autovacuum_max_workers} + 9)
\]

This formula evaluates to the maximum value.
Actually it is used according to the growth of the stack.
In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used in database sessions that use temporary tables

\[
\text{memoryUsedInDbSessionsThatUseTempTables} = \text{temp_buffers} \times \text{max_connections}
\]

This formula evaluates to the maximum value.
Memory is gradually used as temporary buffers are used, and is released when the session ends.

Memory used in database sessions that perform sort and hash table operations

\[
\text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} = \text{work_mem} \times \text{max_connections}
\]

This formula evaluates to the maximum value.
Memory is gradually used as operations such as sort are performed, and is released when the query ends.
Memory used in maintenance operations

\[
\text{memoryUsedInMaintenanceOperations} = \text{maintenance_work_mem} \times (\text{numOfSessionsPerformingMaintenance} + \text{autovacuum_max_workers})
\]

Note that 'maintenance operations' are operations such as VACUUM, CREATE INDEX, and ALTER TABLE ADD FOREIGN KEY.

Base memory used in each process

\[
\text{baseMemoryUsedInEachProcess} = \text{baseMemoryUsedInOneProcess} \times (\text{max_connections} + \text{autovacuum_max_workers} + 9)
\]

Use the result of the following formula for memory consumed per process. This formula evaluates to the memory used when server processes are running.

In the formula above, 9 is the number of processes that perform roles specific to servers.

The amount of memory consumed per process is determined by the number of tables, indexes, and all columns of all tables that the process accesses. If your system has about 100 tables, you can estimate it to be 3 MB, but otherwise use the following estimate:

\[
\text{baseMemoryUsedInOneProcess} = (1.9\text{KB} \times \text{All user tables} + 2.9\text{KB} \times \text{All user indexes} + 1.0\text{KB} \times \text{All user columns}) \times 1.5(*1)
\]

If you enable the Global Meta Cache feature, use the following formula:

\[
\text{baseMemoryUsedInOneProcess} = (\text{All user tables} + \text{All user indexes} + \text{All user columns}) \times 1.0\text{KB} \times 1.5 (*1) + (\text{All user tables} \times 1.4\text{KB} + \text{All user indexes} \times 2.4\text{KB})
\]

(*1) Safety Factor (1.5)

There are variable length information. This value takes that into account.

Memory used preparing for data access

\[
\text{memoryUsedPreparingForDataAccess} = \text{variationAmount} \times (\text{max_connections} + \text{autovacuum_max_workers} + 4)
\]

where \(\text{variationAmount} = \frac{\text{shared_buffers}}{8\text{KB}} \times 4\text{ bytes}\)

(note that 8KB is the page length, and 4 bytes is the size of page management data)

This formula evaluates to the memory required to access the database cache in the shared memory.

In the formula above, among the processes that perform roles specific to servers, 4 is the number of processes that access the database.

F.2 Database Multiplexing Memory Requirements

This section describes the formula for estimating database multiplexing memory requirements for the database server.

Use the following formula to obtain a rough estimate of memory required for database multiplexing:

\[
\text{Memory usage of the database multiplexing feature for the database server} = \text{Peak memory usage of the Mirroring Controller processes} + \text{Peak memory usage of the Mirroring Controller commands}
\]

Peak memory usage of the Mirroring Controller processes=150 MB

Peak memory usage of the Mirroring Controller commands=50 MB \times \text{Number of commands executed simultaneously}

F.3 VCI Memory Requirements

This section describes the formula for estimating VCI memory requirements.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{memUsedByVci} = \text{memForData} + \text{memForEachProcess}
\]
Memory required to store data in memory

Secure the space estimated using the formula below on the stable buffer (part of shared_buffers).

\[ \text{memForData} = \left(\text{numOfRowsInTables} \times \text{numOfBytesPerRow}\right) + \text{wosSize} \]

Number of bytes per row

\[ \text{numOfBytesPerRow} = \left(19 + \left(\frac{\text{numOfColsInCreateIndexStatement}}{8}\right) + \text{numOfBytesPerSingleColValue}\right) \times 1.1 \]

Note: Round up the result to the nearest integer.

WOS size

\[ \text{wosSize} = \left(\frac{\text{numOfWosRows}}{185}\right) \times 8096 \]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Memory required for each process

\[ \text{memForEachProcess} = \text{memUsedPerScanning} + \text{memUsedForVciMaintenace} + \text{memUsedByCreateIndexStatement} \]

Memory used per scanning

- Parallel scan

\[ \text{memUsedPerScanning} = \text{vci.shared_work_mem} + \left(\text{numOfParallelWorkers} + 1\right) \times \text{vci.maintenance_work_mem} \]

Note: The number of parallel workers used by VCI simultaneously in the entire instance is equal to or less than vci.max_parallel_degree.

- Non-parallel scan

\[ \text{memUsedPerScanning} = \text{vci.max_local_ros} + \text{vci.maintenance_work_mem} \]

Note

- vci.shared_work_mem, and vci.max_local_ros are used to create local ROS. If local ROS exceeds these sizes, execute a query without using VCI according to the conventional plan.
- vci.maintenance_work_mem specifies the memory size to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.

Memory used for VCI maintenance

\[ \text{memUsedForVciMaintenace} = \text{vci.maintenance_work_mem} \times \text{vci.control_max_workers} \]

Memory used by CREATE INDEX

\[ \text{memUsedByCreateIndexStatement} = \text{vci.maintenance_work_mem} \]
Note

vci.maintenance_work_mem specifies the memory to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.

F.4 High-Speed Data Load Memory Requirements

This section describes the formula for estimating memory requirements for the high-speed data load feature.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{Memory usage of high speed data load} = \left( \text{Peak memory usage of pgx_loader processes} + \text{Peak memory usage of the pgx_loader commands} \right) \\
\times \text{Number of commands executed simultaneously}
\]

Peak memory usage of pgx_loader processes

\[
\begin{align*}
&= \text{Peak memory usage of the backend process} \quad (6 \text{ MB}) \\
&\quad + \text{Peak memory usage of parallel workers} \quad (6 \text{ MB} \times \text{number of parallel workers}) \\
&\quad + \text{Peak memory usage of dynamic shared memory} \quad (80 \text{ MB} \times \text{number of parallel workers})
\end{align*}
\]

Peak memory usage of the pgx_loader commands = 9 MB

Point

In addition to the size calculated using the formula above, the database cache on the shared memory estimated using the shared_buffers parameter is consumed according to the size of the data (table and index keys) loaded using this feature. Refer to “E.1 Estimating Table Size Requirements” and “E.2 Estimating Index Size Requirements” for information on estimating an appropriate shared buffers value.

F.5 Global Meta Cache Memory Requirements

This section describes the formula for estimating Global Meta Cache memory requirements.

The memory calculated by “Size of the GMC area” is allocated to the shared memory. The memory calculated by the per-process meta cache management information is allocated to the local memory. Refer to the graphic in “Architecture of Global Meta Cache Feature” in the “Memory usage reduction by Global Meta Cache” in the General Description for more information.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{Amount of memory used by the Global Meta Cache feature} = \text{Size of GMC area} + \text{Per-process meta cache management information}
\]

Size of GMC area = (All user tables x 0.4 KB  \\
+ All user indexes x 0.3 KB  \\
+ All user columns x 0.8 KB) x 1.5 (*1)

Per-process meta cache management information = (All user tables + All user indexes + All user columns) x 0.1 KB x max_connections x 1.5 (*1)

*1) Safety Factor (1.5)

This value takes into account the case where both GMC before and after the change temporarily exist at the same time in shared memory when the table definition is changed or the row of the system catalog is changed.
Appendix G Quantitative Limits

This appendix lists the quantitative limits of FUJITSU Enterprise Postgres.

Table G.1 Length of identifier

</tr>
<tr>
<td>Number of index access methods</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
</tbody>
</table>

*1: The total number of all database objects must be less than 4,294,967,296.

### Table G.3 Schema element

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns that can be defined in one table</td>
<td>From 250 to 1600 (according to the data type)</td>
</tr>
<tr>
<td>Table row length</td>
<td>Up to 400 gigabytes</td>
</tr>
<tr>
<td>Number of columns comprising a unique constraint</td>
<td>Up to 32 columns</td>
</tr>
<tr>
<td>Data length comprising a unique constraint</td>
<td>Less than 2,000 bytes (*1) (*2)</td>
</tr>
</tbody>
</table>

- 72 -
### Table G.4 Index

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table size</td>
<td>Up to 32 terabyte</td>
</tr>
<tr>
<td>Search condition character string length in a trigger definition statement</td>
<td>Up to 800 megabytes (*1) (*2)</td>
</tr>
<tr>
<td>Item size</td>
<td>Up to 1 gigabyte</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.

*2: This is the character string byte length when converted by the server character set character code.

### Table G.5 Data types and attributes that can be handled

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td>Data length</td>
</tr>
<tr>
<td></td>
<td>Specification length (n)</td>
</tr>
<tr>
<td>Numeric</td>
<td>External decimal expression</td>
</tr>
<tr>
<td>Internal binary expression</td>
<td>2 bytes</td>
</tr>
<tr>
<td></td>
<td>4 bytes</td>
</tr>
<tr>
<td></td>
<td>8 bytes</td>
</tr>
<tr>
<td>Internal decimal expression</td>
<td>Up to 13,1072 digits before the decimal point, and up to 16,383 digits after the decimal point</td>
</tr>
<tr>
<td>Floating point expression</td>
<td>4 bytes</td>
</tr>
<tr>
<td></td>
<td>8 bytes</td>
</tr>
<tr>
<td>bytea</td>
<td>Up to one gigabyte minus 53 bytes</td>
</tr>
<tr>
<td>Large object</td>
<td>Up to 4 terabyte</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

### Table G.6 Function definition

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of arguments that can be specified</td>
<td>Up to 100</td>
</tr>
<tr>
<td>Number of variable names that can be specified in the declarations section</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of SQL statements or control statements that can be specified in a function processing implementation</td>
<td>No limit</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>---------------------------------------------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>Maximum number of connections for one process in an application</td>
<td>4,000 connections</td>
</tr>
<tr>
<td>(remote access)</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in a selection list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of tables that can be specified in a FROM clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of unique expressions that can be specified in a selection</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>list/DISTINCT clause/ORDER BY clause/GROUP BY clause within one</td>
<td></td>
</tr>
<tr>
<td>SELECT statement</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in a GROUP BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an ORDER BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of SELECT statements that can be specified in a UNION clause</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>INTERSECT clause/EXCEPT clause</td>
<td></td>
</tr>
<tr>
<td>Number of nestings in joined tables that can be specified in one</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>expression</td>
<td></td>
</tr>
<tr>
<td>Number of functions or operator expressions that can be specified in</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>one expression</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row constructor</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an UPDATE statement</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>SET clause</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row of a VALUES</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>list</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in a RETURNING clause</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Total expression length that can be specified in the argument list</td>
<td>Up to 800 megabytes (*2)</td>
</tr>
<tr>
<td>of one function specification</td>
<td></td>
</tr>
<tr>
<td>Number of cursors that can be processed simultaneously by one</td>
<td>No limit</td>
</tr>
<tr>
<td>session</td>
<td></td>
</tr>
<tr>
<td>Character string length of one SQL statement</td>
<td>Up to 800 megabytes (*1) (*3)</td>
</tr>
<tr>
<td>Number of input parameter specifications that can be specified in</td>
<td>No limit</td>
</tr>
<tr>
<td>one dynamic SQL statement</td>
<td></td>
</tr>
<tr>
<td>Number of tokens that can be specified in one SQL statement</td>
<td>Up to 10,000</td>
</tr>
<tr>
<td>Number of values that can be specified as a list in a WHERE clause</td>
<td>No limit</td>
</tr>
<tr>
<td>IN syntax</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in a USING clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of JOINs that can be specified in a joined table</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of expressions that can be specified in COALESCE</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of WHEN clauses that can be specified for CASE in a simple</td>
<td>No limit</td>
</tr>
<tr>
<td>format or a searched format</td>
<td></td>
</tr>
<tr>
<td>Data size per record that can be updated or inserted by one SQL</td>
<td>Up to one gigabyte minus 53</td>
</tr>
<tr>
<td>statement</td>
<td>bytes</td>
</tr>
<tr>
<td>Number of objects that can share a lock simultaneously</td>
<td>Up to 256,000 (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.

*2: The total number of all database objects must be less than 4,294,967,296.

*3: This is the character string byte length when converted by the server character set character code.
<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data size per record for input data files (COPY statement, psql command \copy meta command)</td>
<td>Up to 800 megabytes (*1)</td>
</tr>
<tr>
<td>Data size per record for output data files (COPY statement, psql command \copy meta command)</td>
<td>Up to 800 megabytes (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.
Appendix H Configuring Kernel Parameters

Use the "System V IPC Parameters" table in "Managing Kernel Resources" in the PostgreSQL Documentation for the relationship between configuration parameters and kernel parameters, as well as calculation formulas.

Refer to the "Managing Kernel Resources" in the PostgreSQL Documentation to calculate shared memory usage.

For multiple instances, the kernel parameters should be evaluated for all instances. For example, in the case of the maximum number of shared memory segments for the entire system (SHMMNI), the total number of segments obtained by all instances should be added to the kernel parameters. In the case of the maximum number of semaphores for each process (SEMMSL), the largest of all sizes obtained by all instances should be compared to the current value prior to configuring the settings.

Note

If there is insufficient shared memory due to miscalculation of SHMMAX, a message will be output indicating that the shmget system call failed at "errno=22 (EINVAL)". Review the calculation, and reconfigure.

The relationship between System V IPC parameters and kernel parameters in various operating systems is shown below.

<table>
<thead>
<tr>
<th>System</th>
<th>V IPC parameter</th>
<th>Kernel parameter action</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHMMAX</td>
<td>kernel.shmmax</td>
<td>If current\textit{Value} &lt; calculated\textit{Value}, configure the calculated value</td>
</tr>
<tr>
<td>SHMMIN</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMALL</td>
<td>kernel.shmall</td>
<td>Specify current\textit{Value} + calculated\textit{Value}</td>
</tr>
<tr>
<td>SHMSEG</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMMNI</td>
<td>kernel.shmmni</td>
<td>Specify current\textit{Value} + calculated\textit{Value}</td>
</tr>
<tr>
<td>SEMMNI</td>
<td>Fourth parameter of kernel.sem</td>
<td>Specify current\textit{Value} + calculated\textit{Value}</td>
</tr>
<tr>
<td>SEMMNS</td>
<td>Second parameter of kernel.sem</td>
<td>Specify current\textit{Value} + calculated\textit{Value}</td>
</tr>
<tr>
<td>SEMMSL</td>
<td>First parameter of kernel.sem</td>
<td>If current\textit{Value} &lt; calculated\textit{Value}, configure the calculated value</td>
</tr>
<tr>
<td>SEMMAP</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SEMVMX</td>
<td>No compatible parameter</td>
<td></td>
</tr>
</tbody>
</table>

Remark 1: kernel.shmall specifies the number of pages.
Remark 2: Specify all four parameters for kernel.sem. At this time, the value specified in the third parameter should be the same value as before configuration.
Appendix I  Determining the Preferred WebAdmin Configuration

This appendix describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration.

I.1  WebAdmin Configurations

WebAdmin can be installed in two configurations:
- Single-server
- Multiserver

WebAdmin does not support encrypted communication between browser and server or between servers. Therefore, when using WebAdmin in either configuration, build the communication path with the browser or each server on a network that cannot be accessed externally.

I.1.1  Single-Server Configuration

A single-server configuration enables you to create and operate instances on a single server. In this configuration, WebAdmin must be installed on the same database server as the FUJITSU Enterprise Postgres Server component.

Single-server configuration

I.1.2  Multiserver Configuration

A multiserver configuration enables you to create and operate instances stored on multiple database servers. As shown in the figure below, WebAdmin can be installed on a dedicated WebAdmin server and used to collectively manage the instances stored on the database servers.

Multiserver configuration
Also, when setting up the arbitration server by WebAdmin during database multiplexing mode, install WebAdmin on the arbitration server.

I.2 Installing WebAdmin in a Single-Server Configuration

To install WebAdmin in a single-server configuration, the FUJITSU Enterprise Postgres Server component and WebAdmin must be installed on the same machine.
Select the following items when installing FUJITSU Enterprise Postgres in a single-server configuration:

- FUJITSU Enterprise Postgres Advanced Edition or FUJITSU Enterprise Postgres Standard Edition
- WebAdmin

I.3 Installing WebAdmin in a Multiserver Configuration

In a multiserver configuration, install WebAdmin on one server, and both WebAdmin and the FUJITSU Enterprise Postgres Server component on any number of database servers.

Select the following items when installing FUJITSU Enterprise Postgres in a multiserver configuration:

- WebAdmin server:
  - WebAdmin
- Database server:
  - FUJITSU Enterprise Postgres Advanced Edition or FUJITSU Enterprise Postgres Standard Edition
  - WebAdmin

Also, when setting up the arbitration server by WebAdmin during database multiplexing mode, select the following when installing FUJITSU Enterprise Postgres.

- Arbitration server
  - FUJITSU Enterprise Postgres Server Assistant
  - WebAdmin

Refer to the Installation and Setup Guide for Server Assistant for details on how to install the Server Assistant.
Appendix J System Configuration when using Pgpool-II

Describes the system configuration when using Pgpool-II.

The system configuration when using Pgpool-II is as follows:

Place on database server

System configuration to coexist the database server with Pgpool-II.

Place on application server

System configuration to coexist the application server with Pgpool-II.

Place on dedicated server

System configuration in which Pgpool-II resides on a dedicated server (Pgpool-II Server) that is separate from the database and application servers.

Select the system configuration that best meets your operational requirements.

J.1 Pgpool-II Configuration

In this example, Pgpool-II is deployed on a different Pgpool-II server than the database and application servers.

There are three configurations of Pgpool-II:

- Single-machine configuration
- Two-machine configuration
- Three-machine configuration

Although the Pgpool-II server can be operated on a single machine, to ensure business continuity, it is recommended to operate the Pgpool-II server using a three-machine configuration in FUJITSU Enterprise Postgres.

If employing a configuration of three or more machines, use an odd number of machines in the configuration.

J.1.1 Single-Machine Configuration

This is the basic configuration when running Pgpool-II.

Although the database server has redundancy, if an error occurs on the Pgpool-II server that accesses the database server, the job will stop.
J.1.2 Two-Machine Configuration

When an error occurs on the active server, the Pgpool-II monitoring feature that mutually monitors the status of the Pgpool-II servers enables jobs to continue uninterrupted by switching to the standby server.

If the network between Pgpool-II servers is disconnected, even if the Pgpool-II servers are running correctly, which may lead to stoppage of jobs.

J.1.3 Three-Machine Configuration

The Pgpool-II monitoring feature enables a Pgpool-II server to monitor the other two Pgpool-II servers.

Even if any of the networks monitoring the Pgpool-II servers are disconnected, the status of servers on a network that is operating normally can be checked correctly, enabling accurate continuation of jobs.

J.2 Installing Pgpool-II

Pgpool-II is bundled with the server program and the client program. To use Pgpool-II, use the server program or the client program to install and set up Pgpool-II.

Depending on where Pgpool-II is installed, select the appropriate DVD for deployment:
Installing on Database Server (coexist)
Install the Pgpool-II program along with the server program from the server program DVD.

Installing on Application Server (coexist)
Install the Pgpool-II program along with the client program from the client program DVD.

Installing on Dedicated server different from the above (Pgpool-II server)
Install the Pgpool-II program along with the client program from the client program DVD.
Appendix K  Supported contrib Modules and Extensions Provided by External Projects

FUJITSU Enterprise Postgres supports PostgreSQL contrib modules, and extensions provided by external projects.

Refer to the following for details on the supported contrib modules:
- "Additional Supplied Modules” in the PostgreSQL Documentation
- "Additional Supplied Programs” in the PostgreSQL Documentation

Information

You can also check the list of available extensions using the pg_available_extensions view.

Refer to "OSS Supported by FUJITSU Enterprise Postgres” in the General Description for information on supported extensions provided by external projects.
This appendix describes the procedures to follow when modifying the Oracle JRE installation.

The Oracle JRE, of which the installation destination is specified in the JAVA_HOME environment variable when installing FUJITSU Enterprise Postgres, is used by features such as WebAdmin and database multiplexing.

Therefore, when updating or reinstalling Oracle JRE after installing FUJITSU Enterprise Postgres, the procedures below must be performed.

L.1 When Using WebAdmin

WebAdmin must be set up again.

Follow the procedure below to modify the Oracle JRE installation:

1. Stop the Web server feature of WebAdmin
   Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.

2. Remove WebAdmin
   Refer to "B.2 Removing WebAdmin" for details.

3. Modify the Oracle JRE installation

4. Set the JAVA_HOME environment variable
   Set the JAVA_HOME environment variable to the installation destination of Oracle JRE 8.
   Example
   
   ```
   # export JAVA_HOME=oracleJre8InstallDir
   ```

5. Set up WebAdmin
   Refer to "B.1.1 Setting Up WebAdmin" for details.

6. Start the Web server feature of WebAdmin
   Refer to "B.1.2 Starting the Web Server Feature of WebAdmin" for details.

L.2 When Performing Database Multiplexing

Mirroring Controller must be restarted.

Follow the procedure below to modify the Oracle JRE installation:

1. Stop Mirroring Controller
   Refer to the Cluster Operation Guide (Database Multiplexing) for details.

2. Modify the Oracle JRE installation

3. Change the installation environment to be used by Mirroring Controller
   Set the JAVA_HOME environment variable to the installation destination of Oracle JRE 8, and use the mc_update_jre_env command to change the installation environment to be used by Mirroring Controller.
   This procedure must be executed by the superuser.
   Example
   
   ```
   /opt/fsepv<server64/bin is the installation directory where the server product is installed.
   ```

```
$ su -
Password:******
```
4. Start Mirroring Controller

Refer to the Cluster Operation Guide (Database Multiplexing) for details.

- If database multiplexing is performed using WebAdmin, perform the procedure described in step 3 "Change the installation environment to be used by Mirroring Controller" after performing step 4 "Set the JAVA_HOME environment variable" in "L.1 When Using WebAdmin".

Installation and Setup Guide for Server (Windows)
Preface

Purpose of this document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Windows platform. This document describes how to install and set up "FUJITSU Enterprise Postgres".

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres. Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Windows

Structure of this document
This document is structured as follows:

Chapter 1 Overview of Installation
Describes the installation types and procedures

Chapter 2 Operating Environment
Describes the operating environment required to use FUJITSU Enterprise Postgres

Chapter 3 Installation
Describes how to perform a new installation of FUJITSU Enterprise Postgres

Chapter 4 Setup
Describes the setup to be performed after installation

Chapter 5 Uninstallation
Describes how to uninstall FUJITSU Enterprise Postgres

Appendix A Recommended WebAdmin Environments
Describes the recommended WebAdmin environment

Appendix B Setting Up and Removing WebAdmin
Describes how to set up and remove WebAdmin

Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters
Describes characters that are not allowed in WebAdmin.

Appendix D Configuring Parameters
Describes FUJITSU Enterprise Postgres parameters

Appendix E Estimating Database Disk Space Requirements
Describes how to estimate database disk space requirements

Appendix F Estimating Memory Requirements
Describes the formulas for estimating memory requirements

Appendix G Quantitative Limits
Describes the quantity range

Appendix H Determining the Preferred WebAdmin Configuration
Describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration
Appendix I Supported contrib Modules and Extensions Provided by External Projects

Lists the PostgreSQL contrib modules and the extensions provided by external projects supported by FUJITSU Enterprise Postgres.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that can be Installed

Each FUJITSU Enterprise Postgres feature is installed on the machine that was used to build the database environment. The following table shows the relationship between the product to be installed and the features that can be installed.

<table>
<thead>
<tr>
<th>Feature that can be installed</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic feature (server feature, client feature)</td>
<td>AE</td>
</tr>
</tbody>
</table>

Y: Can be installed

1.2 Installation Types

The following installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, FUJITSU Enterprise Postgres is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

FUJITSU Enterprise Postgres products can be installed on the same server if the product version (indicated by "x" in "x SPz") is different from that of any version of the product that is already installed.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.

Note

If you have antivirus software installed, the server may crash, fail to start, or stop responding, during installation or when starting up after installation. Set scan exception settings for the installation directory and resource allocation directory so that the files in these directories are not scanned for viruses.
1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In the interactive mode installation, the installation state of FUJITSU Enterprise Postgres is determined automatically. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
- Multi-version installation

1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres.
Chapter 2 Operating Environment

This chapter describes the operating environment required to use FUJITSU Enterprise Postgres.

Refer to “Operating Environment” in the Installation and Setup Guide for Client when installing the FUJITSU Enterprise Postgres client feature at the same time.

2.1 Required Operating System

One of the operating systems shown below is required in order to use FUJITSU Enterprise Postgres.

Table 2.1 Operating systems

<table>
<thead>
<tr>
<th>Operating system name</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 Datacenter</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 Standard</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 Essentials</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 Foundation</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 R2 Datacenter</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 R2 Standard</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 R2 Essentials</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2012 R2 Foundation</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2016 Datacenter</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2016 Standard</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2016 Essentials</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2019 Datacenter</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2019 Standard</td>
</tr>
<tr>
<td>- Microsoft(R) Windows Server(R) 2019 Essentials</td>
</tr>
</tbody>
</table>

Note

- The following components of Windows Server(R) 2016 and Windows Server(R) 2019 are not supported:
  - Server Core
  - Nano Server
  - Windows Server Container
- The TCP/IP protocol must be installed.

2.2 Related Software

The following table lists the software required to use FUJITSU Enterprise Postgres.
Table 2.2 Related software

<table>
<thead>
<tr>
<th>No.</th>
<th>Software name</th>
<th>Version</th>
<th>Product name of FUJITSU Enterprise Postgres</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

</tr>
</tbody>
</table>

Y: Can be used

Note
- The following programs are installed during installation of FUJITSU Enterprise Postgres:

Do not uninstall the above programs as they are required for running FUJITSU Enterprise Postgres.

The following table lists servers that can be connected to the FUJITSU Enterprise Postgres client feature.

Table 2.3 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td></td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Linux</td>
<td></td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

2.3 Excluded Software

This section describes excluded software.

FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres cannot be installed if all the following conditions are met:
- The product version (indicated by "x" in "x SPz") of the product to be installed is the same as that of the installed product
- The editions are different

Example
In the following cases, FUJITSU Enterprise Postgres cannot be installed as an exclusive product:
- The installed product is FUJITSU Software Enterprise Postgres Standard Edition (64bit) 13
- The product to be installed is FUJITSU Software Enterprise Postgres Advanced Edition (64bit) 13
Other products

There are no exclusive products.

2.4 Required Patches

There are no required patches.

2.5 Hardware Environment

The following hardware is required to use FUJITSU Enterprise Postgres.

Memory

256 MB or more is recommended (at least 128 MB is required).

2.6 Disk Space Required for Installation

The following table shows the disk space requirements for new installation of FUJITSU Enterprise Postgres. If necessary, increase the size of the file system.

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space (Unit: MB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows system drive</td>
<td>7 + 113 (*1) + 18 (*2)</td>
</tr>
<tr>
<td>Installation destination of the Server</td>
<td>620</td>
</tr>
<tr>
<td>Installation destination of the WebAdmin</td>
<td>610</td>
</tr>
<tr>
<td>Installation destination of the Client (32bit)</td>
<td>470</td>
</tr>
<tr>
<td>Installation destination of the Client (64 bit)</td>
<td>490</td>
</tr>
</tbody>
</table>

*1: Required for the installation of the Uninstall (middleware) tool.
*2: Required for the installation of FJQSS.

2.7 Supported System Environment

This section describes the supported system environment.

2.7.1 TCP/IP Protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

2.7.2 File System

You can install FUJITSU Enterprise Postgres only if the system folder is an NTFS volume.

2.8 PostgreSQL Version Used for FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres is based on PostgreSQL 13.1.
2.9 Notes on Using Streaming Replication

To use streaming replication, build the primary server and all standby servers using the same FUJITSU Enterprise Postgres version (*1).

*1: The product version is indicated by "x" in the notation "x SPz".

Note

Streaming replication cannot be used in combination with Open Source PostgreSQL.
Chapter 3 Installation

This chapter describes the procedures for the installation of FUJITSU Enterprise Postgres.

Note

- The installation must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).
- Stop all applications before starting the installation.
- The Windows Installer service must be running.
- The remote desktop service is installed in application server mode, it is necessary to switch to install mode by executing the command shown below before installation. Also, after the installation is completed, execute the command shown below to switch back to execute mode.

[Before the installation]

```
CHANGE USER /INSTALL
```

[After the installation]

```
CHANGE USER /EXECUTE
```

- When installing the Fujitsu Enterprise Postgres Client (32 bit), do not specify a destination folder under the environment ProgramFiles variable.
- The following window may be displayed when executing the installation program:

![After Installation]

After installation, please click Next.

If this window is displayed, perform the following operations:

1. Perform the installation steps until the [InstallShield Wizard Complete] window is displayed.
2. At the window shown above, click [Next].
3. The window shown below is displayed. Click [Finish].

![Finish Admin Install](image)

When the installation has ended (successfully or not), please click the Finish button or the Cancel button. DO NOT CLICK THE BUTTONS BEFORE INSTALLATION HAS ENDED!

- Information

- If a [User Account Control] dialog box is displayed at the start of the installation, click [Yes] to continue processing:
  - If [No] is clicked, permission to continue is denied and an [Error] dialog box will be displayed. To continue the installation, click [Retry] at the [Error] dialog box. To end the installation, click [Cancel].
- If installation is suspended or processing terminates abnormally, the [Program Compatibility Assistant] dialog box may be displayed. Click [This program installed correctly] and continue operation.

3.1 Pre-installation Tasks

Check the system environment below before installing FUJITSU Enterprise Postgres.

Check the disk space

Ensure that there is sufficient disk space to install FUJITSU Enterprise Postgres. Refer to "2.6 Disk Space Required for Installation" for information on the required disk space.

Check the installed products and determine the installation method

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)]. In the displayed window, check the installed products.

If FUJITSU Enterprise Postgres is already installed, determine which installation method to use:

- Reinstallation
- Multi-version installation

Remove applied updates

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.
Note

If a product is installed without removing applied updates, the following problems will occur:

- Performing reinstallation
  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

1. Display the applied updates

   Execute the following command to display the applied updates:

   ```
   C:\>uam showup
   ```

2. Remove the updates

   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.

   ```
   C:\>uam remove -i update-number
   ```

Determine the preferred WebAdmin configuration

Starting with FUJITSU Enterprise Postgres 9.5, WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

See

Refer to "Appendix H Determining the Preferred WebAdmin Configuration" for details.

3.2 Installation in Interactive Mode

The installation must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).

Note

When reinstalling the product, back up the following folder in which the WebAdmin instance management information is stored:

`webAdminInstallFolder\data\fepwa`

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following folder:

   `webAdminInstallFolder\data\fepwa`

Replace the above folder with the backed up folder when the reinstallation is complete.

Point

For installation in interactive mode, default values are set for the installation information. The following settings can be changed for a new installation or a multi-version installation:
- Installation destination
  - It is necessary to specify a local disk as the installation destination of FUJITSU Enterprise Postgres.
  - If using WebAdmin, do not use fullwidth characters or halfwidth katakana characters in [Installation destination folder].
- WebAdmin setup information, if WebAdmin is selected
  To change the port number, confirm that it is an unused port number between 1024 and 49151. Additionally, take note of the Web server port number for the Windows Firewall settings.

The installation procedure is described below.

1. **Stop applications and programs**

   When reinstalling the product, all applications and programs that use the product must be stopped.

   Before starting the installation, stop the following:
   - Applications that use the product
   - Instance
   - Web server feature of WebAdmin
     If you are using WebAdmin, stop WebAdmin.
     Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
   - Mirroring Controller
     Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

     **Example**

     ```
     > mc_ctl stop -M D:\mcdir\inst1
     ```
   - pgAdmin

2. **Inserting the DVD**

   Insert the FUJITSU Enterprise Postgres DVD into the drive.

3. **Run the installation**

   The installation menu will be displayed. Click [Installation].

   **Note**

   If the Autorun feature of Windows is disabled, or a remote desktop service (terminal service) is used, the installation program is not automatically started. Execute the following file using [Run] or Windows Explorer.

   Z:\autorun.exe

   Z: The drive into which the DVD is inserted.

4. **Select the products to install**

   The [Installation product] window will be displayed.

   Select the products to install, and then click [Next].

   If a selected product can only be reinstalled, refer to "6. Check the settings".
Information

- To develop or execute a 32-bit application in a 64-bit environment, FUJITSU Enterprise Postgres Client (32bit) is required.

- The FUJITSU Enterprise Postgres server component and WebAdmin can be installed on the same machine by selecting the "FUJITSU Enterprise Postgres server component" and the "WebAdmin component".

- If the selected product has been installed, the [Select installation method] window is displayed for each product. To perform a multi-version installation, click [Next].

5. Checking the installation content

The [Confirm installation] window will be displayed.

Click [Next] to start the installation.

To modify the settings, select [Modify], and then click [Next]. Follow the on-screen instructions.

If you have not set up WebAdmin during installation, refer to "Appendix B Setting Up and Removing WebAdmin for details.

Note

If using WebAdmin for operation, make a note of the Web server port number displayed in the settings, for use in the Windows firewall settings.

6. Check the settings

The [Confirm installation] window is displayed for reinstallation, or if the installation information is modified.

Click [Install] to start the installation.

To change any settings, click [Back].

7. Completing installation

The [Installation complete] window is displayed. Click [Finish].

From [All Programs] or [All apps], click [Fujitsu] >> [Uninstall (middleware)]. If the installed product names have been added under [Software Name], installation is complete.

3.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:

- New installation
- Multi-version installation

See

Refer to the FUJITSU Enterprise Postgres product website for information on installation in silent mode, such as the installation parameters and error messages.

The installation procedure is described below.

1. Insert the DVD

Insert the "server program" DVD in the DVD drive.

The [Install Menu] window will be displayed automatically. Click [Finish].
2. Create an installation parameters CSV file

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

**Note**

If using WebAdmin for operation, make a note of the Web server port number displayed in the settings (the port number defined in WebPortNumber1), for use in the Windows firewall settings.

**Information**

The template for the installation parameters CSV file is "Z:\sample\sample.csv" (Z is the drive into which the DVD is inserted).

3. Start the command prompt

In Windows, right-click [Command Prompt] and then select [Run as administrator].

4. Run the installation

Execute the command below.

```
Z:\>silent.bat c:\temp\inspara.csv
```

Z: The drive into which the DVD is inserted.

Also in the example above, c:\temp\inspara.csv is the installation parameter CSV file name.

If the installer ends in an error, a message is output to the log file and return values are returned.
**Chapter 4 Setup**

This chapter describes the setup procedures to be performed after installation completes.

### 4.1 Operating Method Types and Selection

This section describes how to operate FUJITSU Enterprise Postgres.

There are two methods of managing FUJITSU Enterprise Postgres operations - select one that suits your purposes:

The Operation Guide describes the operating method using WebAdmin, and the equivalent operating method using the server commands.

**Simple operation management using a web-based GUI tool (WebAdmin)**

Suitable when using frequently used basic settings and operations for operation management.

This method allows you to perform simple daily tasks such as starting the system before beginning business, and stopping the system when business is over, using an intuitive operation.

**Usage method**

Usage is started by using WebAdmin to create the instance.

By using an external scheduler and the pgx_dmpall command, periodic backups can be performed, which can then be used in recovery using WebAdmin.

**Note**

Do not use a server command other than pgx_dmpall and pgx_keystore or a server application. Operation modes that use server commands and server applications cannot be used in conjunction with WebAdmin. If used, WebAdmin will not be able to manage the instances correctly.

In addition, to perform a backup by copy command from the pgx_dmpall command, select the operating method using the server commands.

Refer to Reference and the PostgreSQL Documentation for information on server commands and server applications.

**Advanced operation management using server commands**

When operating in a system that is automated by operation management middleware (Systemwalker Centric Manager, for example), this method allows you to use more detailed settings and operations and perform higher level operation management.

An overview of the operating method using the GUI, and its relationship with the operating method using the server commands, are shown below.

Refer to the Operation Guide for details.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>
<td>Creating an instance WebAdmin is used. The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically.</td>
<td>The configuration file is edited directly using the initdb command.</td>
</tr>
<tr>
<td></td>
<td>Creating a standby instance WebAdmin is used. WebAdmin performs a base backup of the source instance and creates a standby instance.</td>
<td>A standby instance is created using the pg_basebackup command.</td>
</tr>
<tr>
<td></td>
<td>Changing the configuration files WebAdmin is used.</td>
<td>The configuration file is edited directly.</td>
</tr>
</tbody>
</table>
### Operation

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting and stopping an instance</td>
<td>WebAdmin is used.</td>
<td>The net command or sc command of the operating system is used.</td>
</tr>
<tr>
<td>Creating a database</td>
<td>This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement.</td>
<td></td>
</tr>
<tr>
<td>Backing up the database</td>
<td>WebAdmin, or the pgx_dmpall command, is used.</td>
<td>It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed.</td>
</tr>
<tr>
<td>Database recovery</td>
<td>WebAdmin is used.</td>
<td>To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Monitoring</th>
<th>Database errors</th>
<th>The status in the WebAdmin window can be checked. <em>(1)</em></th>
<th>The messages that are output to the database server log are monitored <em>(1)</em></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Disk space</td>
<td>The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. <em>(1)</em></td>
<td>This is monitored using the fsutil command (check free space), and the dir command (check used space), of the operating system, for example. <em>(1)</em></td>
</tr>
<tr>
<td></td>
<td>Connection status</td>
<td>This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application.</td>
<td></td>
</tr>
</tbody>
</table>

*(1)*: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

---

**See**

Refer to "Periodic Operations" and "Actions when an Error Occurs" in the Operation Guide for information on monitoring and database recovery.

---

### 4.2 Preparations for Setup

This section describes the preparation required before setting up FUJITSU Enterprise Postgres.

#### 4.2.1 Creating an Instance Administrator

Decide the OS user account that will become the instance administrator. Use either a new user, or a user that already exists.

To create a user in Windows, select [Administrative Tools], [Computer Management], and then create the user in [Local Users and Groups]. Refer to "Help and Support" for details.

The following characters can be used for user names:

- - (hyphen)
- _ (underscore)
- Space
- A-Z, a-z, 0-9 (alphanumeric)
The following notes apply if using WebAdmin for operations:

- The instance administrator must have a local OS user account.
- After creating the user account of the instance administrator, log in to the operating system. A profile directory is created for the user when logging in to the operating system for the first time. This directory will be used by WebAdmin.
- If changing the password for the user account of the instance administrator, always ensure to stop the instance and log out of WebAdmin before making the change. If you mistakenly change the password while logged in to WebAdmin or while the instance is running, log out from WebAdmin, and then log in again, and stop and start the instance.
- If the password is changed for the user account of the instance administrator, set the changed password using ALTER ROLE WITH ENCRYPTED PASSWORD. This will encrypt the password with the default md5 algorithm. To encrypt the password with the scram-sha-256 algorithm, set the password encryption parameter to `scram-sha-256` using SET password_encryption = 'scram-sha-256' prior to using the ALTER ROLE function.

4.2.1.1 Security policy settings

If using commands for operation, security settings that allow logon as a service are required for the operating system user account of the instance administrator in order to start and stop an instance using a Windows service.

Information

If using WebAdmin for operation, these settings are not required as WebAdmin performs the settings automatically for the user ID (operating system user account) that logged in to the database server.

The following explains how to perform the security settings to allow logon as a service:

1. Displaying the Local Security Policy window
   In Windows, select [Administrative Tools], and then click [Local Security Policy].

2. Setting up security
   1. In the [Local Security Policy] window, select [Security Settings], select [Local Policies], and then click [User Rights Assignment].
   3. In the [Log on as a service Properties] window, set the following:
      b. On the [Local Security Setting] tab, click [Add User or Group].
      c. In the [Select Users or Groups] window, enter the operating system user account of the instance administrator in [Enter the object names to select].
      d. Click [OK].
   4. In the [Log on as a service Properties] window, click [OK].

4.2.2 Preparing Directories for Resource Deployment

Prepare the directories required when creating instances.

Considerations when deploying resources

The disk configuration on the resource deployment destination is important, because it affects not only recovery following disk corruption, but normal operation as well. The points for determining the disk configuration are as follows:

1. If the backup data storage destination and the data storage destination are both lost, it will not be possible to recover the data, so deploy them to separate disks.
2. To shorten the recovery time following a single disk fault, deploy the system disk and data storage destination to separate disks.

3. The backup data storage destination requires at least double the capacity of the data storage destination, so deploy it to the disk with the most space available.

4. When large amounts of data are updated, the write-to load for the data storage destination, transaction log storage destination, and backup data storage destination (mirrored transaction log) will also be great. For this reason, deploy them to separate disks, out of consideration for performance.

**Note**

- When using the volume manager provided by the operating system, be aware of which physical disk the file system has been created on, for example, by deploying the data storage destination and the backup data storage destination to separate disks.

- If using WebAdmin, specify an NTFS volume for the data storage destination and backup data storage destination. A network drive cannot be specified.

### Server resource of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Resource</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>The area where the database is stored. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster. Specify a space other than that under the database cluster.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Stores log information in preparation for a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
</tbody>
</table>

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.
### Resource and Role

<table>
<thead>
<tr>
<th>Resource</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archive log</td>
<td>Stores log information for recovery</td>
</tr>
<tr>
<td>Mirrored transaction log (mirrored WAL)</td>
<td>Enables a database cluster to be restored to the state immediately before an error even if both the database cluster and transaction log fail when performing backup/recovery operations using the pgx_dmpall command or WebAdmin.</td>
</tr>
<tr>
<td>Corefile</td>
<td>FUJITSU Enterprise Postgres process corefile output when an error occurs with a FUJITSU Enterprise Postgres process.</td>
</tr>
</tbody>
</table>

### Examples of disk deployment

The following are examples of disk deployment:

<table>
<thead>
<tr>
<th>Number of disks</th>
<th>Disk</th>
<th>Deployment</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td>Corefile</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Backup data storage destination</td>
</tr>
<tr>
<td>2</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td>Corefile</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Data storage destination, transaction log storage destination</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Backup data storage destination</td>
</tr>
</tbody>
</table>

### Proposal for disk deployment using WebAdmin

To generate an instance using WebAdmin, we recommend an optimum deployment that takes into account the status of all disks at the time of instance generation, and items 1 to 3 in the "Considerations when deploying resources" subheading above, based on the limitations below (note that a different deployment can also be specified).

- The instance administrator has read and write privileges for the volumes.

### Preparing directories

The directories to be prepared depend on the way that you create the instances.

The following shows the directories that need to be prepared:

<table>
<thead>
<tr>
<th>Directory to be prepared</th>
<th>Using WebAdmin</th>
<th>Using the initdb command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data storage destination</td>
<td>Y (*1)</td>
<td>Y</td>
</tr>
<tr>
<td>Backup data storage destination</td>
<td>O (*1) (*4)</td>
<td>O</td>
</tr>
<tr>
<td>Transaction log storage destination</td>
<td>O (*1) (*2)</td>
<td>O</td>
</tr>
<tr>
<td>Corefile output destination</td>
<td>N (*3)</td>
<td>O</td>
</tr>
</tbody>
</table>

Y: Required  
O: Optional  
N: Not required  

*1: WebAdmin automatically creates a directory  
*2: The default is to create in a directory in the data storage destination. When it is necessary to distribute the I/O load for the database data and the transaction log, consider putting the transaction log storage destination on a different disk from the data storage destination.
*3: The corefile path is as follows:
userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceName\PortNumber\core

Note: The product version is normally the version of WebAdmin used to create the instance. For example, WebAdmin 13 allows a user to create a FUJITSU Enterprise Postgres 9.6 instance on a database server having WebAdmin 9.6. In this case, because WebAdmin 9.6 is used to create the instance, the product version will be "96".

PortNumber: port number specified when creating the instance

Example
C:\Users\naomi\AppData\Local\Fujitsu\fsep_130_WA_64\myinst27599\core

To change the output destination, specify in the core_directory parameter and core_contents parameter in postgresql.conf. Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

*4: This directory is required when instance backup is enabled.

---

**Note**

- The directories must meet the following conditions:
  - The directory owner must be the OS user account that you want to be the instance administrator
  - The directory must have write permission
  - The directory must be empty
- If using WebAdmin, network drives cannot be used.
- If using WebAdmin, the following halfwidth characters can be used for directory names:
  - \ (backslash)
  - - (hyphen)
  - _ (underscore)
  - : (colon)
  - Space
  - A-Z, a-z, 0-9 (alphanumeric)
- If anti-virus software is used, set scan exception settings for folders so that none of the server resources that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the server resources that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop the instance and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

---

**Confirm and configure directory access permissions**

If the instance administrator user has "Administrator" permissions (user ID belonging to the Administrators group), it is necessary to configure the settings so that each directory inherits the file and directory access permissions for the instance administrator user.

Therefore, ensure that the setting to inherit permissions has been configured.

The following is an explanation on how to confirm and configure the settings.

**How to confirm access permissions**

Perform the following operations in Windows Explorer on the directories to be prepared in advance:

1. Right-click on the applicable directory, and then click [Properties] from the menu that is displayed.
2. In the [applicableDir Properties] window, select [Security] >> [Advanced].
3. In the [Advanced Security Settings for applicableDir] window, and in the [Permission entries] list under the [Permissions] tab, confirm that [Applies to] for the instance administrator user is "This folder, subfolders and files".
4. Click [OK].

How to configure the access permissions

Perform the following operations in Windows Explorer if there are any directories that have not been configured for the access permissions to be inherited.

1. Right-click on the applicable directory, and then click [Properties] from the menu that is displayed.
2. In the [applicableDir Properties] window, select [Security] >> [Advanced].
3. In the [Advanced Security Settings for applicableDir] window, click [Add].
4. In the [Permission Entry for applicableDir] window, click [Select a principal].
5. In the [Select User or Group] window, enter the instance administrator user name as the object name to select, and then click [OK].
6. In the [Permission Entry for applicableDir] window, set [This folder, subfolders and files] for [Apply to:] ([Applies to:] for Windows Server(R) 2016 and Windows Server(R) 2019), and under [Basic permissions], allow read and write permissions, and then click [OK].
7. In the [Advanced Security Settings for applicableDir] window, confirm that the instance administrator user has been added, with [This folder, subfolders and files] set for [Apply to] ([Applies to] for Windows Server(R) 2016 and Windows Server(R) 2019) in the [Permission entries] list.
8. Click [OK].

Information

The access permissions can also be configured using the icacls command provided by the operating system.

The following is an execution example in which the application destination is set to "(OI)(CI)" and the access permissions are set to "(F) (Full access permissions)" when the data storage destination is "D:\database\inst1" and the instance administrator user is "fsepuser":

```
>icacls D:\database\inst1 /grant fsepuser:(OI)(CI)(F)
processed file: D:\database\inst1
Successfully processed 1 files; Failed processing 0 files
```

4.2.3 Estimating Resources

Estimate the resources to be used on the FUJITSU Enterprise Postgres.

Refer to "Appendix E Estimating Database Disk Space Requirements" for information on estimating database disk space requirements.

Refer to "Parameters automatically set by WebAdmin according to the amount of memory" when creating multiple instances with WebAdmin.

Refer to "Appendix F Estimating Memory Requirements" when creating instances with the initdb command, to estimate memory usage.

4.2.4 Windows Firewall Settings

This section explains the Windows firewall settings required if using WebAdmin for operation.

These settings are not required if using server commands for operation.

If the Windows firewall feature is to be enabled, you should enable a port number on the Web server. The following explains how to enable a port number:

Windows Server(R) 2019:

1. Select [Systems and Security] from [Control Panel] and click [Windows Defender Firewall].
2. In the [Windows Defender Firewall] window, click [Advanced settings].
5. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
6. Select [TCP] and [Specific local ports], then specify the Web server port number specified during the WebAdmin setup, and then click [Next].
7. Select [Allow the connection], and then click [Next].
8. Select the profiles for which this rule applies, and then click [Next].
9. In [Name], specify the desired name, and then click [Finish].
10. In the [Windows Defender Firewall with Advanced Security] window, check if the added rule is enabled under [Inbound Rules] in the center of the window.

In cases other than the above:
1. Select [Systems and Security] from [Control Panel] and click [Windows Firewall].
2. In the [Windows Firewall] window, click [Advanced settings].
5. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
6. Select [TCP] and [Specific local ports], then specify the Web server port number specified during the WebAdmin setup, and then click [Next].
7. Select [Allow the connection], and then click [Next].
8. Select the profiles for which this rule applies, and then click [Next].
9. In [Name], specify the desired name, and then click [Finish].
10. In the [Windows Firewall with Advanced Security] window, check if the added rule is enabled under [Inbound Rules] in the center of the window.

4.2.5 Preparing for Output to the Event Log

This section provides an explanation on the preparation to be carried out if you are outputting error logs to the event log.

If outputting error logs to the event log, you should register an event source name beforehand.

If you do not register an event source name, the message content output to the event log may be incomplete.

Due to the default event source name "FUJITSU Enterprise Postgres Server" being output to the event log when using the following commands, you should register this default event source name beforehand:
- pg_ctl command
- pgx_dmpall command
- pgx_rcvall command

The following is an example in which the DLL of a 64-bit product is registered under the default event source name:

```bash
> regsvr32 "C:\Program Files\Fujitsu\fsepv\server64\lib\pgevent.dll"
```

Note that this step is not required if using WebAdmin to create an instance.

If using multiple instances

You can output messages corresponding to the event source name assigned by the user, so that messages output to the event log can be identified by instance.

The following is an example in which the DLL of a 64-bit product is registered under the event source name "FUJITSU Enterprise Postgres inst1":

```bash
> regsvr32 "C:\Program Files\Fujitsu\fsepv\server64\lib\pgevent.dll"
```
You will need to edit the parameters for each instance, therefore, after creating an instance, refer to "4.5.1 Error Log Settings" when performing this setting.

### If installing multiple versions

If FUJITSU Enterprise Postgres is already installed on the same machine, search for the key below in Registry Editor, and make a note of the path of the registered DLL. Afterwards, register a new DLL under the default event source name.

Use the DLL path that you made a note of in the above step when re-registering the default event source name during an uninstall.

### 4.3 Creating Instances

There are two methods that can be used to create an instance:

- **4.3.1 Using WebAdmin**
- **4.3.2 Using the initdb Command**

#### Creating multiple instances

Multiple instances can be created.

The memory allocated needs to be adjusted when multiple instances are created with WebAdmin (refer to "Parameters automatically set by WebAdmin according to the amount of memory" for details).

#### Features that cannot be set up using WebAdmin

The "Storage data protection using transparent data encryption" feature cannot be set up using WebAdmin.

To set up this feature in an instance created by WebAdmin, perform the additional setup tasks detailed in "Storage Data Protection using Transparent Data Encryption" in the Operation Guide.

---

**Note**

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.
- Databases with the names 'template0' and 'template1' are automatically created when an instance is created. These databases are used as the templates for databases created later. Furthermore, a default database with the name 'postgres' is automatically created, which will be used with FUJITSU Enterprise Postgres commands. It is important that you do not delete these databases created by default.
- When an instance that uses WebAdmin is created successfully, the following Windows service is registered:

  fsep_version_WA_architecture_userName_instanceNamePortNumber

  The account and password of the instance administrator are registered in the Windows service. If the password for this account is changed, you must also change the password registered in the service. Change this at the Properties window registered in the Windows service.
Note: The product version is normally the version of WebAdmin used to create the instance. In addition, WebAdmin 13 also allows a user to create a FUJITSU Enterprise Postgres 9.6 instance on a database server having WebAdmin 9.6. In this case the product version will be "96".

- Refer to "4.5.2 Configuring Automatic Start and Stop of an Instance" for information on how to start and stop the operating system of the database server, and how to start and stop linked instances.

### 4.3.1 Using WebAdmin

This section describes how to create an instance using WebAdmin.

WebAdmin must be set up correctly before it can be used. Refer to "B.1 Setting Up WebAdmin" for details. Additionally, if WebAdmin needs to be configured to use an external repository database, refer to "B.3 Using an External Repository for WebAdmin" for details.

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build41 or later)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.

Configure your browser to allow cookies and pop-up requests from the server on which FUJITSU Enterprise Postgres is installed.

Refer to "Appendix A Recommended WebAdmin Environments" for information on how to change the pop-up request settings and other recommended settings.

---

**Note**

- WebAdmin does not run in Windows(R) safe mode.
- If the same instance is operated from multiple WebAdmin windows, it will not work correctly.
- If the same instance is operated from multiple WebAdmin versions, it will not work correctly. Always use the latest version of WebAdmin for instance operations.
- For efficient use of WebAdmin, it is recommended not to use the browser [Back] and [Forward] navigation buttons, the [Refresh] button, and context-sensitive menus, including equivalent keyboard shortcuts.
- Copying and pasting the WebAdmin URLs are not supported. Additionally, bookmarking of WebAdmin URLs is not supported.
- It is recommended to match the language between the instance server locale and WebAdmin.
- WebAdmin supports only two languages: English and Japanese.
- It is recommended to change the WebAdmin language setting from the instance details page only.
- It is recommended to operate WebAdmin using the WebAdmin launcher.
- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.
- If the browser was not operated for a fixed period (about 30 minutes), the session will time out and the login page will be displayed again for the next operation.
- **Port access permissions**
  - If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions.
  - Consider the security risks carefully when opening ports.
- When creating or importing an instance in WebAdmin, set the log_directory parameter in postgresql.conf in the following format:
  
  log_directory=userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\log

  Example: userProfileFolder\localSettingsFolder will be C:\Users\userName\AppData\Local.
4.3.1.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

Startup URL for WebAdmin

In the browser address bar, type the startup URL of the WebAdmin window in the following format:

http://hostNameOrIpAddress:portNumber/

- *hostNameOrIpAddress*: Host name or IP address of the server where WebAdmin is installed
- *portNumber*: Port number of WebAdmin. The default port number is 27515.

Example

For a server with IP address "192.0.2.0" and port number "27515":

http://192.0.2.0:27515/

The startup URL window shown below is displayed. From this window you can log in to WebAdmin or access the product documentation.

Logging in to WebAdmin

Click [Launch WebAdmin] in the startup URL window to start WebAdmin and display the login window. Enter the instance administrator user name (operating system user account name) and password, and log in to WebAdmin. User credential (instance administrator user ID and password) should not contain hazardous characters. Refer to "Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters".

4.3.1.2 Creating an Instance

This section describes how to create an instance.

1. Start WebAdmin, and log in to the database server.

2. In the [Instances] tab, click .

- 23 -
3. Enter the information for the instance to be created.

Enter the following items:

- [Configuration type]: Whether to create a standalone instance or an instance that is part of a cluster.
- [Server product type]: Sets which of the following instances to create:
  - FUJITSU Enterprise Postgres 9.5 Instances
  - FUJITSU Enterprise Postgres 9.6 Instances
  - FUJITSU Enterprise Postgres 10 Instances
  - FUJITSU Enterprise Postgres 11 Instances
  - FUJITSU Enterprise Postgres 12 Instances
  - FUJITSU Enterprise Postgres 13 Instances
  The default is "FUJITSU Enterprise Postgres 13".
  WebAdmin can create and manage instances compatible with the following, but new functionality in FUJITSU Enterprise Postgres 13 may not support the instance or it may be disabled.
  - FUJITSU Enterprise Postgres 9.5
  - FUJITSU Enterprise Postgres 9.6
  - FUJITSU Enterprise Postgres 10
  - FUJITSU Enterprise Postgres 11
  - FUJITSU Enterprise Postgres 12
- [Location]: Whether to create the instance in the server that the current user is logged into, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.
- [Instance name]: Name of the database instance to manage
  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters
- [Instance port]: Port number of the database server
[Data storage path]: Directory where the database data will be stored

[Backup]: Whether to enable or disable the WebAdmin backup feature. The default is "Enabled". Select "Disabled" to disable all backup and restore functionality for the instance. If "Enabled" is selected, enter the following item:

[Backup storage path]: Directory where the database backup will be stored

[Transaction log path]: Directory where the transaction log will be stored

[Encoding]: Database encoding system

[WAL file size]: Allow the WAL file size to be set when creating an instance. The default is 16 MB if the field is blank. The size specified must be a power of 2 between 1 and 1024. This option is not available for standby instances.

If "Remote" is selected for [Location], enter the following additional items:

[Host name]: Name of the host where the instance is to be created

[Operating system credential]: Operating system user name and password for the remote machine where the instance is to be created

[Remote WebAdmin port for standalone]: Port in which WebAdmin is accessible in the remote machine

Note
- Refer to "4.2.2 Preparing Directories for Resource Deployment" - "Considerations when deploying resources" for information on points to consider when determining the data storage path, backup storage path, and transaction log path.
- The following items can be modified after the instance has been created. These items cannot be modified on instances that have compatibility with FUJITSU Enterprise Postgres 9.5.
  - Instance name
  - Port number
  - Backup storage path

Refer to "Editing instance information" for details.
- Do not specify shortcuts for the data storage path, backup storage path, or transaction log path.
- In the instance that is created using WebAdmin, the locale of the character set to be used in the database, and the locale of the collating sequence, are fixed using C.
- The following characters can be used for the data storage path, backup storage path, and transaction log path:
  - \ (backslash)
  - - (hyphen)
  - _ (underscore)
  - : (colon)
  - Space
  - A-Z, a-z, 0-9 (alphanumeric)
- Instance administrator read and write permissions are required for the data storage path, backup storage path, and transaction log path.
- For the port number, specify an unused port number in the following range:
  - 1024 to 49151
- Make a note of the port number for use in the Windows firewall settings.
- Refer to "4.5.2 Configuring Automatic Start and Stop of an Instance" for information on configuring the automatic start and stop of instances.
- For enhanced security, WebAdmin encrypts the superuser password using SCRAM-SHA-256 authentication for all FUJITSU Enterprise Postgres 10 or later instances. The client/driver must therefore support SCRAM-SHA-256 authentication if they need to connect to FUJITSU Enterprise Postgres 10 or later instances created by WebAdmin with superuser credentials.

- Host name and Operating system credential (Operating system user name and password) should not contain hazardous characters. Refer to “Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters”.

4. Click ✅ to create the instance.

If the instance is created successfully, a message indicating the same will be displayed.

5. The instance will be started when it is created successfully.

6. Back up the basic information that was set

   Back up the WebAdmin management information periodically to ensure operational continuity when a fault occurs on the system disk. Follow the procedure below to perform the backup.

   a. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.

   b. Back up the following directory:

   \webAdminInstallDir\data\fepwa

   **Note**

   The following message is output during startup of an instance when the startup process is operating normally, therefore, the user does not need to be aware of this message.

   FATAL: the database system is starting up (XXXXX)

4.3.1.3 Changing Instance Settings

You can change the information that is set when an instance is created.

Change the following settings to suit the operating and management environment for FUJITSU Enterprise Postgres.

- **Instance configuration**
  - Character encoding
- Communication
- SQL options
- Memory
- Streaming replication
- Changing client authentication information
- Editing instance information

Information

These settings are the same as the parameters that can be set in the files shown below. Refer to "Appendix D Configuring Parameters" for information on the equivalence relationship between the item name and the parameter.

- postgresql.conf
- pg_hba.conf

Note

The files shown below can also be modified directly, however if a parameter not described in "Appendix D Configuring Parameters" was edited by mistake, WebAdmin may not run correctly.

- postgresql.conf
- pg_hba.conf

Instance configuration

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click .
3. Click to change the configuration.
4. Click to save your changes.

See

Select a client-side encoding system that can be converted to/from the database encoding system. Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the "PostgreSQL Documentation" for information on the encoding system combinations that can be converted.

Changing client authentication information

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click .

   Click to register new authentication information.

   To change authentication information, select the information, and then click .

   To delete authentication information, select the information, and then click .
When creating the instance, do not delete the entry below, because it is a connection required for WebAdmin to monitor the operational status of the database:
Type= host, Database=all, User=all, and Method=md5

Editing instance information

Use the [Edit instance] page to modify the following items for an instance:
- Instance name
- Port number
- Backup storage path

1. In the [Instances] tab, click . The [Edit instance] page is displayed.
2. Modify the relevant items.
   If [Backup storage path] is changed, [Backup management] is enabled. Select the required option:
   Retain existing backup: Create a backup in [Backup storage path] and retain the existing backup in its original location.
   Copy existing backup to new path: Copy the existing backup to [Backup storage path]. A new backup will not be created. The existing backup will be retained in its original location.
   Move existing backup to new path: Move the existing backup to [Backup storage path]. A new backup will not be created.
   Remove existing backup: Create a backup in [Backup storage path]. The existing backup will be removed.
3. Click to save your changes.

Note
- The [Edit instance] page is also displayed when the user selects 'Navigate to the "Edit instance" page' from the [Anomaly Error] dialog box. Refer to "Anomaly Detection and Resolution" in the Operation Guide for information on what takes place when an anomaly is detected.
- When [Instance name] or [Instance port] is modified, the log_directory and core_directory parameters in postgresql.conf are updated. Also, the specified directories are created if they do not exist.

Refer to “4.3.1.4 Importing Instances” for information on the format of these directories.

4.3.1.4 Importing Instances

Instances can be created using WebAdmin, or via the command line using the initdb command. Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin.

This section explains how to import command line instances into WebAdmin.

1. In the [Instances] tab, click . The [Import instance] page is displayed.
2. Enter the information for the instance being imported. Refer to "4.3.1.2 Creating an Instance" for information on the items that need to be entered.
3. Click to import the instance.

Note
- Importing neither starts nor stops the instance.
A Windows service is automatically registered when an instance is imported into WebAdmin. If a Windows service was registered by the user prior to importing the instance, that service will not be deleted. After importing the instance into WebAdmin, it is recommended to discontinue the use of the user-created service.

The following restrictions apply to instance import:

- Any instance already managed by WebAdmin cannot be imported again.
- The postgresql.conf file must be located in the same directory as [Data storage path].
- Read/write permissions are required for [Data storage path].
- The location specified in postgresql.conf for the following files must not have been changed:
  - hba_file
  - ident_file
- If the instance is part of a cluster that is monitored by Mirroring Controller, WebAdmin will be unable to detect the Mirroring Controller settings.
- Instances making use of Mirroring Controller functionality should not be imported, because subsequent operations on those instances may cause unexpected and undesirable side-effects.
- It is not possible to import and operate an instance that uses a directory mounted by Network File System (NFS).
- You must make the following changes to the parameters in postgresql.conf prior to importing the instance in WebAdmin.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The port parameter should be uncommented.</td>
</tr>
</tbody>
</table>

The log_directory and core_directory parameters in postgresql.conf are updated during import. Also, the specified directories are created if they do not exist.

The format of these directories is as follows:

- log_directory: `\userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\log`
- core_directory: `\userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\core`
- version: product version_WA_architecture
- PortNumber: port number specified when creating the instance

Examples:

- log_directory: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_130_WA_64\myinst27599\log`
- core_directory: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_130_WA_64\myinst27599\core`

- When a standby instance is imported, a valid entry, using the IP address of the standby instance, must exist in the pg_hba.conf file of the master instance to allow the standby instance to connect to the master instance.
- When a standby instance is imported, the value for "host" in the primary_conninfo parameter of postgresql.auto.conf should match the host name of the master instance.
- When a standby instance is imported, you cannot specify "passfile" in the primary_conninfo parameter of postgresql.auto.conf. Be sure to specify "password".
- Instances created by other operating systems cannot be imported.
- If a FUJITSU Enterprise Postgres 10 or later instance is being imported while it is running, WebAdmin will encrypt the superuser password using SCRAM-SHA-256 authentication.

4.3.2 Using the initdb Command

This section describes the procedure to create an instance using the initdb command.
4.3.2.1 Creating an Instance

Create an instance, with the database cluster storage destination specified in the PGDATA environment variable or in the -D option. Furthermore, the user that executed the initdb command becomes the instance administrator.

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- If creating multiple instances, ensure that there is no duplication of port numbers or the directories that store database clusters.

See

Refer to "initdb" in "Reference" in the PostgreSQL Documentation for information on the initdb command.

The procedure to create an instance is described below.

1. Use the OS user account that you want as the instance administrator.
   Connect with the server using the OS user account that you want as the instance administrator.

2. Configure the environment variables
   Configure the environment variables in the server with the newly created instance.
   Set the following environment variables:
   - PATH environment variables
     Add installDir\bin and installDir\lib.

   Example
   The following is a setting example for environment variables in which "C:\Program Files\Fujitsu\fsepv<x>server64" is used as the installation folder:
   Note that "<x>" indicates the product version.

   ```bash
   > SET PATH=C:\Program Files\Fujitsu\fsepv<x>server64\bin;C:\Program Files\Fujitsu\fsepv<x>server64\lib;%PATH%
   ```

3. Create a database cluster
   Create the database cluster with the initdb command, specifying the storage destination directory.
   Specify the transaction log storage destination and the locale setting option as required.

   Example
   ```bash
   > initdb -D D:\database\inst1 --waldir=E:\transaction\inst1 --lc-collate="C" --lc-ctype="C" --encoding=UTF8
   ```
In some features, instance names are requested, and those names are required to uniquely identify the instance within the system. These features allow names that conform to WebAdmin naming conventions, so refer to the following points when determining the names:

- Maximum of 16 characters
- The first character must be ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

Note

- To balance I/O load, consider deploying the transaction log storage destination to a disk device other than the database cluster storage destination and the backup data storage destination.
- Messages may not display correctly if a value other than "C" is specified as the display language for messages.
- Specify "C" for collation and character category. Performance deteriorates if you specify a value other than "C", although the behavior will follow the rules for particular languages, countries and regions. Furthermore, this may need to be revised when running applications on systems with different locales.

For example, specify as follows:

```
initdb --locale="C" --lc-messages="C"
initdb --lc-collate="C" --lc-ctype="C"
```

- Specify an encoding system other than SQL_ASCII for the database. If SQL_ASCII is used, there is no guarantee that the encryption system for data in the database will be consistent, depending on the application used to insert the data.

See

Refer to "Locale Support" in "Localization" in "Server Administration" in the PostgreSQL Documentation for information on locales.

4. Set port number.

Specify a port number in the port parameter of postgresql.conf. Ensure that the specified port number is not already used for other software. If a port number is not specified, "27500" is selected.

Register the specified port numbers in the C:\Windows\System32\drivers\etc\services file if WebAdmin is used to create other instances. WebAdmin uses the services file to check if port numbers specified as available candidates have been duplicated.

Register any name as the service name.

Note

Make a note of the port number for use in the Windows firewall settings.

5. Set the corefile output destination.

Specify the output destination of the corefile, which can later be used to collect information for investigation, by setting the core_directory and core_contents parameters of postgresql.conf.

See

Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.
6. Set the backup storage destination.

Specify the backup data storage destination and other backup settings when backup is to be performed as a provision against database errors.

See

Refer to “Backup Methods” in the Operation Guide for information on specifying backup settings.

7. Register an instance in the Windows service

Use the register mode of the pg_ctl command to register an instance in the Windows service.

Specify the service name, user name, password and path to the instance in the pg_ctl command, and register the instance in the Windows service.

Example

The following is a setting example, in which the service name to register is "inst1", the user name is "fepuser", and the storage destination directory of the database cluster is "D:\database\inst1":

```
> pg_ctl register -N "inst1" -U fepuser -P ******** -D D:\database\inst1
```

Note

- This command must be executed by an instance administrator user with administrator privileges. Execute the command from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

- For the following reasons, a user name and password must always be specified:

  Because the Windows service is started up by the Network Service account, all user resources are created as resources of that account. This can result in error events such as failing to access database resources and not being able to perform backups/recovery.

  Note that if not specifying a user name and password for security reasons, you should specify the account from the Windows services list immediately after registering the instance in Windows services.

- When entering the password that is specified in the pg_ctl command, for security reasons, you should be careful not to allow other users to access it.

Commands such as sc query can be used to check the registration status.

8. Start an instance

Use the following procedure to start the service:

a. Display the [Services] window.

   In Windows, select [Administrative Tools], and then click [Services].

b. Start the service

   From the services list, select the instance name that you wish to start, and click [Start Service].

If using commands to start the service, specify the service name using either the net start command or sc start command from the command prompt.

4.4 Configuring Remote Connections

This section describes the settings required when connecting remotely to FUJITSU Enterprise Postgres from a database application or a client command.
4.4.1 When an Instance was Created with WebAdmin

Settings related to connection
The default is to accept connections from remote computers to the database.
Change "listen_addresses" in postgresql.conf to modify the default behavior.
Refer to "Appendix D Configuring Parameters" for information on postgresql.conf.

Client Authentication Information settings
The following content is set by default when WebAdmin is used to create an instance.
- Authentication of remote connections from local machines is performed.
When changing Client Authentication Information, select [Client Authentication] from [Setting], and then change the settings.

4.4.2 When an Instance was Created with the initdb Command

Connection settings
The default setting only permits local connections from the client to the database. Remote connections are not accepted.
Change "listen_addresses" in postgresql.conf to perform remote connection.
All remote connections will be allowed when changed as shown below.
Example

```
listen_addresses = '*'
```

Also, configure the parameters shown below in accordance with the applications and number of client command connections.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
</tr>
</thead>
<tbody>
<tr>
<td>superuser_reserved_connections</td>
<td>Number of connections reserved for database maintenance, for example backup or index rebuilding. If you need to simultaneously perform a large number of processes that exceed the default value, change this value accordingly.</td>
</tr>
<tr>
<td>max_connections</td>
<td>Set the value as:</td>
</tr>
<tr>
<td></td>
<td>numberOfSimultaneousConnectionsToInstance + superuser_reserved_connections</td>
</tr>
</tbody>
</table>

Client authentication information settings
When trying to connect from a client to a database, settings are required to determine whether the instance permits connections from the client - if it does, then it is possible to make settings to determine if authentication is required.

See
Refer to "The pg_hba.conf File" in "Server Administration" in the PostgreSQL Documentation for details.

4.4.3 Windows Firewall Settings

If the Windows firewall feature is to be enabled, you should enable a port number on the database server. The following explains how to enable a port number:

Windows Server(R) 2019:

1. Select [Systems and Security] from [Control Panel] and click [Windows Defender Firewall].
2. In the [Windows Defender Firewall] window, click [Advanced settings].
5. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
6. Select [TCP] and [Specific local ports], then specify the Web server port number specified during the WebAdmin setup, and then click [Next].
7. Select [Allow the connection], and then click [Next].
8. Select the profiles for which this rule applies, and then click [Next].
9. In [Name], specify the desired name, and then click [Finish].
10. In the [Windows Defender Firewall with Advanced Security] window, check if the added rule is enabled under [Inbound Rules] in the center of the window.

In cases other than the above:
1. Select [Systems and Security] from [Control Panel] and click [Windows Firewall].
2. In the [Windows Firewall] window, click [Advanced settings].
5. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
6. Select [TCP] and [Specific local ports], then specify the Web server port number specified during the WebAdmin setup, and then click [Next].
7. Select [Allow the connection], and then click [Next].
8. Select the profiles for which this rule applies, and then click [Next].
9. In [Name], specify the desired name, and then click [Finish].
10. In the [Windows Firewall with Advanced Security] window, check if the added rule is enabled under [Inbound Rules] in the center of the window.

4.5 Other Settings

This section describes settings that are useful for operations.

4.5.1 Error Log Settings

This section explains the settings necessary to monitor errors in applications and operations, and to make discovering the causes easier. Make error log settings only when instances are created with the initdb command. When creating instances with WebAdmin, these settings are already made and hence do not need to be set. Furthermore, some parameters are used by WebAdmin, and if changed, may cause WebAdmin to no longer work properly. Refer to “Appendix D Configuring Parameters” for details.

Edit the following parameters in postgresql.conf:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>How to enable the settings</th>
</tr>
</thead>
</table>
| event_source   | Specify the event source name to be attached to messages, for identifying messages output to the event log when using multiple instances. | - Restart services from the Windows services window.  
- Use the net command or sc command to stop and start services. |
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>How to enable the settings</th>
</tr>
</thead>
</table>
| logging_collector      | Specify "on" to ensure that messages are output by FUJITSU Enterprise Postgres to the server log file. The server log file is created in the log directory in the database cluster. | - Restart services from the Windows services window.  
- Use the net command or sc command to stop and start services. |
| log_destination        | Specify "stderr, eventlog" to output messages from FUJITSU Enterprise Postgres to the screen and either the system log or the event log. | reload option of the pg_ctl mode |
| log_line_prefix        | Specify information to be added at the start of messages output by an instance. This information is useful for automatic monitoring of messages.  
You can output the SQLSTATE value, output time, executing host, application name, and user ID.  
Refer to "What To Log" in the PostgreSQL Documentation for details.  
Example: log_line_prefix = '%e: %t [ %p]: [%l-1] user = %u, db = %d, remote = %r app = %a' | reload option of the pg_ctl mode |

**Point**

- If you want fewer application errors being output to the eventlog, refer to "When To Log" and "What To Log" in the PostgreSQL Documentation for information on how to reduce the output messages.
- If you want to separate errors output from other software, refer to "Where To Log" in the PostgreSQL Documentation to change the output destination to the server log file rather than the system log.

### 4.5.2 Configuring Automatic Start and Stop of an Instance

You can automatically start or stop an instance when the operating system on the database server is started or stopped.

Use the following procedure to configure automatic start and stop of an instance.

Note that, if an instance is started in a failover operation, the cluster system will control the start or stop, therefore this feature should not be used. Also, when performing database multiplexing, refer to "Enabling Automatic Start and Stop of Mirroring Controller and Multiplexed Instances" in the Cluster Operation Guide (Database Multiplexing).

**When an instance was created with WebAdmin**

When an instance is created with WebAdmin, the instance is registered in the Windows service and automatic start and stop is set for the instance.

To change the automatic start and stop setting for an instance, select the service for the applicable instance in the Windows services window, and in [Startup Type], select [Automatic] or [Manual].

**When an instance was created with the initdb command**

When the startup type of the service is set to [Manual], change it to [Automatic]. By setting the startup type to [Automatic], the service will start up automatically when the Windows(R) system is started up, and will stop automatically when the Windows(R) system is shut down.

**Note**

The settings should be performed by a user with administrator privileges.

Use the following procedure to switch the service:
1. Display the [Services] window.
   In Windows, select [Administrative Tools], and then click [Services].

2. Switch the startup type
   Select the FUJITSU Enterprise Postgres service name, display the [Properties] dialog box, and then switch the startup type from [Manual] to [Automatic].

The above setting can also be changed using the `sc config` command.

### 4.5.3 Settings when Using the Features Compatible with Oracle Databases

To use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

```
CREATE EXTENSION oracle_compatible;
```

Features compatible with Oracle databases are defined as user-defined functions in the "public" schema created by default when database clusters are created, so they can be available for all users without the need for special settings.

For this reason, ensure that "public" (without the double quotation marks) is included in the list of schema search paths specified in the `search_path` parameter.

There are also considerations for use the features compatible with Oracle databases. Refer to "Precautions when Using the Features Compatible with Oracle Databases" in the Application Development Guide for details.

### 4.6 Integration with Message-Monitoring Software

To monitor messages output by FUJITSU Enterprise Postgres using software, configure the product to monitor SQLSTATE, instead of the message text - this is because the latter may change when FUJITSU Enterprise Postgres is upgraded.

Configure FUJITSU Enterprise Postgres to output messages in a format that can be read by the message-monitoring software by specifying 
"%e" in the `log_line_prefix` parameter of `postgresql.conf` to output the SQLSTATE value.

A setting example is shown below - it outputs the output time, executing host, application name, and user ID, in addition to the SQLSTATE value.

Example

```
log_line_prefix = '%e: %t [%p]: [%l-1] user = %u, db = %d, remote = %r app = %a '
```

Refer to "What To Log" in the PostgreSQL Documentation for information on how to configure the settings.

### 4.7 Setting Up and Removing OSS

This section explains how to set up OSS supported by FUJITSU Enterprise Postgres.

If you want to use OSS supported by FUJITSU Enterprise Postgres, follow the setup procedure.

If you decide not to use the OSS supported by FUJITSU Enterprise Postgres, follow the removing procedure.

**Information**

- In this section, the applicable database that enables the features of each OSS is described as "postgres".
- Execute `CREATE EXTENSION` for the "template1" database also, so that each OSS can be used by default when creating a new database.
Refer to “OSS Supported by FUJITSU Enterprise Postgres” in the General Description for information on OSS other than those described below.

4.7.1 oracle_fdw

4.7.1.1 Setting Up oracle_fdw

1. Add the path of the OCI library to the environment variable. The available version of the OCI library is 11.2 or later.
   Add the installation path of the OCI library to the PATH environment variable.

2. Open a command prompt with administrator privileges and run the following command:

```
> xcopy /E "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\oracle_fdw\*"
   "c:\Program Files\Fujitsu\fsepv<x>server64"
```

3. Restart FUJITSU Enterprise Postgres.

4. Execute CREATE EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```
postgres=# CREATE EXTENSION oracle_fdw;
CREATE EXTENSION
```

**Information**

- If the OCI library is not installed on the server, install it using the Oracle client or Oracle Instant Client. Refer to the relevant Oracle manual for information on the installation procedure.
- If the version of the OCI library is updated, change the path of the OCI library in the PATH environment variable to the updated path.

**Note**

This feature cannot be used on instances created in WebAdmin. It can only be used via server commands.

4.7.1.2 Removing oracle_fdw

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

```
postgres=# DROP EXTENSION oracle_fdw CASCADE;
DROP EXTENSION
```

2. Open a command prompt with administrator privileges and run the following command:

```
> del "c:\Program Files\Fujitsu\fsepv<x>server64\filesCopiedDuringSetup"
```

**Information**

The files copied during setup can be checked below.

```
> dir /b /s "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\oracle_fdw"
```
### 4.7.2.1 Setting Up pg_hint_plan

1. Set the postgresql.conf file parameters.
   Add "pg_hint_plan" to the "shared_preload_libraries" parameter.

2. Open a command prompt with administrator privileges and run the following command:

   ```
   > xcopy /E "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\pg_hint_plan\*"
   "c:\Program Files\Fujitsu\fsepv<x>server64"
   ```

3. Restart FUJITSU Enterprise Postgres.

4. Run CREATE EXTENSION for the database that uses this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

   ```
   postgres=# CREATE EXTENSION pg_hint_plan;
   CREATE EXTENSION
   ```

**See**

Refer to "Optimizer Hints" in the Application Development Guide for details.

### 4.7.2.2 Removing pg_hint_plan

**Note**

Unsetting pg_hint_plan will cause hints registered in the hint_plan.hints table to be lost. Therefore, it is recommended that pg_dump back up the hint_plan.hints table for each database if it is likely that pg_hint_plan will be used again later.

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

   ```
   postgres=# DROP EXTENSION pg_hint_plan CASCADE;
   DROP EXTENSION
   ```

2. Open a command prompt with administrator privileges and run the following command:

   ```
   > del "c:\Program Files\Fujitsu\fsepv<x>server64\filesCopiedDuringSetup"
   ```

**Information**

The files copied during setup can be checked below.

```
> dir /b /s "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\pg_hint_plan"
```
4.7.3 pg_dbms_stats

4.7.3.1 Setting Up pg_dbms_stats

1. Set the postgresql.conf file parameter.
   Add "pg_dbms_stats" to the "shared_preload_libraries" parameter.

2. Open a command prompt with administrator privileges and run the following command:

   ```
   > xcopy /E "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\pg_dbms_stats\*"
   "c:\Program Files\Fujitsu\fsepv<x>server64"
   ```

3. Restart FUJITSU Enterprise Postgres.

4. Run CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

   ```
   postgres=# CREATE EXTENSION pg_dbms_stats;
   CREATE EXTENSION
   ```

Refer to “Optimizer Hints” in the Application Development Guide for details.

4.7.3.2 Removing pg_dbms_stats

Note

Unsetting pg_dbms_stats causes statistics managed by pg_dbms_stats to be lost. Therefore, it is recommended that you back up each table in the dbms_stats folder of each database in binary format if you may want to use pg_dbms_stats again later.

```
postgres > # COPY <dbms_stats Schema's table name> TO '<Filename>' FORMAT binary;
```

1. Execute DROP EXTENSION for the database that will use this feature.
   Use the psql command to connect to the "postgres" database.

   ```
   postgres=# DROP EXTENSION pg_dbms_stats CASCADE;
   DROP EXTENSION
   ```

2. Open a command prompt with administrator privileges and run the following command:

   ```
   > del "c:\Program Files\Fujitsu\fsepv<x>server64\filesCopiedDuringSetup"
   ```

Information

The files copied during setup can be checked below.

```
> dir /b /s "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\pg_dbms_stats"
```

3. Set the postgresql.conf file parameters.
   Delete "pg_dbms_stats" to the shared_preload_libraries parameter.

4. Restart FUJITSU Enterprise Postgres.
4.8 Deleting Instances

This section explains how to delete an instance.

- 4.8.1 Using WebAdmin
- 4.8.2 Using Server Commands

Note

- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.

4.8.1 Using WebAdmin

This section explains how to delete an instance using WebAdmin.

Use the following procedure to delete an instance.

1. Stop the instance
   In the [Instances] tab, select the instance to stop and click .

2. Back up files.
   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and the transaction log storage destination.

3. Delete the instance
   In the [Instances] tab, select the instance to delete and click .

Note

Deleting an instance deletes only the following lowest-level directories. If they are not required, delete them manually.
- Data storage destination
- Backup data storage destination
- Transaction log storage destination (if different from the data storage destination)

4.8.2 Using Server Commands

This section explains how to delete an instance using server commands.

Use the following procedure to delete an instance.

1. Stop the instance
   Stop the instance in Windows services, or use the pg_ctl command stop mode.
   Use the following procedure to stop a service in Windows services:
   a. Display the [Services] window.
      In Windows, select [Administrative Tools], and then click [Services].
   b. Stop the service
      Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.
      You can also stop a service by specifying the service name in the net stop command or sc stop command.
2. Back up files
   Before deleting the instance, you should back up all necessary files contained in the data storage destination, backup data storage destination, and transaction log storage destination.

3. Delete the instance
   Use a command such as rmdir to delete the following directories:
   - Data storage destination directory
   - Backup data storage destination directory
   - Transaction log storage destination directory (if a different directory to the data storage destination directory was specified)
Chapter 5 Uninstallation

This chapter explains the uninstallation of FUJITSU Enterprise Postgres.

Note that "x SPz" indicates the version and level of the installed product and "<x>" in paths indicates the product version.

**Information**

- If a [User Account Control] dialog box is displayed at the start of the uninstallation, click [Yes] to continue processing.
  If [No] is clicked, permission to continue is denied and an [Error] dialog box will be displayed.
  To continue the uninstallation, click [Retry] in the [Error] dialog box. To end the operation, click [Cancel].

- If uninstallation is suspended or processing terminates abnormally, the [Program Compatibility Assistant] dialog box may be displayed.
  Click [This program uninstalled correctly] and continue operation.

5.1 Uninstallation in Interactive Mode

The uninstallation procedure is described below.

**Note**

- Uninstalling removes all files and directories under the installation directory. If you have placed user files in the installation directory, you may need to save them before uninstalling.

- If performing operation with WebAdmin, back up the following folder before uninstallation.
  Instances will not be recognized by WebAdmin even if FUJITSU Enterprise Postgres is reinstalled after uninstallation.
  If performing operation with WebAdmin after reinstalling FUJITSU Enterprise Postgres, replace the following backed up file after installation.

  Follow the procedure below to perform the backup.

  1. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
  2. Back up the following folder:

     \webAdminInstallFolder\data\fepwa

  By replacing the above folder in the installation folder after installation, the instance will be recognized by WebAdmin, and the recognized instance will be set to automatically start and stop.
  To disable the automatic start and stop setting for an instance, select the service for the applicable instance in the Windows services window, and in [Startup Type], select [Manual].

- If using database multiplexing mode, refer to "Uninstalling in Database Multiplexing Mode" in the FUJITSU Enterprise Postgres Cluster Operation Guide (Database Multiplexing) before performing the uninstallation.

**See**

Refer to the Installation and Setup Guide for Client when uninstalling the FUJITSU Enterprise Postgres client feature.

**Information**

If an error occurs while the product is being uninstalled, refer to "Uninstall (middleware) Messages" in the FUJITSU Enterprise Postgres product website, and take the required action.
1. Stop applications and programs

Before starting the uninstallation, stop the following:

- Applications that use the product
- pgAdmin

2. Stop instances

Stop all instances that are using the product to be uninstalled.

Stopping of instances should be performed by the appropriate instance administrator.

When an instance was created with WebAdmin

In the [Instances] tab, select the instance to stop and click 

When an instance was created with the initdb command

Use the following procedure to stop a service:

a. Display the [Services] window
   
   In Windows, select [Administrative Tools], and then click [Services].

b. Stop the service
   
   Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.

   You can also stop a service by specifying the service name in the net stop command or sc stop command.

3. Stop WebAdmin

If you are using WebAdmin, stop WebAdmin.

Refer to “B.1.3 Stopping the Web Server Feature of WebAdmin” for details.

4. Unregister Windows services

Perform this step if the instance was created with the initdb command.

Unregister the instance registered in Windows services.

Use the unregister mode of the pg_ctl command to specify the registered service name and unregister the instance from Windows services.

Example

The following is an example showing execution of this command on the registered service name “inst1”.

```
> pg_ctl unregister -N "inst1"
```

Note

You should unregister services before uninstalling FUJITSU Enterprise Postgres. If you uninstall FUJITSU Enterprise Postgres while services are running, several files will remain after the uninstallation.

If you have carried out the uninstallation without unregistering services beforehand, use the server command sc delete to unregister the services.

This command must be executed by an instance administrator user with administrator privileges. Execute the command from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

5. Delete registrations related to the event log

If you are outputting to the event log, a DLL registration mentioned in “4.2.5 Preparing for Output to the Event Log” has been performed.
To prevent unnecessary issues from occurring, you should delete this registration. Refer to "Server Setup and Operation", "Registering Event Log on Windows" in the PostgreSQL Documentation for details.

The following is an example showing deletion of the DLL registration for a 64-bit product under the default event source name.

```
> regsvr32 /u "c:\Program Files\Fujitsu\fsepv<server64\lib\pgevent.dll"
```

If using multiple instances

DLL registration is performed so that you can output messages corresponding to the event source name assigned by the user, allowing you to identify messages output to the event log by instance.

Since it is necessary to delete the DLL registration for each instance, delete the DLL registration by event source name.

The following is an example showing deletion of the DLL of a 64-bit product registered under the event source name "Enterprise Postgres inst1".

```
> regsvr32 /u /l:"Enterprise Postgres inst1" "C:\Program Files\Fujitsu\fsepv<server64\lib\pgevent.dll"
```

Note that this step is not required if the instance was created with WebAdmin.

If installing multiple versions

If the instances you created using this package have been set to output error logs to the event log, use the DLL path name that you took note of previously as explained in "4.2.5 Preparing for Output to the Event Log" to reregister the default event source name.

---

6. Start Uninstall (middleware)

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

7. Select the software

Select the product to be uninstalled from [Software Name], and then click [Remove].

8. Start the uninstallation

Click [Uninstall].

9. Finish the uninstallation

The uninstallation completion window will be displayed. Click [Finish].

The installation folder may remain after uninstallation. If it is not required, delete it.

10. Stop Uninstall (middleware)

In Uninstall (middleware), click [Close].

5.2 Uninstallation in Silent Mode

The uninstallation procedure is described below.

---

- Uninstalling removes all files and directories under the installation directory. If you have placed user files in the installation directory, you may need to save them before uninstalling.
If performing operation with WebAdmin, back up the following folder before uninstallation. Instances will not be recognized by WebAdmin even if FUJITSU Enterprise Postgres is reinstalled after uninstallation. If performing operation with WebAdmin after reinstalling FUJITSU Enterprise Postgres, replace the following backed up file after installation.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.

2. Back up the following folder:
   ```
   webAdminInstallFolder\data\fepwa
   ```

   By replacing the above folder in the installation folder after installation, the instance will be recognized by WebAdmin, and the recognized instance will be set to automatically start and stop. To disable the automatic start and stop setting for an instance, select the service for the applicable instance in the Windows services window, and in [Startup Type], select [Manual].

- If using database multiplexing mode, refer to "Uninstalling in Database Multiplexing Mode" in the FUJITSU Enterprise Postgres Cluster Operation Guide (Database Multiplexing) before performing the uninstallation.

---

See

- Refer to the Installation and Setup Guide for Client when uninstalling the FUJITSU Enterprise Postgres client feature.

- Refer to the FUJITSU Enterprise Postgres product website for information on uninstallation in silent mode, such as the error messages.

---

1. **Stop applications and programs**

   Before starting the uninstallation, stop the following:
   - Applications that use the product
   - pgAdmin

2. **Stop all instances**

   Stop all instances that are using the product to be uninstalled.

   **When an instance was created with WebAdmin**
   
   In the [Instances] tab, select the instance to stop and click ![Stop button]
   
   **When an instance was created with the initdb command**
   
   Use the following procedure to stop a service:
   
   a. Display the [Services] window.
      
      In Windows, select [Administrative Tools], and then click [Services].
   
   b. Stop the service
      
      Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.
      
      You can also stop a service by specifying the service name in the net stop command or sc stop command.

3. **Stop WebAdmin**

   If you are using WebAdmin, stop WebAdmin.

   Refer to "B.1.3 Stopping the Web Server Feature of WebAdmin" for details.
4. Unregister Windows services

Perform this step if the instance was created with the initdb command.

Unregister the instance registered in Windows services.

Use the unregister mode of the pg_ctl command to specify the registered service name and unregister the instance from Windows services.

Example

The following is an example showing execution of this command for the registered service name "inst1".

```bash
> pg_ctl unregister -N "inst1"
```

Note

You should unregister services before uninstalling FUJITSU Enterprise Postgres. If you uninstall FUJITSU Enterprise Postgres while services are running, several files will remain after the uninstallation.

If you have carried out the uninstallation without unregistering services beforehand, use the server command sc delete to unregister the services.

This command must be executed by an instance administrator user with administrator privileges. Execute the command from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

5. Delete registrations related to the event log

If you are outputting to the event log, a DLL registration mentioned in "4.2.5 Preparing for Output to the Event Log" has been performed.

To prevent unnecessary issues from occurring, you should delete this registration. Refer to "Server Setup and Operation", "Registering Event Log on Windows" in the PostgreSQL Documentation for details.

The following is an example showing deletion of the DLL registration for a 64-bit product under the default event source name.

```bash
> regsvr32 /u "c:\Program Files\Fujitsu\fsepv<server64\lib\pgevent.dll"
```

If using multiple instances

DLL registration is performed so that you can output messages corresponding to the event source name assigned by the user, allowing you to identify messages output to the event log by instance.

Since it is necessary to delete the DLL registration for each instance, delete the DLL registration by event source name.

The following is an example showing deletion of the DLL of a 64-bit product registered under the event source name "Enterprise Postgres inst1".

```bash
> regsvr32 /u /i:"Enterprise Postgres inst1" "c:\Program Files\Fujitsu\fsepv<server64\lib\pgevent.dll"
```

Note that this step is not required if the instance was created with WebAdmin.

If installing multiple versions

If the instances you created using this package have been set to output error logs to the event log, use the DLL path name that you took note of previously as explained in "4.2.5 Preparing for Output to the Event Log" to reregister the default event source name.

Note

Ensure to delete DLLs before the uninstallation. If you perform the uninstallation without doing so, you may not be able to delete the DLLs at a later time.

6. Start the command prompt

In Windows, right-click [Command Prompt] and then select [Run as administrator].

- 46 -
7. Run the uninstaller

Execute the command below.

The installation folder may remain after uninstallation. If it is not required, delete it.

Example

\texttt{x:~ installFolder\suninst.bat}

\textit{X}: Drive on which the product is installed
Appendix A  Recommended WebAdmin Environments

This appendix describes the recommended WebAdmin environment. The following explanation is based on the assumption that Internet Explorer 11 or later is used unless otherwise stated.

A.1 Recommended Browser Settings

- Use a display resolution of 1280 x 768 or higher, and 256 colors or more.
- Select [View] >> [Text size] >> [Medium].
- Select [View] >> [Zoom] >> [100%].
- Click [Tools] >> [Internet options] >> [General] >> [Fonts], and then:
  - Set [Webpage font] to [Times New Roman].
  - Set [Plain text font] to [Courier New].

A.2 How to Set Up the Pop-up Blocker

If the Pop-up Blocker is enabled, use the procedure below to configure settings to allow pop-ups from the server where FUJITSU Enterprise Postgres is installed.

1. Click [Tools] >> [Internet options], and then select the [Privacy] tab.
   If [Turn on Pop-up Blocker] is not selected, the Pop-up Blocker feature will not operate, and therefore steps below are not required.
2. Click [Settings].
3. In the [Pop-up Blocker Settings] window, enter in the [Address of website to allow] the URL of the server where FUJITSU Enterprise Postgres is installed, and then click [Add].
4. Click [Close].
5. In the [Internet Options] window, click [OK].
Appendix B Setting Up and Removing WebAdmin

This appendix describes how to set up and remove WebAdmin.

Note that "<x>" in paths indicates the product version.

B.1 Setting Up WebAdmin

This section explains how to set up WebAdmin.

B.1.1 Setting Up WebAdmin

Follow the procedure below to set up WebAdmin.

1. Log in
   Log in as a user that belongs to the Administrators group.

2. Display the setup window
   In Windows, click [All Programs] or [All apps], then [Product name], and then [WebAdmin Setup].

   ![Note]

   If the same [User Account Control] dialog box as that shown below is displayed, click [Yes] to continue processing.

3. Specify the port number
   Specify the following port numbers to be used in WebAdmin.
   Refer to the services file. Only change to a different port number if the same port number is being used by another service.
   Make a note of the Web server port number, because it will be required for starting the WebAdmin window.

<table>
<thead>
<tr>
<th>Item</th>
<th>Value (recommended value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web server port number</td>
<td>27515</td>
</tr>
<tr>
<td>WebAdmin internal port number</td>
<td>27516</td>
</tr>
<tr>
<td>WebAdmin automatic start</td>
<td>Selected</td>
</tr>
</tbody>
</table>

   **Web server port number**
   Specify an unused port number in the following range for the port number used for communication between the Web browser and Web server:
   - 1024 to 49151
   The Web server port number is registered as a port number of the following service name in the services file.
   fep_130_WA_64_WebAdmin_Port1

   **WebAdmin internal port number**
   Specify an unused port number in the following range for the port number used for communication between the Web server and WebAdmin runtime environment:
   - 1024 to 49151
   The WebAdmin internal port number is registered as a port number of the following service name in the services file.
   fep_130_WA_64_WebAdmin_Port2

   **WebAdmin automatic start**
   Select whether or not to start WebAdmin when the machine is started.
Note

- Make a note of the Web server port number for use in the Windows firewall settings.

- Unused port numbers
  In the operating system and other products, regardless of the information in the service file, unused port numbers may be automatically numbered and then used, or port numbers specified in environment files within products may also be used. Check the port numbers used by the OS and other products, and ensure that these are not duplicated.

- Access restrictions
  Prevent unauthorized access and maintain security by using a firewall product, or the packet filtering feature of a router device, to restrict access to the server IP address and the various specified port numbers.

- Port access permissions
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions.
  Consider the security risks carefully when opening ports.

- Changing port numbers
  When using WebAdmin in multi-server mode, it is recommended not to change WebAdmin ports after creating instances. Otherwise, the created instances may not be accessible through WebAdmin after the port is changed.

4. Prepare for setup

Click [OK] in the setup window, and after completing the WebAdmin setup, refer to “4.2 Preparations for Setup” and perform the required preparations for setting up FUJITSU Enterprise Postgres if using WebAdmin for operation.

B.1.2 Starting the Web Server Feature of WebAdmin

Follow the procedure below to start the Web server feature of WebAdmin.

1. Display the Services window
   In Windows, select [Administrative Tools], and then click [Services].

2. Start the service
   Select the displayed name “FUJITSU Enterprise Postgres WebAdmin version”, and then click [Start Service].
   You can also start the service by specifying the service name of the Web server feature of WebAdmin in the net start command or sc start command.

B.1.3 Stopping the Web Server Feature of WebAdmin

Follow the procedure below to stop the Web server feature of WebAdmin.

1. Display the Services window
   In Windows, select [Administrative Tools], and then click [Services].

2. Stop the service
   Select the displayed name “FUJITSU Enterprise Postgres WebAdmin version”, and then click [Stop Service].
   You can also stop the service by specifying the service name of the Web server feature of WebAdmin in the net stop command or sc stop command.

Note

- For efficient operation of WebAdmin, it is recommended to stop the Web server feature only during a scheduled maintenance period.

- When WebAdmin is used to create and manage instances in a multi-server configuration, the Web server feature must be started and running on all servers at the same time.
B.2 Removing WebAdmin

This section explains how to remove WebAdmin. This removal procedure stops WebAdmin and ensures that it no longer starts automatically when the machine is restarted.

To remove the setup, execute the command shown below.

Example

When WebAdmin is installed in "C:\Program Files\Fujitsu\fsepv<x>webadmin":

```
> C:
> cd C:\Program Files\Fujitsu\fsepv<x>webadmin\sbin
> WebAdminSetup --delete
```

Note

- The removal of the WebAdmin setup must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).
- Commands that require administrator privileges must be executed from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

B.3 Using an External Repository for WebAdmin

WebAdmin can be configured to use an external database, where it can store the various metadata information it uses. WebAdmin will use this database as a repository to store the information it uses to manage all the created instances. This can be a FUJITSU Enterprise Postgres database or an Open Source PostgreSQL V9.2 or later database.

Using an external database as a WebAdmin repository provides you with more flexibility in managing WebAdmin. This repository can be managed, backed up and restored as needed using pgAdmin or command line tools, allowing users to have greater flexibility and control.

Follow the procedure below to set up the repository.

1. Start WebAdmin, and log in to the database server.
2. Click the [Settings] tab, and then click in the [WebAdmin repository configuration] section.

Enter the following items:

- **[Host name]**: Host name of the database server
- **[Port]**: Port number of the database server
- **[Database name]**: Name of the database
- **[User name]**: User name to access the database
- **[Password]**: Password of the database user

**Note**

- **Database type**
  It is recommended to use a FUJITSU Enterprise Postgres database as a repository. A compatible PostgreSQL database can also be used as an alternative.
- It is recommended to click [Test connection] to ensure that the details entered are valid and WebAdmin is able to connect to the target database.
- Host name, Database name, User name, Password should not contain hazardous characters. Refer to "Appendix C WebAdmin Disallow User Inputs Containing Hazardous Characters".

3. Click to register the repository details.
Once the repository is set up, it can be changed any number of times by the user logged into WebAdmin. When a repository is changed:
- It is recommended to preload the backup into this database.
- If the data is not preloaded, WebAdmin will create a new repository.
- The database repository can be set up even after WebAdmin was already used to create instances. In that scenario, the instances already created are retained and can continue to be operated on.
- If the instance used as a repository is stopped, WebAdmin will be unusable. For this reason, it is recommended to be familiar with starting an instance from the command line. If the instance is stopped for any reason, start it from the command line and WebAdmin will be usable again.

B.4 Using the WebAdmin Auto-Refresh Feature

The WebAdmin auto-refresh feature automatically refreshes the operating status of all instances in the Instance list at the specified interval. It also refreshes the details of the selected instance.

Follow the procedure below to configure the auto-refresh options.

1. Click the [Settings] tab, and then click in the [User preferences] section.
2. Enter the following items:
   - [Auto-refresh instance]: To use the auto-refresh feature, select "Enabled". The default is "Disabled".
   - [Refresh interval (seconds)]: Number of seconds between each refresh. This is a countdown timer, which is reset every time the instance status is refreshed by any operation. Specify a value from 30 to 3600 (seconds). The default is 30.
3. Click to save the auto-refresh settings.

Note
- Auto-refresh will run only if the [Instances] page is displayed and no user-initiated operation is in progress.
- A text indicator, which is independent of auto-refresh, is displayed at the top of the Instance list. It is dynamically updated to display when the page was last refreshed.
Appendix C  WebAdmin Disallow User Inputs Containing Hazardous Characters

WebAdmin considers the following as hazardous characters, which are not allowed in user inputs.

| (pipe sign)
& (ampersand sign)
; (semicolon sign)
$ (dollar sign)
% (percent sign)
@ (at sign)
' (single apostrophe)
" (quotation mark)
\' (backslash-escaped apostrophe)
\* (backslash-escaped quotation mark)
<> (triangular parenthesis)
() (parenthesis)
+ (plus sign)
CR (Carriage return, ASCII 0x0d)
LF (Line feed, ASCII 0x0a)
, (comma sign)
\ (backslash)
Appendix D Configuring Parameters

WebAdmin operates and manages databases according to the contents of the following configuration files:

- **postgresql.conf**
  Contains various items of information that define the operating environment of FUJITSU Enterprise Postgres.

- **pg_hba.conf**
  Contains various items of information related to client authentication.

These configuration files are deployed to a data storage destination. Data is written to them when the instance is created by WebAdmin and when settings are changed, and data is read from them when the instance is started and when information from the [Setting] menu is displayed.

Direct editing of each configuration file is possible with a text editor.

See

Refer to "Server Configuration" and "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on the parameters.

Note

WebAdmin checks for port number and backup storage path anomalies when various operations are performed. An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of the corresponding parameter in postgresql.conf. Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.

**postgresql.conf**

Parameters that can be changed in WebAdmin

The `postgresql.conf` parameters that can be changed in WebAdmin are shown below:

<table>
<thead>
<tr>
<th>Section</th>
<th>WebAdmin item</th>
<th><code>postgresql.conf</code> file parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Instance Configuration</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Character encoding</td>
<td>Character set</td>
<td><code>client_encoding</code></td>
</tr>
<tr>
<td></td>
<td>Message locale</td>
<td><code>lc_messages</code></td>
</tr>
<tr>
<td>Communication</td>
<td>Max connections</td>
<td><code>max_connections</code></td>
</tr>
<tr>
<td>SQL options</td>
<td>Transform NULL format</td>
<td><code>transform_null_equals</code></td>
</tr>
<tr>
<td></td>
<td>Date output format</td>
<td><code>DateStyle (*1)</code></td>
</tr>
<tr>
<td></td>
<td>Interval output format</td>
<td><code>IntervalStyle</code></td>
</tr>
<tr>
<td></td>
<td>Number of digits for floating values</td>
<td><code>extra_float_digits</code></td>
</tr>
<tr>
<td></td>
<td>Transaction isolation levels</td>
<td><code>default_transaction_isolation</code></td>
</tr>
<tr>
<td></td>
<td>Currency format</td>
<td><code>lc_monetary</code></td>
</tr>
<tr>

<td>Sort memory (KB)</td>
<td><code>work_mem</code></td>
</tr>
<tr>
<td></td>
<td>Shared buffers (KB)</td>
<td><code>shared_buffers</code></td>
</tr>
<tr>
<td>Streaming replication</td>
<td>WAL level</td>
<td><code>wal_level</code></td>
</tr>
</tbody>
</table>
### Information

- Calculate the maximum number of connections using the formula below:

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + 3 \quad (*1)
\]

*1: 3 is the default number of connections required by the system.

Calculate the maximum number of connections using the following formula when changing `superuser_reserved_connections` (connections reserved for use by the superuser) in `postgresql.conf`.

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + \text{superuser_reserved_connections}
\]

- Also check if the memory used exceeds the memory installed (refer to "Parameters automatically set by WebAdmin according to the amount of memory").

### Parameters set by WebAdmin

The following `postgresql.conf` parameters are set by WebAdmin during instance startup (they will be ignored even if specified in `postgresql.conf`):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>event_source (*1)</code></td>
<td>'fsep_version_userName_instanceNamePortNumber'</td>
</tr>
<tr>
<td><code>listen_addresses</code></td>
<td>*</td>
</tr>
<tr>
<td><code>log_destination</code></td>
<td>'stderr,eventlog'</td>
</tr>
<tr>
<td><code>logging_collector</code></td>
<td>on</td>
</tr>
<tr>
<td><code>log_line_prefix</code></td>
<td>'%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a'</td>
</tr>
<tr>
<td><code>log_filename (*2) (*3)</code></td>
<td>'logfile-%a.log'</td>
</tr>
<tr>
<td><code>log_truncate_on_rotation</code></td>
<td>on</td>
</tr>
<tr>
<td><code>log_rotation_age</code></td>
<td>1d</td>
</tr>
</tbody>
</table>

*1: `PortNumber` is the port number of the database server specified when creating the instance.

*2: The server logs are split into files based on the day of the week, and are rotated after each week.

*3: If the date changes while the instance is stopped, old logs are not deleted and continue to exist. Manually delete old logs that are no longer required to release disk space.
Parameters automatically set by WebAdmin according to the amount of memory

The postgresql.conf parameters automatically set according to the amount of installed memory, during the creation of instances by WebAdmin, are shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30% of the machine's installed memory</td>
</tr>
<tr>
<td>work_mem</td>
<td>30% of the machine's installed memory / max_connections / 2</td>
</tr>
<tr>
<td>effective_cache_size</td>
<td>75% of the machine's installed memory</td>
</tr>
<tr>
<td>maintenance_work_mem</td>
<td>10% of the machine's installed memory / (1 + autovacuum_max_workers) (*)</td>
</tr>
</tbody>
</table>

*1: The value will be capped at 2097151 KB.

When determining the values to be configured in the above parameters, you must take into account any anticipated increases in access volume or effects on performance during business operations, such as the number of applications and commands that will access the instance, and the content of processes. Also, note that in addition to FUJITSU Enterprise Postgres, other software may be running on the actual database server. You will need to determine the degree of priority for the database and other software, as well as the memory allocation size.

WebAdmin automatically configures complex parameter settings such as those mentioned above, based on the size of the internal memory of the machine. This enables maximum leverage of the machine memory to facilitate resistance against fluctuations during business operations.

Accordingly, the effects of the above-mentioned factors must be estimated and taken into account when determining and configuring parameter values, so that memory resources can be effectively allocated among other software or instances, and so that adverse effects can be mutually avoided. Refer to "Memory" in "Resource Consumption", and "Planner Cost Constants" in "Query Planning", under "Server Administration" in the PostgreSQL Documentation for information on parameter values and required considerations.

Parameter values can be modified using the WebAdmin [Setting] menu, or edited directly using a text editor.

If adding an instance, determine the parameter values, including for existing instances, and make changes accordingly.

Note

- Do not directly edit the following postgresql.conf parameters with a text editor, otherwise WebAdmin may not work properly if you make a mistake:
  - archive_mode
  - archive_command
  - wal_level
  - wal_sync_method
  - log_line_prefix
  - log_destination
  - logging_collector
  - log_directory
  - log_file_mode
  - log_filename
  - log_truncate_on_rotation
  - log_rotation_age
  - event_source
You must take care with the following parameter:

- superuser_reserved_connections

Set it to a number that includes the 3 connections required in WebAdmin (the default is 3).

---

**pg_hba.conf**

Refer to "Client Authentication" in “Server Administration” in the PostgreSQL Documentation for information on content that can be configured in pg_hba.conf.

---

**Note**

- Use the following client authentication settings to allow the instance administrator to connect to the database using WebAdmin:
  - The connection type: "host"
  - The IP address is a loopback address ("127.0.0.1/32")
- If you specify an item or value that cannot be set by WebAdmin when editing the pg_hba.conf file with a text editor, it will not be possible to reference that line from WebAdmin.
Appendix E Estimating Database Disk Space Requirements

This appendix describes how to estimate database disk space requirements.

E.1 Estimating Table Size Requirements

The following tables provide the formulas for estimating table size requirements.

Table E.1 Estimation formula when the record length is 2032 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Record length</td>
<td>27(*1) + NULL map + OID + column data</td>
</tr>
<tr>
<td></td>
<td>NULL map: Number of columns / 8 (*2)</td>
</tr>
<tr>
<td></td>
<td>OID: 4</td>
</tr>
<tr>
<td></td>
<td>Column data: Sum of column lengths</td>
</tr>
<tr>
<td></td>
<td>*1: Record header section</td>
</tr>
<tr>
<td></td>
<td>*2: Round the result up to the next integer.</td>
</tr>
<tr>
<td></td>
<td>- Because the column data is placed in boundaries of 8 bytes, you need to make an adjustment so that the sum of the record header section, NULL map and OID is a multiple of 8. For example, if the calculated length is 27 + 1 / 8 (rounded up) + 0 = 28 bytes, add 4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- Because the data of each column is placed in boundaries of the defined data type, take the boundary of each data type into account for the length of the column data. For example, the length of the column data in the table below will not be the sum of the data types, which is 37 bytes, but will instead be 64 bytes following boundary adjustment. Definition: create table tb1(c1 char(1), c2 long, c3 int, c4 box) Estimation: CHAR type 1 byte + boundary adjustment of 7 bytes for LONG type 8 bytes + LONG type 8 bytes + INT type 4 bytes + boundary adjustment of 12 bytes for BOX type 32 bytes + BOX type 32 bytes = 64 bytes</td>
</tr>
<tr>
<td></td>
<td>- Because each record is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the column data is a multiple of 8.</td>
</tr>
<tr>
<td></td>
<td>- If the calculated record length exceeds 2,032 bytes, the variable length data in the record might be compressed automatically. If so, use the estimation formulas in &quot;Table E.2 Estimation formula when the record length exceeds 2032 bytes&quot; to estimate the table size.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>(2) Page size requirement</th>
<th>8192 (*1) × fillfactor (*2) - 24 (*3)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>*1: Page length (8192)</td>
</tr>
<tr>
<td></td>
<td>*2: Value of the fillfactor specified in the table definitions (if omitted, 100%)</td>
</tr>
<tr>
<td></td>
<td>*3: Page header (24)</td>
</tr>
<tr>
<td></td>
<td>- The calculated (2) page size requirement will be rounded down to the nearest integer.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>(3) Number of records per page</th>
<th>(2) Page size requirement / ((1) record length + 4 (*1))</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>*1: Pointer length (4)</td>
</tr>
<tr>
<td></td>
<td>- The result will be rounded down to the nearest integer.</td>
</tr>
</tbody>
</table>
### Table E.2 Estimation formula when the record length exceeds 2032 bytes

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5) Amount of space</td>
<td>Total number of records x (1) record length x safety factor (*1)</td>
</tr>
<tr>
<td></td>
<td>*1: Specify 2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>- This is the safety factor assumed if vacuuming is performed for garbage collection in tables and indexes.</td>
</tr>
</tbody>
</table>

### E.2 Estimating Index Size Requirements

This section provides the formulas for estimating index size requirements.

FUJITSU Enterprise Postgres provides six index types: B-tree, Hash, GiST, GIN, SP-GiST, and VCI. If you do not specify the index type in the CREATE INDEX statement, a B-tree index is generated.

The following describes how to estimate a B-tree index. Refer to "E.7 Estimating VCI Disk Space Requirements" for information on how to estimate VCI.

A B-tree index is saved as a fixed-size page of 8 KB. The page types are meta, root, leaf, internal, deleted, and empty. Since leaf pages usually account for the highest proportion of space required, you need to calculate the requirements for these only.

### Table E.3 Estimation formula when the key data length is 512 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Entry length</td>
<td>8 (*1) + key data length (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: Entry header</td>
</tr>
<tr>
<td></td>
<td>*2: The key data length depends on its data type (refer to &quot;E.3 Sizes of Data Types&quot; for details).</td>
</tr>
<tr>
<td></td>
<td>Because each entry is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the key data is a multiple of 8. For example, if the calculated length is 28 bytes, add 4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- If the key data length exceeds 512 bytes, key data may be automatically compressed.</td>
</tr>
<tr>
<td></td>
<td>In this case, use the estimation formula given in &quot;Table E.4 Estimation formula when the key data length exceeds 512 bytes&quot; to estimate the key data length.</td>
</tr>
<tr>
<td>(2) Page size requirement</td>
<td>8192 (*1) × fillfactor (*2) - 24 (*3) - 16 (*4)</td>
</tr>
<tr>
<td></td>
<td>*1: Page length (8192)</td>
</tr>
<tr>
<td></td>
<td>*2: Value of the fillfactor specified in the index definitions (if omitted, 90%)</td>
</tr>
<tr>
<td></td>
<td>In the case of indexes of primary key constraints and unique constraints,</td>
</tr>
<tr>
<td></td>
<td>the value of the fillfactor specified for each constraint in the table definitions (if omitted, 90%)</td>
</tr>
<tr>
<td></td>
<td>*3: Page header (24)</td>
</tr>
<tr>
<td></td>
<td>*4: Special data (16)</td>
</tr>
</tbody>
</table>
Table E.4 Estimation formula when the key data length exceeds 512 bytes

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5) Space requirement</td>
<td>Total number of records x key data length x compression ratio (*1) / usage rate (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: The compression ratio depends on the data value, so specify 1.</td>
</tr>
<tr>
<td></td>
<td>*2: Specify 0.7 or lower as the usage rate.</td>
</tr>
</tbody>
</table>

E.3 Sizes of Data Types

This section lists the sizes of the data types.

E.3.1 Sizes of Fixed-Length Data Types

The following table lists the sizes of fixed-length data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMALLINT (INT2)</td>
<td>2</td>
</tr>
<tr>
<td>INTEGER (INT4)</td>
<td>4</td>
</tr>
<tr>
<td>BIGINT (INT8)</td>
<td>8</td>
</tr>
<tr>
<td>REAL</td>
<td>4</td>
</tr>
<tr>
<td>DOUBLE PRECISION</td>
<td>8</td>
</tr>
<tr>
<td>SERIAL (SERIAL4)</td>
<td>4</td>
</tr>
<tr>
<td>BIGSERIAL (SERIAL8)</td>
<td>8</td>
</tr>
<tr>
<td>MONEY</td>
<td>8</td>
</tr>
<tr>
<td>FLOAT</td>
<td>8</td>
</tr>
<tr>
<td>FLOAT (1-24)</td>
<td>4</td>
</tr>
<tr>
<td>FLOAT (25-53)</td>
<td>8</td>
</tr>
<tr>
<td>TIMESTAMP WITHOUT TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>DATE</td>
<td>4</td>
</tr>
<tr>
<td>TIME WITHOUT TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>TIME WITH TIME ZONE</td>
<td>12</td>
</tr>
</tbody>
</table>
### E.3.2 Sizes of Variable-Length Data Types

The following table lists the sizes of variable-length data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Length of size portion + 12 + 16 x number of vertices</td>
<td>1) When carrying out division, round to the next integer.</td>
</tr>
<tr>
<td>polygon</td>
<td>Length of size portion + 36 + 16 x number of vertices</td>
<td>2) If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes.</td>
</tr>
<tr>
<td>decimal</td>
<td>Length of size portion + 2 + (integer precision / 4 + decimal precision / 4) x 2</td>
<td>3) The number of bytes per character depends on the character set (refer to &quot;E.3.4 Number of Bytes per Character&quot; for details).</td>
</tr>
<tr>
<td>numeric</td>
<td>Length of size portion + real data length</td>
<td></td>
</tr>
<tr>
<td>bytea</td>
<td>Length of size portion + number of characters x number of bytes per character</td>
<td></td>
</tr>
<tr>
<td>character varying(n), varchar(n)</td>
<td>Length of size portion + number of characters x number of bytes per character</td>
<td></td>
</tr>
<tr>
<td>character(n), char(n)</td>
<td>Length of size portion + n x number of bytes per character</td>
<td></td>
</tr>
<tr>
<td>text</td>
<td>Length of size portion + number of characters x number of bytes per character</td>
<td></td>
</tr>
</tbody>
</table>

### E.3.3 Sizes of Array Data Types

The following table lists the sizes of array data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Length of size portion + 12 + 8 x number of dimensions + data size of each item</td>
<td>If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Example of estimation when array data is &quot;ARRAY([[1,2,3], [1,2,3]])&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Number of dimensions: 2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>INTEGER data size: 4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Total size = 1+12+8x2+6x4 = 53</td>
</tr>
</tbody>
</table>
E.3.4 Number of Bytes per Character

The following table lists the number of bytes per character.
The given values relate to the common character sets EUC-JP and UTF8.

<table>
<thead>
<tr>
<th>Character type</th>
<th>Character set</th>
<th>Number of bytes per character</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>
<td>EUC_JP</td>
<td>1</td>
</tr>
<tr>
<td>Halfwidth katakana</td>
<td>EUC_JP</td>
<td>2</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>EUC_JP</td>
<td>2</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>EUC_JP</td>
<td>3</td>
</tr>
<tr>
<td>ASCII</td>
<td>UTF8</td>
<td>1</td>
</tr>
<tr>
<td>Halfwidth katakana</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
</tbody>
</table>

E.4 Estimating Transaction Log Space Requirements

This section provides the formula for estimating transaction log space requirements.

\[
\text{Transaction log space requirements} = \text{max_wal_size}
\]

However, if the update volume is extremely high (for example, due to a large data load and batch processing), disk writing at a checkpoint may not be able to keep up with the load, and a higher number of transaction logs than indicated here may temporarily be accumulated.

E.5 Estimating Archive Log Space Requirements

This section explains how to estimate archive log space requirements.
The archive log is an archive of the transaction logs from the time of a previous backup to the present, so it fluctuates depending on the backup period and the content of update transactions.
The longer the backup period and the more update transactions, the greater the space required for the archive log.
Therefore, measure the actual archive log space by using a test environment to simulate backup scheduling and database update in a real operating environment.

E.6 Estimating Backup Disk Space Requirements

This section provides the formula for estimating backup disk space requirements.

\[
\text{Backup disk space requirements} = \text{size of the database cluster} \times 2 + \text{transaction log space requirements} + \text{archive log space requirements}
\]

Note

If the pgx_dmpall command performs a backup using a user exit, the backup disk size differs according to the database resources targeted for backup and the copy method.

E.7 Estimating VCI Disk Space Requirements

This section provides the formula for estimating VCI disk space requirements.

\[
\text{Disk space} = (\text{number of rows in tables}) \times (\text{number of bytes per row}) \times (\text{compression ratio}) + \text{(WOS size)}
\]
Number of bytes per row

\[
\text{Number of bytes per row} = (19 + \frac{\text{(number of columns specified in CREATE INDEX)}}{8} + \frac{\text{(number of bytes per single column value)}}{1.1}) \times 1.1
\]

Note: Round up the result to the nearest integer.

Compression ratio

Specify a value between 0 and 1. Since compression ratio depends on the data being compressed, use actual data or test data that simulates it, then compare the value with the estimation result. As a guide, the compression ratio measured with the Fujitsu sample data is shown below:

- Data with high degree of randomness (difficult to compress): Up to approximately 0.9 times.
- Data with high degree of similarity (easy to compress): Up to approximately 0.5 times.

WOS size

\[
\text{WOS size} = \frac{\text{(number of WOS rows)}}{185 \times 8096}
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Note

VCI does not support retrieval of disk space usage using the database object size function pg_indexes_size. To find out the actual total VCI disk space, check the disk space of the storage directory using an OS command or other method.
APPENDIX F  Estimating Memory Requirements

This appendix explains how to estimate the memory.

F.1 FUJITSU Enterprise Postgres Memory Requirements

This section describes the formulas for estimating FUJITSU Enterprise Postgres memory requirements.

Use the following formula to obtain a rough estimate of memory required for FUJITSU Enterprise Postgres:

\[
\text{fujitsuEnterprisePostgresRequiredMemory} = \text{sharedMemoryAmount} + \text{localMemoryAmount}
\]

Shared memory amount

Refer to "Shared Memory and Semaphores" under "Server Administration" in the PostgreSQL Documentation for information on shared memory. If you enable the Global Meta Cache feature, you must also add the value of \( \text{pgx\_global\_metacache} \). Refer to "Parameters" in the Operation Guide for the setting values.

However, note that if instances have been created using WebAdmin, the parameters below will be configured automatically when the instances are created. Take this into account when calculating the shared memory size.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30 percent of the internal memory of the machine.</td>
</tr>
<tr>
<td>max_connections</td>
<td>100</td>
</tr>
<tr>
<td>max_prepared_transactions</td>
<td>100</td>
</tr>
</tbody>
</table>

Local memory amount

\[
\text{localMemoryAmount} = \text{processStackArea} + \text{memoryUsedInDbSessionsThatUseTempTables} + \text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} + \text{memoryUsedInMaintenanceOperations} + \text{baseMemoryUsedInEachProcess} + \text{memoryUsedPreparingForDataAccess}
\]

Process stack area

\[
\text{processStackArea} = \text{max\_stack\_depth} \times (\text{max\_connections} + \text{autovacuum\_max\_workers} + 9)
\]

This formula evaluates to the maximum value.
Actually it is used according to the growth of the stack.
In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used in database sessions that use temporary tables

\[
\text{memoryUsedInDbSessionsThatUseTempTables} = \text{temp\_buffers} \times \text{max\_connections}
\]

This formula evaluates to the maximum value.
Memory is gradually used as temporary buffers are used, and is released when the session ends.

Memory used in database sessions that perform sort and hash table operations

\[
\text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} = \text{work\_mem} \times \text{max\_connections}
\]

This formula evaluates to the maximum value.
Memory is gradually used as operations such as sort are performed, and is released when the query ends.
Memory used in maintenance operations

\[
\text{memoryUsedInMaintenanceOperations} = \text{maintenance_work_mem} \times (\text{numOfSessionsPerformingMaintenance} + \text{autovacuum_max_workers})
\]

Note that ‘maintenance operations’ are operations such as VACUUM, CREATE INDEX, and ALTER TABLE ADD FOREIGN KEY.

Base memory used in each process

\[
\text{baseMemoryUsedInEachProcess} = \text{baseMemoryUsedInOneProcess} \times (\text{max_connections} + \text{autovacuum_max_workers} + 9)
\]

Use the result of the following formula for memory consumed per process. This formula evaluates to the memory used when server processes are running.

In the formula above, 9 is the number of processes that perform roles specific to servers.

The amount of memory consumed per process is determined by the number of tables, indexes, and all columns of all tables that the process accesses. If your system has about 100 tables, you can estimate it to be 3 MB, but otherwise use the following estimate:

\[
\text{baseMemoryUsedInOneProcess} = (1.9\text{KB} \times \text{All user tables} + 2.9\text{KB} \times \text{All user indexes} + 1.0\text{KB} \times \text{All user columns}) \times 1.5(*1)
\]

If you enable the Global Meta Cache feature, use the following formula:

\[
\text{baseMemoryUsedInOneProcess} = (\text{All user tables} + \text{All user indexes} + \text{All user columns}) \times 1.0\text{KB} \times 1.5 (*1) + (\text{All user tables} \times 1.4\text{KB} + \text{All user indexes} \times 2.4\text{KB})
\]

*1) Safety Factor (1.5)
There are variable length information. This value takes that into account.

Memory used preparing for data access

\[
\text{memoryUsedPreparingForDataAccess} = \text{variationAmount} \times (\text{max_connections} + \text{autovacuum_max_workers} + 4)
\]

where \(\text{variationAmount} = \frac{\text{shared_buffers}}{8\text{KB}} \times 4\text{ bytes}\)
(note that 8KB is the page length, and 4 bytes is the size of page management data)

This formula evaluates to the memory required to access the database cache in the shared memory.
In the formula above, among the processes that perform roles specific to servers, 4 is the number of processes that access the database.

F.2 Database Multiplexing Memory Requirements

This section describes the formula for estimating database multiplexing memory requirements for the database server.

Use the following formula to obtain a rough estimate of memory required for database multiplexing:

Memory usage of the database multiplexing feature for the database server
\[= \text{Peak memory usage of the Mirroring Controller processes} + \text{Peak memory usage of the Mirroring Controller commands}\]

Peak memory usage of the Mirroring Controller processes=150 MB
Peak memory usage of the Mirroring Controller commands=50 MB x Number of commands executed simultaneously

F.3 VCI Memory Requirements

This section describes the formula for estimating VCI memory requirements.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{memUsedByVci} = \text{memForData} + \text{memForEachProcess}
\]
**Memory required to store data in memory**

Secure the space estimated using the formula below on the stable buffer (part of shared_buffers).

\[
\text{memForData} = (\text{numOfRowsInTables}) \times (\text{numOfBytesPerRow}) + (\text{wosSize})
\]

**Number of bytes per row**

\[
\text{numOfBytesPerRow} = (19 + (\text{numOfColsInCreateIndexStatement}) / 8 + (\text{numOfBytesPerSingleColValue})) \times 1.1
\]

Note: Round up the result to the nearest integer.

**WOS size**

\[
\text{wosSize} = (\text{numOfWosRows}) / 185 \times 8096
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

**Memory required for each process**

\[
\text{memForEachProcess} = \text{memUsedPerScanning} + \text{memUsedForVciMaintenace} + \text{memUsedByCreateIndexStatement}
\]

**Memory used per scanning**

- **Parallel scan**

\[
\text{memUsedPerScanning} = \text{vci.shared_work_mem} + (\text{numOfParallelWorkers} + 1) \times \text{vci.maintenance_work_mem}
\]

Note: The number of parallel workers used by VCI simultaneously in the entire instance is equal to or less than vci.max_parallel_degree.

- **Non-parallel scan**

\[
\text{memUsedPerScanning} = \text{vci.max_local_ros} + \text{vci.maintenance_work_mem}
\]

**Note**

- vci.shared_work_mem, and vci.max_local_ros are used to create local ROS. If local ROS exceeds these sizes, execute a query without using VCI according to the conventional plan.
- vci.maintenance_work_mem specifies the memory size to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.

**Memory used for VCI maintenance**

\[
\text{memUsedForVciMaintenace} = \text{vci.maintenance_work_mem} \times \text{vci.control_max_workers}
\]

**Memory used by CREATE INDEX**

\[
\text{memUsedByCreateIndexStatement} = \text{vci.maintenance_work_mem}
\]
Note

ci.maintenance_work_mem specifies the memory to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.

F.4 High-Speed Data Load Memory Requirements

This section describes the formula for estimating memory requirements for the high-speed data load feature.

Use the following formula to obtain a rough estimate of memory requirements:

<table>
<thead>
<tr>
<th>Memory usage of high speed data load</th>
</tr>
</thead>
<tbody>
<tr>
<td>= (Peak memory usage of pgx_loader processes + Peak memory usage of the pgx_loader commands) x Number of commands executed simultaneously</td>
</tr>
</tbody>
</table>

Peak memory usage of pgx_loader processes

- Peak memory usage of the backend process (6 MB)
- Peak memory usage of parallel workers (6 MB x number of parallel workers)
- Peak memory usage of dynamic shared memory (80 MB x number of parallel workers)

Peak memory usage of the pgx_loader commands = 9 MB

Point

In addition to the size calculated using the formula above, the database cache on the shared memory estimated using the shared_buffers parameter is consumed according to the size of the data (table and index keys) loaded using this feature. Refer to "E.1 Estimating Table Size Requirements" and "E.2 Estimating Index Size Requirements" for information on estimating an appropriate shared buffers value.

F.5 Global Meta Cache Memory Requirements

This section describes the formula for estimating Global Meta Cache memory requirements.

The memory calculated by “Size of the GMC area” is allocated to the shared memory. The memory calculated by the per-process meta cache management information is allocated to the local memory. Refer to the graphic in "Architecture of Global Meta Cache Feature" in the "Memory usage reduction by Global Meta Cache” in the General Description for more information.

Use the following formula to obtain a rough estimate of memory requirements:

<table>
<thead>
<tr>
<th>Amount of memory used by the Global Meta Cache feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>= Size of GMC area + Per-process meta cache management information</td>
</tr>
</tbody>
</table>

Size of GMC area = (All user tables x 0.4 KB + All user indexes x 0.3 KB + All user columns x 0.8 KB) x 1.5 (*1)

Per-process meta cache management information

= (All user tables + All user indexes + All user columns) x 0.1KB x max_connections x 1.5 (*1)

*1) Safety Factor (1.5)

This value takes into account the case where both GMC before and after the change temporarily exist at the same time in shared memory when the table definition is changed or the row of the system catalog is changed.
### Appendix G Quantitative Limits

This appendix lists the quantitative limits of FUJITSU Enterprise Postgres.

#### Table G.1 Length of identifier

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Schema name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>View name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Index name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Tablespace name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cursor name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Aggregate function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Trigger name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Constraint name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Role name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cast name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Collation sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Encoding method conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Domain name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Extension name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator class name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator family name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Rewrite rule name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search settings name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search dictionary name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search parser name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search template name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Data type name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Enumerator type label</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

*2: If an identifier that exceeds 63 bytes in length is specified, the excess characters are truncated and it is processed.

#### Table G.2 Database object

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of databases</td>
<td>Less than 4,294,967,296 (*1)</td>
</tr>
<tr>

</tr>
<tr>
<td>Number of text search dictionaries</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of text search parsers</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of text search templates</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of data types</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of enumerator type labels</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of default access privileges defined in the ALTER DEFAULT PRIVILEGES statement</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of large objects</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of index access methods</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
</tbody>
</table>

*1: The total number of all database objects must be less than 4,294,967,296.

Table G.3 Schema element

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns that can be defined in one table</td>
<td>From 250 to 1600 (according to the data type)</td>
</tr>
<tr>
<td>Table row length</td>
<td>Up to 400 gigabytes</td>
</tr>
<tr>

Appendix H Determining the Preferred WebAdmin Configuration

This appendix describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration.

H.1 WebAdmin Configurations

WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

WebAdmin does not support encrypted communication between browser and server or between servers. Therefore, when using WebAdmin in either configuration, build the communication path with the browser or each server on a network that cannot be accessed externally.

H.1.1 Single-Server Configuration

A single-server configuration enables you to create and operate instances on a single server. In this configuration, WebAdmin must be installed on the same database server as the FUJITSU Enterprise Postgres Server component.

Single-server configuration

H.1.2 Multiserver Configuration

A multiserver configuration enables you to create and operate instances stored on multiple database servers. As shown in the figure below, WebAdmin can be installed on a dedicated WebAdmin server and used to collectively manage the instances stored on the database servers.

Multiserver configuration
Also, when setting up the arbitration server by WebAdmin during database multiplexing mode, install WebAdmin on the arbitration server.

H.2 Installing WebAdmin in a Single-Server Configuration

To install WebAdmin in a single-server configuration, the FUJITSU Enterprise Postgres Server component and WebAdmin must be installed on the same machine.
Select the following items when installing FUJITSU Enterprise Postgres in a single-server configuration:

- FUJITSU Enterprise Postgres Advanced Edition or FUJITSU Enterprise Postgres Standard Edition
- WebAdmin

H.3 Installing WebAdmin in a Multiserver Configuration

In a multiserver configuration, install WebAdmin on one server, and both WebAdmin and the FUJITSU Enterprise Postgres Server component on any number of database servers.

Select the following items when installing FUJITSU Enterprise Postgres in a multiserver configuration:

- WebAdmin server:
  - WebAdmin
- Database server:
  - FUJITSU Enterprise Postgres Advanced Edition or FUJITSU Enterprise Postgres Standard Edition
  - WebAdmin

Also, when setting up the arbitration server by WebAdmin during database multiplexing mode, select the following when installing FUJITSU Enterprise Postgres.

- Arbitration server
  - FUJITSU Enterprise Postgres Server Assistant
  - WebAdmin

See Refer to the Installation and Setup Guide for Server Assistant for details on how to install the Server Assistant.
Appendix I  Supported contrib Modules and Extensions Provided by External Projects

FUJITSU Enterprise Postgres supports PostgreSQL contrib modules, and extensions provided by external projects.

Refer to the following for details on the supported contrib modules:

- "Additional Supplied Modules" in the PostgreSQL Documentation
- "Additional Supplied Programs" in the PostgreSQL Documentation

Information

You can also check the list of available extensions using the pg_available_extensions view.

Refer to "OSS Supported by FUJITSU Enterprise Postgres" in the General Description for information on supported extensions provided by external projects.

FUJITSU Enterprise Postgres 13

Installation and Setup Guide for Client
Preface

Purpose of this document

This document describes how to install, uninstall and set up the "FUJITSU Enterprise Postgres client feature".

Intended readers

This document is intended for those who install and operate FUJITSU Enterprise Postgres.

Readers of this document are assumed to have general knowledge of:

- PostgreSQL
- SQL
- Windows
- PostgreSQL
- SQL
- Linux

Structure of this document

This document is structured as follows:

Chapter 1 Overview of Installation

Describes the features that can be installed, and provides an overview of installation methods

Chapter 2 Installation and Uninstallation of the Windows Client

Describes how to install the FUJITSU Enterprise Postgres client feature (Windows client)

Chapter 3 Installation and Uninstallation of the Linux Client

Describes how to install the FUJITSU Enterprise Postgres client feature (Linux client)

Chapter 4 Setup

Describes the setup procedures to be performed after installation completes

Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that can be Installed

FUJITSU Enterprise Postgres provides features to enable access to the database from a variety of platforms and languages, as the connection environment for the client and the database server.

The FUJITSU Enterprise Postgres client package must be installed on the client system to use these features.

The following table shows the relationship between the platforms and the features provided by client packages.

<table>
<thead>
<tr>
<th>Platform</th>
<th>JDBC</th>
<th>ODBC</th>
<th>.NET Data Provider</th>
<th>C language (libpq)</th>
<th>Embedded SQL (ECPG) in C language</th>
<th>Embedded SQL (ECOBP) in COBOL</th>
<th>Connect Manager</th>
<th>High-speed data load</th>
<th>pgAdmin</th>
<th>Pgpool-II</th>
</tr>
</thead>

1.2 Installation Types

The following installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, the FUJITSU Enterprise Postgres client feature is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

Perform multi-version installation to install different versions to the installed program files separately.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.
1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In interactive mode installation, the FUJITSU Enterprise Postgres installer automatically determines the installation state of FUJITSU Enterprise Postgres. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
- Multi-version installation

1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres client feature.
Chapter 2 Installation and Uninstallation of the Windows Client

This chapter explains how to install and uninstall the Windows client.

2.1 Operating Environment

This section describes the operating environment required to use the Windows client.

2.1.1 Required Operating System

One of the following operating systems is required to use the Windows client:

- Windows(R) 8.1
- Windows(R) 8.1 Pro
- Windows(R) 8.1 Enterprise
- Windows(R) 10 Home
- Windows(R) 10 Education
- Windows(R) 10 Pro
- Windows(R) 10 Enterprise
- Microsoft(R) Windows Server(R) 2012 Datacenter
- Microsoft(R) Windows Server(R) 2012 Standard
- Microsoft(R) Windows Server(R) 2012 Essentials
- Microsoft(R) Windows Server(R) 2012 Foundation
- Microsoft(R) Windows Server(R) 2012 R2 Datacenter
- Microsoft(R) Windows Server(R) 2012 R2 Standard
- Microsoft(R) Windows Server(R) 2012 R2 Essentials
- Microsoft(R) Windows Server(R) 2012 R2 Foundation
- Microsoft Windows Server 2016 Datacenter
- Microsoft Windows Server 2016 Standard
- Microsoft Windows Server 2016 Essentials
- Microsoft Windows Server 2019 Datacenter
- Microsoft Windows Server 2019 Standard
- Microsoft Windows Server 2019 Essentials

**Note:** If Windows is 32 bit, only the Windows client (32 bit) can be installed.

**Note**

The following components of Windows Server(R) 2016 and Windows Server(R) 2019 are not supported:

- Server Core
- Nano Server
- Windows Server Container
2.1.2 Related Software

The following table lists the software compatible (that can operate) with the Windows client. Before using any of these, confirm that the OS supports the software.

Table 2.1 Related software

<table>
<thead>

<td>(*3)</td>
</tr>
</tbody>
</table>

*1: Only operations using the C compiler provided with the operating system are guaranteed.

*2: NetCOBOL is available in the following editions:
- NetCOBOL Base Edition V10.5.0 or later
- NetCOBOL Standard Edition V10.5.0 or later
- NetCOBOL Professional Edition V10.5.0 or later
- NetCOBOL Enterprise Edition V10.5.0 or later

*3: NetCOBOL for .NET is available in the following editions:
- NetCOBOL Standard Edition for .NET V5.0.0 or later
- NetCOBOL Professional Edition for .NET V5.0.0 or later
- NetCOBOL Enterprise Edition for .NET V5.0.0 or later

Note

The following JDKs or JREs are available:
- JDK or JRE shipped with the Interstage Application Server
- Oracle JDK or JRE
- An OpenJDK that has passed the Java TCK (Technology Compatibility Kit)

It is recommended that the JDK or JRE included with Interstage Application Server is used.

The following table lists servers that can be connected to the Windows client.

Table 2.2 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FJUITUS Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td>Linux</td>
<td>- FJUITUS Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
</tbody>
</table>
2.1.3 Excluded Software

FUJITSU Enterprise Postgres

Other products

There are no exclusive products.

2.1.4 Hardware Environment

The following hardware is required to use the Windows client.

Memory

At least 256 MB of memory is required.

Mandatory hardware

None.

2.1.5 Disk Space Required for Installation

The disk space shown below is required for new installation of the Windows client.

At the Windows (32-bit) client installation destination:

470 MB

At the Windows (64-bit) client installation destination:

490 MB

System folder:

121 MB

2.1.6 Supported System Environment

This section describes the supported system environment.

TCP/IP protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

File system

You can install FUJITSU Enterprise Postgres only if the system folder is an NTFS volume.

2.1.7 Versions of Open-Source Software Used as the Base for FUJITSU Enterprise Postgres Drivers

The following table lists the versions of open-source software used as the base for the various FUJITSU Enterprise Postgres drivers.

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>
2.2 Installation

This section explains how to install the Windows client.

Note

When installing the Fujitsu Enterprise Postgres Client (32 bit) in a 64 bit environment, do not specify a destination folder under the environment ProgramFiles variable.

2.2.1 Pre-installation Tasks

This section describes the operations to be performed before installing the Windows client.

hosts file settings

Using an editor, add the IP address and server name of the connected server to the \System32\drivers\etc\hosts file in the folder where Windows is installed.

Note

For Windows(R) 8.1, or Windows(R) 10, assign write privileges in advance to the user responsible for editing the hosts file.

Check the installed product and determine the installation method

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)]. In the displayed window, check the installed products.

If the Windows client is already installed, determine the installation method to use:

- Reinstallation
- Multi-version installation

Remove applied updates

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

Note

If a product is installed without removing applied updates, the following problems will occur:

- Performing reinstallation

  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

1. Display the applied updates

  Execute the following command to display the applied updates:

<table>
<thead>
<tr>
<th>Driver</th>
<th>Open-source software version</th>
</tr>
</thead>
<tbody>
<tr>
<td>.NET Data Provider</td>
<td>Npgsql 4.1.7</td>
</tr>
<tr>
<td>JDBC</td>
<td>pgjdbc 42.2.18</td>
</tr>
<tr>
<td>ODBC</td>
<td>psqlodbc 13.00.0000</td>
</tr>
<tr>
<td>libpq</td>
<td>PostgreSQL 13.1</td>
</tr>
</tbody>
</table>
2. Remove the updates

Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.

```
C:\Program Files (x86)\Fujitsu\UpdateAdvisor\UpdateAdvisorMW>uam remove -i update-number
```

Confirm service

The Windows Installer service must be running.

Confirm Path system environment variable

Ensure that the Path system environment variable includes "%SystemRoot%\system32".

2.2.2 Pre-installation Considerations

This section describes points that the user must take into account prior to installation.

- The remote desktop service is installed in application server mode, it is necessary to switch to install mode by executing the command shown below before installation. Also, after the installation is completed, execute the command shown below to switch back to execute mode.

Before installation:

```
CHANGE USER /INSTALL
```

After installation:

```
CHANGE USER /EXECUTE
```

- The following window may be displayed when the installation program is executed.

If the above window is displayed, follow the procedure below:

1. Perform the steps in the installation procedure until the [InstallShield Wizard Complete] window is displayed.
2. Click [Next] in the [InstallShield Wizard Complete] window.
3. The following window is displayed. Click [Finish].

![Finish Admin Install window]

4. Restart the system.

**Information**

- If the [User Account Control] dialog box is displayed when installation or uninstallation starts, click [Yes] to continue the operation. If [No] is clicked, the [Error] dialog box will be displayed because continuing is not permitted. Click [Retry] in the displayed [Error] dialog box to proceed with installation or uninstallation. To end operations, click [Cancel].
- If installation or uninstallation is suspended or processing terminates abnormally, the [Program Compatibility Assistant] dialog box may be displayed. If this happens, click [This program installed correctly] or [This program uninstalled correctly] and continue operation.

**2.2.3 Installation in Interactive Mode**

The installation procedure is described below.

**Point**

For installation in interactive mode, default values are set for the installation information. The following settings can be changed for a new installation or a multi-version installation:
- Installation folder

**1. Stop applications and programs**

If the installation method is the following, all applications and programs that use the product must be stopped:
- Reinstallation

Before starting the installation, stop the following:
- Applications that use the product
- pgAdmin
2. Insert the DVD
Insert the client program DVD into the DVD drive.

3. Run the installation
The installation menu is displayed. Click [Installation].

4. Select the product to install
Select the product to install, and then click [Next].
If a selected product can only be reinstalled, refer to "6. Check the settings".

Information
If multi-version installation is possible, the [Select Installation Method] window is displayed for each selected product. Select "Multi-version installation" and click [Next].

5. Confirm the contents for installation
The [Confirm installation] window will be displayed.
Click [Next] to start the installation.
To modify the settings, select [Modify], and then click [Next]. Follow the on-screen instructions.

6. Check the settings
The [Confirm installation] window will be displayed for reinstallation, or if the installation information is modified.
Click [Install] to start the installation.
To modify the settings again, click [Back].

7. Completion of installation
The completion window is displayed. Click [Finish].

Note
In the cases below, refer to "2.4 Registering .NET Data Provider" for information on how to set up .NET Data Provider:
- .NET Framework is installed subsequently
- An issue occurs during installation
- A multi-version installation is performed

2.2.4 Installation in Silent Mode
Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

See
Refer to the FUJITSU Enterprise Postgres product website for information on installation in silent mode, such as the installation parameters and error messages.
The installation procedure is described below.

1. Insert the DVD

Insert the client program DVD into the DVD drive.

The [Install Menu] window is displayed. Click [Finish].

2. Create an installation parameters CSV file

Consider the server type or features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Information

The template for the installation parameters CSV file is "Z:\sample\sample_windows.csv (Z is the drive into which the DVD is inserted.)."

3. Start the command prompt

In Windows, right-click [Command Prompt] and then select [Run as administrator].

4. Run the installation

Execute the following command:

```
Z:\>silent.bat c:\temp\Inspara.csv
```

Z:  The drive into which the DVD is inserted.

c:\temp\Inspara.csv: The installation parameter CSV file name.

If the silent installer ends in an error, a message is output to the log file and return values are returned.

Note

In the cases below, refer to "2.4 Registering .NET Data Provider" for information on how to set up .NET Data Provider:
- .NET Framework is installed subsequently
- An issue occurs during installation
- A multi-version installation is performed

2.3 Uninstallation

This section describes the procedure for uninstalling the Windows client.

Note

- Before uninstalling the product, close the product program and all applications that are using it.
- Log in using an account that has administrator privileges and then execute the command, or switch to an account that has administrator privileges and then uninstall the product.
2.3.1 Uninstallation in Interactive Mode

The uninstallation procedure is described below.

Information

If an error occurs while the product is being uninstalled, refer to "Uninstall (middleware) Messages" in the FUJITSU Enterprise Postgres product website, and take the required action.

1. Stop applications and programs
   Before starting the uninstallation, stop the following:
   - Applications that use the product
   - pgAdmin

2. Start the Uninstall (middleware) tool
   In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

3. Select the software
   Select the product to be uninstalled from [Software Name], and then click [Remove].

4. Start the uninstallation
   Click [Uninstall].

5. Finish the uninstallation
   The uninstallation completion window is displayed. Click [Finish].
   The installation folder may remain after uninstallation. If it is not required, delete it.

6. Stop the Uninstall (middleware) tool
   The [Uninstall (middleware)] window is displayed. Click [Close].

2.3.2 Uninstallation in Silent Mode

The uninstallation procedure is described below.

See

Refer to the FUJITSU Enterprise Postgres product website for information on uninstallation in silent mode, such as the error messages.

1. Stop applications and programs
   Before starting the uninstallation, stop the following:
   - Applications that use the product
   - pgAdmin

2. Start the command prompt
   In Windows, right-click [Command Prompt] and then select [Run as administrator].
3. Start the uninstaller

Execute the command below.

The installation folder may remain after uninstallation. If it is not required, delete it.

Example

```
X:>
installFolder\suninst.bat
```

: Drive on which the product is installed

2.4 Registering .NET Data Provider

This section explains how to register the .NET Data Provider feature in cases such as below, after installing the FUJITSU Enterprise Postgres client feature.

- .NET Framework is installed subsequently
- An issue occurs during installation of the FUJITSU Enterprise Postgres client feature
- Multiple versions of the FUJITSU Enterprise Postgres client feature are installed

In [Control Panel], select [Programs and Features], right-click [FUJITSU Enterprise Postgres Npgsql <x>], and then select [Change]. Note that "<x>" indicates the product version.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Change</strong></td>
<td>Install Npgsql Performance Counters or perform the Npgsql GAC Installation again. Click [Change], click the relevant item, select &quot;Entire feature will be installed on local hard drive&quot;, and then click [Next] &gt;&gt; [Change] &gt;&gt; [Finish].</td>
</tr>
<tr>
<td><strong>Repair</strong></td>
<td>Repair a damaged installation. Click [Repair] &gt;&gt; [Repair] &gt;&gt; [Finish].</td>
</tr>
</tbody>
</table>

When you select [Change] and then select [Npgsql Installation], note that this consists of two parts:

- "Npgsql GAC only Installation"
- "Npgsql Publisher Policy and machine.config Installation"

If the FUJITSU Enterprise Postgres client feature is installed in an environment where no other versions exist

Perform "Npgsql GAC only Installation" and "Npgsql Publisher Policy and machine.config Installation".

If multiple versions of the FUJITSU Enterprise Postgres client feature are installed

The procedure differs depending on whether "FUJITSU.Npgsql" or another value is used for the invariant value. Using "FUJITSU.Npgsql"

Perform "Npgsql GAC only Installation" and "Npgsql Publisher Policy and machine.config Installation".

**Note**

- When "Npgsql Publisher Policy and machine.config Installation" is performed, an entry with the invariant value "FUJITSU.Npgsql" will be registered in the DbProviderFactories section of the machine.config file. All .NET applications that specify "FUJITSU.Npgsql" as an argument of GetFactory method of the DbProviderFactories class will now use the latest FUJITSU Enterprise Postgres Npgsql. Therefore, in a multi-version installation environment, carefully consider whether to use this option.

- If creating an application using Visual Studio tools when using the invariant value “FUJITSU.Npgsql” in a multi-version environment with FUJITSU Enterprise Postgres 9.6 or earlier, use the Visual Studio Integration Add-On bundled with this version.

Using values other than "FUJITSU.Npgsql"

When using a value other than "FUJITSU.Npgsql" for the invariant value, perform "Npgsql GAC only Installation" and "2.4.1 Registering Entries to the machine.config File".

**Point**

- If you want to make a modification to use a value other than "FUJITSU.Npgsql" after performing the procedure to use "FUJITSU.Npgsql" for the invariant value, follow the procedure below:
  1. In [Control Panel], select [Programs and Features], right-click [FUJITSU Enterprise Postgres Npgsql <x>], and then select [Change]. Note that "<x>" indicates the product version.
  2. Open the [Npgsql Installation] feature and deselect [Npgsql Publisher Policy and machine.config Installation].
  3. Select [Next] >> [Change] >> [Finish].

- If you want to use different versions of Npgsql for each application in a multi-version environment, use the NpgsqlRegister.exe tool provided. Refer to "2.4.1 Registering Entries to the machine.config File" for details.

**2.4.1 Registering Entries to the machine.config File**

If you want to use different versions of Npgsql for each application during multi-version installation, this can be achieved by registering multiple entries with different invariant values to DbProviderFactories in the machine.config file and using the relevant value for each application.

NpgsqlRegister.exe is a tool provided by FUJITSU.

The NpgsqlRegister.exe tool allows a user to:

- Change the invariant value registered to a different version of FUJITSU Enterprise Postgres to this version (cannot be edited with the exception of the default invariant value “FUJITSU.Npgsql”).
- Register an invariant value.

**Note**

- When changing existing invariant values, a user must edit existing DbProvider entries very carefully. Ensure that no application is using the DbProvider entries being edited.
- If it is likely that a user will install multiple versions of Npgsql, then it is recommended to add and use new invariant values.

The instructions below describe where to find and how to use this tool to register machine.config entries for the version being installed.

**Location of NpgsqlRegister.exe**

The NpgsqlRegister.exe tool is stored in the following location.

```
fujitsuEnterprisePostgresClientInstallDir\dotnet\NpgsqlRegister.exe
```

The NpgsqlRegister.exe tool requires .NET Framework 4.6.1 or later to be installed. If not installed, install .NET Framework 4.6.1 or later, and then execute the command again.

**Using NpgsqlRegister.exe**

Execute the command below as a user with administrator privileges.

```
> NpgsqlRegister.exe
```

The NpgsqlRegister.exe tool checks if a FUJITSU Enterprise Postgres invariant value exists. If a FUJITSU Enterprise Postgres invariant value does not exist in machine.config, an invariant value with the current version (FUJITSU.Npgsql)
is registered to machine.config, and this will be notified to the user. If a FUJITSU Enterprise Postgres invariant value exists, the user will be prompted with the following options.

1 - Edit an existing DbProvider entry to point to the current version
2 - Add a new Invariant alias DbProvider entry to point to the current version
3 - Exit

Editing an existing DbProvider entry

When this option is selected, applications that use an existing DbProvider entry will reference the latest installed Npgsql version from the GAC.

A list of all FUJITSU Enterprise Postgres Npgsql invariant name entries that exist in machine.config will be displayed as follows.

Example

Please select the Invariant attribute you would like to point to the current version.
1 - Invariant attribute: FUJITSU.Npgsql.12, Npgsql Version: 12.0.0.0
2 - Invariant attribute: FUJITSU.Npgsql.13, Npgsql Version: 13.0.0.0
3 - Invariant attribute: Npgsql, Npgsql Version: 13.0.0.0
4 - Exit

Selecting one of the invariant values listed will result in the machine.config entries being updated to point to this version, and any existing application referencing this invariant value will start referencing this version of Npgsql.

Adding a new entry to DbProvider

When this option is selected, a new invariant value can be registered. When referencing the new registered invariant value from the application, this FUJITSU Enterprise Postgres server version of Npgsql is referenced.

Upon selecting the option to add a new invariant value, the following will be displayed.

You have chosen to add a new DbProvider entry with an Invariant Alias to the machine.config

The Invariant attribute can either be in the form of 2 user defined formats (define xyz):
1 - 'FUJITSU.Npgsql.xyz'
2 - 'Npgsql.xyz'

or add a DbProvider entry with Invariant attribute set to 'Npgsql'
3 - 'Npgsql'
4 - Exit

Please enter one of the options (1 .. 4):

By specifying a value to "xyz" in the first two options, any invariant value can be created. However, the user must specify at least one alphanumeric character of up to 10 characters.

The option three registers a new invariant value "Npgsql".

If the specified value already exists, a warning will be output as follows.

A DbProvider entry with Invariant attribute 'Npgsql' already exists in machine.config
If you require this Invariant attribute, restart the application and choose 'Edit an existing DbProvider entry'
Chapter 3 Installation and Uninstallation of the Linux Client

This chapter explains how to install and uninstall the Linux client.

3.1 Operating Environment

This section describes the operating environment required to use the Linux client.

3.1.1 Required Operating System

One of the following operating systems is required to use the Linux client:

- RHEL7.2 or later minor version
- RHEL8.1 or later minor version
- SLES 12 SP5

- The following packages are required for operations on RHEL7.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>glibc</td>
<td></td>
</tr>
<tr>
<td>glibc.i686</td>
<td></td>
</tr>
<tr>
<td>libgcc</td>
<td></td>
</tr>
<tr>
<td>libmemcached</td>
<td>Required when using Pgpool-II.</td>
</tr>
<tr>
<td>libstdc++</td>
<td></td>
</tr>
<tr>
<td>libtool-ltdl</td>
<td></td>
</tr>
<tr>
<td>ncurses-libs</td>
<td></td>
</tr>
<tr>
<td>nss-softokn-freebl</td>
<td></td>
</tr>
<tr>
<td>redhat-lsb</td>
<td></td>
</tr>
<tr>
<td>rsync</td>
<td>Required when using Pgpool-II.</td>
</tr>
<tr>
<td>unixODBC</td>
<td>Required when using ODBC drivers</td>
</tr>
<tr>
<td>unzip</td>
<td></td>
</tr>
<tr>
<td>xz-libs</td>
<td></td>
</tr>
<tr>
<td>zlib</td>
<td></td>
</tr>
</tbody>
</table>

- The following packages are required for operations on RHEL8.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>glibc</td>
<td></td>
</tr>
<tr>
<td>glibc.i686</td>
<td></td>
</tr>
<tr>
<td>libnsl2</td>
<td></td>
</tr>
<tr>
<td>libgcc</td>
<td></td>
</tr>
<tr>
<td>libmemcached</td>
<td>Required when using Pgpool-II.</td>
</tr>
<tr>
<td>libstdc++</td>
<td></td>
</tr>
<tr>
<td>libtool-ltdl</td>
<td></td>
</tr>
<tr>
<td>ncurses-libs</td>
<td></td>
</tr>
<tr>
<td>nss-softokn-freebl</td>
<td></td>
</tr>
<tr>
<td>redhat-lsb</td>
<td></td>
</tr>
<tr>
<td>rsync</td>
<td>Required when using Pgpool-II.</td>
</tr>
<tr>
<td>unixODBC</td>
<td>Required when using ODBC drivers</td>
</tr>
<tr>
<td>unzip</td>
<td></td>
</tr>
<tr>
<td>xz-libs</td>
<td></td>
</tr>
<tr>
<td>zlib</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.2 Related Software

The following table lists the software required to use the Linux client.

**Table 3.1 Related software**

<table>
<thead>
<tr>
<th>No.</th>
<th>Software name</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>C compiler</td>
<td>(*1)</td>
</tr>
<tr>
<td>2</td>
<td>JDK or JRE</td>
<td>Java SE 6 or later</td>
</tr>
<tr>
<td>3</td>
<td>NetCOBOL</td>
<td>(*2)</td>
</tr>
</tbody>
</table>

- *1: Only operations using the C compiler provided with the operating system are guaranteed.

- *2: NetCOBOL is available in the following editions:

  - NetCOBOL Base Edition V12.2.0 or later
NetCOBOL Standard Edition V12.2.0 or later
- NetCOBOL Enterprise Edition V12.2.0 or later
(RHEL7)
- NetCOBOL Base Edition V11.1.0 or later
- NetCOBOL Standard Edition V11.1.0 or later
- NetCOBOL Enterprise Edition V11.1.0 or later

Note

The following JDKs or JREs are available:
- JDK or JRE shipped with the Interstage Application Server
- Oracle JDK or JRE
- An OpenJDK that has passed the Java TCK (Technology Compatibility Kit)

It is recommended that the JDK or JRE included with Interstage Application Server is used.

The following table lists servers that can be connected to the Linux client.

### Table 3.2 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Linux</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td></td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

3.1.3 Excluded Software

FUJITSU Enterprise Postgres

The Linux client cannot coexist with the FUJITSU Enterprise Postgres Community Edition (hereafter, "CE") client.

Other products

There are no exclusive products.

3.1.4 Required Patches

There are no required patches.

3.1.5 Hardware Environment

The following hardware is required to use the Linux client.

Memory

At least 160 MB of memory is required.

Mandatory hardware

None.
3.1.6 Disk Space Required for Installation

The following table lists the disk space requirements of the corresponding directories for new installation of the Linux client. If necessary, increase the size of the file system.

### RHEL

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 2 (*1)</td>
</tr>
<tr>
<td>/opt</td>
<td>106 (*1)</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>131</td>
</tr>
<tr>
<td>Installation destination of Pgpool-II</td>
<td>14</td>
</tr>
</tbody>
</table>

*1: Uninstall (middleware) must be installed.

### SLES

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 2 (*1)</td>
</tr>
<tr>
<td>/opt</td>
<td>2 (*1)</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>125</td>
</tr>
<tr>
<td>Installation destination of Pgpool-II</td>
<td>12</td>
</tr>
</tbody>
</table>

*1: Uninstall (middleware) must be installed.

3.1.7 Supported System Environment

This section describes the supported system environment.

**TCP/IP protocol**

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

**Note**

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

3.1.8 Versions of Open-Source Software Used as the Base for FUJITSU Enterprise Postgres Drivers

The following table lists the versions of open-source software used as the base for the various FUJITSU Enterprise Postgres drivers.

<table>
<thead>
<tr>
<th>Driver</th>
<th>Open-source software version</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC</td>
<td>pgjdbc 42.2.18</td>
</tr>
<tr>
<td>ODBC</td>
<td>psqlodbc 13.00.0000</td>
</tr>
<tr>
<td>libpq</td>
<td>PostgreSQL 13.1</td>
</tr>
</tbody>
</table>
3.2 Installation

This section explains how to install the Linux client.

3.2.1 Pre-installation Tasks

Check the system environment for the following before the Linux client is installed.

**Check the disk capacity**

Check if sufficient free disk space is available for installing the Linux client.

Refer to “3.1.6 Disk Space Required for Installation” for information on disk space requirements.

If sufficient free disk space is unavailable, reconfigure disk partitions.

**Set JAVA_HOME (SLES 12 only)**

Ensure that Oracle JRE 8 is installed, and export the JAVA_HOME environment variable.

```
#export JAVA_HOME="oracleJre8InstallDir"
```

**Check the installed product and determine the installation method**

Using the operation shown below, start Uninstall (middleware), and check the installed products.

Example

```
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. productName
2. productName

Type [number] to select the software you want to uninstall.
[number,q]
=>q

Exiting Uninstaller.
```

If the Linux client is already installed, determine the installation method to use:

- Reinstallation
- Multi-version installation

**Remove applied updates**

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

---

If a product is installed without removing applied updates, the following will occur:

- Performing reinstallation

  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

  Perform the reinstallation after removing the update.

---
1. Display the applied updates
   Execute the following command to display the applied updates:
   
   ```shell
   # /opt/FJSVfupde/bin/uam showup
   ```

2. Remove the updates
   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.
   
   ```shell
   # /opt/FJSVfupde/bin/uam remove -i update-number
   ```

### 3.2.2 Installation in Interactive Mode

The installation procedure is described below.

---

**Note**

The following characters can be used as input values:

- Alphanumeric characters, hyphens, commas and forward slashes

---

**Point**

For installation in interactive mode, default values are set for the installation information. The following settings can be changed for a new installation or a multi-version installation:

- Installation directory

---

1. Stop applications and programs

If the installation method is the following, all applications and programs that use the product must be stopped:

- Reinstallation

Before starting the installation, stop the following:

- Applications that use the product
- pgBadger
- Pgpool-II

2. Change to the superuser

Run the following command to switch to the superuser on the system.

```bash
$ su -
Password:******
```

3. Mount the DVD drive

Insert the client program DVD into the DVD drive, and then execute the following command:

**Example**

```bash
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```

Here /dev/dvd is the device name for the DVD drive (which may vary depending on your environment), and /media/dvd is the mount point (which may need to be created before calling the command).
4. Run the installation

Execute the following command:

Example

```bash
# cd /media/dvd
# ./install.sh
```

In the example above, /media/dvd is the DVD mount point.

5. Select the product to install

The list of installation target products is displayed.
Type the number for the product to be installed, or "all", and press Enter.

Information

If the selected product has already been installed, a window for selecting reinstallation or multi-version installation is displayed for each product. Follow the on-screen instructions to select the installation method.

6. Check the settings

The window for checking the installation information is displayed as shown below.
Type "y" and press Enter to start the installation.
To change the settings, type "c" and press Enter, and follow the on-screen instructions. This option is not displayed if there is no information that can be modified.

7. Check the changed settings

If the installation information has been modified, the new installation information is displayed.
Type "y" and press Enter to start the installation.
To change the settings again, type "c" and press Enter.

8. Finish the installation

When the installation is complete, a message is displayed showing the status.
If installation was successful, the following message is displayed:

```
Installed successfully.
```

Note

If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.

3.2.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:

- New installation
### Multi-version installation

See

Refer to the FUJITSU Enterprise Postgres product website for information on installation in silent mode, such as the installation parameters and error messages.

The installation procedure is described below.

1. **Change to the superuser**

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

2. **Mount the DVD drive**

Insert the client program DVD into the DVD drive, and then execute the following command:

**Example**

```
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```

Here `/dev/dvd` is the device name for the DVD drive (which may vary depending on your environment), and `/media/dvd` is the mount point (which may need to be created before calling the command).

**Note**

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

3. **Create an installation parameters CSV file**

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

**Information**

The templates for the installation parameters CSV file is "mountPoint/sample/sample_linux.csv"

4. **Run the installation**

Execute the following command:

**Example**

```
# cd /media/dvd
# ./silent.sh /home/work/inspara.csv
```

In the example above, `/media/dvd` is the DVD mount point, and `/home/work/inspara.csv` is the installation parameter CSV.

If the silent installer ends in an error, a message is output to the log file and return values are returned.
3.3 Uninstallation

This section describes the procedure for uninstalling the Linux client.

**Note**
- Before uninstalling the product, close the product program and all applications that are using it.
- On SLES 12, before uninstallation, ensure that Oracle JRE 8 is installed, and export the JAVA_HOME environment variable.

```bash
#export JAVA_HOME="oracleJre8InstallDir"
```

3.3.1 Uninstallation in Interactive Mode

The uninstallation procedure is described below.

**Information**
If an error occurs while the product is being uninstalled, refer to "Uninstall (middleware) Messages" in the FUJITSU Enterprise Postgres product website, and take the required action.

1. **Stop applications and programs**
   Before starting the uninstallation, stop the following:
   - Applications that use the product
   - pgBadger
   - Pgpool-II

2. **Change to the superuser**
   Run the following command to switch to the superuser on the system.

   ```bash
   $ su -
   Password:******
   ```

3. **Start the Uninstall (middleware)**
   Execute the following command:

   ```bash
   # /opt/FJSVcir/cimanager.sh -c
   ```

4. **Select the product**
   Enter the number for the product to be uninstalled, and press Enter.

5. **Start the uninstallation**
   To start the uninstallation, type "y" and press Enter.
   To display the list of products again, type "b" and press Enter.

6. **Finish the uninstallation**
   If uninstallation is successful, the message below is displayed.
   The installation directory may remain after uninstallation. If it is not required, delete it.
Uninstalling...

ProductName is being uninstalled now.

100% ##############################

The following products have been uninstalled successfully:

ProductName

Uninstallation of "ProductName" has completed successfully.

Exiting Uninstaller.

3.3.2 Uninstallation in Silent Mode

The uninstallation procedure is described below.

See

Refer to the FUJITSU Enterprise Postgres product website for information on uninstallation in silent mode, such as the error messages.

1. Stop applications and programs

Before starting the uninstallation, stop the following:

- Applications that use the product
- pgBadger
- Pgpool-II

2. Change to the superuser

Run the following command to switch to the superuser on the system.

$ su -
Password:******

3. Run the uninstallation

Execute the following command:

The installation directory may remain after uninstallation. If it is not required, delete it.

Example

# /opt/fsepv<x>/client64/setup/suninst.sh

In the example above, /opt/fsepv<x>/client64 is the installation directory, and "<x>" indicates the product version.

# /opt/fsepv<x>/pgpool-II/setup/suninst.sh

In the example above, /opt/fsepv<x>/pgpool-II/setup is the name of the installation directory in which the Pgpool-II is installed.
Chapter 4 Setup

This chapter describes the setup procedures to be performed after installation completes.

4.1 Configuring Environment Variables

Configure the following environment variables when using client commands.

4.1.1 Windows

PATH environment variable
Add "installationFolder\bin".
PGLOCALEDIR environment variable
Add "installationFolder\share\locale".

Examples of environment variable configurations are shown below.

Example
This example is specific to 32-bit Windows.
Note that "<x>" indicates the product version.

> SET PATH=%ProgramFiles%\Fujitsu\fsepv<x>client32\bin;%PATH%
> SET PGLOCALEDIR=%ProgramFiles%\Fujitsu\fsepv<x>client32\share\locale

4.1.2 Linux

PATH environment variable
Add "installationDirectory/bin".
MANPATH environment variable
Add "installationDirectory/share/man".
PGLOCALEDIR environment variable
Add "installationDirectory/share/locale".
LD_LIBRARY_PATH environment variable
Add "installationDirectory/lib".

Examples of environment variable configurations are shown below.

Example
This example is specific to 64-bit Linux.
Note that "<x>" indicates the product version.

$ PATH=/opt/fsepv<x>client64/bin:$PATH ; export PATH

Preface

Purpose of this document
This document describes how to install and uninstall the FUJITSU Enterprise Postgres Server Assistant.

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres.

Readers of this document are assumed to have general knowledge of:

- PostgreSQL
- SQL
- Linux
- PostgreSQL
- SQL
- Windows

Structure of this document
This document is structured as follows:

Chapter 1 Overview of Installation
Describes the features that can be installed, and provides an overview of installation methods

Chapter 2 Installation and Uninstallation of the Linux Server Assistant
Describes how to install and uninstall the Linux Server Assistant

Chapter 3 Installation and Uninstallation of the Windows Server Assistant
Describes how to install and uninstall the Windows Server Assistant

Chapter 4 Setup of the Server Assistant
Describes the setup to be performed after installation

Appendix A Estimating Memory Requirements
Describes the formulas for estimating memory requirements

Appendix B Procedure when Modifying the Oracle JRE Installation
Describes the procedure to follow when modifying the Oracle JRE installation.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue date and version
Edition 1.0: April 2021

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres Server Assistant installation and uninstallation.

1.1 Features that can be Installed

The Server Assistant is provided as a Server Assistant package, which is installed on a different server (referred to as the arbitration server) to that of the database server.

The following table shows the relationship between the platforms and the features provided by the Server Assistant package.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Server Assistant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>Y</td>
</tr>
<tr>
<td>Windows</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be installed

1.2 Installation Types

The following installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, the FUJITSU Enterprise Postgres Server Assistant is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

FUJITSU Enterprise Postgres products can be installed on the same server if the product version (indicated by "x" in "x SPy") is different from that of any version of the product that is already installed.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.

1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In the interactive mode installation, the FUJITSU Enterprise Postgres installer automatically determines the installation state of FUJITSU Enterprise Postgres. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively. New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres Server Assistant.
Chapter 2 Installation and Uninstallation of the Linux Server Assistant

This chapter explains how to install and uninstall the Linux Server Assistant.

2.1 Operating Environment

This section describes the operating environment required in order to use the Linux Server Assistant.

2.1.1 Required Operating System

One of the following operating systems is required in order to use the Linux Server Assistant:

- RHEL7.2 or later minor version
- RHEL8.1 or later minor version
- SLES 12 SP5

Information

- The following packages are required for operations on RHEL7.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>gdb</td>
<td>Required to run FJQSS.</td>
</tr>
<tr>
<td>glibc</td>
<td></td>
</tr>
<tr>
<td>glibc.i686</td>
<td></td>
</tr>
<tr>
<td>iputils</td>
<td>Required for Mirroring Controller.</td>
</tr>
<tr>
<td>libgcc</td>
<td></td>
</tr>
<tr>
<td>libstdc++</td>
<td></td>
</tr>
<tr>
<td>ncurses-libs</td>
<td></td>
</tr>
<tr>
<td>nss-softokn-freebl</td>
<td></td>
</tr>
<tr>
<td>redhat-lsb</td>
<td></td>
</tr>
<tr>
<td>rsync</td>
<td>Required when using Pgpool-II.</td>
</tr>
<tr>
<td>sysstat</td>
<td>Required when using FJQSS. Set up the sar command after installation.</td>
</tr>
<tr>
<td>unzip</td>
<td></td>
</tr>
<tr>
<td>xz-libs</td>
<td></td>
</tr>
<tr>
<td>zlib</td>
<td></td>
</tr>
</tbody>
</table>

- The following packages are required for operations on RHEL8.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>gdb</td>
<td>Required to run FJQSS.</td>
</tr>
<tr>
<td>glibc</td>
<td></td>
</tr>
<tr>
<td>glibc.i686</td>
<td></td>
</tr>
<tr>
<td>iputils</td>
<td>Required for Mirroring Controller.</td>
</tr>
<tr>
<td>libgcc</td>
<td></td>
</tr>
</tbody>
</table>
### 2.1.2 Related Software

No other software is required in order to use FUJITSU Enterprise Postgres.

The following table lists servers that can be connected to the Linux Server Assistant.

#### Table 2.1 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>FUJITSU Software Enterprise Postgres Advanced Edition 13</td>
</tr>
<tr>
<td>Windows</td>
<td></td>
</tr>
</tbody>
</table>
2.1.3 Excluded Software

There is no excluded software.

2.1.4 Required Patches

There are no required patches.

2.1.5 Hardware Environment

The following hardware is required in order to use the Linux Server Assistant:

**Memory**

At least 150 MB of memory is required.

**Mandatory hardware**

None.

2.1.6 Disk Space Required for Installation

The following table lists the disk space requirements of the corresponding directories for new installation of the Linux Server Assistant. If necessary, increase the size of the file system.

**Disk space required for installation**

**RHEL**

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 2 (*1) + 1 (*2)</td>
</tr>
<tr>
<td>/opt</td>
<td>106 (*1) + 1 (*2)</td>
</tr>
<tr>
<td>serverAssistantInstallDir</td>
<td>140</td>
</tr>
</tbody>
</table>

*1: Uninstall (middleware) must be installed.

*2: Required for the installation of FJQSS.

**SLES**

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 2 (*1) + 1 (*2)</td>
</tr>
<tr>
<td>/opt</td>
<td>2 (*1) + 1 (*2)</td>
</tr>
<tr>
<td>serverAssistantInstallDir</td>
<td>3</td>
</tr>
</tbody>
</table>

*1: Uninstall (middleware) must be installed.

*2: Required for the installation of FJQSS.

2.1.7 Supported System Environment

This section describes the supported system environment.

**TCP/IP Protocol**

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.
2.2 Installation

This section describes how to install the Linux Server Assistant.

2.2.1 Pre-installation Tasks

Check the following system environment before installing the Linux Server Assistant.

Check the disk space

Ensure that there is sufficient disk space to install the Linux Server Assistant.

Refer to “2.1.6 Disk Space Required for Installation” for information on disk space requirements.

If sufficient free disk space is unavailable, reconfigure disk partitions.

Set JAVA_HOME (SLES 12 only)

Ensure that Oracle JRE 8 is installed, and export the JAVA_HOME environment variable.

```
# export JAVA_HOME="oracleJre8InstallDir"
```

Refer to "Appendix B Procedure when Modifying the Oracle JRE Installation" for information on modifying Oracle JRE after installation.

Check the installed product and determine the installation method

Using the operation shown below, start Uninstall (middleware), and check the installed products.

Example

```
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. productName

Type [number] to select the software you want to uninstall.
[number,q]
=>q

Exiting Uninstaller.
```

If the Linux Server Assistant is already installed, determine the installation method to use:

- Reinstallation
- Multi-version installation

Remove applied updates

If you perform reinstallation, remove applied updates using the procedure shown below.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.
If a product is installed without removing applied updates, the following will occur:

- Performing reinstallation
  
  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.
  
  Perform reinstallation after removing the update.

1. Display the applied updates
   
   Execute the following command to display the applied updates:
   
   ```
   # /opt/FJSVfupde/bin/uam showup
   ```

2. Remove the updates
   
   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.
   
   ```
   # /opt/FJSVfupde/bin/uam remove -i update-number
   ```

### 2.2.2 Installation in Interactive Mode

The installation procedure is described below.

**Note**

The following characters can be used as input values:

- Alphanumeric characters, hyphens and forward slashes

**Point**

In interactive mode installation, the default values of the installation information are set. The following setting can be changed for a new installation or a multi-version installation.

- Installation directory

---

1. **Stop the program**

   If the installation method is the following, the program must be stopped:

   - Reinstallation

   Before starting the installation, stop the following:

   - Mirroring Controller arbitration process

   Execute the `mc_arb` command in stop mode to stop the Mirroring Controller arbitration process.

   **Example**

   ```
   $ mc_arb stop -M /mcarb_dir/arbiter1
   ```

2. **Change to the superuser**

   Run the following command to switch to the superuser on the system.
3. Mount the DVD drive

Insert the Server Assistant program DVD into the DVD drive, and then execute the following command:

Example

```bash
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```

Here /dev/dvd is the device name for the DVD drive (which may vary depending on your environment), and /media/dvd is the mount point (which may need to be created before calling the command).

Note

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

4. Run the installation

Execute the following command:

Example

```bash
# cd /media/dvd
# ./install.sh
```

In the example above, /media/dvd is the DVD mount point.

5. Select the product to install

The list of installation target products is displayed.
Type the number for the product to be installed, or "all", and press Enter.

Information

If the selected product has been installed, a window for selecting reinstallation or multi-version installation is displayed for each product. Follow the on-screen instructions to select the installation method.

6. Check the settings

The window for checking the installation information is displayed.
Type "y" and press Enter to start the installation.
To change the settings, type "c", press Enter, and follow the on-screen instructions. This option is not displayed if there is no information that can be modified.

7. Check the changed settings

If the settings have been changed, the new installation information is displayed.
Type "y" and press Enter to start the installation.
To change the settings again, type "c" and press Enter.

8. Finish the installation

When the installation is complete, a message is displayed showing the status.
If installation was successful, the following message is displayed:

```
Installed successfully.
```
If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.

### 2.2.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:

- New installation
- Multi-version installation

See

Refer to the FUJITSU Enterprise Postgres product website for information on installation in silent mode, such as the installation parameters and error messages.

The installation procedure is described below.

1. **Change to the superuser**

   Run the following command to switch to the superuser on the system.

   ```
   $ su -
   Password:******
   ```

2. **Mount the DVD drive**

   Insert the Server Assistant program DVD into the DVD drive, and then execute the following command:

   **Example**

   ```
   # mount -t iso9660 -r -o loop /dev/dvd /media/dvd
   ```

   Here /dev/dvd is the device name for the DVD drive (which may vary depending on your environment), and /media/dvd is the mount point (which may need to be created before calling the command).

   **Note**

   If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

3. **Create an installation parameters CSV file**

   Create an installation parameters CSV file that uses the following specification format.

   ```
   sectionName, parameterName, value
   sectionName, parameterName, value
   ```

   **Information**

   The templates for the installation parameters CSV file is "mountPoint/sample/sample.csv"
4. Run the installation

Execute the following command:

Example

```
# cd /media/dvd
# ./silent.sh /home/work/inspara.csv
```

In the example above, /media/dvd is the DVD mount point, and /home/work/inspara.csv is the installation parameter CSV.

If the silent installer ends in an error, a message is output to the log file and return values are returned.

2.3 Uninstallation

This section describes how to uninstall the Linux Server Assistant.

**Note**

Before uninstalling the product, close the product program.

2.3.1 Uninstallation in Interactive Mode

The uninstallation procedure is described below.

**Information**

If an error occurs while the product is being uninstalled, refer to "Uninstall (middleware) Messages" in the FUJITSU Enterprise Postgres product website, and take the required action.

1. Stop the program

Before starting the uninstallation, stop the following:

- Mirroring Controller arbitration process

  Execute the mc_arb command in stop mode to stop the Mirroring Controller arbitration process.

  **Example**

  `mc_arb stop -M /mcarb_dir/arbiter1`

2. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

3. Start Uninstall (middleware)

Execute the following command:

```
# /opt/FJSVcir/cimanager.sh -c
```

4. Select the product

Enter the number for the product to be uninstalled, and press Enter.
5. Start the uninstallation
To start the uninstallation, type "y" and press Enter.
To display the list of products again, type "b" and press Enter.

6. Finish the uninstallation
If uninstallation is successful, the message below is displayed.
The installation directory may remain after uninstallation. If it is not required, delete it.

```
Uninstalling...

productName is being uninstalled now.
  100% #############################################################

The following products have been uninstalled successfully:
  productName

Uninstallation of "productName" has completed successfully.

Exiting Uninstaller.
```

2.3.2 Uninstallation in Silent Mode
The uninstallation procedure is described below.

See
Refer to the FUJITSU Enterprise Postgres product website for information on uninstallation in silent mode, such as the error messages.

1. Stop the program
Before starting the uninstallation, stop the following:
- Mirroring Controller arbitration process
  Execute the mc_arb command in stop mode to stop the Mirroring Controller arbitration process.
  Example

```
$ mc_arb stop -M /mcarb_dir/arbiter1
```

2. Change to the superuser
Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

3. Run the uninstallation
Execute the following command:
The installation directory may remain after uninstallation. If it is not required, delete it.

Example

```
# /opt/fsepv<x>assistant/setup/suninst.sh
```
In the example above, /opt/fsep<version>assistant is the installation directory, and "<version>" indicates the product version.
Chapter 3 Installation and Uninstallation of the Windows Server Assistant

This chapter explains how to install and uninstall the Windows Server Assistant.

3.1 Operating Environment

This section describes the operating environment required in order to use the Windows Server Assistant.

3.1.1 Required Operating System

One of the following operating systems is required in order to use the Windows Server Assistant:

- Microsoft(R) Windows Server(R) 2012 Datacenter
- Microsoft(R) Windows Server(R) 2012 Standard
- Microsoft(R) Windows Server(R) 2012 Essentials
- Microsoft(R) Windows Server(R) 2012 Foundation
- Microsoft(R) Windows Server(R) 2012 R2 Datacenter
- Microsoft(R) Windows Server(R) 2012 R2 Standard
- Microsoft(R) Windows Server(R) 2012 R2 Essentials
- Microsoft(R) Windows Server(R) 2012 R2 Foundation
- Microsoft(R) Windows Server(R) 2016 Datacenter
- Microsoft(R) Windows Server(R) 2016 Standard
- Microsoft(R) Windows Server(R) 2016 Essentials
- Microsoft(R) Windows Server(R) 2019 Datacenter
- Microsoft(R) Windows Server(R) 2019 Standard
- Microsoft(R) Windows Server(R) 2019 Essentials

Note

- The following features of Windows Server(R) 2016 and Windows Server(R) 2019 are not supported:
  - Server Core
  - Nano Server
  - Windows Server Container
- The TCP/IP protocol must be installed.

3.1.2 Related Software

There is no software related to FUJITSU Enterprise Postgres.

Note

- The following programs are installed during installation of FUJITSU Enterprise Postgres:
Do not uninstall the above programs as they are required for running FUJITSU Enterprise Postgres.

The following table lists servers that can be connected to the Windows Server Assistant.

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>FUJITSU Software Enterprise Postgres Advanced Edition 13</td>
</tr>
<tr>
<td>Windows</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.3 Excluded Software

There is no excluded software.

### 3.1.4 Required Patches

There are no required patches.

### 3.1.5 Hardware Environment

The following hardware is required in order to use the Windows Server Assistant:

- **Memory**: At least 256 MB of memory is required.
- **Mandatory hardware**: None.

### 3.1.6 Disk Space Required for Installation

The disk space shown below is required for new installation of the Windows Server Assistant.

- **Windows Server Assistant installation destination**: 260 MB
- **System folder**: 138 MB

### 3.1.7 Supported System Environment

This section describes the supported system environment.

**TCP/IP protocol**

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

- **Note**: Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

**File system**

You can install FUJITSU Enterprise Postgres only if the system folder is an NTFS volume.

### 3.2 Installation

This section describes how to install the Windows Server Assistant.
- The installation must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).

- Stop all applications before starting the installation.

- The Windows Installer service must be running.

- If antivirus software is installed, the system may crash, fail to start, or stop responding during installation or when starting after installation. Set the scan exclusions so that the installation directory and the resource allocation directory are not scanned for viruses.

- The remote desktop service is installed in application server mode, it is necessary to switch to install mode by executing the command shown below before installation. Also, after the installation is completed, execute the command shown below to switch back to execute mode.

  [Before the installation]

  CHANGE USER /INSTALL

  [After the installation]

  CHANGE USER /EXECUTE

- The following window may be displayed when executing the installation program:

  ![After Installation Window](image)

  If this window is displayed, perform the following operations:

  1. Perform the installation steps until the [InstallShield Wizard Complete] window is displayed.

  2. At the window shown above, click [Next].
3. The window shown below is displayed. Click [Finish].

![Finish Admin Install](image)

**Information**

- If a [User Account Control] dialog box is displayed at the start of the installation, click [Yes] to continue processing:
  
  If [No] is clicked, permission to continue is denied and an [Error] dialog box will be displayed.
  To continue the installation, click [Retry] at the [Error] dialog box. To end the installation, click [Cancel].

- If installation is suspended or processing terminates abnormally, the [Program Compatibility Assistant] dialog box may be displayed. Click [This program installed correctly] and continue operation.

### 3.2.1 Pre-installation Tasks

This section describes the tasks to be performed before installing the Windows Server Assistant.

**Check the disk space**

Ensure that there is sufficient disk space to install the Windows Server Assistant.

Refer to "3.1.6 Disk Space Required for Installation" for information on disk space requirements.

**hosts file settings**

Using an editor, add the IP address and name of the server to be connected to the \\System32\drivers\etc\hosts file in the folder where Windows is installed.

**Check the installed product and determine the installation method**

Using the operation shown below, start Uninstall (middleware), and check the installed products.

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

If the Windows Server Assistant is already installed, determine the installation method to use:

- Reinstallation
- Multi-version installation
**Remove applied updates**

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

**Note**

If a product is installed without removing applied updates, the following will occur:

- Performing reinstallation
  - If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

1. **Display the applied updates**
   - Execute the following command to display the applied updates:
     
     C:\>uam showup

2. **Remove the updates**
   - Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.
     
     C:\>uam remove -i update-number

---

### 3.2.2 Installation in Interactive Mode

The installation procedure is described below.

**Point**

In interactive mode installation, the default values of the installation information are set. The following setting can be changed for a new installation or a multi-version installation.

- Installation folder

---

1. **Stop the program**
   - If the installation method is the following, the program must be stopped:
     - Reinstallation
   - Before starting the installation, stop the following:
     - Mirroring Controller arbitration process
       - Execute the `mc_arb` command in stop mode to stop the Mirroring Controller arbitration process.
       - **Example**
         
         > mc_arb stop -M D:\mcarb_dir\arbiter1

2. **Insert the DVD**
   - Insert the Server Assistant program DVD into the DVD drive.

3. **Run the installation**
   - The installation menu is displayed. Click [Installation].
4. Select the product to install

The [Installation product] window is displayed. Select the product to install, and then click [Next].
If a selected product can only be reinstalled, refer to "6. Check the settings".

Information

If the selected product has been installed, a window for selecting reinstallation or multi-version installation is displayed for each product. Follow the on-screen instructions to select the installation method.

5. Confirm the contents for installation

The [Confirm installation] window will be displayed. Click [Next] to start the installation.
To modify the settings, select [Modify], and then click [Next]. Follow the on-screen instructions.

6. Check the settings

The [Confirm installation] window will be displayed. Click [Install] to start the installation.
To modify the settings again, click [Back].

7. Completion of installation

The completion window is displayed. Click [Finish].

3.2.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

The installation procedure is described below.

See

Refer to the FUJITSU Enterprise Postgres product website for information on installation in silent mode, such as the installation parameters and error messages.

1. Insert the DVD

Insert the Server Assistant program DVD into the DVD drive.
The [Install Menu] window is displayed. Click [Finish].

2. Create an installation parameters CSV file

Create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

The template for the installation parameters CSV file is "Z:\sample\sample.csv (Z is the drive into which the DVD is inserted.).

3. Start the command prompt
In Windows, right-click [Command Prompt] and then select [Run as administrator].

4. Run the installation
Execute the following command:

```
Z:\>silent.bat c:\temp\inspara.csv
```

Z: The drive into which the DVD is inserted.
c:\temp\inspara.csv: The installation parameter CSV file name.
If the silent installer ends in an error, a message is output to the log file and return values are returned.

3.3 Uninstallation
This section describes how to uninstall the Windows Server Assistant.

Note
- Before uninstalling the product, close the product program.
- Log in using an account that has administrator privileges and then execute the command, or switch to an account that has administrator privileges and then uninstall the product.

Information
- If a [User Account Control] dialog box such as the following is displayed at the start of the uninstallation, click [Yes] to continue processing:
  If [No] is clicked, permission to continue is denied and an [Error] dialog box will be displayed.
  To continue the uninstallation, click [Retry] in the [Error] dialog box. To end the operation, click [Cancel].
- If uninstallation is suspended or processing terminates abnormally, a dialog box of the Program Compatibility Assistant similar to the one shown below may be displayed. Click [This program uninstalled correctly] and continue operation.

3.3.1 Uninstallation in Interactive Mode
The uninstallation procedure is described below.

Information
If an error occurs while the product is being uninstalled, refer to "Uninstall (middleware) Messages" in the FUJITSU Enterprise Postgres product website, and take the required action.

1. Stop the program
Before starting the uninstallation, stop the following:
Mirroring Controller arbitration process
1. Execute the mc_arb command in stop mode to stop the Mirroring Controller arbitration process.

   Example
   ```
   > mc_arb stop -M D:\mcarb_dir\arbiter1
   ```

2. Unregister the Mirroring Controller arbitration process from the Windows service.

   Execute the mc_arb command in unregister mode to unregister the Mirroring Controller arbitration process from the Windows service.

   Example
   ```
   > mc_arb unregister -M D:\mcarb_dir\arbiter1
   ```

3. Delete registrations related to the event log.

   If messages are output to the event log, DLLs are registered in accordance with "Preparatory Tasks for the Output of Error Logs to the Event Log (Windows)" in the Cluster Operation Guide (Database Multiplexing). Delete these registrations so that no unnecessary issues occur.

   - Delete registration for the default event source name
     
     Example)
     ```
     > regsvr32 /u "c:\Program Files\Fujitsu\fsepv<x>assistant64\lib\mcarbevent.dll"
     ```

   - Delete registration for other event source names
     
     DLL registration is performed so that messages output to the event log are output to any event source named by the user.
     
     Accordingly, it is necessary to delete the DLL registration. Do this for any event source name.

     Example)
     ```
     > regsvr32 /u /i:"Mirroring Controller arbiter1" "c:\Program Files\Fujitsu\fsepv<x>assistant64\lib\mcarbevent.dll"
     ```

   - If installing multiple versions
     
     If error logs are set to be output to the event log, use the DLL path name that you took note of previously as explained in "Preparatory Tasks for the Output of Error Logs to the Event Log (Windows)" in the Cluster Operation Guide (Database Multiplexing) to reregister the default event source name.

   **Note**

   Ensure that you delete the DLLs before the uninstallation. If you perform the uninstallation without doing so, you may not be able to delete the DLLs at a later time.

---

2. Start Uninstall (middleware)

   In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

3. Select the software

   Select the product to be uninstalled from [Software Name], and then click [Remove].

4. Start the uninstallation

   Click [Uninstall].
5. Finish the uninstallation

The uninstallation completion window will be displayed. Click [Finish].

The installation folder may remain after uninstallation. If it is not required, delete it.

6. Stop Uninstall (middleware)

Click [Close].

3.3.2 Uninstallation in Silent Mode

The uninstallation procedure is described below.

See

Refer to the FUJITSU Enterprise Postgres product website for information on uninstallation in silent mode, such as the error messages.

1. Stop the program

Before starting the uninstallation, stop the following:

Mirroring Controller arbitration process

1. Execute the mc_arb command in stop mode to stop the Mirroring Controller arbitration process.

Example

> mc_arb stop -M D:\mcarb_dir\arbiter1

2. Unregister the Mirroring Controller arbitration process from the Windows service.

Example

> mc_arb unregister -M D:\mcarb_dir\arbiter1

3. Delete registrations related to the event log.

If messages are output to the event log, DLLs are registered in accordance with "Preparatory Tasks for the Output of Error Logs to the Event Log (Windows)") in the Cluster Operation Guide (Database Multiplexing). Delete these registrations so that no unnecessary issues occur.

- Delete registration for the default event source name

Example

> regsvr32 /u "c:\Program Files\Fujitsu\fsepv<x>assistant64\lib\mcarbevent.dll"

- Delete registration for other event source names

DLL registration is performed so that messages output to the event log are output to any event source named by the user.

Accordingly, it is necessary to delete the DLL registration. Do this for any event source name.

Example

The example below deletes a DLL of a 64-bit product registered under the event source name "Mirroring Controller arbiter1". "<x>" indicates the product version.
> regsvr32 /u /i:"Mirroring Controller arbiter1" "c:\Program Files\Fujitsu\fsep\<assistant64\lib\mcarbevent.dll"

- If installing multiple versions

If error logs are set to be output to the event log, use the DLL path name that you took note of previously as explained in "Preparatory Tasks for the Output of Error Logs to the Event Log (Windows)" in the Cluster Operation Guide (Database Multiplexing) to reregister the default event source name.

**Note**

Ensure that you delete the DLLs before the uninstallation. If you perform the uninstallation without doing so, you may not be able to delete the DLLs at a later time.

**2. Start the command prompt**

In Windows, right-click [Command Prompt] and then select [Run as administrator].

**3. Run the uninstallation**

Execute the following command:

The installation folder may remain after uninstallation. If it is not required, delete it.

**Example**

```
X:> installFolder\suninst.bat
```

X: Drive on which the product is installed
Chapter 4 Setup of the Server Assistant

The Server Assistant is a feature that is installed and used on the arbitration server, so its setup is performed as the arbitration server setup.

See

Refer to “Setting up Database Multiplexing Mode” in the Cluster Operation Guide (Database Multiplexing) for information on setting up and operating the Mirroring Controller arbitration server.
Appendix A Estimating Memory Requirements

This appendix explains how to estimate the memory.

A.1 Server Assistant Memory Requirements

This section describes the formula for estimating memory requirements for the Server Assistant.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{Memory usage of the Server Assistant} = \text{Peak memory usage of the Mirroring Controller arbitration processes} + \text{Peak memory usage of the Mirroring Controller commands}
\]

Peak memory usage of the Mirroring Controller arbitration processes = 100 MB

Peak memory usage of the Mirroring Controller commands = 50 MB * Number of commands executed simultaneously
Appendix B Procedure when Modifying the Oracle JRE Installation

This appendix describes the procedure to follow when modifying the Oracle JRE installation.

The Oracle JRE, of which the installation destination is specified in the JAVA_HOME environment variable when installing FUJITSU Enterprise Postgres, is used by the Server Assistant.

Therefore, when updating or reinstalling Oracle JRE after installing FUJITSU Enterprise Postgres, it is necessary to restart the Mirroring Controller arbitration process, therefore follow the procedure below to modify the Oracle JRE installation:

1. Stop the Mirroring Controller arbitration process.
   Refer to the Cluster Operation Guide (Database Multiplexing) for details.

2. Modify the Oracle JRE installation.

3. Change the installation environment to be used by Mirroring Controller.
   Set the JAVA_HOME environment variable to the installation destination of Oracle JRE 8, and use the mc_update_jre_env command to change the installation environment to be used by the Server Assistant.
   This procedure must be executed by the superuser.
   Example
   /opt/fsepvxassistant/bin is the installation directory where the Server Assistant is installed.

   ```bash
   $ su -
   Password:******
   # export JAVA_HOME="oracleJre8InstallDir"
   # /opt/fsepvxassistant/bin/mc_update_jre_env
   ```

4. Start the Mirroring Controller arbitration process.
   Refer to the Cluster Operation Guide (Database Multiplexing) for details.

Installation / Uninstallation in Silent Mode

Linux >

Windows >
Installation/Uninstallation in Silent Mode

(Linux)
Preface

Purpose of this document

This document explains the parameters to be specified when installing and uninstalling FUJITSU Enterprise Postgres in silent mode, and explains the installation messages and return values.

Structure of this document

This document is structured as follows:

Chapter 1 Server Feature

Describes how to install and uninstall the FUJITSU Enterprise Postgres server feature in silent mode.

Chapter 2 Client Feature

Describes how to install and uninstall the FUJITSU Enterprise Postgres client feature in silent mode.

Chapter 3 Server Assistant

Describes how to install and uninstall the FUJITSU Enterprise Postgres Server Assistant in silent mode.

Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Server Feature

This chapter provides specifications for installation and uninstallation of the server feature in silent mode.

1.1 Installation

This chapter provides specifications for installation.

1.1.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sectionName</code></td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installinfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td><code>parameterName</code></td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**Note**

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (") and commas (,).
- The following characters can be used in the setting for rows with the section name "parameters":
  
  Alphanumeric characters, hyphens, commas and forward slashes

**Information**

The template for the installation parameters CSV file is "mountPoint/sample/sample.csv".

1.1.2 List of Parameters

This section describes the parameters that can be set for each section.
installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Name</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>For this software, specify the following value:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>&quot;FUJITSU Enterprise Postgres&quot;</td>
</tr>
</tbody>
</table>

**Information**

- In addition to "Name", the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition
- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.
- The values set in these parameters do not affect silent installation.

**Example**

```
installInfo,Name,FUJITSU Enterprise Postgres
```

parameters section

The parameters that can be set in the parameters section are shown below.

Note that "<x>" indicates the product version.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the server</td>
<td>ServerInstallExecute</td>
<td>Optional. Specify whether to run the installation of the server.</td>
</tr>
<tr>
<td></td>
<td></td>

- parameters,ServerInstallPath,
- parameters,Client64InstallExecute,Y
- parameters,Client64InstallPath,
- parameters,WebAdminInstallExecute,Y
1.1.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error is detected during installation of the product, a message is output to the log:

**Log file**

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

```
var/log/fsep_SERVER64_media_xyz_install.log
```

**Messages and return values**

**CSV file errors**

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error:code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 2, installInfo/Name is required.</td>
<td>Either installInfo or the Name parameter has not been specified.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 5, Invalid character length.</td>
<td>No setting value is specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 8, Parameter is required.</td>
<td>There is no line in the &quot;parameters&quot; section.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified parameter is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values. The parameter name is displayed in @1@ and @2@.</td>
</tr>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
</tbody>
</table>
Product installer errors

The following return values are returned when errors occur while the product installer is running.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>3</td>
<td>Failed to setup WebAdmin.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for installation do not exist.</td>
</tr>
<tr>
<td>16</td>
<td>Unable to change the permission because the directory does not exist.</td>
</tr>
<tr>
<td>17</td>
<td>Failed to install because a required package is missing.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>30</td>
<td>Failed to copy the installation material.</td>
</tr>
<tr>
<td>32</td>
<td>The same version of the same product is already installed.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>61</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>The uninstallation cannot be performed either because Uninstall (middleware) does not exist or because there are no execution privileges.</td>
</tr>
<tr>
<td>83</td>
<td>Failed to install FJQSS or register information.</td>
</tr>
<tr>
<td>85</td>
<td>Different editions of the same generation are installed.</td>
</tr>
<tr>
<td>86</td>
<td>A newer version of the product is already installed.</td>
</tr>
<tr>
<td>88</td>
<td>Exclusive product is already installed.</td>
</tr>
<tr>
<td>99</td>
<td>A system error occurred.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>110</td>
<td>License registration failed.</td>
</tr>
<tr>
<td>129</td>
<td>Unsupported operating system.</td>
</tr>
</tbody>
</table>
### 1.1.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

#### Records

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bbb</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bbb</td>
</tr>
</tbody>
</table>

- Headers cannot be specified.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>field1</td>
<td>field2</td>
</tr>
<tr>
<td></td>
<td>field3</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bbb</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
</tbody>
</table>

#### Double quotation marks

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bb</td>
</tr>
<tr>
<td></td>
<td>b</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bb,b</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
</tbody>
</table>

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bb&quot;b</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
</tbody>
</table>

#### Note

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.
- A space is entered before or after a field enclosed with double quotation marks.
- The number of fields differs between records.

```
<table>
<thead>
<tr>
<th>Field 1</th>
<th>Field 2</th>
<th>Field 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb</td>
<td></td>
<td>aaa,bbb,ccc</td>
</tr>
<tr>
<td></td>
<td></td>
<td>aaa,bbb,ccc,ddd</td>
</tr>
</tbody>
</table>
```

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

```
<table>
<thead>
<tr>
<th>Field 1</th>
<th>Field 2</th>
<th>Field 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,&quot;bbb&quot;,ccc</td>
<td>&quot;xxx&quot;,yyy,&quot;zzz&quot;</td>
<td></td>
</tr>
</tbody>
</table>
```

- The double quotation escape characters are not positioned correctly.

```
<table>
<thead>
<tr>
<th>Field 1</th>
<th>Field 2</th>
<th>Field 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;&quot;mb&quot;,&quot;ccc&quot;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

- Double quotation marks enclose the entire field.

```
<table>
<thead>
<tr>
<th>Field 1</th>
<th>Field 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa,bbb,ccc&quot;</td>
<td></td>
</tr>
</tbody>
</table>
```

---

### 1.2 Uninstallation

This chapter provides specifications for uninstallation.

#### 1.2.1 Messages and Return Values

The uninstaller result is output to the log file.

**Log file**

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

**Server product**

```
/var/log/fsep_SERVER64_xyz_uninstall.log
```

**WebAdmin**

```
/var/log/fsep_WEBADMIN_xyz_uninstall.log
```

**Pgpool-II**

```
/var/log/fsep_PGPOOL2_xyz_uninstall.log
```

**Return values**

The following return values are output:

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>3</td>
<td>WebAdmin unsetup failed.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for uninstallation do not exist.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>Return values</td>
<td>Meaning</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
</tr>
<tr>
<td>63</td>
<td>Uninstall (middleware) has not been installed, or there are no execution privileges.</td>
</tr>
<tr>
<td>83</td>
<td>Failed to delete the information from FJQSS.</td>
</tr>
<tr>
<td>99</td>
<td>A system error occurred.</td>
</tr>
<tr>
<td>100</td>
<td>The command argument is invalid.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>200</td>
<td>Failed to uninstall of package.</td>
</tr>
</tbody>
</table>
Chapter 2 Client Feature

This chapter provides specifications for installation and installation of the client feature in silent mode.

Note that "<x>" in paths indicates the product version.

2.1 Installation

This chapter provides specifications for installation.

2.1.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**Note**

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (") and commas (,).
- Do not use the following halfwidth characters in the setting values for lines with the section name "parameters".

**Windows**: `# & ` ~ `| @ ` `[ ` ]; < > / tab

**Linux**: `" # & = ` ( ) `~ \ | @ ` `[ ` ] `_; : < > tab

**Information**

The template for the installation parameters CSV file is as follows:

- **Windows client**: Z:\sample\sample_windows.csv (Z is the drive into which the DVD is inserted.)
2.1.2 List of Parameters

This section describes the parameters that can be set for each section.

installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Parameter</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td>name</td>
<td>Name</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>String. For this software, specify the following value:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>None.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For this software, specify the following value:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>“FUJITSU Enterprise Postgres”</td>
</tr>
</tbody>
</table>

Information

- In addition to "Name", the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition

- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.

- The values set in these parameters do not affect silent installation.

Example

installInfo,Name,FUJITSU Enterprise Postgres

parameters section

The parameters that can be set in the parameters section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the client (32-bit)</td>
<td>Parameter</td>
<td>Optional. Specify whether to run the installation of the client (32-bit).</td>
</tr>
<tr>
<td></td>
<td>name</td>
<td>Client32InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (32-bit).</td>
</tr>
</tbody>
</table>
|     | Value/Range                               | Y or N        | Y: Install
N: Do not install  |
<p>|     | Default value                             | Y             |                                                                           |
| 2   | Installation destination of the client (32-bit) | Parameter   | Optional. Specify the installation destination of the client (32-bit).   |
|     | name                                      | Client32InstallPath | Optional. Specify the installation destination of the client (32-bit). |
|     | Value/Range                               | Path name     |                                                                           |</p>
<table>

</tbody>
</table>
### 2.1.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis. If an error occurs during installation of the product, a message is output to the log.

**Log file**

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

- **Windows**
  
  `\%TEMP\%\fsep_CLIENT_media_\*\*.log`

- **Linux**
  
  `/var/log/fsep_CLIENT_media_\*\*\_install.log`

**Messages and return values**

**CSV file errors**

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error: code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value has been specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>The &quot;parameters&quot; section has no lines.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values. The parameter name is displayed in @1@ and @2@.</td>
</tr>
<tr>
<td>Return value</td>
<td>Message</td>
<td>Explanation and actions</td>
</tr>
<tr>
<td>--------------</td>
<td>---------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>24</td>
<td>Drive @2@ of @1@ does not exist.</td>
<td>The drive does not exist. Specify an existing drive. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>28</td>
<td>There is no product for installation.</td>
<td>There is no product to be installed. Specify &quot;Y&quot; for at least one of the following parameters:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Windows</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Client32InstallExecute</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Client64InstallExecute</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Linux</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Client64InstallExecute</td>
</tr>
<tr>
<td></td>

<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>129</td>
<td>Unsupported operating system.</td>
</tr>
<tr>
<td>200</td>
<td>Failed to install of package.</td>
</tr>
<tr>
<td>201</td>
<td>A conflicting package is installed.</td>
</tr>
</tbody>
</table>

### 2.1.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

**Records**

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".
- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- You cannot specify a header.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>field1 field2 field3</td>
<td>field1</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>

### Double quotation marks

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
<tr>
<td>&quot;aaa&quot;,&quot;bb,b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
</tbody>
</table>

### Note

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.

- A space is entered before or after a field enclosed with double quotation marks.

- The number of fields differs between records.

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

- The double quotation escape characters are not positioned correctly.
## 2.2 Uninstallation

This chapter provides specifications for uninstallation.

### 2.2.1 Messages and Return Values

The uninstaller result is output to the log file.

**Log file**

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

**Windows**

<table>
<thead>
<tr>
<th>64-bit product</th>
<th>Log file</th>
</tr>
</thead>
<tbody>
<tr>
<td>%TEMP\fsep_CLIENT64_xyz_uninstall.log</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>32-bit product</th>
<th>Log file</th>
</tr>
</thead>
<tbody>
<tr>
<td>%TEMP\fsep_CLIENT32_xyz_uninstall.log</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

**Pgpool-II**

<table>
<thead>
<tr>
<th>Log file</th>
</tr>
</thead>
<tbody>
<tr>
<td>/var/log/fsep_PGPOOL2_xyz_uninstall.log</td>
</tr>
</tbody>
</table>

**Return values**

The following return values are output:

**Windows**

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>64</td>
<td>Failed to install because &quot;Uninstall (middleware)&quot; is running.</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write product information (updating registry).</td>
</tr>
<tr>
<td>79</td>
<td>Failed to read product information (viewing registry).</td>
</tr>
<tr>
<td>144</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>200</td>
<td>Failed to uninstall of package.</td>

Chapter 3 Server Assistant

This chapter provides specifications for installation and uninstallation of the Server Assistant in silent mode.

Note that "<x>" in paths indicates the product version.

3.1 Installation

This chapter provides specifications for installation.

3.1.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

<table>
<thead>
<tr>
<th>sectionName</th>
<th>parameterName</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>parameterName</td>
<td>value</td>
</tr>
</tbody>
</table>

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Note

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (") and commas (,).
- Do not use the following halfwidth characters in the setting values for lines with the section name "parameters".

Windows: # $ & ` ^ ~ | @ ` [ ] ; < > / tab

Linux: " # $ = ' ( ) ^ ~ < > \

Information

The template for the installation parameters CSV file is as follows:

- Windows Server Assistant: Z:\sample\sample.csv (Z is the drive into which the DVD is inserted.)
3.1.2 List of Parameters

This section describes the parameters that can be set for each section.

installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Name</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>None</td>
</tr>
<tr>
<td></td>
<td><strong>Parameter</strong></td>
<td><strong>name</strong></td>
<td><strong>Mandatory.</strong> Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td><strong>Value/Range</strong></td>
<td><strong>String</strong></td>
<td><strong>For this software, specify the following</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Default value</strong></td>
<td><strong>None</strong></td>
<td><strong>value:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>&quot;FUJITSU Enterprise Postgres&quot;</strong></td>
</tr>
</tbody>
</table>

**Information**

- In addition to "Name", the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition
- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.
- The values set in these parameters do not affect silent installation.

Example

```
installInfo,Name,FUJITSU Enterprise Postgres
```

parameters section

The parameters that can be set in the parameters section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the server assistant</td>
<td>ArbiterInstallExecute</td>
<td>Optional. Specify whether to run the installation of the Server Assistant.</td>
</tr>
<tr>
<td></td>
<td>Parameter name</td>
<td>Value/Range</td>
<td>Y or N</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td><strong>Parameter</strong></td>
<td><strong>name</strong></td>
<td><strong>Optional.</strong> Specify whether to run the**</td>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>A root folder (such as C:) cannot be specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Windows</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>A root directory cannot be specified.</td>
</tr>
</tbody>
</table>
### Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error occurs during installation of the product, a message is output to the log.

#### Log file

In “xyz” below, “x” is the product version, “z” is the product level, and for this release, “y” is 0.

<table>
<thead>
<tr>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td>%TEMP%\fsep_SERVER_ASSISTANT_media_xzy.log</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Linux</th>
</tr>
</thead>
<tbody>
<tr>
<td>/var/log/fsep_SERVER_ASSISTANT_media_xzy_install.log</td>
</tr>
</tbody>
</table>

#### CSV file errors

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error: code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value has been specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>The “parameters” section has no lines.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values.</td>
</tr>
</tbody>
</table>
### Product installer errors

The following return values are returned when errors occur while the product installer is running.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
<td></td>
</tr>
<tr>
<td>32</td>
<td>The same version of the same product is already installed.</td>
<td></td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
<td></td>
</tr>
<tr>
<td>61</td>
<td>Failed to install Uninstall (middleware).</td>
<td></td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
<td></td>
</tr>
<tr>
<td>74</td>
<td>Failed to write to the registry.</td>
<td></td>
</tr>
<tr>
<td>79</td>
<td>Failed to load the registry.</td>
<td></td>
</tr>
<tr>
<td>83</td>
<td>Failed to install FJQSS or register information.</td>
<td></td>
</tr>
<tr>
<td>86</td>
<td>A newer version of the product is already installed.</td>
<td></td>
</tr>
<tr>
<td>88</td>
<td>Exclusive product is already installed.</td>
<td></td>
</tr>
<tr>
<td>129</td>
<td>The operating system is not supported.</td>
<td></td>
</tr>
<tr>
<td>142</td>
<td>Insufficient disk space at the installation destination.</td>
<td></td>
</tr>
<tr>
<td>144</td>
<td>The command was not executed with administrator privileges.</td>
<td></td>
</tr>
<tr>
<td>200</td>
<td>Failed to install of package.</td>
<td></td>
</tr>
<tr>
<td>201</td>
<td>A conflicting package is installed.</td>
<td></td>
</tr>
<tr>
<td>220</td>
<td>Failed to create a folder in the installation folder.</td>
<td></td>
</tr>
<tr>
<td>221</td>
<td>Failed to create files in the installation folder.</td>
<td></td>
</tr>
<tr>
<td>251</td>
<td>An error occurred when running a system function.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage

#### Windows

Return value | Message | Explanation and actions |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The parameter name is displayed in @1@.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>24</td>
<td>Drive @2@ of @1@ does not exist.</td>
<td>The drive does not exist. Specify an existing drive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The parameter name is displayed in @1@.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>28</td>
<td>There is no product for installation.</td>
<td>There is no product to be installed. Specify &quot;Y&quot; for the following parameters:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ArbiterInstallExecute</td>
</tr>
<tr>
<td>29</td>
<td>Windows</td>
<td></td>
</tr>
<tr>
<td></td>
<td>USAGE : silent.bat inputfile</td>
<td>The argument specified in the command is incorrect. Specify the correct argument.</td>
</tr>
</tbody>
</table>

#### Linux

Return value | Message | Explanation and actions |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>The parameter name is displayed in @1@.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>220</td>
<td>Failed to create a folder in the installation folder.</td>
<td></td>
</tr>
<tr>
<td>221</td>
<td>Failed to create files in the installation folder.</td>
<td></td>
</tr>
<tr>
<td>251</td>
<td>An error occurred when running a system function.</td>
<td></td>
</tr>
</tbody>
</table>
### 3.1.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

**Records**

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a half-width comma ",,.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td></td>
<td>bbb</td>
</tr>
<tr>
<td></td>
<td>ccc</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.
<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- You cannot specify a header.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>field1</td>
<td>field2</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>

### Double quotation marks

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
<tr>
<td>&quot;aaa&quot;,&quot;bb,b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
</tbody>
</table>

### Note

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.

- A space is entered before or after a field enclosed with double quotation marks.

  "zzz", "yyy", "xxx"

- The number of fields differs between records.

  aaa,bbb
  aaa,bbb,ccc
  aaa,bbb,ccc,ddd

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

  aaa,"bbb",ccc
  "xxx",yyy,"zzz"

- The double quotation escape characters are not positioned correctly.

  "aaa","bb"b","ccc"

- Double quotation marks enclose the entire field.

  "aaa,bbb,ccc"
3.2 Uninstallation

This chapter provides specifications for uninstallation.

3.2.1 Messages and Return Values

The uninstaller result is output to the log file.

Log file

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

**Windows**

\%TEMP\%\fsep_SERVER_ASSISTANT_\(\text{xz}_\text{y}\)\_uninstall.log

**Linux**

/var/log/fsep_SERVER_ASSISTANT_\(\text{xz}_\text{y}\)\_uninstall.log

Return values

The following return values are output:

**Windows**

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>64</td>
<td>Failed to install because &quot;Uninstall (middleware)&quot; is running.</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write product information (updating registry).</td>
</tr>
<tr>
<td>79</td>
<td>Failed to read product information (viewing registry).</td>
</tr>
<tr>
<td>83</td>
<td>Failed to delete the information from FJQSS.</td>
</tr>
<tr>

Installation/Uninstallation in Silent Mode
(Windows)
Preface

Purpose of this document
This document explains the parameters to be specified when installing and un installing FUJITSU Enterprise Postgres in silent mode, and explains the installation messages and return values.

Structure of this document
This document is structured as follows:

Chapter 1 Server Feature
Describes how to install and uninstall the FUJITSU Enterprise Postgres server feature in silent mode.

Chapter 2 Client Feature
Describes how to install and uninstall the FUJITSU Enterprise Postgres client feature in silent mode.

Chapter 3 Server Assistant
Describes how to install and uninstall the FUJITSU Enterprise Postgres Server Assistant in silent mode.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Server Feature

This chapter provides specifications for installation and uninstallation of the server feature in silent mode.

1.1 Installation

This chapter provides specifications for installation.

1.1.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value

```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installinfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks ("), and commas (,). Specify values up to 32 bytes.
- The setting values for lines where the section name is "parameters" may contain the following characters: [a-zA-Z0-9], halfwidth space, hyphen (-), backslash (\), and comma (,).
  For path names, specify up to 160 bytes.

Information

The installation parameter CSV template is "dvd\drive\sample\sample.csv".
1.1.2 List of Parameters

This section describes the parameters that can be set for each section.

installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter name</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Name</td>
<td>String</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td></td>
<td>None</td>
<td>For this software, specify the following value:</td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td></td>
<td></td>
<td>“FUJITSU Enterprise Postgres”</td>
</tr>
</tbody>
</table>

**Information**

- In addition to “Name”, the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition

- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.
- The values set in these parameters do not affect silent installation.

**Example**

```
installInfo,Name,FUJITSU Enterprise Postgres
```

parameters section

The parameters that can be set in the parameters section are shown below.

Note that "<x>" indicates the product version.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter name</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the server</td>
<td></td>
<td>ServerInstallExecute</td>
<td>Optional. Specify whether to run the installation of the server.</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td></td>
<td>Y or N</td>
<td>Y: Install</td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td></td>
<td>Y</td>
<td>No: Do not install</td>
</tr>
<tr>
<td>2</td>
<td>Installation destination of the server</td>
<td>Parameter name</td>
<td>ServerInstallPath</td>
<td>Optional. Specify the installation destination of the software.</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td></td>
<td>Path name</td>
<td>The root folder (such as C:) cannot be specified.</td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td></td>
<td>C:\Program Files\Fujitsu\fsepv&lt;x&gt;server64</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Whether to install the client (32-bit)</td>
<td>Parameter name</td>
<td>Client32InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (32-bit).</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td></td>
<td>Y or N</td>
<td></td>
</tr>
<tr>
<td>No.</td>
<td>Type</td>
<td>Parameter</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-----</td>
<td>------</td>
<td>-----------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>Path name</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td>C:\Program Files\Fujitsu \ssep&lt;x&gt;\client32 or C:\Program Files (x86)\Fujitsu \ssep&lt;x&gt;\client32</td>
<td>The root folder (such as C:) cannot be specified.</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Whether to install the client (64-bit)</td>
<td>Client64InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (64-bit).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>Y or N</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
|     | Default value | Y | Y: Install  
N: Do not install  
This parameter is ignored on 32-bit operating systems. |
| 6   | Installation destination of the client (64-bit) | Client64InstallPath | Optional. Specify the installation destination of the client (64-bit). |
|     | Value/Range | Path name | |
|     | Default value | C:\Program Files\Fujitsu \\ssep\<x>\client64 | The root folder (such as C:\) cannot be specified. |
| 7   | Whether to install WebAdmin | WebAdminInstallExecute | Optional. Specify whether to run the installation of WebAdmin in multi-server mode. |
|     | Value/Range | Y or N | |
|     | Default value | Y | Y: Install  
N: Do not install |
| 8   | Installation destination of WebAdmin (64-bit) | WebAdminInstallPath | Optional. Specify the installation destination of WebAdmin. |
|     | Value/Range | Path name | |
|     | Default value | C:\Program Files\Fujitsu \\ssep\<x>\webadmin64 | This parameter is ignored on 32-bit operating systems.  
The root folder (such as C:\) cannot be specified. |
| 9   | Whether to set up WebAdmin | WebSetupExecute | Optional. Specify whether to set up WebAdmin. |
|     | Value/Range | Y or N | |
|     | Default value | Y | Y: Setup  
N: Do not set up  
WebAdmin is not installed. |
| 10  | Web server port number | WebPortNumber1 | Optional. Specify the port number of the Web server. |
### Example

```
installInfo,Name,FUJITSU Enterprise Postgres
parameters,ServerInstallExecute,Y
parameters,ServerInstallPath,
parameters,Client32InstallExecute,Y
parameters,Client32InstallPath,
parameters,Client64InstallExecute,Y
parameters,Client64InstallPath,
parameters,WebAdminInstallExecute,Y
parameters,WebAdminInstallPath,
parameters,WebSetupExecute,Y
parameters,WebPortNumber1,27515
parameters,WebPortNumber2,27516
```

### 1.1.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error is detected during installation of the product, a message is output to the log:

#### Log file

In "xyz" below, "x" is the product version, "y" is the product level, and for this release, "y" is 0.

```
%TEMP%\fsep_SERVER64_media_"xyz"_install.log
```

#### Note

Directories under the TEMP environment variable may be deleted when the operating system is restarted. Therefore, ensure that you browse or save the file before restarting the operating system.

#### Messages and return values

**CSV file errors**

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error:code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 2, installInfo/Name is required.</td>
<td>Either installInfo or the Name parameter has not been specified.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 3, InstallInfo key invalid.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>Return value</td>
<td>Message</td>
<td>Explanation and actions</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value is specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid format or character set is being used for the character string.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>There is no line in the &quot;parameters&quot; section.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified parameter is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values. The parameter name is displayed in @1@ and @2@.</td>
</tr>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>

<td>The drive does not exist. Specify an existing drive. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>26</td>
<td>Port number @1@ is already used in the service file.</td>
<td>The port number is already being used. Specify an unused port number. The port number is displayed in @1@</td>
</tr>
<tr>
<td>28</td>
<td>There is no product for installation.</td>
<td>No product was specified for installation. Specify &quot;Y&quot; for at least one of the following parameters: - ServerInstallExecute - Client32InstallExecute - Client64InstallExecute - WebAdminInstallExecute</td>
</tr>
<tr>
<td>29</td>
<td>USAGE : silent.sh inputfile</td>
<td>The argument specified in the command is incorrect. Specify the correct argument.</td>
</tr>
</tbody>
</table>

Product installer errors

The following return values are returned when errors occur while the product installer is running.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>3</td>
<td>Failed to set up WebAdmin.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>Return value</td>
<td>Explanation</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------</td>
</tr>
<tr>
<td>32</td>
<td>The same version of the same product is already installed.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>61</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write to the registry.</td>
</tr>
<tr>
<td>79</td>
<td>Failed to read the registry.</td>
</tr>
<tr>
<td>83</td>
<td>Failed to install FJQSS or register information.</td>
</tr>
<tr>
<td>85</td>
<td>Different editions of the same generation are installed.</td>
</tr>
<tr>
<td>86</td>
<td>A newer version of the product is already installed.</td>
</tr>
<tr>
<td>88</td>
<td>Exclusive product is already installed.</td>
</tr>
<tr>
<td>110</td>
<td>License registration failed.</td>
</tr>
<tr>
<td>129</td>
<td>Unsupported operating system.</td>
</tr>
<tr>
<td>142</td>
<td>The installation destination has insufficient disk capacity.</td>
</tr>
<tr>
<td>144</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>200</td>
<td>Failed to install of package.</td>
</tr>
<tr>
<td>201</td>
<td>A conflicting package is installed.</td>
</tr>
<tr>
<td>251</td>
<td>An error occurred when running a system function.</td>
</tr>
<tr>
<td>255</td>
<td>An internal inconsistency occurred.</td>
</tr>
</tbody>
</table>

### 1.1.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

**Records**

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a comma "," (comma: ASCII (single-byte character)).

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- Headers cannot be specified

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>field1</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>
Double quotation marks

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb b&quot;,&quot;ccc&quot;</td>
<td>aaa</td>
</tr>
<tr>
<td>&quot;aaa&quot;,&quot;bb,b&quot;,&quot;ccc&quot;</td>
<td>bb</td>
</tr>
</tbody>
</table>

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;b&quot;,&quot;ccc&quot;</td>
<td>aaaa</td>
</tr>
</tbody>
</table>

Note

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;zzz&quot;,&quot;yyy&quot;,&quot;xxx&quot;</td>
<td></td>
</tr>
</tbody>
</table>

- A space is entered before or after a field enclosed with double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaaa,bbb,ccc</td>
<td></td>
</tr>
</tbody>
</table>

- The number of fields differs between records.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaaa,bbb,ccc</td>
<td></td>
</tr>
</tbody>
</table>

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaaa,&quot;bbb&quot;,&quot;ccc&quot;</td>
<td></td>
</tr>
</tbody>
</table>

- The double quotation escape characters are not positioned correctly.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;&quot;b&quot;,&quot;ccc&quot;</td>
<td></td>
</tr>
</tbody>
</table>

- Double quotation marks enclose the entire field.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa,bbb,ccc&quot;</td>
<td></td>
</tr>
</tbody>
</table>

1.2 Uninstallation

This chapter provides specifications for uninstallation.

1.2.1 Messages and Return Values

The uninstaller result is output to the log file.

Log file

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.
Server product

```text
%TEMP%\fsep_SERVER64_\.xyz_uninstall.log
```

WebAdmin

```text
%TEMP%\fsep_WEBADMIN_\.xyz_uninstall.log
```

**Return values**

The following return values are output:

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>3</td>
<td>WebAdmin unsetup failed.</td>
</tr>
<tr>
<td>64</td>
<td>Failed to install because &quot;Uninstall (middleware)&quot; is running.</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write product information (updating registry).</td>
</tr>
<tr>
<td>79</td>
<td>Failed to read product information (viewing registry).</td>
</tr>
<tr>
<td>83</td>
<td>Failed to delete the information from FJQSS.</td>
</tr>
<tr>
<td>144</td>
<td>Not executed with administrator privileges.</td>
</tr>
<tr>
<td>200</td>
<td>Failed to uninstall of package.</td>
</tr>
<tr>
<td>251</td>
<td>An error occurred when running a system function.</td>
</tr>
<tr>
<td>255</td>
<td>An internal inconsistency occurred.</td>
</tr>
</tbody>
</table>
Chapter 2 Client Feature

This chapter provides specifications for installation and installation of the client feature in silent mode.

Note that "<x>" in paths indicates the product version.

2.1 Installation

This chapter provides specifications for installation.

2.1.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (”) and commas (,).
- Do not use the following halfwidth characters in the setting values for lines with the section name "parameters".

Windows: # $ ‘`~\[\]@^\';<>/tab

Linux: " # $ & ‘'()~\[\]@^\{}:::< > tab

Information

The template for the installation parameters CSV file is as follows:

- Windows client: Z\sample\sample_windows.csv (Z is the drive into which the DVD is inserted.)
2.1.2 List of Parameters

This section describes the parameters that can be set for each section.

installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Name</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>For this software, specify the following value: ”FUJITSU Enterprise Postgres”</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>None</td>
</tr>
</tbody>
</table>

Information

- In addition to “Name”, the following parameters can be used in the “installInfo” section.
  - softwareName
  - OS
  - Version
  - Edition

- Note that specifying a parameter name other than “Name” and the parameters listed above will result in an error.
- The values set in these parameters do not affect silent installation.

Example

installInfo,Name,FUJITSU Enterprise Postgres

parameters section

The parameters that can be set in the parameters section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the client (32-bit)</td>
<td>Client32InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (32-bit).</td>
</tr>
</tbody>
</table>
|     | Parameter name                                 | Y or N             | Y: Install
N: Do not install

<p>|     | Value/Range                                    | Y                  | This parameter is ignored on Linux.                                        |
|     | Default value                                  |                    |                                                                             |
| 2   | Installation destination of the client (32-bit)| Client32InstallPath | Optional. Specify the installation destination of the client (32-bit).      |
|     | Parameter name                                 | Path name          |                                                                             |</p>
<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td></td>
<td>Client64InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (64-bit). Y: Install N: Do not install This parameter is ignored on 32-bit operating systems.</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td>Client64InstallPath</td>
<td>Optional. Specify the installation destination of the client (64-bit). Windows(64-bit) % Program Files %\Fujitsu\fsepv\x\client64 Linux /opt/fsepv \x\client64 This parameter is ignored on 32-bit operating systems. A root directory cannot be specified.</td>
</tr>
<tr>
<td>5</td>
<td></td>
<td>Pgpool2InstallExecute</td>
<td>Specify whether to run the installation of the Pgpool-II. Y: Install N: Do not install This parameter is ignored on Windows.</td>
</tr>
<tr>
<td>6</td>
<td></td>
<td>Pgpool2InstallPath</td>
<td>Optional. Specify the installation destination of Pgpool-II. /opt/fsepv \x\pgpool-II This parameter is ignored on Windows. A root directory cannot be specified.</td>
</tr>
</tbody>
</table>
Example

parameters,Client64InstallPath,
parameters,Pgpool2InstallExecute,Y
parameters,Pgpool2InstallPath,

2.1.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error occurs during installation of the product, a message is output to the log.

Log file

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

Windows

%TEMP%\fsep_CLIENT_media_\xyz.log

Linux

/var/log/fsep_CLIENT_media_\xyz_install.log

Messages and return values

CSV file errors

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error:code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error:code = 2, installInfo/Name is required.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>

</tr>
<tr>
<td>201</td>
<td>A conflicting package is installed.</td>
</tr>
</tbody>
</table>

### 2.1.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

**Records**

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".
If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

- You cannot specify a header.

**Double quotation marks**

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

**Note**

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.

- A space is entered before or after a field enclosed with double quotation marks.

- The number of fields differs between records.

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

- The double quotation escape characters are not positioned correctly.
2.2 Uninstallation

This chapter provides specifications for uninstallation.

2.2.1 Messages and Return Values

The uninstaller result is output to the log file.

Log file

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

**Windows**

| 64-bit product | %TEMP%sep_CLIENT64_\(xyz\)_uninstall.log |
| 32-bit product | %TEMP%sep_CLIENT32_\(xyz\)_uninstall.log |

**Linux**

| 64-bit product | /var/log/fsep_CLIENT64_\(xyz\)_uninstall.log |

**Pgpool-II**

| /var/log/fsep_PGPOOL2_\(xyz\)_uninstall.log |

Return values

The following return values are output:

**Windows**

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>64</td>

</tbody>
</table>
Chapter 3 Server Assistant

This chapter provides specifications for installation and uninstallation of the Server Assistant in silent mode.

Note that "<x>" in paths indicates the product version.

3.1 Installation

This chapter provides specifications for installation.

3.1.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td></td>
</tr>
</tbody>
</table>

Note

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (") and commas (,).
- Do not use the following halfwidth characters in the setting values for lines with the section name "parameters":
  ```
  Windows: # $ ` ^ ~ | @ ` [ ] : ; > / tab
  Linux: " " $ ` ( ) ^ ~ \ | @ ` [ ] { } ; : < > tab
  ```

Information

The template for the installation parameters CSV file is as follows:

- Windows Server Assistant: Z:\sample\sample.csv (Z is the drive into which the DVD is inserted.)
3.1.2 List of Parameters

This section describes the parameters that can be set for each section.

installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Parameter name</td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>- In addition to “Name”, the following parameters can be used in the &quot;installInfo&quot; section.</td>
</tr>
<tr>
<td>- softwareName</td>
</tr>
<tr>
<td>- OS</td>
</tr>
<tr>
<td>- Version</td>
</tr>
<tr>
<td>- Edition</td>
</tr>
<tr>
<td>- Note that specifying a parameter name other than &quot;Name&quot; and the parameters listed above will result in an error.</td>
</tr>
<tr>
<td>- The values set in these parameters do not affect silent installation.</td>
</tr>
</tbody>
</table>

Example

installInfo,Name,FUJITSU Enterprise Postgres

parameters section

The parameters that can be set in the parameters section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the server assistant</td>
<td>Parameter name</td>
<td>Optional. Specify whether to run the installation of the Server Assistant.</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>Y or N</td>
<td>Y: Install N: Do not install</td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td>Y</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Installation destination of the server assistant</td>
<td>Parameter name</td>
<td>Optional. Specify the installation destination of the Server Assistant.</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>Path name</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td>Windows</td>
<td>A root folder (such as C:) cannot be specified.</td>
</tr>
<tr>

parameters, ArbiterInstallPath,

3.1.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.
If an error occurs during installation of the product, a message is output to the log.

Log file

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

**Windows**

```bash
%TEMP%\fsep_SERVER_ASSISTANT_media_xyz.log
```

**Linux**

```bash
/var/log/fsep_SERVER_ASSISTANT_media_xyz_install.log
```

**Messages and return values**

**CSV file errors**

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error: code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value has been specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>The &quot;parameters&quot; section has no lines.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values.</td>
</tr>
</tbody>
</table>
The parameter name is displayed in @1@ and @2@.

The path already exists. Specify a different path.
The parameter name is displayed in @1@.
The specified value is displayed in @2@.

The drive does not exist. Specify an existing drive.
The parameter name is displayed in @1@.
The specified value is displayed in @2@.

There is no product to be installed. Specify "Y" for the following parameters:
- ArbiterInstallExecute

The argument specified in the command is incorrect. Specify the correct argument.

The following return values are returned when errors occur while the product installer is running.

### Windows

</tr>
<tr>
<td>200</td>
<td>Failed to install of package.</td>
</tr>
<tr>
<td>201</td>
<td>A conflicting package is installed.</td>
</tr>
</tbody>
</table>

### 3.1.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

**Records**

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.
### Format | Record
--- | ---
aaa,ccc | aaa | ccc
aaa,bbb, | aaa | bbb

- You cannot specify a header.

### Format | Record
--- | ---
field1 | field2 | field 3
aaa,bbb,ccc | aaa | bbb | ccc

### Double quotation marks

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

| Format | Record |
--- | ---
"aaa","bb b","ccc" | aaa | bb b | ccc
"aaa","bb,b","ccc" | aaa | bb,b | ccc

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

| Format | Record |
--- | ---
"aaa","bb""b","ccc" | aaa | bb"b | ccc

### Note

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.
- A space is entered before or after a field enclosed with double quotation marks.

| "zzz ", "yyy ", " xxx " |

- The number of fields differs between records.

| aaa,bbb |
| aaa,bbb,ccc |
| aaa,bbb,ccc,ddd |

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

| aaa,"bb",ccc |
| xxx",yyy,"zzz" |

- The double quotation escape characters are not positioned correctly.

| "aaa","bb""b","ccc" |

- Double quotation marks enclose the entire field.

| "aaa,bbb,ccc" |
3.2 Uninstallation

This chapter provides specifications for uninstallation.

3.2.1 Messages and Return Values

The uninstaller result is output to the log file.

Log file

In "xyz" below, "x" is the product version, "z" is the product level, and for this release, "y" is 0.

<table>
<thead>
<tr>
<th>OS</th>
<th>Return Values</th>

Uninstall (middleware)
Preface

Purpose of this document
This document explains the features, notes, and messages of Uninstall (middleware).

Structure of this document
This document is structured as follows:

Chapter 1 Using Uninstall (middleware)
Describes the features and notes of Uninstall (middleware).

Chapter 2 Uninstall (middleware) Messages
Describes the messages output by Uninstall (middleware).

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

</table>

1.2 Notes

1.2.1 Notes on the Uninstall (middleware) Tool

"Uninstall (middleware)" is a tool used by Fujitsu middleware products. It performs information management for middleware products, and also, launching the uninstaller for removing these products from the installed systems.

- To uninstall FUJITSU Enterprise Postgres, uninstall from "Uninstall (middleware)".
- This tool manages information about other Fujitsu middleware products as well as FUJITSU Enterprise Postgres. For this reason, do not uninstall it unless absolutely necessary. If you have accidentally uninstalled this tool, re-install it as described below.

[Windows]

1. Log on to the machine to be installed using a user name belonging to the Administrators group, or switch to an account with administrator privileges.
2. Insert the server program DVD into the drive device.
3. Execute the installation command.

```
ze:\CIR\Windows\cirinst.exe
```

In the example above, z is the drive into which the DVD is inserted.
1. Log in as a superuser to the installation target machine, or switch to a user with administrative privileges.
2. Insert the product media in the drive.
3. Execute the installation command.

[Linux]

```bash
# /media/dvd/CIR/Linux/cirinst.sh
```

In the example above, /media/dvd is the DVD mount point.

[Solaris]

```bash
# /dvd/dvd0/CIR/Solaris/cirinst.sh
```

In the example above, /dvd/dvd0 is the DVD mount point.

---

- If you uninstall this tool as described below.

1. Check that there are no Fujitsu middleware products installed in the system.
   You can check this by using "Uninstall (middleware)", which is launched by the command below.
   [Windows]
   Select [All Programs] > [Fujitsu] > [Uninstall (middleware)]
   [Linux/Solaris]

```bash
/opt/FJSVcir/cir/bin/cimanager.sh -c
```

-c: CUI

2. If no Fujitsu middleware products have been installed, then issue the command below.
   [Windows]

```bash
%systemdrive%\FujitsuF4CR\bin\cirremove.exe
```

[Linux/Solaris]

```bash
# /opt/FJSVcir/bin/cirremove.sh
```

3. At the uninstallation confirmation prompt, enter "y".

```bash
This software is a common tool of Fujitsu products. Are you sure you want to remove it?[y/n]:
```

Uninstallation will start.
Chapter 2 Uninstall (middleware) Messages

2.1 Messages output by FJSVcir

**FSP_FJSVCIR_CIRINST: ERROR: 101: CIRINST101: Administrator privilege is required.**

Description
The user does not have administrator privileges.

Action method
Login with administrator privileges and run the command again.

**FSP_FJSVCIR_CIRINST: ERROR: 102: CIRINST102: Failed to create %s**

Parameters
%s: Directory name

Description
Failed to create a directory during the installation.

Action method
Creating the directory might have failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 103: CIRINST103: It is required at least %dMB**

Parameters
%d: Disk spaces

Description
Insufficient disk space.

Action method
Confirm that the system has sufficient disk spaces.

**FSP_FJSVCIR_CIRINST: ERROR: 104: CIRINST104: Failed to copy CIR files.**

Description
Failed to copy files required for the installation.

Action method
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 105: CIRINST105: Failed to copy JRE.**

Description
Failed to copy JRE required for installation.

Action method
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.
**FSP_FJSVCIR_CIRINST: ERROR: 106: CIRINST106: Failed to copy CIR**

**Description**
Failed to copy files during the installation.

**Action method**
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

---

**FSP_FJSVCIR_CIRINST: ERROR: 107: CIRINST107: invalid option.**

**Description**
An invalid option was specified.

**Action method**
Specify a valid option. [-c]: CUI

---

**FSP_FJSVCIR_CIRINST: ERROR: 108: CIRINST108: JRE which should be deployed is not bundled.**

**Description**
An appropriate JRE for this system is not bundled.

**Action method**
Confirm that the product supports the platform.

---

**Description**
Unsupported operating system.

**Action method**
Confirm that the product supports the operating system.

---

**FSP_FJSVCIR_CIRINST: ERROR: 185: CIRINST185: lsb_release was not found. Please install the package below. - redhat-lsb**

**Description**
lsb_release command was not found.

**Action method**
Add redhat-lsb package and then execute install again.

---

**FSP_FJSVCIR_CIRINST: ERROR: 186: CIRINST186: lsb_release was not found.**

**Description**
lsb_release command was not found.

**Action method**
Add the relevant package and then execute install again.

---

**FSP_FJSVCIR_CIRINST: ERROR: 201: CIRINST201: Administrator privilege is required.**

**Description**
The user does not have administrator privileges.
Action method
Login with administrator privileges and run the command again.

**FSP_FJSVCIR_CIRINST: ERROR: 203: CIRINST203: Failed to delete files.**
Description
Failed to delete FJSVcir files.

**Action method**
Deleting the files failed for some reason. Run cirremove command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 205: CIRINST205: invalid option.**
Description
Invalid option is specified.

**Action method**
No option is supported. Retry without any options.

**Specified installation parameters file was not found.**
Description
Specified installation parameters file was not found. (silent mode)

**Action method**
Specify the installation parameters file.

**It failed to install. See log for details**
Description
An error occurred during install. (silent mode)

**Action method**
Collect the files stored in the following directories.

- **[UNIX]**
  `/var/opt/FJSVcir/logs/cirlog0.log.0`
- **[Windows]**
  `%ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0`

**Parameters are invalid. Please specify valid parameters.**
Description
Invalid option is specified. (silent mode)

**Action method**
Specify a valid option.

**Internal data is broken.**
Description
Internal data used by this product is corrupt.

**Action method**
Collect the files stored in the following directories and contact Fujitsu technical support:
### 2.2 Messages output by Uninstall (middleware)

#### It has already been running in another process.

**Description**

An attempt was made to start Uninstall (middleware) more than once. Alternatively, an attempt was made to start Uninstall (middleware) while the installer was starting.

**Action method**

End any Uninstall (middleware) that have already started. Alternatively, start Uninstall (middleware) after the installer has ended.

#### Specified option is invalid.

**Description**

An invalid option was specified.

**Action method**

Specify valid options and run the command again.

#### Please enter a valid option.

**Description**

An invalid character was entered. Valid characters are y, n, or item numbers.

**Action method**

Enter a valid character.

#### Failed to uninstall of the following software packages:

**Description**

Failed to uninstall the software listed in this message.

**Action method**

Confirm the information shown after this message and take the appropriate action.

#### Unable to uninstall the software as it is referred from more than one software.

**Description**

Failed to uninstall the software because it is used by other software.

**Action method**

No specific action is required.

#### Unable to uninstall the software as the software is mandatory.

**Description**

Failed to uninstall the software because it is required by another program.
**Internal data is broken.**

**Description**

Internal data used by this product is corrupt.

**Action method**

Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
**Unable to uninstall the software you were about to uninstall as the existence of the software is a precondition for the operation of another software.**

**Description**

Failed to uninstall the software because it is required by another program.

**Action method**

No specific action is required.

**The program terminated abnormally.**

**Description**

The program has terminated abnormally.

**Action method**

Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
**An unexpected error has occurred during uninstall.**

**Description**

An error occurred during uninstall.

**Action method**

Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
It failed to uninstall. See log for details.

Description
An error occurred during uninstall. (silent mode)

Action method
Collect the files stored in the following directories.

[UNIX]
/var/opt/FJSVcir/cir/logs/cirlog0.log.0

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0

Failed to initialize the temp directory.

Description
Can not start Uninstall (middleware) because failed to initialize the temp directory.

Action method
Run Uninstall (middleware) again. If the problem persists, check whether other processes have accessed the files in the following directories.

[UNIX]
/var/opt/FJSVcir/cir/temp/meta_db

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\temp\meta_db

[Notice] Need to restart for uninstall completion.

Description
Uninstallation was completed. (silent mode)

Action method
Restart the system.
FUJITSU Enterprise Postgres 13

Application Development Guide >
Operation Guide >
Security Operation Guide >
Cluster Operation Guide >
Connection Manager User Guide >
Preface

Purpose of this document

This is a guide for the developers of FUJITSU Enterprise Postgres applications.

Intended readers

This document is intended for developers of applications that use FUJITSU Enterprise Postgres. Of the interfaces provided by FUJITSU Enterprise Postgres, this guide describes the PostgreSQL extended interface.

Readers of this document are also assumed to have general knowledge of:

- PostgreSQL
- SQL
- Linux
- Windows

Structure of this document

This document is structured as follows:

Chapter 1 Overview of the Application Development Function

Provides an overview of FUJITSU Enterprise Postgres application development.

Chapter 2 JDBC Driver

Explains how to use JDBC drivers.

Chapter 3 ODBC Driver

Explains how to use ODBC drivers.

Chapter 4 .NET Data Provider

Explains how to use .NET Data Provider.

Chapter 5 C Library (libpq)

Explains how to use C applications.

Chapter 6 Embedded SQL in C

Explains how to use embedded SQL in C.

Chapter 7 Embedded SQL in COBOL

Explains how to use embedded SQL in COBOL.

Chapter 8 SQL References

Explains the SQL statements which were extended in FUJITSU Enterprise Postgres development.

Chapter 9 Compatibility with Oracle Databases

Explains features that are compatible with Oracle databases.

Chapter 10 Application Connection Switch Feature

Explains the application connection switch feature.

Chapter 11 Performance Tuning

Explains how to tune application performance.
Chapter 12 Scan Using a Vertical Clustered Index (VCI)
Expects how to perform scan using a Vertical Clustered Index (VCI).

Appendix A Precautions when Developing Applications
Provides some points to note about application development.

Appendix B Conversion Procedures Required due to Differences from Oracle Database
Explains how to convert from an Oracle database to FUJITSU Enterprise Postgres, within the scope noted in “Compatibility with Oracle Databases” from the following perspectives.

Appendix C Tables Used by the Features Compatible with Oracle Databases
Explains the tables used by the features compatible with Oracle databases.

Appendix D ECOBPG - Embedded SQL in COBOL
Explains application development using embedded SQL in COBOL.

Appendix E Quantitative Limits
This appendix explains limitations.

Appendix F Reference
Provides a reference for each interface.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue date and version
Edition 1.0: April 2021

Chapter 1 Overview of the Application Development
Function

The interface for application development provided by FUJITSU Enterprise Postgres is perfectly compatible with PostgreSQL.

Along with the PostgreSQL interface, FUJITSU Enterprise Postgres also provides the following extended interfaces:

- Support for National Characters
  In order to secure portability from mainframes and databases of other companies, FUJITSU Enterprise Postgres provides data types that support national characters. The national characters are usable from the client application languages. Refer to "1.1 Support for National Characters" for details.

- Integration with Visual Studio
  By integrating with Visual Studio, applications can be created using a standard framework for the building of a database server. Refer to "1.2 Integration with Visual Studio" for details.

- Compatibility with Oracle Databases
  Compatibility with Oracle databases is offered. Use of the compatible features means that the revisions to existing applications can be isolated, and migration to open interfaces is made simpler. Refer to "1.3 Compatibility with Oracle Database" for details.

- Application connection switch feature
  The application connection switch feature is provided to enable automatic connection to the target server when there are multiple servers with redundant configurations. Refer to "1.4 Application Connection Switch Feature" for details.
- Performance tuning

The following features are provided to control SQL statement query plans:
- Optimizer hints
- Locked statistics

Refer to "11.1 Enhanced Query Plan Stability" for details.

- Scanning using a Vertical Clustered Index (VCI)

Scans becomes faster during aggregation of many rows by providing the features below:
- Vertical clustered index (VCI)
- In-memory data

This feature can only be used in Advanced Edition.

Refer to "Chapter 12 Scan Using a Vertical Clustered Index (VCI)" for details.

## 1.1 Support for National Characters

NCHAR type is provided as the data type to deal with national characters.

The NCHAR type can be used with FUJITSU Enterprise Postgres pgAdmin.

### Point

- NCHAR can only be used when the character set of the database is UTF-8.
- NCHAR can be used in the places where CHAR can be used (function arguments, etc.).
- For applications handling NCHAR type data in the database, the data format is the same as CHAR type. Therefore, applications handling data in NCHAR type columns can also be used to handle data stored in CHAR type columns.

### Note

Note the following in order to cast NCHAR type data as CHAR type.

- When comparing NCHAR type data where the length differs, ASCII spaces are used to fill in the length of the shorter NCHAR type data so that it can be processed as CHAR type data.
- Depending on the character set, the data size may increase by between 1.5 and 2 times.

### 1.1.1 Literal

**Syntax**

```
{ N | n }'[national character [ ...]]'
```

**General rules**

National character string literals consist of an 'N' or 'n', and the national character is enclosed in single quotation marks ('). Example: N'ABCDEF'

The data type is national character string type.
1.1.2 Data Type

Syntax

{ NATIONAL CHARACTER | NATIONAL CHAR | NCHAR } [ VARYING ][(length)]

The data type of the NCHAR type column is as follows:

<table>
<thead>
<tr>
<th>Data type specification format</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NATIONAL CHARACTER(n)</td>
<td>National character string with a fixed length of n characters</td>
</tr>
<tr>
<td>NATIONAL CHAR(n)</td>
<td>This will be the same as (1) if (n) is omitted.</td>
</tr>
<tr>
<td>NCHAR(n)</td>
<td>n is a whole number larger than 0.</td>
</tr>
<tr>
<td>NATIONAL CHARACTER VARYING(n)</td>
<td>National character string with a variable length with a maximum of n characters</td>
</tr>
<tr>
<td>NATIONAL CHAR VARYING(n)</td>
<td>Any length of national character string can be accepted when this is omitted.</td>
</tr>
<tr>
<td>NCHAR VARYING(n)</td>
<td>n is a whole number larger than 0.</td>
</tr>
</tbody>
</table>

General rules

NCHAR is the national character string type data type. The length is the number of characters.

The length of the national character string type is as follows:

- When VARYING is not specified, the length of national character strings is fixed and will be the specified length.
- When VARYING is specified, the length of national character strings will be variable.
  In this case, the lower limit will be 0 and the upper limit will be the value specified for length.
- NATIONAL CHARACTER, NATIONAL CHAR, and NCHAR each have the same meaning.

When the national character string to be stored is shorter than the declared upper limit, the NCHAR value is filled with spaces, whereas NCHAR VARYING is stored as is.

The upper limit for character storage is approximately 1GB.

1.1.3 Functions and Operator

Comparison operator

When a NCHAR type or NCHAR VARYING type is specified in a comparison operator, comparison is only possible between NCHAR types or NCHAR VARYING types.

String functions and operators

All of the string functions and operators that can be specified by a CHAR type can also be specified by a NCHAR type. The behavior of these string functions and operators is also the same as with CHAR type.

Pattern matching (LIKE, SIMILAR TO regular expression, POSIX regular expression)

The patterns specified when pattern matching with NCHAR types and NCHAR VARYING types specify the percent sign (%) and the underline (_).

The underline (_) means a match with one national character. The percent sign (%) means a match with any number of national characters 0 or over.

1.2 Integration with Visual Studio

When developing an application to access database server resources, you can create applications and build database server environments integrated with Microsoft Visual Studio.
Refer to "Chapter 4 .NET Data Provider" for information on integration with Visual Studio.

1.2.1 Relationship between .NET Framework and FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres provides .NET Data Provider, which is an interface for ADO.NET of .NET Framework. This enables you to select FUJITSU Enterprise Postgres as the connection destination database of ADO.NET and use the intuitive and efficient application development features of Visual Studio.

The following provides an overview of application development integrated with Visual Studio.

**Edit directory in Visual Studio's text editor**

By using a component specified in Visual Studio, applications to access database resources can be created manually.

**Create an application with Visual Studio tools**

By using basic drag-and-drop operations in the tools provided in Visual Studio, programs to access database resources can be generated automatically.
1.2.2 Automatic Application Generation

The Visual Studio tools used to automatically generate applications include TableAdapter and Server Explorer, which enable the following:

- Data manipulation of database resources with TableAdapter
- Management of database resources with Server Explorer

Whether you use TableAdapter or the Server Explorer, programs can be created with basic operations like drag and drop with the resources and tools that comprise Visual Studio.
The following features are available with TableAdapter and Server Explorer:

- Manipulation of database resources with TableAdapter
  - Generating queries using existing tables/views
  - Generating methods using existing tables/views
- Management of database resources with Server Explorer
  - Listing of database resources
  - Generating queries using existing tables/views
  - Generating methods using existing tables/views

1.3 Compatibility with Oracle Database

The following features have been extended in order to enhance compatibility with Oracle databases:

- Query (external join operator (+), DUAL table)
- Function (DECODE, SUBSTR, NVL)
- Built-in package (DBMS_OUTPUT, UTL_FILE, DBMS_SQL)

Refer to "Chapter 9 Compatibility with Oracle Databases" for information on the features compatible with Oracle databases.

1.4 Application Connection Switch Feature

The application connection switch feature enables automatic connection to the target server when there are multiple servers with redundant configurations.

Refer to "Chapter 10 Application Connection Switch Feature" for information on the application connection switch feature.

1.4.1 Integration with Database Multiplexing

The application connection switch feature is provided to enable automatic connection to the appropriate server when there are multiple servers with redundant configurations.
1.5 Notes on Application Compatibility

FUJITSU Enterprise Postgres upgrades contain feature improvements and enhancements that may affect the applications. Accordingly, note the points below when developing applications, to ensure compatibility after upgrade.

- Checking execution results
- Referencing system catalogs
- Using functions

1.5.1 Checking Execution Results

Refer to SQLSTATE output in messages to check the SQL statements used in applications and the execution results of commands used during development.

1.5.2 Referencing System Catalogs

System catalogs can be used to obtain information about the FUJITSU Enterprise Postgres system and database objects. However, system catalogs may change when the FUJITSU Enterprise Postgres version is upgraded. Also, there are many system catalogs that return information that is inherent to FUJITSU Enterprise Postgres.

Accordingly, reference the information schema defined in standard SQL (information_schema) wherever possible. Note also that queries specifying "*" in the selection list must be avoided to prevent columns being added.

Example

```
CREATE VIEW my_tablespace_view(spcname) AS SELECT spcname FROM pg_tablespace;
SELECT * FROM my_tablespace_view V1, pg_tables T1 WHERE V1.spcname = T1.tablespace;
```

If changes are made to a system catalog, the user will be able to take action by simply making changes to the view, without the need to make changes to the application.

The following shows an example of taking action by redefining a view as if no changes were made.

The pg_tablespace system catalog is redefined in response to the column name being changed from spcname to spacename.
1.5.3 Using Functions

The default functions provided with FUJITSU Enterprise Postgres enable a variety of operations and manipulations to be performed, and information to be obtained, using SQL statements.

However, it is possible that internal FUJITSU Enterprise Postgres functions, such as those relating to statistical information or for obtaining system-related information, may change as FUJITSU Enterprise Postgres versions are upgraded.

Accordingly, when using these functions, define them as new functions and then use the newly-defined functions in the applications.

An example of defining and using a function is shown below.

```
DROP VIEW my_tablespace_view;
CREATE VIEW my_tablespace_view(spcname) AS SELECT spacename FROM pg_tablespace;
```

```
CREATE FUNCTION my_func(relid regclass) RETURNS bigint LANGUAGE SQL AS 'SELECT
pg_relation_size(relid);
SELECT my_func(2619);
'

If changes are made to a function, the user will be able to take action by simply redefining the function, without the need to make changes to the application.

The following shows an example of taking action by redefining a function as if no changes were made.

The `pg_relation_size` function is redefined after arguments are added.

```
DROP FUNCTION my_func(regclass);
CREATE FUNCTION my_func(relid regclass) RETURNS bigint LANGUAGE SQL AS 'SELECT
pg_relation_size(relid,$$main$$);
SELECT my_func(2619);
'
```
Chapter 2 JDBC Driver

This section describes how to use JDBC drivers.

2.1 Development Environment

This section describes application development using JDBC drivers and the runtime environment.

2.1.1 Combining with JDK or JRE

Refer to Installation and Setup Guide for Client for information on combining with JDK or JRE where JDBC drivers can operate.

2.2 Setup

This section describes the environment settings required to use JDBC drivers and how to encrypt communication data.

2.2.1 Environment Settings

Configuration of the CLASSPATH environment variable is required as part of the runtime environment for JDBC drivers.

The name of the JDBC driver file is as follows:

- If using JDK 6 or JRE 6
  postgresql-jdbc4.jar

- If using JDK 7 or JRE 7
  postgresql-jdbc41.jar

- If using JDK 8, JRE 8, JDK 11 or JRE 11
  postgresql-jdbc42.jar

The examples below show how to set the CLASSPATH environment variable if JDK 6 or JRE 6 is used.

If JDK 7, JRE 7, JDK 8, JRE 8, JDK 11 or JRE 11 is used, only the name of the JDBC driver file will be different. The method for configuring the CLASSPATH environment variable is the same.

Note that "<x>" indicates the product version.

- Linux
  - Setting example (TC shell)
    ```
    setenv CLASSPATH /opt/fsepv<x>/client64/jdbc/lib/postgresql-jdbc4.jar:${CLASSPATH}
    ```
  - Setting example (bash)
    ```
    CLASSPATH=/opt/fsepv<x>/client64/jdbc/lib/postgresql-jdbc4.jar:$CLASSPATH;export CLASSPATH
    ```

- Windows (32-bit)
  - Setting example
    ```
    set CLASSPATH=C:\Program Files\Fujitsu\fsepv<x>\client32\JDBC\lib\postgresql-jdbc4.jar;%CLASSPATH%
    ```
2.2.2 Message Language and Encoding System Used by Applications Settings

If the JDBC driver is used, it will automatically set the encoding system on the client to UTF-8, so there is no need to configure this.

See

Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the PostgreSQL Documentation for information on encoding systems.

Language settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Set language in the "user.language" system property.

Example

Example of running a Java command with system property specified

```
java -Duser.language=en TestClass1
```

2.2.3 Settings for Encrypting Communication Data

When using the communication data encryption feature to connect to the database server, set as follows:

Settings for encrypting communication data for connection to the server

This section describes how to create applications for encrypting communication data.

Set the property of the SSL parameter to "true" to encrypt. The default for the SSL parameter is "false".

If ssl is set to "true", sslmode is internally treated as "verify-full".

Example

- Setting example 1

```java
String url = "jdbc:postgresql://sv1/test";
Properties props = new Properties();
props.setProperty("user","fsepuser");
props.setProperty("password","secret");
props.setProperty("ssl","true");
```
To prevent spoofing of the database server, you need to use the keytool command included with Java to import the CA certificate to the Java keystore. In addition, specify "org.postgresql.ssl.DefaultJavaSSLFactory" for the sslfactory parameter.

Refer to JDK documentation and the Oracle website for details.

Note

There is no need to set the ssl parameter if the connection string of the DriverManager class is specified, or if the ssmode parameter is specified in the data source, such as when the application connection switch feature is used. If the ssl parameter is set, the value in the ssmode parameter will be enabled.

See

Refer to "Secure TCP/IP Connections with SSL" in "Server Administration" in the PostgreSQL Documentation for information on encrypting communication data.

2.3 Connecting to the Database

This section explains how to connect to a database.

- Using the DriverManager Class
- Using the PGConnectionPoolDataSource Class
- Using the PGXAdatabase Class

Note

Do not specify "V2" for the "protocolVersion" of the connection string.

2.3.1 Using the DriverManager Class

To connect to the database using the DriverManager class, first load the JDBC driver, then specify the connection string as a URI in the API of the DriverManager class.

Load the JDBC driver

Specify org.postgresql.Driver.

Connection string

URI connection is performed as follows:

```java
props.setProperty("sslfactory","org.postgresql.ssl.DefaultJavaSSLFactory");
Connection conn = DriverManager.getConnection(url, props);
```

```
Connection conn = DriverManager.getConnection(url);
```
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>port</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is “27500”.</td>
</tr>
<tr>
<td>database</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>user</td>
<td>Specify the username that will connect with the database. For authentication, the password must also be specified.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the username logged into the operating system that is executing the application will be used.</td>
</tr>
<tr>
<td>password</td>
<td>Specify a password when authentication is required.</td>
</tr>
<tr>
<td>loginTimeout</td>
<td>Specify the timeout for connections (in units of seconds). Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td>socketTimeout</td>
<td>Specify the timeout for communication with the server (in units of seconds). Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when data is not received from the server within the specified time.</td>
</tr>
</tbody>
</table>

**Example**

Code examples for applications

```java
import java.sql.*;
...
Class.forName("org.postgresql.Driver");
String url = "jdbc:postgresql://sv1:27500/mydb?
user=myuser&password=myuser01&loginTimeout=20&socketTimeout=20";
Connection con = DriverManager.getConnection(url);
```

**2.3.2 Using the PGConnectionPoolDataSource Class**

To connect to databases using data sources, specify the connection information in the properties of the data source.

**Method description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setServerName</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>setPortNumber</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is “27500”.</td>
</tr>
<tr>
<td>setDatabaseName</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>setUser</td>
<td>Specify the username of the database.</td>
</tr>
<tr>
<td></td>
<td>By default, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>setPassword</td>
<td>Specify a password for server authentication.</td>
</tr>
<tr>
<td>setLoginTimeout</td>
<td>Specify the timeout for connections (in units of seconds). Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
</tbody>
</table>
### Argument Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setServerName</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>setPortNumber</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is “27500”</td>
</tr>
<tr>
<td>setDatabaseName</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>setUser</td>
<td>Specify the username that will connect with the database.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the name used will be that of the user on the operating</td>
</tr>
<tr>
<td></td>
<td>system that is executing the application.</td>
</tr>
<tr>
<td>setPassword</td>
<td>Specify a password when authentication by a password is required.</td>
</tr>
<tr>
<td>setLoginTimeout</td>
<td>Specify the timeout for connections.</td>
</tr>
<tr>
<td></td>
<td>The units are seconds. Specify a value between 0 and 2147483647. There is</td>
</tr>
<tr>
<td></td>
<td>no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when a connection cannot be established within the specified</td>
</tr>
<tr>
<td></td>
<td>time.</td>
</tr>
<tr>
<td>setSocketTimeout</td>
<td>Specify the timeout for communication with the server.</td>
</tr>
<tr>
<td></td>
<td>The units are seconds. Specify a value between 0 and 2147483647. There is</td>
</tr>
<tr>
<td></td>
<td>no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when data is not received from the server within the specified</td>
</tr>
<tr>
<td></td>
<td>time.</td>
</tr>
</tbody>
</table>

#### Example

Code examples for applications

```java
go import java.sql.*;
go import org.postgresql.ds.PGConnectionPoolDataSource;
go ...
go PGConnectionPoolDataSource source = new PGConnectionPoolDataSource();
go source.setServerName("sv1");
go source.setPortNumber(27500);
go source.setDatabaseName("mydb");
go source.setUser("myuser");
go source.setPassword("myuser01");
go source.setLoginTimeout(20);
go source.setSocketTimeout(20);
go ...
go Connection con = source.getConnection();
go...```

### 2.3.3 Using the PGXADatasource Class

To connect to databases using data sources, specify the connection information in the properties of the data source.

Method description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setServerName</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>setPortNumber</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is “27500”</td>
</tr>
<tr>
<td>setDatabaseName</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>setUser</td>
<td>Specify the username that will connect with the database.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the name used will be that of the user on the operating</td>
</tr>
<tr>
<td></td>
<td>system that is executing the application.</td>
</tr>
<tr>
<td>setPassword</td>
<td>Specify a password when authentication by a password is required.</td>
</tr>
<tr>
<td>setLoginTimeout</td>
<td>Specify the timeout for connections.</td>
</tr>
<tr>
<td></td>
<td>The units are seconds. Specify a value between 0 and 2147483647. There is</td>
</tr>
<tr>
<td></td>
<td>no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when a connection cannot be established within the specified</td>
</tr>
<tr>
<td></td>
<td>time.</td>
</tr>
<tr>
<td>setSocketTimeout</td>
<td>Specify the timeout for communication with the server.</td>
</tr>
<tr>
<td></td>
<td>The units are seconds. Specify a value between 0 and 2147483647. There is</td>
</tr>
<tr>
<td></td>
<td>no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when data is not received from the server within the specified</td>
</tr>
<tr>
<td></td>
<td>time.</td>
</tr>
</tbody>
</table>
2.4 Application Development

This section describes the data types required when developing applications that will be connected with FUJITSU Enterprise Postgres.

2.4.1 Relationship between the Application Data Types and Database Data Types

The following table shows the correspondence between data types in applications and data types in databases.

<table>
<thead>
<tr>
<th>Data type on the server</th>
<th>Java data type</th>
<th>Data types prescribed by java.sql.Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>character</td>
<td>String</td>
<td>java.sql.Types.CHAR</td>
</tr>
<tr>
<td>national character</td>

</tr>
</tbody>
</table>

Although the get<String>() method of the ResultSet object can be used for all server data types, it is not guaranteed that it will always return a string in the same format for the same data type.

Strings in a format compatible with the JDBC specifications can be obtained using the Java toString() method of the appropriate data type (for example, getInt(), getTimestamp()) to conform to the data type on the server.

### 2.4.2 Statement Caching Feature

The statement caching feature caches SQL statements for each individual connection. This means that when an SQL statement with an identical string is next executed, the analysis and creation of the statement can be skipped. This improves performance in cases such as when an SQL statement with an identical string is executed within a loop or method that is executed repeatedly. Furthermore, the statement caching feature can be combined with the connection pooling feature to further enhance performance.

#### Cache registration controls

You can configure whether to cache SQL statements using the setPoolable(boolean) method of the PreparedStatement class when the statement caching feature is enabled.

Values that can be configured are shown below:
false

SQL statements will not be cached, even when the statement caching feature is enabled.

true

SQL statements will be cached if the statement caching feature is enabled.

### 2.4.3 Creating Applications while in Database Multiplexing Mode

This section explains points to consider when creating applications while in database multiplexing mode.

---

See

- Refer to the Cluster Operation Guide (Database Multiplexing) for information on database multiplexing mode.
- Refer to "Application Development" in the Cluster Operation Guide (PRIMECLUSTER) for points to consider when creating applications using the failover feature integrated with the cluster software.

---

### 2.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs while in database multiplexing mode, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access</td>
<td>57P01 08006 08007</td>
</tr>
<tr>
<td></td>
<td>Accessed during system failure</td>
<td>08001</td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access</td>
<td>57P01 08006 08007</td>
</tr>
<tr>
<td></td>
<td>Accessed during switch</td>
<td>08001</td>
</tr>
</tbody>
</table>

*1: Return value of the getSQLState() method of SQLException.
Chapter 3 ODBC Driver

This section describes application development using ODBC drivers.

3.1 Development Environment

Applications using ODBC drivers can be developed using ODBC interface compatible applications, such as Access, Excel, and Visual Basic.

Refer to the manuals for the programming languages corresponding to the ODBC interface for information about the environment for development.

FUJITSU Enterprise Postgres supports ODBC 3.5.

3.2 Setup

You need to set up PsqlODBC, which is an ODBC driver, in order to use applications that use ODBC drivers with FUJITSU Enterprise Postgres. PsqlODBC is included in the FUJITSU Enterprise Postgres client package.

The following describes how to register the ODBC drivers and the ODBC data source.

3.2.1 Registering ODBC Drivers

When using the ODBC driver on Linux platforms, register the ODBC driver using the following procedure:

1. Install the ODBC driver manager (unixODBC)

   Information

   - FUJITSU Enterprise Postgres supports unixODBC Version 2.3 or later.
   - You can download unixODBC from the following site:
     http://www.unixodbc.org/
   - To execute unixODBC, you must first install libtool 2.2.6 or later.
     You can download libtool from the following website:
     http://www.gnu.org/software/libtool/

   [Note]

   - ODBC driver operation is supported.
   - unixODBC operation is not supported.

2. Register the ODBC drivers

   Edit the ODBC driver manager (unixODBC) odbcinst.ini file.

   Information

   [location of the odbcinst.ini file]

   unixOdbcInstallDir/etc/odbcinst.ini

   Set the following content:
<table>
<thead>
<tr>
<th>Definition name</th>
<th>Description</th>
<th>Setting value</th>
</tr>
</thead>
</table>
| [Driver name]  | ODBC driver name | Set the name of the ODBC driver. Select the two strings below that correspond to the application type. Concatenate the strings with no spaces, enclose in "[ ]", and then specify this as the driver name.  
   - Application architecture  
     "FUJITSUEnterprisePostgres<fujitsuEnterprisePostgresClientVers>x64"  
   - Encoding system used by the application  
     - In Unicode (only UTF-8 can be used)  
       "unicode"  
     - Other than Unicode  
       "ansi"  
   Example: The encoding system used by the application is Unicode:  
   "[FUJITSUEnterprisePostgres<fujitsuEnterprisePostgresClientVers>x64unicode]"
| Description     | Description of the ODBC driver | Specify a supplementary description for the current data source. Any description may be set. |
| Driver64        | Path of the ODBC driver (64-bit) | Set the path of the ODBC driver (64-bit).  
   - If the encoding system is Unicode:  
     fujitsuEnterprisePostgresClientInstallDir/odbc/lib/psqlodbca.so  
   - If the encoding system is other than Unicode:  
     fujitsuEnterprisePostgresClientInstallDir/odbc/lib/psqlodbca.so |
| FileUsage       | Use of the data source file | Specify 1. |
| Threading       | Level of atomicity secured for connection pooling | Specify 2. |
Example

Note that "<x>" indicates the product version.

<table>
<thead>
<tr>
<th>[FUJITSU Enterprise Postgres13x64unicode]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description = FUJITSU Enterprise Postgres 13 x64 unicode driver</td>
</tr>
<tr>
<td>Driver64 = /opt/fsep&lt;x&gt;/client64/odbc/lib/psqlodbcw.so</td>
</tr>
<tr>
<td>FileUsage = 1</td>
</tr>
<tr>
<td>Threading = 2</td>
</tr>
</tbody>
</table>

3.2.2 Registering ODBC Data Sources(for Windows(R))

This section describes how to register ODBC data sources.

There are the following two ways to register ODBC data sources on Windows(R).

3.2.2.1 Registering Using GUI

This section describes how to start the [ODBC Data Source Administrator] and register ODBC data sources.

Use the following procedure to register ODBC data sources:

1. Start the [ODBC Data Source Administrator].
   Select [Start] >> [Control Panel] >> [Administrative Tools] >> [ODBC Data Source Administrator].

   Note

   To register data sources for 32-bit applications in Windows(R) for 64-bit, execute the ODBC administrator (odbcad32.exe) for 32-bit, as shown below.

   %SYSTEMDRIVE%\WINDOWS\SysWOW64\odbcad32.exe

2. When only the current user is to use the ODBC data source, select [User DSN]. When all users using the same computer are to use the ODBC data source, select [System DSN].

3. Click [Add].

4. Select one of the following drivers from the list of available ODBC drivers displayed in [Create New Data Source], and then click [Finish]. The notation "<x>" indicates the version of the FUJITSU Enterprise Postgres client feature.
   - FUJITSU Enterprise Postgres Unicode <x>
     Select this driver if using Unicode as the application encoding system.
   - FUJITSU Enterprise Postgres ANSI <x>
     Select this driver if using other than Unicode as the application encoding system.
5. The [PostgreSQL ANSI ODBC Driver (psqlODBC) Setup] window is displayed. Enter or select the required items, then click [Save].

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Source</strong></td>
<td>Specify the data source name to be registered in the ODBC driver manager. The application will select the name specified here and connect with the FUJITSU Enterprise Postgres database. This parameter cannot be omitted. Specify the following characters up to 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- National characters</td>
</tr>
<tr>
<td></td>
<td>- Alphanumerics</td>
</tr>
<tr>
<td></td>
<td>- &quot;,&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;&quot;, &quot;;,&quot;</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Specify a supplementary description for the current data source. Specify characters up to 255 bytes.</td>
</tr>
<tr>
<td></td>
<td>- National characters</td>
</tr>
<tr>
<td></td>
<td>- Alphanumerics</td>
</tr>
<tr>
<td><strong>Database</strong></td>
<td>Specify the database name to be connected.</td>
</tr>
<tr>
<td><strong>SSLMode</strong></td>
<td>Specify to encrypt communications. The default is &quot;disable&quot;. The setting values for SSLMode are as follows:</td>
</tr>
<tr>
<td></td>
<td>- disable: Connect without SSL</td>
</tr>
<tr>
<td></td>
<td>- allow: Connect without SSL, and if it fails, connect using SSL</td>
</tr>
<tr>
<td></td>
<td>- prefer: Connect using SSL, and if it fails, connect without SSL</td>
</tr>
<tr>
<td></td>
<td>- require: Connect always using SSL</td>
</tr>
<tr>
<td></td>
<td>- verify-ca: Connect using SSL, and use a certificate issued by a trusted CA (*1)</td>
</tr>
<tr>
<td></td>
<td>- verify-full: Connect using SSL, and use a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
</tbody>
</table>
### Definition

<table>
<thead>
<tr>
<th>Name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Specify the host name of the database server to connect to, using up to 63 bytes. This parameter cannot be omitted.</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the port number to be used for remote access. The default value is &quot;27500&quot;.</td>
</tr>
<tr>
<td>Username(2)</td>
<td>Specify the user that will access the database.</td>
</tr>
<tr>
<td>Password(2)</td>
<td>Specify the password for the user that will access the database.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT of your operating system to specify the CA certificate file as shown below.

Example:

Variable name: PGSSLROOTCERT  
Variable value: cACertificateFile

*2: In consideration of security, specify the Username and the Password by the application.

### 3.2.2.2 Registering Using Commands

This section describes how to use commands to register ODBC data sources.

Use the following tools from Microsoft to register ODBC data sources.

- ODBCConf.exe  
- Add-OdbcDsn

Refer to the Microsoft Developer Network (MSDN) Library for information on how to use these tools.

#### When using ODBCConf.exe

ODBCConf.exe is a tool supported on all Windows(R) platforms.

**Specification format**

```
ODBCConf.exe /A { dataSourceType "odbcDriverName" "optionName=value[|optionName=value...]*" } [/Lv fileName]
```

Refer to the Microsoft MSDN library for information on the format and parameters.

**Description**

Set the following content:

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Specify the data source type.</td>
</tr>
<tr>
<td></td>
<td>- &quot;CONFIGSYSDSN&quot;: A system data source is created. This requires user admin rights. The data source can be used by all users of the same computer.</td>
</tr>
<tr>
<td></td>
<td>- &quot;CONFIGDSN&quot;: A user data source is created. The data source can be used by the current user only.</td>
</tr>
</tbody>
</table>

**Note**

When CONFIGSYSDSN is specified as the data source type, it is necessary to execute the command in the command prompt in administrator mode.
<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODBC driver name</td>
<td>Specify an ODBC driver name that has already been registered on the system. Specify one of the following.</td>
</tr>
</tbody>
</table>

**Note**

The placeholders shown below are enclosed in angle brackets '<>' to avoid confusion with literal text. Do not include the angle brackets in the string.

- "FUJITSU Enterprise Postgres Unicode <fujitsuEnterprisePostgresClientVers>"
  Specify this driver name if using Unicode as the application encoding system.

- "FUJITSU Enterprise Postgres ANSI <fujitsuEnterprisePostgresClientVers>"
  Specify this driver name if using other than Unicode as the application encoding system.

<table>
<thead>
<tr>
<th>Option name</th>
<th>The following items must be set:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- &quot;DSN&quot;: Specify the data source name.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Servername&quot;: Specify the host name for the database server.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Port&quot;: Specify the port number for connection to the database</td>
</tr>
<tr>
<td></td>
<td>- &quot;Database&quot;: Specify the database name.</td>
</tr>
<tr>
<td></td>
<td>Specify the following values as required:</td>
</tr>
<tr>
<td></td>
<td>- &quot;UID&quot;: User ID</td>
</tr>
<tr>
<td></td>
<td>- &quot;Password&quot;: Password</td>
</tr>
<tr>
<td></td>
<td>- &quot;SSLMode&quot;: Specify to encrypt communications. The default is &quot;disable&quot;. Refer to the SSLMode explanation in the table under step 5 of &quot;3.2.2.1 Registering Using GUI&quot; for information on how to configure SSLMode.</td>
</tr>
</tbody>
</table>

| File Name | You can output process information to a file when creating a data source. This operand can be omitted. |

**Example**

```bash
ODBCConf.exe /A {CONFIGYSDSN "FUJITSU Enterprise Postgres Unicode 12" "DSN=odbcconf1|Servername=sv1|Port=27500|Database=db01|SSLMode=verify-ca"} /Lv log.txt
```

**Note**

In consideration of security, specify the UID and the Password by the application.

**When using Add-OdbcDsn**

Add-OdbcDsn is used in the PowerShell command interface.

**Specification format**

```
Add-OdbcDsn dataSourceName -DriverName "odbcDriverName" -DsnType dataSourceType -Platform oSArchitecture -SetPropertyValue @("optionName=value" [,"optionName=value"...])
```
Refer to the Microsoft MSDN library for information on the format and parameters.

**Description**

Set the following content:

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source name</td>
<td>Specify any name for the data source name.</td>
</tr>
<tr>
<td>ODBC driver name</td>
<td>Specify an ODBC driver name that has already been registered on the system. Specify one of the following.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The placeholders shown below are enclosed in angle brackets ‘&lt;&gt;’ to avoid confusion with literal text. Do not include the angle brackets in the string.</td>
</tr>
<tr>
<td>- &quot;FUJITSU Enterprise Postgres Unicode &lt;fujitsuEnterprisePostgresClientVers&gt;&quot;</td>
<td>Specify this driver name if using Unicode as the application encoding system.</td>
</tr>
<tr>
<td>- &quot;FUJITSU Enterprise Postgres ANSI &lt;fujitsuEnterprisePostgresClientVers&gt;&quot;</td>
<td>Specify this driver name if using other than Unicode as the application encoding system.</td>
</tr>
<tr>
<td>Data source type</td>
<td>Specify the data source type.</td>
</tr>
<tr>
<td>- &quot;System&quot;: A system data source is created. Requires user admin rights. The data source can be used by all users of the same computer.</td>
<td></td>
</tr>
<tr>
<td>- &quot;User&quot;: A user data source is created. The data source can be used by the current user only.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>When System is specified as the data source type, it is necessary to execute the command in the administrator mode of the command prompt.</td>
</tr>
<tr>
<td>OS architecture</td>
<td>Specify the OS architecture of the system.</td>
</tr>
<tr>
<td>- &quot;32-bit&quot;: 32-bit system</td>
<td></td>
</tr>
<tr>
<td>- &quot;64-bit&quot;: 64-bit system</td>
<td></td>
</tr>
<tr>
<td>Option name</td>
<td>The following items must be set:</td>
</tr>
<tr>
<td>- &quot;Servername&quot;: Specify the host name for the database server.</td>
<td></td>
</tr>
<tr>
<td>- &quot;Port&quot;: Specify the port number for connection to the database</td>
<td></td>
</tr>
<tr>
<td>- &quot;Database&quot;: Specify the database name.</td>
<td></td>
</tr>
<tr>
<td>Specify the following values as required:</td>
<td></td>
</tr>
<tr>
<td>- &quot;SSLMode&quot;: Specify to encrypt communications. The default is &quot;disable&quot;. Refer to the SSLMode explanation in the table under step 5 of &quot;3.2.2.1 Registering Using GUI&quot; for information on how to configure SSLMode.</td>
<td></td>
</tr>
</tbody>
</table>
When using Add-OdbcDsn, the strings "UID" and "Password" cannot be set as option names. These can only be used when using ODBCConf.exe.

Example

Add-OdbcDsn odbcps1 -DriverName "FUJITSU Enterprise Postgres Unicode 12" -DsnType System -Platform 32-bit -SetPropertyValue @("Servername=sv1", "Port=27500", "Database=db01", "SSLMode=verify-ca")

3.2.3 Registering ODBC Data Sources(for Linux)

This section describes how to register ODBC data sources on Linux.

1. Register the data sources
   Edit the odbc.ini definition file for the data source.

   Information

   Edit the file in the installation directory for the ODBC driver manager (unixODBC)

   unixOdbcInstallDir/etc/odbc.ini

   Or

   Create a new file in the HOME directory

   ~/.odbc.ini

   Point

   If unixOdbcInstallDir is edited, these will be used as the shared settings for all users that log into the system. If created in the HOME directory (~), the settings are used only by the single user.

   Set the following content:

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Data source name]</td>
<td>Set the name for the ODBC data source.</td>
</tr>
<tr>
<td>Description</td>
<td>Set a description for the ODBC data source. Any description may be set.</td>
</tr>
<tr>
<td>Driver</td>
<td>Set the following as the name of the ODBC driver. Do not change this value. Select the two strings below that correspond to the application type. Concatenate the strings with no spaces and then specify this as the driver name.</td>
</tr>
</tbody>
</table>

   Note

   The placeholders shown below are enclosed in angle brackets '<>' to avoid confusion with literal text. Do not include the angle brackets in the string.
<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Application architecture</td>
<td>&quot;FUJITSU Enterprise Postgres&lt;fujitsuEnterprisePostgres\Client\Vers&gt;x64&quot;</td>
</tr>
</tbody>
</table>
| - Encoding system used by the application | - In Unicode (only UTF-8 can be used) "unicode"
- Other than Unicode "ansi"
Example: The encoding system used by the application is Unicode: "FUJITSU Enterprise Postgres\<fujitsuEnterprisePostgres\Client\Vers\>x64unicode" |
| Database | Specify the database name to be connected. |
| Servername | Specify the host name for the database server. |
| Username | Specify the user ID that will connect with the database. |
| Password | Specify the password for the user that will connect to the database. |
| Port | Specify the port number for the database server. The default is "27500". |
| SSLMode | Specify the communication encryption method. The setting values for SSLMode are as follows:  
- disable: Connect without SSL  
- allow: Connect without SSL, and if it fails, connect using SSL  
- prefer: Connect using SSL, and if it fails, connect without SSL  
- require: Connect always using SSL  
- verify-ca: Connect using SSL, and use a certificate issued by a trusted CA (*1)  
- verify-full: Connect using SSL, and use a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1) |
| ReadOnly | Specify whether to set the database as read-only.  
- 1: Set read-only  
- 0: Do not set read-only |

*1: If specifying either "verify-ca" or "verify-full", use the environment variable PGSSLROOTCERT to specify the CA certificate file as shown below.

Example

```
export PGSSLROOTCERT=cACertificateFileStorageDir/root.crt
```

Example

```
[MyDataSource]
Description = FUJITSU Enterprise Postgres
Driver = FUJITSU Enterprise Postgres\3x64ansi
Database = db01
Servername = sv1
```
Port  = 27500
ReadOnly  = 0

---

**Note**

In consideration of security, specify the UserName and the Password by the application.

2. Configure the environment variable settings

To execute applications that use ODBC drivers, all of the following settings must be configured in the LD_LIBRARY_PATH environment variable:

- fujitsuEnterprisePostgresClientInstallDir/lib
- unixOdbcInstallDir(*1)/lib
- libtoolInstallDir(*1)/lib

*1: If the installation directory is not specified when unixODBC and libtool are installed, they will be installed in /usr/local.

---

### 3.2.4 Message Language and Encoding System Used by Applications Settings

This section explains the language settings for the application runtime environment and the encoding settings for the application.

**Language settings**

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Messages output by an application may include text from messages sent from the database server. In the resulting text, the text of the application message will use the message locale of the application, and the text of the message sent by the database server will use the message locale of the database server. If the message locales do not match, more than one language or encoding system will be used. Moreover, if the encoding systems do not match, characters in the resulting text can be garbled.

**Linux**

Set the locale for messages (LC_MESSAGES category) to match the message locale of the database server. This can be done in a few different ways, such as using environment variables. Refer to the relevant manual of the operating system for information on the setlocale function.

**Example**

Example of specifying "en_US.UTF-8" with the setlocale function

```c
setlocale(LC_ALL, "en_US.UTF-8");
```

Specifying the locale of the LC_ALL category propagates the setting to LC_MESSAGE.

**Windows(R)**

Align the locale of the operating system with the message locale of the database server.
Encoding System Settings

Ensure that the encoding system that is embedded in the application and passed to the database, and the encoding system setting of the runtime environment, are the same. The encoding system cannot be converted correctly on the database server.

Use one of the following methods to set the encoding system for the application:

- Set the PGCLIENTENCODING environment variable in the runtime environment.
- Set the client_encoding keyword in the connection string.
- Use the PQsetClientEncoding function.

See

Refer to “Supported Character Sets” in “Server Administration” in the PostgreSQL Documentation for information on the strings that represent the encoding system that can be set.

For example, when using "Unicode“ and "8 bit", set the string “UTF8”.

Example

Setting the "PGCLIENTENCODING" environment variable

An example of setting when the encoding of the client is "UTF8" (Bash)

```
> PGCLIENTENCODING=UTF8; export PGCLIENTENCODING
```

An example of setting when the encoding of the client is "UTF8"

```
> set PGCLIENTENCODING=UTF8
```

Note

Text may be garbled when outputting results to the command prompt. Review the font settings for the command prompt if this occurs.

3.3 Connecting to the Database

Refer to the manual for the programming language corresponding to the ODBC interface, i.e. Access, Excel, or Visual Basic, for example.

3.4 Application Development

This section describes how to develop applications using ODBC drivers.

3.4.1 Compiling Applications (for Windows (R))

Refer to the manual for the programming language corresponding to the ODBC interface, i.e. Access, Excel, or Visual Basic, for example.
The cl command expects input to be a program that uses one of the following code pages, so convert the program to these code pages and then compile and link it (refer to the Microsoft documentation for details).

- ANSI console code pages (example: UTF8)
- UTF-16 little-endian with or without BOM (Byte Order Mark)
- UTF-16 big-endian with or without BOM
- UTF-8 with BOM

The cl command converts strings in a program to an ANSI console code page before generating a module, so the data sent to and received from the database server becomes an ANSI console code page. Therefore, set the coding system corresponding to the ANSI console code page as the coding system of the client.

Refer to “Character Set Support” in “Server Administration” in the PostgreSQL Documentation for information on how to set the client encoding system.

### 3.4.2 Compiling Applications (for Linux)

Specify the following options when compiling applications.

<table>
<thead>
<tr>
<th>Option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>-I unixOdbc64bitIncludeFileDir</td>
</tr>
<tr>
<td>Path of the library</td>
<td>-L unixOdbc64bitLibraryDir</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic library</td>
<td>libodbc.so</td>
</tr>
</tbody>
</table>

Specify -m64 when creating a 64-bit application.

**Example**

The following are examples of compiling ODBC applications:

```bash
gcc -m64 -I/usr/local/include(*1) -L/usr/local/lib(*1) -lodbc testproc.c -o testproc
```

*1: This is an example of building and installing from the source without specifying an installation directory for unixODBC. If you wish to specify a location, set the installation directory.

### 3.4.3 Creating Applications While in Database Multiplexing Mode

This section explains points to consider when creating applications while in database multiplexing mode.

**See**

- Refer to the Cluster Operation Guide (Database Multiplexing) for information on database multiplexing mode.
Refer to "Application Development" in the Cluster Operation Guide (PRIMECLUSTER) for points to consider when creating applications using the failover feature integrated with the cluster software.

### 3.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs while in database multiplexing mode, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres</td>
<td>Failure occurs during access</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td>system failure</td>
<td>57P01 08S01</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accessed during system failure</td>
<td></td>
</tr>
<tr>
<td></td>
<td>08001</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access</td>
<td></td>
</tr>
<tr>
<td></td>
<td>57P01 08S01</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accessed during switch</td>
<td></td>
</tr>
<tr>
<td></td>
<td>08001</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of SQLSTATE.
Chapter 4 .NET Data Provider

This chapter describes how to configure for the purpose of creating .NET applications with Visual Studio.

4.1 Development Environment

.NET Data Provider can operate in the following environments:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>.NET Framework 4.8</td>
<td>.NET Framework 4.7/4.7.x</td>
<td>.NET Framework 4.6.1 or later</td>
<td></td>
</tr>
<tr>
<td>Integrated development environment for applications running in a .NET Framework environment</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>.NET Framework 4.8</td>
<td>.NET Framework 4.7/4.7.x</td>
<td>.NET Framework 4.6.1 or later</td>
<td></td>
</tr>
</tbody>
</table>

Combinations when TableAdapter is used

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Visual Studio 2015</td>
<td>.NET Framework 4.8</td>
<td>.NET Framework 4.7/4.7.x</td>
<td>.NET Framework 4.6.1 or later</td>
</tr>
</tbody>
</table>

Available development languages

C#  
Visual Basic .NET

4.2 Setup

This section explains how to set up .NET Data Provider and Npgsql for Entity Framework.

4.2.1 Setting Up the Visual Studio Integration Add-On

A user with administrator privileges can register Npgsql Development Tools for .NET as an add-on installing the VSIX package provided. Note that Visual Studio must already be installed in the system prior to installing the VSIX package.

Location of VSIX binaries

The Npgsql.vsix setup package is stored in the following location

```
fujitsuEnterprisePostgresClientInstallDir\DOTNET\Npgsql.vsix
```

Using Npgsql.vsix

Navigate to the Npgsql.vsix binary directory and double-click the package to install it.

```
> Npgsql.vsix
```

See

Refer to “4.5.1 Uninstalling Npgsql” for details.
4.2.2 Setting Up .NET Data Provider

FUJITSU Enterprise Postgres has utilized Microsoft best practices of VSIX technology to integrate .NET Data Provider with Visual Studio.

There is no need to explicitly add a reference to .NET Data Provider when using VSIX. This will be done automatically when a database object is created and added to a project through the Visual Studio Server Explorer.

**Note**

Additional setup is needed if using ProviderFactory to connect to a database in a multi-version installation. Refer to “2.4 Registering .NET Data Provider” in the Installation and Setup Guide for Client.

**Information**

The following name will be displayed in [References] in Visual Studio Solution Explorer once a database object has been created and added to the project. Note that the Npgsql reference is automatically added when the new database object is first compiled.

- Npgsql

4.2.3 Setting Up .NET Data Provider Type Plugins

FUJITSU Enterprise Postgres .NET Data Provider now comes packaged with 6 Type Plugins that provide additional support for more data type mappings (eg date time support via the Npgsql.NodaTime). The plugins modify how Npgsql maps the PostgreSQL values to CLR types.

The type plugins are available for installation as a local NuGet packages. There are 6 pacakages available for installation. “<x>” indicates the product version.

- Npgsql.NodaTime.<x>.0.0.nupkg
- Npgsql.Json.NET.<x>.0.0.nupkg
- Npgsql.NetTopologySuite.<x>.0.0.nupkg: Spatial type(*1)
- Npgsql.GeoJSON.<x>.0.0.nupkg: Spatial type(*1)
- Npgsql.LegacyPostgis.<x>.0.0.nupkg: Spatial type(*1)
- Npgsql.RawPostgis.<x>.0.0.nupkg: Spatial type(*1)

*1: Please note that the Spatial Type plugins require the PostGIS extension installed on the server.

Also, Refer to “Type Plugins” and ”Additional Notes on each Type Plugin” on the each type plugins.

To install any of the plugins please follow the procedure below:

**Location of NuGet package**

The Plugin NuGet package are stored in the following location:

```
fujitsuEnterprisePostgresClientInstallDir\DOTNET\Npgsql.*.<x>.0.0.nupkg
```

**Add a local package source**

In Visual Studio, add a NuGet local package source if one does not exist.

1. Click [Tools] >> [Options] >> [NuGet Package Manager], and then select [Package Sources].
2. Click [+ ] in the upper-right corner, and then set [Name] to "Local Package Source".
3. Click […] and navigate to the folder above. Select this folder, and then click [OK].
Install the NuGet package

In Visual Studio, install the NuGet package from the local package source.

1. Click [Tools] >> [NuGet Package Manager] >> [Manage NuGet Packages for Solution].
2. In the upper-right corner, select "Local Package Source" from [Package Source].
3. Once the local package source is set, all available NuGet packages in this local location will be displayed. Select the plugin to be installed (eg "Npgsql.NodaTime"), and then select the projects for which this package is to be installed.
4. Click [Install].

4.2.4 Setting Up Npgsql for Entity Framework

Npgsql for Entity Framework is supplied as a NuGet package file. To install it locally, follow the procedure below.

Location of NuGet package

The EntityFramework6.Npgsql NuGet package is stored in the following location:

```
fujitsuEnterprisePostgresClientInstallDir\DOTNET\EntityFramework6.npgsql.6.4.1.nupkg
```

Add a local package source

In Visual Studio, add a NuGet local package source if one does not exist.

1. Click [Tools] >> [Options] >> [NuGet Package Manager], and then select [Package Sources].
2. Click [+] in the upper-right corner, and then set [Name] to "Local Package Source".
3. Click […] and navigate to the folder above. Select this folder, and then click [OK].

Install the NuGet package

In Visual Studio, install the NuGet package from the local package source.

1. Click [Tools] >> [NuGet Package Manager] >> [Manage NuGet Packages for Solution].
2. In the upper-right corner, select "Local Package Source" from [Package Source].
3. Once the local package source is set, all available NuGet packages in this local location will be displayed. Select "EntityFramework6.Npgsql", and then select the projects for which this package is to be installed.
4. Click [Install].

4.2.5 Message Language Settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Example

Code example for changing the locale in a C# application

```
System.Globalization.CultureInfo.CreateSpecificCulture("en");
```

4.3 Connecting to the Database

This section explains how to connect to a database.

- Using NpgsqlConnection
4.3.1 Using NpgsqlConnection

Connect to the database by specifying the connection string.

**Example**

Code examples for applications

```csharp
using Npgsql;

NpgsqlConnection conn = new NpgsqlConnection("Server=sv1;Port=27500;Database=mydb;Username=myuser;Password=myuser01;Timeout=20;CommandTimeout=20;");
```

Refer to "4.3.4 Connection String" for information on database connection strings.

4.3.2 Using NpgsqlConnectionStringBuilder

Generate connection strings by specifying the connection information in the properties of the NpgsqlConnectionStringBuilder object.

**Example**

Code examples for applications

```csharp
using Npgsql;

NpgsqlConnectionStringBuilder sb = new NpgsqlConnectionStringBuilder();
sb.Host = "sv1";
sb.Port = 27500;
sb.Database = "mydb";
sb.Username = "myuser";
sb.Password = "myuser01";
sb.Timeout = 20;
sb.CommandTimeout = 20;
NpgsqlConnection conn = new NpgsqlConnection(sb.ConnectionString);
```

Refer to "4.3.4 Connection String" for information on database connection strings.

4.3.3 Using the ProviderFactory Class

Obtain the DbConnection object from the provider factory.

**Example**

Code examples for applications

```csharp
using System.Data.Common;

DbProviderFactory factory = DbProviderFactories.GetFactory("FUJITSU.Npgsql");
DbConnection conn = factory.CreateConnection();
conn.ConnectionString = "Server=sv1;Port=27500;Database=mydb;Username=myuser;Password=myuser01;Timeout=20;CommandTimeout=20;";
```
4.3.4 Connection String

Specify the following connection information to connect to the database.

| Server=127.0.0.1;Port=27500;Database=mydb;Username=myuser;Password=myuser01;...; |
|---|---|---|---|---|---|
| (1) | (2) | (3) | (4) | (5) | (6) |

(1) Specify the host name or IP address of the server to be connected. This must be specified.
(2) Specify the port number for the database server. The default is “27500”.
(3) Specify the database name to be connected.
(4) Specify the username that will connect with the database.
(5) Specify the password for the user that will connect to the database.
(6) Refer to the following for information on how to specify other connection information.

The table below shows keywords that are available to specify in the connection string in .NET Data Provider (Npgsql):

Note that some settings require care if using an Oracle database-compatible feature (refer to “9.2.2 Notes when Integrating with the Interface for Application Development” for details).

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>None</td>
<td>Specify the host name or IP address of the server to be connected. Specify up to 63 bytes when specifying a host name. A host name or IP address must be specified.</td>
</tr>
<tr>
<td>Port</td>
<td>27500</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td>Username</td>
<td>None</td>
<td>Specify the username that will connect with the database. Not required if using Integrated Security.</td>
</tr>
<tr>
<td>Password</td>
<td>None</td>
<td>Specify the password for the username that will connect to the database. Not required if using Integrated Security.</td>
</tr>
<tr>
<td>Database</td>
<td>Username</td>
<td>Specify the database name to be connected.</td>
</tr>
<tr>
<td>Search Path</td>
<td></td>
<td>Specify the default schema name of the SQL statements used in the application.</td>
</tr>
<tr>
<td>Timeout</td>
<td>15</td>
<td>Specify the timeout for connections. Specify a value between 0 and 1024 (in seconds). The default is 15 seconds. An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td>Connection Idle Lifetime</td>
<td>300</td>
<td>Specify the time to wait before closing idle connections in the pool if the count of all connections exceeds Minimum Pool Size.</td>
</tr>
<tr>
<td>Pooling</td>
<td>true</td>
<td>Specify whether to use connection pooling. - Connection pooling is used if you specify true. - Connection pooling is not used if you specify false.</td>
</tr>
<tr>
<td>Maximum Pool Size</td>
<td>100</td>
<td>Maximum size of a connection pool. If the request exceeds this limit, it will wait until another connection closes and the pool is available. Specify in the range between 0 and 1024.</td>
</tr>
<tr>
<td><strong>Keyword</strong></td>
<td><strong>Default value</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Minimum Pool Size</td>
<td>1</td>
<td>Minimum size of a connection pool. When you specify Minimum Pool Size, NpgsqlConnection will pre-allocate connections with the specified number of servers. Specify in the range from 0 to the value specified at Maximum Pool Size.</td>
</tr>
<tr>
<td>SSL Mode</td>
<td>Disable</td>
<td>Specify one of the following values for the SSL connection control mode:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Prefer: SSL is used for connection wherever possible.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Require: An exception is thrown when SSL connection is not possible.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Disable: SSL connection is not performed.</td>
</tr>
<tr>
<td>Enlist</td>
<td>true</td>
<td>Specify whether to have connections participate in transactions with the transaction scope declared:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Connections will participate in transactions when true is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Connections will not participate in transactions when false is specified.</td>
</tr>
<tr>
<td>Command Timeout</td>
<td>30</td>
<td>Specify the timeout for communication with the server. Specify a value between 0 and 2147483647 (in seconds). There is no limit set if you set 0. An error occurs when data is not received from the server within the specified time.</td>
</tr>
<tr>
<td>Integrated Security</td>
<td>false</td>
<td>Set this when using Windows Integrated Security.</td>
</tr>
<tr>
<td>Trust Server Certificate</td>
<td>false</td>
<td>Whether to trust the server certificate without validating it.</td>
</tr>
<tr>
<td>Check Certificate Revocation</td>
<td>false</td>
<td>Whether to check the certificate revocation list during authentication.</td>
</tr>
<tr>
<td>Persist Security Info</td>
<td>false</td>
<td>Gets or sets a Boolean value that indicates if security-sensitive information, such as the password, is not returned as part of the connection if the connection is open or has ever been in an open state.</td>
</tr>
<tr>
<td>Kerberos Service Name</td>
<td>postgres</td>
<td>The Kerberos service name to be used for authentication.</td>
</tr>
<tr>
<td>Include Realm</td>
<td></td>
<td>The Kerberos realm to be used for authentication.</td>
</tr>
<tr>
<td>Connection Pruning Interval</td>
<td>10</td>
<td>How many seconds the pool waits before attempting to prune idle connections that are beyond idle lifetime</td>
</tr>
<tr>
<td>Internal Command Timeout</td>
<td>-1</td>
<td>The time to wait (in seconds) while trying to execute an internal command before terminating the attempt and generating an error. -1 uses Command Timeout, 0 means no timeout.</td>
</tr>
<tr>
<td>Keepalive</td>
<td>disabled</td>
<td>The number of seconds of connection inactivity before Npgsql sends a keepalive query.</td>
</tr>
<tr>
<td>Tcp Keepalive Time</td>
<td>disabled</td>
<td>The number of milliseconds of connection inactivity before a TCP keepalive query is sent. Use of this option is discouraged, use Keepalive instead if possible. Supported only on Windows.</td>
</tr>
<tr>
<td>Tcp Keepalive Interval</td>
<td>Tcp Keepalive Time</td>
<td>The interval, in milliseconds, between when successive keep-alive packets are sent if no acknowledgement is received. Tcp Keepalive Time must be non-zero as well. Supported only on Windows.</td>
</tr>
</tbody>
</table>
### Application Development

This section explains the range of support provided with Visual Studio integration.

#### 4.4.1 Data Types

A variety of data types can be used with FUJITSU Enterprise Postgres.

The data types below are supported whether you automatically generate applications using tools in Visual Studio (Query Builder in TableAdapter and Server Explorer), or create applications yourself (withDataProvider).
<table>
<thead>
<tr>
<th>Data Types</th>
<th>Supported in the Visual Studio integration window</th>
<th>Supported Fujitsu Npgsql .NET Data Provider</th>
</tr>

</tr>
</tbody>
</table>
### Data Types Supported

<table>
<thead>
<tr>
<th>Data Types</th>
<th>Operation in the Visual Studio integration window</th>
<th>Fujitsu Npgsql .NET Data Provider</th>
</tr>
</thead>
<tbody>
<tr>
<td>json</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Types related to text searches(tsvector, tsquery)</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Enumerated type</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Composite type</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Range type</td>
<td>N</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Supported  
N: Not supported

*1: As shown below, “time with time zone” and “time without time zone” values display the date portion as additional information. However, the actual data comprises the time data only, so with the exception of this displayed format, there are no other resulting issues.

Example:
Composition of table (t1)

<table>
<thead>
<tr>
<th>col1 (time with time zone)</th>
<th>col2 (time without time zone)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/01/0001 10:21:30 +08:00</td>
<td>10:21:30</td>
</tr>
<tr>
<td>1/01/0001 23:34:03 +08:00</td>
<td>23:34:03</td>
</tr>
<tr>
<td>1/01/0001 17:23:54 +08:00</td>
<td>17:23:54</td>
</tr>
</tbody>
</table>

“time with time zone” values display a fixed value of “2/01/0001” in the date portion, while “time without time zone” values display just the time data.

```
SELECT * 
FROM t1;
<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/01/0001</td>
<td>10:21:30</td>
</tr>
<tr>
<td>1/01/0001</td>
<td>23:34:03</td>
</tr>
<tr>
<td>1/01/0001</td>
<td>17:23:54</td>
</tr>
</tbody>
</table>
```

*2: The format is d.hh:mm:ss, where d is an integer and hh:mm:ss is a maximum of 23.59.59 (23 hours, 59 minutes, and 59 seconds).

*3: When updating inet types, only a single host is supported. The input format is addr/y where addr is an IPv4 or IPv6 address and y is the number of bits in the netmask. If /y is omitted, the number of bits in the netmask is set to 32 for an IPv4 address and 128 for an IPv6 address. On display, the /y portion is suppressed.

*4: When updating cidr types, only a single host is supported.

### 4.4.2 Relationship between Application Data Types and Database Data Types

The data types available for SQL data types are as follows:
<table>
<thead>
<tr>
<th>DbType</th>
<th>NpgsqlDbType</th>
<th>PostgreSQL type</th>
<th>Accepted C# types</th>
<th>.Net Framework Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Char</td>
<td>char</td>
<td>string, char[], char</td>
<td>IConvertible</td>
<td>System.String, System.Char[], System.Char</td>
</tr>
<tr>
<td>Varchar</td>
<td>varchar</td>
<td>string, char[], char</td>
<td>IConvertible</td>
<td>System.String, System.Char[], System.Char</td>
</tr>
<tr>
<td>String, StringFixedLength, AnsiString, AnsiStringFixedLength</td>
<td>Text</td>
<td>string, char[], char</td>
<td>IConvertible</td>
<td>System.String, System.Char[], System.Char</td>
</tr>
<tr>
<td>Binary</td>
<td>bytea</td>
<td>byte[], ArraySegment</td>
<td></td>
<td>System.Byte[]</td>
</tr>
<tr>
<td>Int16</td>
<td>Smallint</td>
<td>int2</td>
<td>short, IConvertible</td>
<td>System.Int16</td>
</tr>
<tr>
<td>Int32</td>
<td>Integer</td>
<td>int4</td>
<td>int, IConvertible</td>
<td>System.Int32</td>
</tr>
<tr>
<td>Int64</td>
<td>Bigint</td>
<td>int8</td>
<td>long, IConvertible</td>
<td>System.Int64</td>
</tr>
<tr>
<td>Single</td>
<td>Real</td>
<td>float4</td>
<td>float, IConvertible</td>
<td>System.Single</td>
</tr>
<tr>
<td>Double</td>
<td>Double</td>
<td>float8</td>
<td>double, IConvertible</td>
<td>System.Double</td>
</tr>
<tr>
<td>Decimal, VarNumeric</td>
<td>Numeric</td>
<td>numeric</td>
<td>decimal, IConvertible</td>
<td>System.Decimal</td>
</tr>
<tr>
<td>Date</td>
<td>Date</td>
<td>date</td>
<td></td>
<td>System.DateTime</td>
</tr>
<tr>
<td>TimeTZ</td>
<td>timetz</td>
<td>DateTimeOffset, DateTime, TimeSpan</td>
<td>System.DateTimeOffset, System.DateTime, System.TimeSpan</td>
<td></td>
</tr>
<tr>
<td>Time</td>
<td>Time</td>
<td>time</td>
<td>TimeSpan, string</td>
<td>System.TimeSpan</td>
</tr>
<tr>
<td>DateTime, DateTime2</td>
<td>Timestamp</td>
<td>timestamp</td>
<td>DateTime, DateTimeOffset, NpgsqlDateTime, IConvertible</td>
<td>System.DateTime</td>
</tr>
<tr>
<td>DateTimeOffset</td>
<td>TimestampTZ</td>
<td>timestamptz</td>
<td>DateTime, DateTimeOffset, NpgsqlDateTime, IConvertible</td>
<td>System.DateTime</td>
</tr>
<tr>
<td>Interval</td>
<td>interval</td>
<td>TimeSpan</td>
<td>TimeSpan, NpgsqlTimeSpan, string</td>
<td>System.TimeSpan</td>
</tr>
<tr>
<td>Boolean</td>
<td>bool</td>
<td>bool, IConvertible</td>
<td></td>
<td>System.Boolean</td>
</tr>
<tr>
<td>Bit</td>
<td>bit</td>
<td>BitArray, bool, string</td>
<td></td>
<td>System.Boolean, System.String</td>
</tr>
<tr>
<td>Uuid</td>
<td>uuid</td>
<td>Guid, string</td>
<td></td>
<td>System.Guid</td>
</tr>
<tr>
<td>Inet</td>
<td>inet</td>
<td>IPAddress, NpgsqlInet</td>
<td></td>
<td>ValueTuple&lt;IPAddress, NpgsqlInet, int&gt;, IPAddress, NpgsqlInet</td>
</tr>
</tbody>
</table>
4.4.3 Creating Applications while in Database Multiplexing Mode

This section explains points to consider when creating applications while in database multiplexing mode.

- Refer to the Cluster Operation Guide (Database Multiplexing) for information on database multiplexing mode.
- Refer to "Application Development" in the Cluster Operation Guide (PRIMECLUSTER) for points to consider when creating applications using the failover feature integrated with the cluster software.

4.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs while in database multiplexing mode, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access: 57P01 (*1) Empty string (*1)</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td></td>
<td>Accessed during system failure: Empty string (*1)</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access: 57P01 (*1) Empty string (*1)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accessed during switch: Empty string (*1)</td>
<td></td>
</tr>
</tbody>
</table>

*1: This is the return value of the PostgresException attribute SqlState.

4.4.4 Notes
Notes on TableAdapter

- If [SELECT which returns a single value] is selected when adding a query to a TableAdapter, it will not be possible to execute the SQL statement displayed on the window - therefore, correct the SQL statement.

Type Plugins

- These type libraries include:
  - NodaTime - the recommended way to interact with PostgreSQL date/time types
  - Json.NET - allows Npgsql to use the Newtonsoft.Json.NET library when reading and writing JSON data (both json and jsonb)
  - NetTopologySuite - allows Npgsql to map PostGIS spatial types directly to the NetTopology suite types (the leading spatial library in .NET)
  - GeoJSON - allows Npgsql to read and write PostGIS spatial types as GeoJSON types via the GeoJSON.NET library
  - LegacyPostgis - implements the previously supported PostGIS spatial types as a plugin and is limited to geometry and XY only. Geography and XYZ, XYM and XYZM is not supported in this plugin and if required, use the NetTopologySuite plugin
  - RawPostgis - allows raw byte access to PostGIS types

- Setup the plugin in your application simply by adding a dependency on the plugin (this should have been done automatically when installed to the project) and set it up. See the following code snippet for an example of setting up the Npgsql.NodaTime plugin:

```csharp
using Npgsql;
// Place this at the beginning of your program to use NodaTime everywhere
// (recommended)
NpgsqlConnection.GlobalTypeMapper.UseNodaTime();
// Or to temporarily use NodaTime on a single connection only:
conn.TypeMapper.UseNodaTime();
```

Once the plugin is setup, you can read and write NodaTime objects as per the code snippet below:

```csharp
// Write NodaTime Instant to PostgreSQL "timestamp without time zone"
using (var cmd = new NpgsqlCommand(@"INSERT INTO mytable (my_timestamp) VALUES (@p)", conn))
{
    cmd.Parameters.Add(new NpgsqlParameter("p", Instant.FromUtc(2011, 1, 1, 10, 30)));
    cmd.ExecuteNonQuery();
}

// Read timestamp back from the database as an Instant
using (var cmd = new NpgsqlCommand(@"SELECT my_timestamp FROM mytable", conn))
using (var reader = cmd.ExecuteReader())
{
    reader.Read();
    var instant = reader.GetFieldValue<Instant>(0);
}
```

- To apply the type plugin updates, do one of the following:
  - After uninstalling the type plugin (Refer to "4.5.2 Uninstalling .NET Data Provider Type Plugins"), setup the type plugin (Refer to "4.2.3 Setting Up .NET Data Provider Type Plugins").
  - Remove the type plugin directory from the packages directory of the solution, and then restore it using the nuget restore command.
  - When you deploy an application with a type plugin, the type plugin is included in the distribution. Therefore, after applying the type plugin updates, you must rebuild the application and deploy the updated application.
**Additional Notes on each Type Plugin**

Describe notes about each type plugin.

**NodaTime**

**Mapping Table**

Describes the mapping of PostgreSQL data types to NodaTime data types.

<table>
<thead>
<tr>
<th>PostgreSQL Type</th>
<th>Default NodaTime Type</th>
<th>Additional NodaTime Type</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>Instant</td>
<td>LocalDateTime</td>
<td>It's common to store UTC timestamps in databases - you can simply do so and read/write Instant values. You also have the option of readin/writing LocalDateTime, which is a date/time with no information about timezones; this makes sense if you're storing the timezone in a different column and want to read both into a NodaTime ZonedDateTime.</td>
</tr>
<tr>
<td>timestamp with time zone</td>
<td>Instant</td>
<td>ZonedDateTime, OffsetDateTime</td>
<td>This PostgreSQL type stores only a timestamp, assumed to be in UTC. If you read/write this as an Instant, it will be provided as stored with no timezone conversions whatsoever. If, however, you read/write as a ZonedDateTime or OffsetDateTime, the plugin will automatically convert to and from UTC according to your PostgreSQL session's timezone.</td>
</tr>
<tr>
<td>date</td>
<td>LocalDate</td>
<td></td>
<td>A simple date with no timezone or offset information.</td>
</tr>
<tr>
<td>time</td>
<td>LocalTime</td>
<td></td>
<td>A simple time-of-day, with no timezone or offset information.</td>
</tr>
<tr>
<td>time with time zone</td>
<td>OffsetTime</td>
<td></td>
<td>This is a PostgreSQL type that stores a time and an offset.</td>
</tr>
<tr>
<td>interval</td>
<td>Period</td>
<td></td>
<td>This is a human interval which does not have a fixed absolute length (&quot;two months&quot; can vary depending on the months in question), and so it is mapped to NodaTime's Period (and not Duration or TimeSpan).</td>
</tr>
</tbody>
</table>

**Json.NET**

Once the JSON plugin has been setup, users can transparently read and write CLR objects as JSON values and the plugin will automatically serialize/deserialize them.

See the code snippet below:

```csharp
// Write arbitrary CLR types as JSON
using (var cmd = new NpgsqlCommand("INSERT INTO mytable (my_json_column) VALUES (@p)*", conn))
{
    cmd.Parameters.Add(new NpgsqlParameter("p", NpgsqlDbType.Jsonb) { Value = MyClrType });
    cmd.ExecuteNonQuery();
}
```
// Read arbitrary CLR types as JSON
using (var cmd = new NpgsqlCommand(@"SELECT my_json_column FROM mytable", conn))
using (var reader = cmd.ExecuteReader())
{
reader.Read();
var someValue = reader.GetFieldValue<MyClrType>(0);
}

NetTopologySuite (spatial)
By default the plugin handles only ordinates provided by the DefaultCoordinateSequenceFactory of
GeometryServiceProvider.Instance. If GeometryServiceProvider is initialized automatically the X and Y ordinates are
handled. To change the behavior specify the handleOrdinates parameter like in the following example:
conn.TypeMapper.UseNetTopologySuite(handleOrdinates: Ordinates.XYZ);

To process the M ordinate, you must initialize GeometryServiceProvider.Instance to a new NtsGeometryServices
instance with coordinateSequenceFactory set to a DotSpatialAffineCoordinateSequenceFactory. Or you can specify the
factory when calling UseNetTopologySuite.
// Place this at the beginning of your program to use the specified settings everywhere
(recommended)
GeometryServiceProvider.Instance = new NtsGeometryServices(
new DotSpatialAffineCoordinateSequenceFactory(Ordinates.XYM),
new PrecisionModel(PrecisionModels.Floating),
-1);
// Or specify settings for Npgsql only
conn.TypeMapper.UseNetTopologySuite(
new DotSpatialAffineCoordinateSequenceFactory(Ordinates.XYM));

Reading and Writing Geometry Values
When reading PostGIS values from the database, Npgsql will automatically return the appropriate NetTopologySuite
types: Point, LineString, and so on. Npgsql will also automatically recognize NetTopologySuite's types in parameters,
and will automatically send the corresponding PostGIS type to the database. The following code demonstrates a
roundtrip of a NetTopologySuite Point to the database:
var point = new Point(new Coordinate(1d, 1d));
conn.ExecuteNonQuery("CREATE TEMP TABLE data (geom GEOMETRY)");
using (var cmd = new NpgsqlCommand("INSERT INTO data (geom) VALUES (@p)", conn))
{
cmd.Parameters.AddWithValue("@p", point);
cmd.ExecuteNonQuery();
}
using (var cmd = new NpgsqlCommand("SELECT geom FROM data", conn))
using (var reader = cmd.ExecuteReader())
{
reader.Read();
Assert.That(reader[0], Is.EqualTo(point));
}

You may also explicitly specify a parameter's type by setting NpgsqlDbType.Geometry.

Geography (geodetic) Support
PostGIS has two types:geometry (for Cartesian coordinates) and geography (for geodetic or spherical coordinates).
You can read about the geometry/geography distinction in the PostGIS docs. In a nutshell, geography is much more

- 43 -


accurate when doing calculations over long distances, but is more expensive computationally and supports only a small subset of the spatial operations supported by geometry.

Npgsql uses the same NetTopologySuite types to represent both geometry and geography - the Point type represents a point in either Cartesian or geodetic space. You usually don't need to worry about this distinction because PostgreSQL will usually cast types back and forth as needed. However, it's worth noting that Npgsql sends Cartesian geometry by default, because that's the usual requirement. You have the option of telling Npgsql to send geography instead by specifying NpgsqlDbType.Geography:

```csharp
using (var cmd = new NpgsqlCommand("INSERT INTO data (geog) VALUES (@p)", conn))
{
    cmd.Parameters.AddWithValue("@p", NpgsqlDbType.Geography, point);
    cmd.ExecuteNonQuery();
}
```

If you prefer to use geography everywhere by default, you can also specify that when setting up the plugin:

```csharp
NpgsqlConnection.GlobalTypeMapper.UseNetTopologySuite(geographyAsDefault: true);
```

**GeoJSON (spatial)**

Using the GeoJSON plugin is the same as the NetTopologuSuite.

**LegacyPostgis (spatial)**

If you've used the internal PostGIS types in Npgsql 3.2 or earlier, the plugin works in the same way:

```csharp
NpgsqlConnection.GlobalTypeMapper.UseLegacyPostgis();
```

// Write
var cmd = new NpgsqlCommand("INSERT INTO table (pg_point, pg_polygon) VALUES (@point, @polygon)", conn);
    cmd.Parameters.AddWithValue("point", new PostgisPoint(3.5, 4.5));
    cmd.ExecuteNonQuery();

// Read
var cmd = new NpgsqlCommand("SELECT * FROM table", conn);
var reader = cmd.ExecuteReader();
while (reader.Read())
{
    var point = reader.GetFieldValue<PostgisPoint>(0);
    var polygon = reader.GetFieldValue<PostgisPolygon>(1);
}
```

**Notes on the Query Builder**

- Prefix named parameters with "@".
- Uppercase object names cannot be used, even when enclosed in double quotation marks.
  To use uppercase object names enclosed in double quotation marks, include them in SQL statements and enter these in the [Generate the SQL statements] window rather than in the Query Builder.
- SQL statements cannot be correctly generated if the SQL statement specified in Filter matches any of the conditions below:
  - It uses PostgreSQL intrinsic operators such as << or ::.
  - It uses functions with keywords such as AS, FROM, IN, OVER.
    Example: extract(field from timestamp), RANK() OVER
  - It uses functions with the same names as those prescribed in SQL conventions, but that require different arguments.
Notes on Server Explorer
- The temporary table is not displayed.

Notes on metadata
- The CommandBehavior.KeyInfo argument must be specified if executing ExecuteReader before obtaining metadata using GetSchemaTable.

Example
```csharp
NpgsqlDataReader ndr = cmd.ExecuteReader(CommandBehavior.KeyInfo);
DataTable dt = dr.GetSchemaTable();
```

Notes on automatically generating update-type SQL statements
- If the SQL statement includes a query (which cannot be updated) that matches any of the conditions below, an update-type SQL statement will be generated (note that it may not be possible to execute this SQL statement in some cases):
  - It includes derived tables
  - It includes the same column name as the select list

Update-type SQL statements will be automatically generated in the following cases:
- If update statements are obtained using NpgsqlCommandBuilder
- If data is updated using NpgsqlDataAdapter
- If data is updated using TableAdapter

Notes on distributed transactions
- Applications using transaction scope can use distributed transactions by linking with Microsoft Distributed Transaction Coordinator (MSDTC). In this case, note the following:
  - Ensure that the value of max_prepared_transactions is greater than max_connection, so that "PREPARE TRANSACTION" can be issued for each transaction that simultaneously connects to the database server.
  - If each transaction in the transaction scope accesses the same resource using different connections, the database server will perceive it as requests from different applications, and a deadlock may occur. By configuring a timeout value for the transaction scope beforehand, the deadlock can be broken.

4.5 Uninstallation
This section explains how to uninstall Npgsql and Npgsql for Entity Framework.

4.5.1 Uninstalling Npgsql
To uninstall Npgsql, uninstall each of its components separately:

1. Uninstall DDEX.
   DDEX provides the Visual Studio integration tools within the IDE through the Npgsql.VSIX package installation.
   2. Click [Tools], and then [Extensions and Updates].
   3. Select the FUJITSU Npgsql PostgreSQL Integration extension, and then click [Uninstall].
4. In the confirmation dialog box "Are you sure you want to schedule FUJITSU Npgsql PostgreSQL Integration for uninstall?", click [Yes].

   Note that the status at the bottom of the [Extensions and Updates] window will change to "Your changes will be scheduled. The modifications will begin when all Microsoft Visual Studio windows are closed".

5. Click [Close].

6. Close all Visual Studio instances currently open.

   The VSIX Installer will automatically start.

7. Click [Modify] to continue with uninstallation of FUJITSU Npgsql PostgreSQL Integration.

8. Upon completion, a dialog box will be displayed - click [Close].

2. Uninstall Npgsql GAC.

   Npgsql.dll provides DBProviderFactory functionality for Npgsql.

   1. Click [Control Panel], and then [Programs and Features].

   2. Right-click the target program below in the list, and click [Uninstall]. (The notation "<x>" indicates the version of the FUJITSU Enterprise Postgres.)

      Name: FUJITSU Enterprise Postgres Npgsql <x>
      Issuing company: FUJITSU LIMITED
      Version: <x>.0.000

   3. In the confirmation dialog box "Are you sure you want to uninstall FUJITSU Enterprise Postgres Npgsql <x>?", click [Yes].

   4. Upon completion, the uninstall window will close, and the uninstallation target version of FUJITSU Enterprise Postgres Npgsql <x> will no longer be listed.

4.5.2 Uninstalling .NET Data Provider Type Plugins

   The .NET Data Provider type plugins are installed per project. To uninstall it, follow the procedure below:

   1. In Visual Studio, open a project for which Npgsql the Plugin to be removed is installed.

   2. Click [Tools] >> [NuGet Package Manager] >> [Manage NuGet Packages for Solution].

   3. Select all the projects that have Npgsql Plugin(s) installed, and then click [Uninstall].

      Alternatively, if the plugin packages have been removed and are no longer installed, in the solution explorer open the Dependencies/NuGet node and delete the plugins that require uninstallation.

4.5.3 Uninstalling Npgsql for Entity Framework

   Npgsql for Entity Framework is installed per project. To uninstall it, follow the procedure below:

   1. In Visual Studio, open a project for which Npgsql for Entity Framework is installed.

   2. Click [Tools] >> [NuGet Package Manager] >> [Manage NuGet Packages for Solution].

   3. Select all the projects that have Npgsql for Entity Framework installed, and then click [Uninstall].

      Alternatively, if the Entity Framework package has been removed and is no longer installed, in the solution explorer open the Dependencies/NuGet node and delete the Entity Framework package
Chapter 5 C Library (libpq)

This chapter describes how to use C libraries.

5.1 Development Environment

Install FUJITSU Enterprise Postgres Client Package for the architecture to be developed and executed.

See

Refer to Installation and Setup Guide for Client for information on the C compiler required for C application development.

5.2 Setup

This section describes the environment settings required to use C libraries and how to encrypt data for communication.

5.2.1 Environment Settings

To execute an application that uses libpq, set the environment variable as shown below.

Linux

- Required for compile/link
  - LD_LIBRARY_PATH
    fujitsuEnterprisePostgresClientInstallDir\lib
  
- Required for execution of the application
  - PGLOCALEDIR
    fujitsuEnterprisePostgresClientInstallDir\share\locale

Example

"<xx>" indicates the product version.

> LD_LIBRARY_PATH=/opt/fsepv<xx>client64/lib:$LD_LIBRARY_PATH;export LD_LIBRARY_PATH
> PGLOCALEDIR=/opt/fsepv<xx>client64/share/locale;export PGLOCALEDIR

Windows (R)

- Required for compile/link
  - LIB
    fujitsuEnterprisePostgresClientInstallDir\lib

- INCLUDE
  fujitsuEnterprisePostgresClientInstallDir\include

- Required for execution of the application
  - PATH
    fujitsuEnterprisePostgresClientInstallDir\lib

- PGLOCALEDIR
  fujitsuEnterprisePostgresClientInstallDir\share\locale
5.2.2 Message Language and Encoding System Used by Applications Settings

This section explains the language settings for the application runtime environment and the encoding settings for the application.

Language settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Messages output by an application may include text from messages sent from the database server. In the resulting text, the text of the application message will use the message locale of the application, and the text of the message sent by the database server will use the message locale of the database server. If the message locales do not match, more than one language or encoding system will be used. Moreover, if the encoding systems do not match, characters in the resulting text can be garbled.

- Linux

Set the locale for messages (LC_MESSAGES category) to match the message locale of the database server. This can be done in a few different ways, such as using environment variables. Refer to the relevant manual of the operating system for information on the setlocale function.

Example of specifying "en_US.UTF-8" with the setlocale function

```c
setlocale(LC_ALL, "en_US.UTF-8");
```

Specifying the locale of the LC_ALL category propagates the setting to LC_MESSAGE.

- Windows(R)

Align the locale of the operating system with the message locale of the database server.

Encoding System Settings

Ensure that the encoding system that is embedded in the application and passed to the database, and the encoding system setting of the runtime environment, are the same. The encoding system cannot be converted correctly on the database server.

Use one of the following methods to set the encoding system for the application:

- Set the PGCLIENTENCODING environment variable in the runtime environment.
- Set the client_encoding keyword in the connection string.
- Use the PQsetClientEncoding function.
See

Refer to “Supported Character Sets” in “Server Administration” in the PostgreSQL Documentation for information on the strings that represent the encoding system that can be set.

For example, when using "Unicode" and "8 bit", set the string "UTF8".

Note

Text may be garbled when outputting results to the command prompt. Review the font settings for the command prompt if this occurs.

5.2.3 Settings for Encrypting Communication Data

Set in one of the following ways when performing remote access using communication data encryption:

When setting from outside with environment variables

Specify "require", "verify-ca", or "verify-full" in the PGSSLMODE environment variable.

In addition, the parameters for the PGSSLROOTCERT and PGSSLCRL environment variables need to be set to prevent spoofing of the database server.

See

Refer to "Environment Variables" in "Client Interfaces" in the PostgreSQL Documentation for information on environment variables.

When specifying in the connection URI

Specify "require", "verify-ca", or "verify-full" in the "sslmode" parameter of the connection URI.

In addition, the parameters for the sslcert, sslkey, sslrootcert, and sslcrl need to be set to prevent spoofing of the database server.

See

Refer to "Secure TCP/IP Connections with SSL" in "Server Administration" in the PostgreSQL Documentation for information on encrypting communication data.

5.3 Connecting with the Database

Point

Use the connection service file to specify the connection destination. In the connection service file, a name (service name) is defined as a set, comprising information such as connection destination information and various types of tuning information set for connections. By using the service name defined in the connection service file when connecting to databases, it is no longer necessary to modify applications when the connection information changes.

Refer to “Client Interfaces”, “The Connection Service File” in the PostgreSQL Documentation for details.

See

Refer to "Database Connection Control Functions" in "Client Interfaces" in the PostgreSQL Documentation.
5.4 Application Development

See

Refer to "libpq - C Library" in "Client Interfaces" in the PostgreSQL Documentation for information on developing applications.

However, if you are using the C library, there are the following differences to the PostgreSQL C library (libpq).

5.4.1 Compiling Applications

Specify the following paths when compiling applications.

Refer to your compiler documentation for information on how to specify the path.

- Linux

Table 5.1 Include file and library path

<table>
<thead>
<tr>
<th>Type of path</th>
<th>Path name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>fujitsuEnterprisePostgresClientInstallDir/lib</td>
</tr>
</tbody>
</table>

- Windows(R)

If the include file and the library path have been set in the environment variable, there is no need to specify the paths shown below for the compile.

Table 5.3 Include file and library path

<table>
<thead>
<tr>
<th>Type of path</th>
<th>Path name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>fujitsuEnterprisePostgresClientInstallDir/lib</td>
</tr>
</tbody>
</table>

Table 5.4 C Library (libpq library)

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library for links</td>
<td>libpq.lib</td>
</tr>
<tr>
<td>Dynamic library</td>
<td>libpq.dll</td>
</tr>
</tbody>
</table>

5.4.2 Creating Applications while in Database Multiplexing Mode

This section explains points to consider when creating applications while in database multiplexing mode.

See

- Refer to the Cluster Operation Guide (Database Multiplexing) for information on database multiplexing mode.
5.4.2.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs while in database multiplexing mode, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information</th>
<th>Action</th>
</tr>
</thead>
</table>
| Server failure or FUJITSU Enterprise Postgres system failure           | Failure occurs during access
PGRES\_FATAL\_ERROR(*1)
57P01(*2)
NULL(*2)                  | After the switch is complete, reestablish the connection, or reexecute the application. |
| Accessed during system failure                                       | CONNECTION\_BAD(*3)        |                                                                        |
| Switch to the standby server                                         | Switched during access     | PGRES\_FATAL\_ERROR(*1)
57P01(*2)
NULL(*2)                  |                                                                        |
| Accessed during switch                                               | CONNECTION\_BAD(*3)        |                                                                        |

*1: Return value of PQresultStatus().
*2: Return value of PQresultErrorField() PG\_DIAG\_SQLSTATE.
*3: Return value of PQstatus().
Chapter 6 Embedded SQL in C

This chapter describes application development using embedded SQL in C.

6.1 Development Environment

Install FUJITSU Enterprise PostgreSQL Client Package for the architecture to be developed and executed.

See

Refer to Installation and Setup Guide for Client for information on the C compiler required for C application development.

Note

C++ is not supported. Create a library by implementing embedded SQL in C, and call it from C++.

6.2 Setup

6.2.1 Environment Settings

When using embedded SQL in C, the same environment settings as when using the C library (libpq) are required.

Refer to "5.2.1 Environment Settings" in "C Library (libpq)" for information on the environment settings for the library for C.

Additionally, set the following path for the precompiler ecpg in the PATH environment variable:

Linux

![fujitsuEnterprisePostgresClientInstallDir/bin](filename)

Windows(R)

![fujitsuEnterprisePostgresClientInstallDir\bin](filename)

6.2.2 Message Language and Encoding System Used by Applications Settings

The message language and the encoding System Settings Used by Applications settings are the same as when using the library for C.

However, in embedded SQL, the PQsetClientEncoding function cannot be used in the encoding system settings. In embedded SQL, use the SET command to specify the encoding system in client_encoding.

Refer to "5.2.2 Message Language and Encoding System Used by Applications Settings" in "C Library (libpq)" for information on the settings for the library for C.

6.2.3 Settings for Encrypting Communication Data

When encrypting the communication data, the same environment settings as when using the C library (libpq) are required.

Refer to "5.2.3 Settings for Encrypting Communication Data" in "C Library (libpq)" for information on the environment settings for the C library.
6.3 Connecting with the Database

- It is recommended to use a connection service file to specify connection destinations. In the connection service file, a name (service name) is defined as a set, comprising information such as connection destination information and various types of tuning information set for connections. By using the service name defined in the connection service file when connecting to databases, it is no longer necessary to modify applications when the connection information changes. Refer to "The Connection Service File" in "Client Interfaces" in the PostgreSQL Documentation for information.

- If using a connection service file, perform either of the procedures below:
  - Set the service name as a string literal or host variable, as follows:
    ```
tcp:postgresql://?service=my_service
    ```
  - Set the service name in the environment variable PGSERVICE, and use CONNECT TO DEFAULT

Use the CONNECT statement shown below to create a connection to the database server.

**Format**

```
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name];
```

**target**

Write in one of the following formats:

- `dbname@host:port`
- `tcp:postgresql://host:port/dbname[?options]`
- `unix:postgresql://host[[:port][/dbname]][?options]`
  (Definition method when using the UNIX domain socket)
- SQL string literal containing one of the above formats
- Reference to a character variable containing one of the above formats
- `DEFAULT`

**user-name**

Write in one of the following formats:

- `username`
- `username/password`
- `username IDENTIFIED BY password`
- `username USING password`

**Description of the arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dbname</code></td>
<td>Specify the database name.</td>
</tr>
<tr>
<td><code>host</code></td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td><code>port</code></td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td><code>connection-name</code></td>
<td>Specify connection names to identify connections when multiple connections are to be processed within a single program.</td>
</tr>
<tr>
<td><code>user-name</code></td>
<td></td>
</tr>
<tr>
<td>Argument</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>username</td>
<td>Specify the user that will connect with the database. If this is omitted, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>password</td>
<td>Specify a password when authentication is required.</td>
</tr>
</tbody>
</table>
| options  | Specify the following parameter when specifying a time for timeout. Connect parameters with & when specifying more than one. The following shows the values specified for each parameter.  
- connect_timeout  
  Specify the timeout for connections.  
  Specify a value between 0 and 2147483647 (in seconds). There is no limit set if you set 0 or an invalid value. If "1" is specified, the behavior will be the same as when "2" was specified. An error occurs when a connection cannot be established within the specified time.  
- keepalives  
  This enables keepalive.  
  Keepalive is disabled if 0 is specified. Keepalive is enabling when any other value is specified. The default is keepalive enabled. Keepalive causes an error to occur when it is determined that the connection with the database is disabled.  
- keepalives_idle  
  Specify the time until the system starts sending keepalive messages when communication with the database is not being performed.  
  - Linux  
    Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.  
  - Windows(R)  
    Specify a value between 1 and 2147483647 (in seconds). 7200 will be set as default if a value outside this range is specified or if nothing is specified.  
- keepalives_interval  
  Specify the interval between resends when there is no response to keepalive messages.  
  - Linux  
    Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.  
  - Windows(R)  
    Specify a value between 1 and 2147483647 (in seconds). 1 will be set as default if a value outside this range is specified or if nothing is specified.  
- keepalives_count  
  Specify the number of resends for keepalive messages.  
  - Linux  
    Specify a value between 1 and 127. The default value of the system is used if this is not specified.  
  - Windows(R)  
    The system default value is used irrespective of what is specified for this parameter.  
- tcp_user_timeout  
  - 54 -
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>After establishing the connection, when sending from the client to the server, if the TCP resend process operates, specify the time until it is considered to be disconnected.</td>
</tr>
</tbody>
</table>
|          | - Linux  
|          | Specify a value between 0 and 2147483647 (in milliseconds). The default value of the system is used if 0. 0 will be set as default if nothing is specified. |
|          | - Windows(R)  
|          | Cannot be specified. |

**Note**

If a value other than 0 is specified for the tcp_user_timeout parameter, the waiting time set by the tcp_keepalives_idle parameter and tcp_keepalives_interval parameter will be invalid and the waiting time specified by the tcp_user_timeout parameter will be used.

**Code examples for applications**

```sql
EXEC SQL CONNECT TO tcp:postgresql://sv1:27500/mydb?
  connect_timeout=20&keepalives_idle=20&keepalives_interval=5&keepalives_count=2&keepalives=1 USER myuser/myuser01;
```

### 6.4 Application Development

Refer to "ECPG - Embedded SQL in C" in "Client Interfaces" in the PostgreSQL Documentation for information on developing applications.

However, when using embedded SQL in C, there are the following differences to the embedded SQL (ECPG) in PostgreSQL C.

#### 6.4.1 Support for National Character Data Types

This section describes how to use the national character data types using the SQL embedded C preprocessor.

The following explains the C language variable types corresponding to the NCHAR type:

Specify the number of characters specified for the NCHAR type multiple by 4, plus 1 for the length of the host variable.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Host variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>NATIONAL CHARACTER(n)</td>
<td>NCHAR variable [nx4+1]</td>
</tr>
<tr>
<td>NATIONAL CHARACTER VARYING(n)</td>
<td>NVARCHAR variable [nx4+1]</td>
</tr>
</tbody>
</table>

**See**

Refer to "Handling Character Strings" in "Client Interfaces" in the PostgreSQL documentation for information on using character string types.

#### 6.4.2 Compiling Applications

Append the extension "pgc" to the name of the source file for the embedded SQL in C.

When the pgc file is precompiled using the ecpg command, C source files will be created, so use the C compiler for the compile.
Precompiling example

If an optimizer hint block comment is specified for the SQL statement, specify the following option in the ecpg command:

```
--enable-hint
```

Enables the optimizer hint block comment (hereafter, referred to as the "hint clause"). If this option is not specified, the hint clause will be removed as a result of the ecpg precompile and be disabled.

The SQL statements that can be specified in the hint clause are SELECT, INSERT, UPDATE, and DELETE.

The locations in which the hint clause can be specified are immediately after one of the SELECT, INSERT, UPDATE, DELETE, or WITH keywords. A syntax error will occur if any other location is specified.

Example of specifying the hint clause

```
EXEC SQL SELECT /*+ IndexScan(prod ix01) */ name_id INTO :name_id FROM prod WHERE id = 1;
```

Refer to "11.1.1 Optimizer Hints" for information on optimizer hints.

**Note**

Take the following points into account when using embedded SQL source files:

- Multibyte codes expressed in SJIS or UTF-16 cannot be included in statements or host variable declarations specified in EXEC SQL.
- Do not use UTF-8 with a byte order mark (BOM), because an error may occur during compilation if the BOM character is incorrectly recognized as the source code.
- Multibyte characters cannot be used in host variable names.
- It is not possible to use a TYPE name that contains multibyte characters, even though it can be defined.

Specify the following paths when compiling a C application output with precompiling.

Refer to your compiler documentation for information on how to specify the path.

### Linux

<table>
<thead>
<tr>
<th>Type of path</th>
<th>Path name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>fujitsuEnterprisePostgresClientInstallDir/lib</td>
</tr>
</tbody>
</table>

### C Library

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic library</td>
<td>libecpg.so</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.so</td>
<td>When using the pgtypes library</td>
</tr>
<tr>
<td>Static library</td>
<td>libecpg.a</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.a</td>
<td>When using the pgtypes library</td>
</tr>
</tbody>
</table>
If the include file and the library path have been set in the environment variable, there is no need to specify the paths shown below for the compile.

**Table 6.3 Include file and library path**

<table>
<thead>
<tr>
<th>Type of path</th>
<th>Path name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>fujitsuEnterprisePostgresClientInstallDir\include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>fujitsuEnterprisePostgresClientInstallDir\lib</td>
</tr>
</tbody>
</table>

**Table 6.4 C Library**

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library for links</td>
<td>libecpg.lib</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.lib</td>
<td>When using the pgtypes library</td>
</tr>
<tr>
<td>Dynamic library</td>
<td>libecpg.dll</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.dll</td>
<td>When using the pgtypes library</td>
</tr>
</tbody>
</table>

**Note**

- The libecpg library in Windows(R) is created by "release" and "multithreaded" options. When using the ECPGdebug function included in this library, compile using the "release" and "multithreaded" flags in all programs that use this library. When you do this, use the "dynamic" flag if you are using libecpg.dll, and use the "static" flag if you are using libecpg.lib.

Refer to "Library Functions" in "Client Interfaces" in the PostgreSQL Documentation for information on the ECPGdebug function.

- The cl command expects input to be a program that uses one of the following code pages, so convert the program to these code pages and then compile and link it (refer to the Microsoft documentation for details).
  - ANSI console code pages (example: Shift-JIS for Japanese)
  - UTF-16 little-endian with or without BOM (Byte Order Mark)
  - UTF-16 big-endian with or without BOM
  - UTF-8 with BOM

The cl command converts strings in a program to an ANSI console code page before generating a module, so the data sent to and received from the database server becomes an ANSI console code page. Therefore, set the coding system corresponding to the ANSI console code page as the coding system of the client.

Refer to "Character Set Support" in "Server Administration" in the PostgreSQL Documentation for information on how to set the client encoding system.
(Example: To use environment variables in Japanese, set SJIS in PGCLIENTENCODING.)

### 6.4.3 Bulk INSERT

This section describes the bulk INSERT.

**Synopsis**

```
EXEC SQL [ AT conn ] [ FOR { numOfRows | ARRAY_SIZE } ]
 INSERT INTO tableName [ ( colName [, ...] ) ]
 [ VALUES ( { expr | DEFAULT } [, ...] ) [, ...] | query ]
```
[ RETURNING * | outputExpr [ [ AS ] outputName ] [, ...] ]
INTO outputHostVar [ [ INDICATOR ] indicatorVar ] [, ... ];

**Description**

Bulk INSERT is a feature that inserts multiple rows of data in bulk. By specifying the array host variable that stored the data in the VALUES clause of the INSERT statement, the data for each element in the array can be inserted in bulk. This feature is used by specifying the insertion count in the FOR clause immediately before the INSERT statement.

**FOR Clause**

Specify the insertion count using numOfRows or ARRAY_SIZE in the FOR clause. The FOR clause can be specified only in the INSERT statement, not in other update statements.

**numOfRows and ARRAY_SIZE**

Insertion processing will be executed only for the specified count. However, if the count is 1, it will be assumed that the FOR clause was omitted when the application is executed. In this case, proceed according to the INSERT specification in the PostgreSQL Documentation.

Specify the FOR clause as an integer host variable or as a literal.

Specify ARRAY_SIZE to insert all elements of the array in the table. When specifying ARRAY_SIZE, specify at least one array in expr.

If two or more arrays were specified in expr, it will be assumed that ARRAY_SIZE is the minimum number of elements in the array.

numOfRows or ARRAY_SIZE must exceed the minimum number of elements in all arrays specified in expr, outputHostVar, and indicatorVal.

The following example shows how to specify the FOR clause.

```sql
int number_of_rows = 10;
int id[25];
char name[25][10];
EXEC SQL FOR :number_of_rows  /* will process 10 rows */
    INSERT INTO prod (name, id) VALUES (:name, :id);
EXEC SQL FOR ARRAY_SIZE           /* will process 25 rows */
    INSERT INTO prod (name, id) VALUES (:name, :id);
```

**expr**

Specify the value to be inserted in the table. Array host variables, host variable literals, strings, and pointer variables can be specified. Structure type arrays and pointer variable arrays cannot be specified.

Do not use pointer variables and ARRAY_SIZE at the same time. The reason for this is that the number of elements in the area represented by the pointer variable cannot be determined.

**query**

A query (SELECT statement) that supplies the rows to be inserted. The number of rows returned by query must be 1. If two or more rows are returned, an error will occur. This cannot be used at the same time as ARRAY_SIZE.

**outputHostVar, indicatorVal**

These must be array host variables or pointer variables.

**Error Messages**

Given below are the error messages that are output when bulk INSERT functionality is not used correctly.
invalid statement name "FOR value should be positive integer"

Cause
The value given for numOfRows is less than or equal to 0.

Solution
Specify a value that is more than or equal to 1 for numOfRows.

invalid statement name "Host array variable is needed when using FOR ARRAY_SIZE"

Cause
A host array is not specified in the values clause when using the ARRAY_SIZE keyword.

Solution
At least one host array variable should be included in the values clause.

SELECT...INTO returns too many rows

Cause
The number of rows returned by the 'SELECT ... INTO' query in the INSERT statement is more than one.

Solution
When the value of numOfRows is more than one, the maximum number of rows that can be returned by the 'SELECT ... INTO' query in the INSERT statement is one.

Limitations
The limitations when using bulk INSERT are given below.

- Array of structures should not be used as an input in the 'VALUES' clause. Attempted use will result in junk data being inserted into the table.
- Array of pointers should not be used as an input in the 'VALUES' clause. Attempted use will result in junk data being inserted into the table.
- ECPG supports the use of 'WITH' clause in single INSERT statements. 'WITH' clause cannot be used in bulk INSERT statements.
- ECPG does not calculate the size of the pointer variable. So when a pointer variable is used that includes multiple elements, numOfRows should be less than or equal to the number of elements in the pointer. Otherwise, junk data will be inserted into the table.
- If an error occurs, all bulk INSERT actions will be rolled back, therefore, no rows are inserted. However, if the RETURNING clause was used, and the error occurred while obtaining the rows after the insertion was successful, the insertion processing will not be rolled back.

Samples
Given below are some sample usages of the bulk INSERT functionality.

Basic Bulk INSERT

```
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:in_f1);
```

The number of rows to insert indicated by the FOR clause is 3, so the data in the first 3 elements of the host array variable are inserted into the table. The contents of the target table will be:
Also a host integer variable can be used to indicate the number of rows that will be inserted in FOR clause, which will produce the same result as above:

```c
int num = 3;
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR :num INSERT INTO target (f1) VALUES (:in_f1);
```

Inserting constant values

Constant values can also be bulk INSERTed into the table as follows:

```c
EXEC SQL FOR 3 INSERT INTO target (f1,f2) VALUES (DEFAULT,'hello');
```

Assuming the 'DEFAULT' value for the 'f1' column is '0', the contents of the target table will be:

<table>
<thead>
<tr>
<th>f1</th>
<th>f2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>hello</td>
</tr>
<tr>
<td>0</td>
<td>hello</td>
</tr>
<tr>
<td>0</td>
<td>hello</td>
</tr>
</tbody>
</table>

(3 rows)

Using ARRAY_SIZE

'FOR ARRAY_SIZE' can be used to insert the entire contents of a host array variable, without explicitly specifying the size, into the table.

```c
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1) VALUES (:in_f1);
```

In the above example, four rows are inserted into the table.

**Note**

If there are multiple host array variables specified as input values, then the number of rows inserted is same as the smallest array size. The example given below demonstrates this usage.

```c
int in_f1[4] = (1,2,3,4);
char in_f3[3][10] = {"one", "two", "three"};
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1,f3) VALUES (:in_f1,:in_f3);
```

In the above example, the array sizes are 3 and 4. Given that the smallest array size is 3, only three rows are inserted into the table. The table contents are given below.

<table>
<thead>
<tr>
<th>f1</th>
<th>f3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>one</td>
</tr>
<tr>
<td>2</td>
<td>two</td>
</tr>
</tbody>
</table>
Using Pointers as Input

Pointers that contain multiple elements can be used in bulk INSERT.

```
int *in_pf1 = NULL;
in_pf1 = (int*)malloc(4*sizeof(int));
in_pf1[0]=1;
in_pf1[1]=2;
in_pf1[2]=3;
in_pf1[3]=4;
...
EXEC SQL FOR 4 INSERT INTO target (f1) values (:in_pf1);
```

The above example will insert four rows into the target table.

Using SELECT query

When using bulk INSERT, the input values can be got from the results of a SELECT statement. For example,

```
EXEC SQL FOR 4 INSERT INTO target(f1) SELECT age FROM source WHERE name LIKE 'foo';
```

Assuming that the 'SELECT' query returns one row, the same row will be inserted into the target table four times.

**Note**

If the 'SELECT' query returns more than one row, the INSERT statement will throw an error.

```
EXEC SQL FOR 1 INSERT INTO target(f1) SELECT age FROM source;
```

In the above example, all the rows returned by the 'SELECT' statement will be inserted into the table. In this context '1' has the meaning of 'returned row equivalent'.

Using RETURNING clause

Bulk INSERT supports the same RETURNING clause syntax as normal INSERT. An example is given below.

```
int out_f1[4];
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:in_f1) RETURNING f1 INTO :out_f1;
```

After the execution of the above INSERT statement, the 'out_f1' array will have 3 elements with the values of '1', '2' and '3'.

### 6.4.4 DECLARE STATEMENT

This section describes the DECLARE STATEMENT.

**Synopsis**

```sql
EXEC SQL [ AT connName] DECLARE statementName STATEMENT;
```
**Description**

DECLARE STATEMENT is an embedded SQL command that declares an identifier for a prepared statement. The declared identifier can be used as an identifier in a prepared statement for the following SQL commands:

- EXECUTE
- DECLARE
- DESCRIBE
- PREPARE (Embedded SQL commands)
- PREPARE (SQL commands)

You can associate an identifier in a prepared statement with a connection by executing a DECLARE STATEMENT that specifies the connection. If you specify an identifier associated with the connection in a later SQL command, the SQL command is executed using the connection associated with the identifier. The association between the connection and the identifier in the prepared statement is shared throughout the process.

Only one connection can be associated with a prepared statement of the same name. If you make multiple associations across files, subsequent DECLARE STATEMENT are ignored. If you associate the same file more than once, precompiling the file fails.

If you use the identifier associated with a connection in a SQL command, do not use the AT clause. If a connection different from the connection linked to the identifier using the AT clause is selected, a runtime error will occur.

**Parameters**

**connName**

A database connection name established by the CONNECT command.

If AT clause is omitted, no association is made between the connection and the identifier. DECLARE STATEMENT is executed, but has no effect.

**statementName**

Specify the identifier of the prepared statement. You can specify either a SQL identifier or a host variable.

**Examples**

**Dynamic SQL statement**

DECLARE STATEMENT is primarily used to execute dynamic SQL statements.

```sql
EXEC SQL BEGIN DECLARE SECTION;
  char dbname[128];
EXEC SQL END DECLARE SECTION;
...
EXEC SQL CONNECT TO postgres AS con1;
EXEC SQL CONNECT TO another_database AS con2;
EXEC SQL AT con1 DECLARE sql_stmt STATEMENT;
EXEC SQL DECLARE cursor_name CURSOR FOR sql_stmt;
EXEC SQL PREPARE sql_stmt FROM "SELECT current_database()";
EXEC SQL OPEN cursor_name;
EXEC SQL FETCH cursor_name INTO :dbname;
EXEC SQL CLOSE cursor_name;
```

In the example above, the connection 'con1' is associated with the prepared statement identifier 'sql_stmt'. So the current connection is 'con2', but the embedded SQL commands that follow are executed on 'con1'.

**PREPARE AS statement**

The following is an example using a PREPARE statement in the SQL command:

```sql
EXEC SQL AT db1 DECLARE stmt STATEMENT;
EXEC SQL PREPARE stmt (int) AS
```
The above SELECT statement is executed on the connection 'db1'.

Compatibility

DECLARE STATEMENT is not specified in the SQL standard.

See Also

EXECUTE, DECLARE, DESCLIBE, PREPARE (Embedded SQL commands), PREPARE (SQL commands)

See

- Refer to "Embedded SQL Commands" in "Client Interfaces" in the PostgreSQL documentation for information on the embedde SQL commands.
- Refer to "SQL Commands" in "Reference" in the PostgreSQL documentation for information on the SQL commands.

6.4.5 Creating Applications while in Database Multiplexing Mode

This section explains points to consider when creating applications while in database multiplexing mode.

See

- Refer to the Cluster Operation Guide (Database Multiplexing) for information on database multiplexing mode.
- Refer to "Application Development" in the Cluster Operation Guide (PRIMECLUSTER) for points to consider when creating applications using the failover feature integrated with the cluster software.

6.4.5.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs while in database multiplexing mode, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access 5P01 57P02 YE000 26000 40001</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td></td>
<td>Accessed during node/system failure 08001</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access 5P01 57P02 YE000 26000</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>Error information (*1)</td>
<td>Action</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------</td>
<td>--------</td>
</tr>
<tr>
<td></td>
<td>40001</td>
<td></td>
</tr>
<tr>
<td>Accessed during switch</td>
<td>08001</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of SQLSTATE.

6.4.6 Notes

Notes on creating multithreaded applications

In embedded SQL in C, DISCONNECT ALL disconnects all connections within a process, and therefore it is not thread-safe in all operations that use connections. Do not use it in multithreaded applications.
Chapter 7 Embedded SQL in COBOL

This chapter describes application development using embedded SQL in COBOL.

7.1 Development Environment

Install FUJITSU Enterprise Postgres Client Package for the architecture to be developed and executed.

See

Refer to the Installation and Setup Guide for Client for information on the COBOL compiler required for COBOL application development.

7.2 Setup

7.2.1 Environment Settings

When using embedded SQL in COBOL, the same environment settings as when using the C library (libpq) are required. Refer to "5.2.1 Environment Settings" in "C Library (libpq)" for information on the environment settings for the library for C.

Additionally, set the following path for the precompiler ecobpg in the PATH environment variable:

- Linux
  - fujitsuEnterprisePostgresClientInstallDir/bin

- Windows(R)
  - fujitsuEnterprisePostgresClientInstallDir\bin

7.2.2 Message Language and Encoding System Used by Applications

The settings for the message language and the encoding system used by applications should be the same as those required when using the library for C.

However, in embedded SQL, the PQsetClientEncoding function cannot be used in the encoding system settings. In embedded SQL, use the SET command to specify the encoding system in client_encoding.

Refer to "5.2.2 Message Language and Encoding System Used by Applications Settings" in "C Library (libpq)" for information on the settings for the library for C.

7.2.3 Settings for Encrypting Communication Data

When encrypting the communication data, the same environment settings as when using the C library (libpq) are required.

Refer to "5.2.3 Settings for Encrypting Communication Data" in "C Library (libpq)" for information on the environment settings for the C library.

7.3 Connecting with the Database

Use the CONNECT statement shown below to create a connection to the database server.

Format

EXEC SQL CONNECT TO target [AS connection-name] [USER user-name] END-EXEC.
target

Write in one of the following formats:
- dbname@host:port
- tcp:postgresql://host:port/dbname[?options]
- unix:postgresql://host[::port]/dbname[?options]
  (Definition method when using the UNIX domain socket)
- SQL string literal containing one of the above formats
- Reference to a character variable containing one of the above formats
- DEFAULT

Note

If target is DEFAULT, the AS clause and USER clause cannot be specified.

user-name

Write in one of the following formats:
- username
- username/password
- username IDENTIFIED BY password
- username USING password

Description of the arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbname</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>host</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>port</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is “27500”.</td>
</tr>
<tr>
<td>connection-name</td>
<td>Specify connection names to identify connections when multiple connections are to be processed within a single program.</td>
</tr>
<tr>
<td>username</td>
<td>Specify the user that will connect with the database.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>password</td>
<td>Specify a password when authentication is required.</td>
</tr>
<tr>
<td>options</td>
<td>Specify the following parameter when specifying a time for timeout. Connect parameters with &amp; when specifying more than one. The following shows the values specified for each parameter.</td>
</tr>
<tr>
<td></td>
<td>- connect_timeout</td>
</tr>
<tr>
<td></td>
<td>Specify the timeout for connections.</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 0 and 2147483647 (in seconds). There is no limit set if you set 0 or an invalid value. If “1” is specified, the behavior will be the same as when “2” was specified. An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td></td>
<td>- keepalives</td>
</tr>
<tr>
<td></td>
<td>This enables keepalive.</td>
</tr>
</tbody>
</table>
Argument | Description
---|---
Keepalive is disabled if 0 is specified. Keepalive is enabled when any other value is specified. The default is keepalive enabled. Keepalive causes an error to occur when it is determined that the connection with the database is disabled.

- keepalives_idle
Specify the time until the system starts sending keepalive messages when communication with the database is not being performed.

  - Linux
    Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.

  - Windows(R)
    Specify a value between 1 and 2147483647 (in seconds). 7200 will be set as default if a value outside this range is specified or if nothing is specified.

- keepalives_interval
Specify the interval between resends when there is no response to keepalive messages.

  - Linux
    Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.

  - Windows(R)
    Specify a value between 1 and 2147483647 (in seconds). 1 will be set as default if a value outside this range is specified or if nothing is specified.

- keepalives_count
Specify the number of resends for keepalive messages.

  - Linux
    Specify a value between 1 and 127. The default value of the system is used if this is not specified.

  - Windows(R)
    The system default value is used irrespective of what is specified for this parameter.

<table>
<thead>
<tr>
<th>National character data type</th>
<th>COBOL variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARACTER(n)</td>
<td>varName PIC N(n)</td>
</tr>
</tbody>
</table>

7.4 Application Development

Refer to “Appendix D ECOBPG - Embedded SQL in COBOL” for information on developing applications.

7.4.1 Support for National Character Data Types

This section describes how to use the national character data types using the SQL embedded COBOL preprocessor.

The table below lists the COBOL variable types supporting the national character data types. The number of characters specified for the national character data type must be specified for the length of the host variable.

EXEC SQL CONNECT TO tcp:postgresql://sv1:27500/mydb?
  connect_timeout=20&keepalives_idle=20&keepalives_interval=5&keepalives_count=2&keepalives=1 USER myuser/myuser01 END-EXEC.
To use COBOL variable types that support national character data types, it is necessary to specify the ECOBPG_NCHAR environment variable.

ECOBPG_NCHAR={ UTF16LE | UTF16BE | UTF32LE | UTF32BE | SJIS }

In SQL embedded COBOL, specify the encoding of the COBOL variable types that support national character data types.

- UTF16LE: UTF-16 little-endian
- UTF16BE: UTF-16 big-endian
- UTF32LE: UTF-32 little-endian
- UTF32BE: UTF-32 big-endian
- SJIS: Shift JIS

If this environment variable is omitted, the encoding will be determined according to the encoding system of the client.

- If UTF8 is used: UTF16 (endians will be encoded in accordance with endians of the client system)
- If SJIS is used: SJIS

If encoding is specified for the translation option when compiling with NetCOBOL, the encoding specified for the national character data types should be used for the environment variable ECOBPG_NCHAR.

The list below shows NetCOBOL translation options and their corresponding environment variable ECOBPG_NCHAR values.

<table>
<thead>
<tr>
<th>NetCOBOL translation options</th>
<th>Environment variable ECOBPG_NCHAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCODE (UTF-8,UTF16,LE) RCS (UTF-16,LE)</td>
<td>UTF-16LE</td>
</tr>
<tr>
<td>ENCODE (UTF-8,UTF16,BE) RCS (UTF-16,BE)</td>
<td>UTF-16BE</td>
</tr>
<tr>
<td>ENCODE (UTF-8,UTF32,LE)</td>
<td>UTF-32LE</td>
</tr>
<tr>
<td>ENCODE (UTF-8,UTF32,BE)</td>
<td>UTF-32BE</td>
</tr>
<tr>
<td>ENCODE (SJIS,SJIS)</td>
<td>SJIS</td>
</tr>
<tr>
<td>Not specified</td>
<td>No need to specify</td>
</tr>
</tbody>
</table>

Also, if the post-compiling encoding for an application differs from the locale of the execution environment, then the client encoding must be used for the application.

The list below shows the values supported for the combinations of application encoding, locale of the execution environment, and client encodings.

<table>
<thead>
<tr>
<th>Application encoding</th>
<th>Locale used when executing an application</th>
<th>Client encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTF-8</td>
<td>UTF-8</td>
<td>UTF-8</td>
</tr>
<tr>
<td></td>
<td>SJIS</td>
<td>UTF-8</td>
</tr>
<tr>
<td>SJIS</td>
<td>UTF-8</td>
<td>SJIS</td>
</tr>
</tbody>
</table>
Refer to "7.2.2 Message Language and Encoding System Used by Applications" for information on how to set client encoding systems.

The following example shows host variable declaration of a national character data type.

```
01 DATA1 PIC N(10).
01 DATA2 PIC N(10) VARYING.
```

**Note**
- Halfwidth characters should not be used for the national character data type COBOL variable.
- The national character data type column attribute obtained by applications should be the CHAR type.
- Encoding cannot be specified using the ENCODING clause, which is a feature of NetCOBOL.

### 7.4.2 Compiling Applications

Append the extension "pco" to the name of the source file for the embedded SQL in COBOL.

When the pco file is precompiled using the ecobpg command, COBOL source files will be created, so use the COBOL compiler for the compile.

**Precompiling example**

```
ecobpg testproc.pco
```

For COBOL code notation, "fixed" or "variable" format can be specified as an ecobpg command option. If not specified, "fixed" format is used.

Refer to "D.1 Precautions when Using Functions and Operators" and "D.12.1 ecobpg" for information on COBOL code notation and how to specify options for ecobpg.

If an optimizer hint block comment is specified for the SQL statement, specify the following option in the ecobpg command:

```
--enable-hint
```

Enables the optimizer hint block comment (hereafter, referred to as the "hint clause"). If this option is not specified, the hint clause will be removed as a result of the ecobpg precompile and be disabled.

The SQL statements that can be specified in the hint clause are SELECT, INSERT, UPDATE, and DELETE.

The locations in which the hint clause can be specified are immediately after one of the SELECT, INSERT, UPDATE, DELETE, or WITH keywords. A syntax error will occur if it is specified in any other location.

**Example of specifying the hint clause**

```
EXEC SQL SELECT /*+ IndexScan(prod ix01) */ name_id
  INTO :name_id FROM prod WHERE id = 1 END-EXEC.
```

Refer to "11.1.1 Optimizer Hints" for information on optimizer hints.

If the encoding used for embedded SQL source files differs from that of the locale when precompiling was executed, set the encoding for the embedded SQL source files by specifying the following option for ecobpg.

```
-E-encode
```

Specify "UTF8", "SJIS", or "EUC_JP".

If this option is omitted, the encoding is processed based on the locale.
Path of the library file

The ecobpg command defines a group item "sqlca_t" to handle errors, which is defined in the library file stored in the following path:

<table>
<thead>
<tr>
<th>Library file name</th>
<th>The storage destination of library file</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLCA-COBOL.cob</td>
<td>fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
</tbody>
</table>

When the ecobpg command generates a COBOL file, it inserts a COPY statement with no options to copy the library file. Therefore, specify the path of the storage destination of library file when compiling. How to specify the path must conform to your compiler's specifications.

There is also a library file with the same contents without the extension "cob".

Information

Refer "D.7.2 sqlca" for information on the sqlca_t.

Libraries to use

The applications generated by ecobpg connect to PostgreSQL through the ECPG library. The ECPG library internally loads the libpq library.

Path of library

Refer to "6.4.2 Compiling Applications" for information on the location and name of the ECPG library. And Refer to "Chapter 5 C Library (libpq)" for information on the location and name of the libpq library.

The COBOL compiler provides the how to link various libraries, so be sure to specify the path and libraries according to the specifications of your compiler.

Entry information of subprogram

If you use the ECPG library with a dynamic program structure, copy the entry information stored below. For details, follow the specifications of your compiler.

<table>
<thead>
<tr>
<th>Linux</th>
</tr>
</thead>
<tbody>
<tr>
<td>fujitsuEnterprisePostgresClientInstallDir/share/cobol_entry.info</td>
</tr>

Example

The examples of compiling the applications that dynamically links the COBOL language library.

Note that "<x>" indicates the product version.
7.4.3 Bulk INSERT

This section describes the bulk INSERT.

Synopsis

```
EXEC SQL [ AT conn ] [ FOR { numOfRows | ARRAY_SIZE } ]
INSERT INTO tableName [ ( colName [, ...] ) ]
  [ VALUES ( { expr | DEFAULT } [, ...] ) [, ...] | query ]
  [ RETURNING * | outputExpr [ [ AS ] outputName ] [, ...] ]
INTO outputHostVar [ [ INDICATOR ] indicatorVar ] [, ...] END-EXEC
```

Description

Bulk INSERT is a feature that inserts multiple rows of data in bulk.

By specifying the array host variable that stored the data in the VALUES clause of the INSERT statement, the data for each element in the array can be inserted in bulk. This feature is used by specifying the insertion count in the FOR clause immediately before the INSERT statement.

FOR Clause

Specify the insertion count using `numOfRows` or `ARRAY_SIZE` in the FOR clause. The FOR clause can be specified only in the INSERT statement, not in other update statements.
numOfRows and ARRAY_SIZE

Insertion processing will be executed only for the specified count. However, if the count is 1, it will be assumed that the FOR clause was omitted when the application is executed. In this case, proceed according to the INSERT specification in the PostgreSQL Documentation.

Specify the FOR clause as an integer host variable or as a literal.

Specify ARRAY_SIZE to insert all elements of the array in the table. When specifying ARRAY_SIZE, specify at least one array in expr.

If two or more arrays were specified in expr, it will be assumed that ARRAY_SIZE is the minimum number of elements in the array.

numOfRows or ARRAY_SIZE must exceed the minimum number of elements in all arrays specified in expr, outputHostVar, and indicatorVal.

The following example shows how to specify the FOR clause.

```
01 NUMBER-OF-ROWS PIC S9(9) COMP VALUE 10.
01 GROUP-ITEM.
05 ID1 PIC S9(9) OCCURS 25.
05 NAME PIC X(10) OCCURS 25.
* will process 10 rows
EXEC SQL FOR :NUMBER-OF-ROWS
INSERT INTO prod (name, id) VALUES (:NAME, :ID1) END-EXEC
* will process 25 rows
EXEC SQL FOR ARRAY_SIZE
INSERT INTO prod (name, id) VALUES (:NAME, :ID1) END-EXEC
```

expr

Specify the value to be inserted in the table. Array host variables, host variable literals, strings, and pointer variables can be specified. Structure type arrays and pointer variable arrays cannot be specified.

Do not use pointer variables and ARRAY_SIZE at the same time. The reason for this is that the number of elements in the area represented by the pointer variable cannot be determined.

query

A query (SELECT statement) that supplies the rows to be inserted. The number of rows returned by query must be 1. If two or more rows are returned, an error will occur. This cannot be used at the same time as ARRAY_SIZE.

outputHostVar and indicatorVal

These must be array host variables or pointer variables.

Error Messages

The messages below are output if an error occurs when the bulk INSERT is used.

Message

The value for the FOR clause must be a positive integer.

Cause

The value given for numOfRows is less than or equal to 0.

Solution

Specify a value that is more than or equal to 1 for numOfRows.
Array host variable is needed when using FOR ARRAY_SIZE.

Cause
An array host variable is not specified in the VALUES clause.

Solution
Specify more than one array host variable in the VALUES clause.

Message
The SELECT..INTO query returned too many rows in row number %d.

Cause
The 'SELECT ... INTO' query in the INSERT statement returned more than one row.

Solution
If numOfRows is more than one, the maximum number of rows that can be returned in the "SELECT ... INTO" query in the INSERT statement is one.

Limitations
The limitations when using bulk INSERT are given below.
- Array of structures should not be used as an input in the 'VALUES' clause.
- Array of pointers should not be used as an input in the 'VALUES' clause.
- ECOBPG supports the use of 'WITH' clause in single INSERT statements. 'WITH' clause cannot be used in bulk INSERT statements.
- If an error occurs, all bulk INSERT actions will be rolled back, therefore, no rows are inserted. However, if the RETURNING clause was used, and the error occurred while obtaining the rows after the insertion was successful, the insertion processing will not be rolled back.

Samples
Given below are some sample usages of the bulk INSERT functionality.

Basic Bulk INSERT

```assembly
01 GROUP-ITEM.
05 IN-F1 PIC S9(9) OCCURS 4.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
MOVE 4 TO IN-F1(4)
...
EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:IN-F1) END-EXEC
```

The number of rows to insert indicated by the FOR clause is 3, so the data in the first 3 elements of the host array variable are inserted into the table. The contents of the target table will be:

<table>
<thead>
<tr>
<th>f1</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
</tbody>
</table>

(3 rows)

Also a host integer variable can be used to indicate the number of rows that will be inserted in FOR clause, which will produce the same result as above:

```assembly
01 NUM PIC S9(9) COMP VALUE 3.
01 GROUP-ITEM.
```
05 IN-F1 PIC S9(9) OCCURS 4.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
MOVE 4 TO IN-F1(4)
...
EXEC SQL FOR :NUM INSERT INTO target (f1) VALUES (:IN-F1) END-EXEC

Inserting constant values

Constant values can also be bulk INSERTed into the table as follows:

EXEC SQL FOR 3 INSERT INTO target (f1,f2) VALUES (DEFAULT,'hello') END-EXEC

Assuming the 'DEFAULT' value for the 'f1' column is '0', the contents of the target table will be:

<table>
<thead>
<tr>
<th>f1</th>
<th>f2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>hello</td>
</tr>
<tr>
<td>0</td>
<td>hello</td>
</tr>
<tr>
<td>0</td>
<td>hello</td>
</tr>
</tbody>
</table>

(3 rows)

Using ARRAY_SIZE

'FOR ARRAY_SIZE' can be used to insert the entire contents of a host array variable, without explicitly specifying the size, into the table.

01 GROUP-ITEM.
05 IN-F1 PIC S9(9) OCCURS 4.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
MOVE 4 TO IN-F1(4)
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1) VALUES (:IN-F1) END-EXEC

Note

If there are multiple host array variables specified as input values, then the number of rows inserted is same as the smallest array size. The example given below demonstrates this usage.

01 GROUP-ITEM.
05 IN-F1 PIC S9(9) OCCURS 4.
05 IN-F3 PIC X(10) OCCURS 3.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
MOVE 4 TO IN-F1(4)
MOVE "one" TO IN-F3(1)
MOVE "two" TO IN-F3(2)
MOVE "three" TO IN-F3(3)
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1,f3) VALUES (:IN-F1,:IN-F3) END-EXEC

In the above example, the array sizes are 3 and 4. Given that the smallest array size is 3, only three rows are inserted into the table. The table contents are given below.

<table>
<thead>
<tr>
<th>f1</th>
<th>f3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>one</td>
</tr>
</tbody>
</table>

- 74 -
Using SELECT query

The result of a SELECT query can be used to insert values.

EXEC SQL FOR 4 INSERT INTO target(f1) SELECT age FROM source WHERE name LIKE 'foo' END-EXEC

In the example above, assuming that the SELECT query returns one row, the same row will be inserted into the table four times.

**Note**

If "2" or more is specified for the FOR clause, the INSERT statement returns an error when two or more rows of query results are returned.

If "1" is specified for the FOR clause, all rows returned by the SELECT query will be inserted into the table.

EXEC SQL FOR 1 INSERT INTO target(f1) SELECT age FROM source END-EXEC

In the example above, "1" specified for the FOR clause indicates all returned rows.

Using RETURNING clause

Bulk INSERT supports the same RETURNING clause syntax as normal INSERT. An example is given below.

EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:IN-F1) RETURNING f1 INTO :OUT-F1 END-EXEC

After the execution of the above INSERT statement, the 'out_f1' array will have 3 elements with the values of '1', '2' and '3'.

7.4.4 DECLARE STATEMENT

Refer to "6.4.4 DECLARE STATEMENT" in "Embedded SQL in C".

7.4.5 Creating Applications while in Database Multiplexing Mode

This section explains points to consider when creating applications while in database multiplexing mode.

See

- Refer to the Cluster Operation Guide (Database Multiplexing) for information on database multiplexing mode.
- Refer to "Application Development" in the Cluster Operation Guide (PRIMECLUSTER) for points to consider when creating applications using the failover feature integrated with the cluster software.
7.4.5.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs while in database multiplexing mode, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access 57P01 57P02 YE000 26000 40001</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td>Accessed during system failure</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access 57P01 57P02 YE000 26000 40001</td>
<td></td>
</tr>
<tr>
<td>Accessed during switch</td>
<td>08001</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of SQLSTATE.
Chapter 8 SQL References

This chapter explains the SQL statement features expanded by FUJITSU Enterprise Postgres.

8.1 Expanded Trigger Definition Feature

This section explains the expanded trigger definition feature.

8.1.1 CREATE TRIGGER

In addition to features of PostgreSQL, triggers can be created with OR REPLACE option and DO option.

Synopsis

```
CREATE [ OR REPLACE ] [ CONSTRAINT ] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [ OR ... ] }
  ON table_name
  [ FROM referenced_table_name ]
  [ NOT DEFERRABLE | [ DEFERRABLE ] [ INITIALLY IMMEDIATE | INITIALLY DEFERRED ] ]
  [ REFERENCING { { OLD | NEW } TABLE [ AS ] transition_relation_name } [ ... ] ]
  [ FOR [ EACH ] { ROW | STATEMENT } ]
  [ WHEN ( condition ) ]
  { EXECUTE { FUNCTION | PROCEDURE } function_name ( arguments )
    | DO [ LANGUAGE lang_name ] code }
```

Description

Refer to the PostgreSQL Documentation for information about CREATE TRIGGER. This section describes OR REPLACE option and DO option.

A trigger which is created with OR REPLACE option and DO option will be associated with the specified table or view and will execute the specified code by the specified procedural language of DO (unnamed code block) when certain events occur.

Parameters

**OR REPLACE**

- If the specified trigger is not defined in the table, it defines a new trigger.
- If the specified trigger is already defined in the table, the named trigger replaces existing trigger.

**code**

- When the certain events occur, it executes the code in a specified procedural language. The unnamed code block does not require a prior definition like a function. Syntax is same as procedural language.

**lang_name**

- The name of the language that the function is implemented in. Can be SQL, C, internal, or the name of a user-defined procedural language. The default is 'plpgsql'.

plpgsql is supported in CREATE TRIGGER.

**Note**

- A normal trigger cannot be replaced by a constraint trigger.
- A constraint trigger cannot be replaced by a normal trigger.
- A trigger defined with DO option cannot be replaced by a trigger defined with EXECUTE PROCEDURE option.
- A trigger defined with EXECUTE PROCEDURE option cannot be replaced by a trigger defined with DO option.

**Examples**

It executes the code block that is specified by DO before the table is updated.

(Example that LANGUAGE is plpgsql)

```sql
CREATE TRIGGER check_update
    BEFORE UPDATE ON accounts
    FOR EACH ROW
    DO $$BEGIN RETURN NEW; END;$$ ;
```

**Information**

When a trigger created with DO option, a new function is created internally. The name of function is "schema name"."on table name"."_trigger name".TRIGPROC(serial number).

---

### 8.1.2 How to Define Triggers in pgAdmin

The expanded features of the trigger definition can also be used in pgAdmin.

**See**

Refer to "pgAdmin Help" for information on how to define triggers using pgAdmin.
Chapter 9 Compatibility with Oracle Databases

This chapter describes the environment settings and functionality offered for features that are compatible with Oracle databases.

9.1 Overview

Features compatible with Oracle databases are provided. These features enable you to easily migrate to FUJITSU Enterprise Postgres and reduce the costs of reconfiguring applications.

The table below lists features compatible with Oracle databases.

Table 9.1 Features compatible with Oracle databases

<table>
<thead>
<tr>
<th>Category</th>
<th>Feature</th>
<th>Item</th>
<th>Overview</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL Queries</td>
<td>Outer join operator (+)</td>
<td>Operator for outer joins</td>

</tr>
</tbody>
</table>

See

In addition to the above, refer to the file below for information on the features compatible with Oracle databases.

- Linux: `fujitsuEnterprisePostgresInstallDir/share/doc/extension/README.asciidoc`
- Windows(R): `fujitsuEnterprisePostgresInstallDir/doc/extension/README.asciidoc`

9.2 Precautions when Using the Features Compatible with Oracle Databases

This section provides notes on using the features compatible with oracle databases.

9.2.1 Notes on SUBSTR

SUBSTR is implemented in FUJITSU Enterprise Postgres and Oracle databases using different external specifications.
For this reason, when using SUBSTR, define which specification is to take precedence. In the default configuration of FUJITSU Enterprise Postgres, the specifications of FUJITSU Enterprise Postgres take precedence.

When using the SUBSTR function compatible with Oracle databases, set "oracle" and "pg_catalog" in the "search_path" parameter of postgresql.conf. You must specify "oracle" before "pg_catalog" when doing this.

```
search_path = "'$user', public, oracle, pg_catalog"
```

---

**Information**

- The `search_path` parameter specifies the order in which schemas are searched. The SUBSTR function in Oracle databases is defined in the oracle schema.
- Refer to "Statement Behavior" in "Client Connection Defaults" in "Server Administration" in the PostgreSQL Documentation for information on `search_path`.

---

### 9.2.2 Notes when Integrating with the Interface for Application Development

The SQL noted in "Table 9.1 Features compatible with Oracle databases" can be used in the interface for application development. However, outer join operators cannot be used when integrated with Visual Studio.

When integrated with Visual Studio or using the features compatible with Oracle databases from Fujitsu Npgsql .NET Data Provider, select one of the actions below for the SearchPath parameter, which is one of the pieces of information needed to connect to databases specified for individual connections.

- Do not specify the SearchPath parameter itself, or
- Specify both "public" and the schema name in the SQL statement.

Note that both "public" and the schema name in the SQL statement must be specified as the SearchPath parameter before "oracle" and "pg_catalog" when using the Oracle database-compatible feature SUBSTR.

### 9.3 Queries

The following queries are supported:

- **Outer Join Operator (+)**
- **DUAL Table**

#### 9.3.1 Outer Join Operator (+)

In the WHERE clause conditional expression, by adding the plus sign (+), which is the outer join operator, to the column of the table you want to add as a table join, it is possible to achieve an outer join that is the same as a joined table (OUTER JOIN).

**Syntax**

```
SELECT statement

SELECT ... [WHERE [NOT] joinCond ...] ...
SELECT ... [WHERE srchCond ]... ] ...  

Join condition
{ colSpec(+) = colSpec | colSpec = colSpec(+)}
```

**Note**

Here we are dealing only with the WHERE clause of the SELECT statement. Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on the overall syntax of the SELECT statement.
General rules

WHERE clause

- The WHERE clause specifies search condition or join conditions for the tables that are derived.

- Search conditions are any expressions that return BOOLEAN types as the results of evaluation. Any rows that do not meet these conditions are excluded from the output. When the values of the actual rows are assigned to variables and if the expression returns TRUE, those rows are considered to have met the conditions.

- Join conditions are comparison conditions that specify outer join operators. Join conditions in a WHERE clause return a table that includes all the rows that meet the join conditions, including rows that do not meet all the join conditions.

- Join conditions take precedence over search conditions. For this reason, all rows returned by the join conditions are subject to the search conditions.

- The following rules and restrictions apply to queries that use outer join operators. It is therefore recommended to use FROM clause joined tables (OUTER JOIN) rather than outer join operators:
  - Outer join operators can only be specified in the WHERE clause.
  - Outer join operators can only be specified for base tables or views.
  - To perform outer joins using multiple join conditions, it is necessary to specify outer join operators for all join conditions.
  - When combining join conditions with constants, specify outer join operators in the corresponding column specification. When not specified, they will be treated as search conditions.
  - The results column of the outer join of table t1 is not returned if table t1 is joined with table t2 by specifying an outer join operator in the column of t1, then table t1 is joined with table t3 by using search conditions.
  - It is not possible to specify columns in the same table as the left/right column specification of a join condition.
  - It is not possible to specify an expression other than a column specification for outer join operators, but they may be specified for the columns that compose the expression.

There are the following limitations on the functionality of outer join operators when compared with joined tables (OUTER JOIN). To use functionality that is not available with outer join operators, use joined tables (OUTER JOIN).

Table 9.2 Range of functionality with outer join operators

<table>
<thead>
<tr>
<th>Functionality available with joined tables (OUTER JOIN)</th>
<th>Outer join operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outer joins of two tables</td>
<td>Y</td>
</tr>
<tr>
<td>Outer joins of three or more tables</td>
<td>Y (*1)</td>
</tr>
<tr>
<td>Used together with joined tables within the same query</td>
<td>N</td>
</tr>
<tr>
<td>Use of the OR logical operator to a join condition</td>
<td>N</td>
</tr>
<tr>
<td>Use of an IN predicate to a join condition</td>
<td>N</td>
</tr>
<tr>
<td>Use of subqueries to a join condition</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Available
N: Not available

*1: The outer joins by outer join operators can return outer join results only for one other table. For this reason, to combine outer joins of table t1 and table t2 or table t2 and table t3, it is not possible to specify outer join operators simultaneously for table t2.
Example

Table configuration
t1

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>AAAAA</td>
<td>1000</td>
</tr>
<tr>
<td>1002</td>
<td>BBBBB</td>
<td>2000</td>
</tr>
<tr>
<td>1003</td>
<td>CCCCC</td>
<td>3000</td>
</tr>
</tbody>
</table>

t2

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>aaaaa</td>
</tr>
<tr>
<td>1002</td>
<td>bbbbb</td>
</tr>
<tr>
<td>1004</td>
<td>ddddd</td>
</tr>
</tbody>
</table>

Example 1: Return all rows in table t2, including those that do not exist in table t1.

```
SELECT *
FROM t1, t2
WHERE t1.col1(+) = t2.col1;
```

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>AAAAA</td>
<td>1000</td>
</tr>
<tr>
<td>1002</td>
<td>BBBBB</td>
<td>2000</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1004</td>
</tr>
</tbody>
</table>

This is the same syntax as the joined table (OUTER JOIN) of the FROM clause shown next.

```
SELECT *
FROM t1 RIGHT OUTER JOIN t2
ON t1.col1 = t2.col1;
```

Example 2: In the following example, the results are filtered to records above 2000 in t1.col3 by search conditions, and the records are those in table t2 that include ones that do not exist in table t1. After filtering with the join conditions, there is further filtering with the search conditions, so there will only be one record returned.

```
SELECT *
FROM t1, t2
WHERE t1.col1(+) = t2.col1
AND t1.col3 >= 2000;
```

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1002</td>
<td>BBBBB</td>
<td>2000</td>
</tr>
</tbody>
</table>

This is the same syntax as the joined table (OUTER JOIN) of the FROM clause shown next.

```
SELECT *
FROM t1 RIGHT OUTER JOIN t2
ON t1.col1 = t2.col1
WHERE t1.col3 >= 2000;
```
9.3.2 DUAL Table

DUAL table is a virtual table provided by the system. Use when executing SQL where access to a base table is not required, such as when performing tests to get result expressions such as functions and operators.

Example

In the following example, the current system date is returned.

```
SELECT  CURRENT_DATE  "date" FROM DUAL;
```

```
+------------+
<table>
<thead>
<tr>
<th>date</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-05-14</td>
</tr>
</tbody>
</table>
+------------+
1 row
```

9.4 SQL Function Reference

The following SQL functions are supported:

- DECODE
- SUBSTR
- NVL

9.4.1 DECODE

Description

Compares values and if they match, returns a corresponding value.

Syntax

```
DECODE(expr, srch, result [, srch, result ]... [, default ])
```

General rules

- DECODE compares values of the value expression to be converted and the search values one by one. If the values match, a corresponding result value is returned. If no values match, the default value is returned if it has been specified. A NULL value is returned if a default value has not been specified.
- If the same search value is specified more than once, then the result value returned is the one listed for the first occurrence of the search value.
- The following data types can be used in result values and in the default value:
  - CHAR
  - VARCHAR
  - NCHAR
  - NCHAR VARYING
  - TEXT
  - INTEGER
  - BIGINT
  - NUMERIC
  - DATE
  - TIME WITHOUT TIME ZONE
  - TIMESTAMP WITHOUT TIME ZONE
- TIMESTAMP WITH TIME ZONE

- The same data type must be specified for the values to be converted and the search values. However, note that different data types may also be specified if a literal is specified in the search value, and the value expression to be converted contains data types that can be converted. When specifying literals, refer to "Table A.1 Data type combinations that contain literals and can be converted implicitly" in "A.3 Implicit Data Type Conversions" for information on the data types that can be specified.

- If the result values and default value are all literals, the data types for these values will be as shown below:
  - If all values are string literals, all will become character types.
  - If there is one or more numeric literal, all will become numeric types.
  - If there is one or more literal cast to the datetime/time types, all will become datetime/time types.

- If the result values and default value contain a mixture of literals and non-literals, the literals will be converted to the data types of the non-literals. When specifying literals, refer to "Table A.1 Data type combinations that contain literals and can be converted implicitly" in "A.3 Implicit Data Type Conversions" for information on the data types that can be converted.

- The same data type must be specified for all result values and for the default value. However, different data types can be specified if the data type of any of the result values or default value can be converted - these data types are listed below:

<table>
<thead>
<tr>
<th>Result value (any)</th>
<th>Numeric type</th>
<th>Character type</th>
<th>Date/time type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td>Y</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Character type</td>
<td>N</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>Date/time type</td>
<td>N</td>
<td>N</td>
<td>S (*1)</td>
</tr>
</tbody>
</table>

Y: Can be converted
S: Some data types can be converted
N: Cannot be converted

*1: The data types that can be converted for date/time types are listed below:

<table>
<thead>
<tr>
<th>Result value (any)</th>
<th>DATE</th>
<th>TIME WITHOUT TIME ZONE</th>
<th>TIMESTAMP WITHOUT TIME ZONE</th>
<th>TIMESTAMP WITH TIME ZONE</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATE</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>TIME WITHOUT TIME ZONE</td>
<td>N</td>
<td>Y</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>TIMESTAMP WITHOUT TIME ZONE</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be converted
N: Cannot be converted

- The data type of the return value will be the data type within the result or default value that is longest and has the highest precision.
Example

In the following example, the value of col3 in table t1 is compared and converted to a different value. If the col3 value matches search value 1, the result value returned is "one". If the col3 value does not match any of search values 1, 2, or 3, the default value "other number" is returned.

```
SELECT col1, DECODE(col3, 1000, 'one',
                   2000, 'two',
                   3000, 'three',
                   'other number') "num-word"
FROM t1;
```

coll | num-word
-----|----------------
1001 | one
1002 | two
1003 | three

(3 rows)

9.4.2 SUBSTR

Description
Extracts part of a string using characters to specify position and length.

Syntax
```
SUBSTR(str, startPos [, len ])
```

General rules
- SUBSTR extracts and returns a substring of string str, beginning at position startPos, for number of characters len.
- When startPos is positive, it will be the number of characters from the beginning of the string.
- When startPos is 0, it will be treated as 1.
- When startPos is negative, it will be the number of characters from the end of the string.
- When len is not specified, all characters to the end of the string are returned. NULL is returned when len is less than 1.
- For startPos and len, specify a SMALLINT or INTEGER type. When specifying literals, refer to "Table A.1 Data type combinations that contain literals and can be converted implicitly" in "A.3 Implicit Data Type Conversions" for information on the data types that can be specified.
- The data type of the return value is TEXT.

Note
- There are two types of SUBSTR. One that behaves as described above, and one that behaves the same as SUBSTRING. The search_path parameter must be modified for it to behave the same as the specification described above.
- It is recommended to set search_path in postgresql.conf. In this case, it will be effective for each instance. Refer to "9.2.1 Notes on SUBSTR" for information on how to configure postgresql.conf.
- The configuration of search_path can be done at the user level or at the database level. Setting examples are shown below.
  - Example of setting at the user level
    This can be set by executing an SQL command. In this example, user1 is used as the username.
    ```
    ALTER USER user1 SET search_path = "$user",public,oracle,pg_catalog;
    ```
  - Example of setting at the database level
    This can be set by executing an SQL command. In this example, db1 will be used as the database name.
ALTER DATABASE db1 SET search_path = "$user",public,oracle,pg_catalog;

You must specify "oracle" before "pg_catalog".
- If the change has not been implemented, SUBSTR is the same as SUBSTRING.

See

Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on ALTER USER and ALTER DATABASE.

Information

The general rules for SUBSTRING are as follows:
- The start position will be from the beginning of the string, whether positive, 0, or negative.
- When len is not specified, all characters to the end of the string are returned.
- An empty string is returned if no string is extracted or len is less than 1.

See

Refer to "String Functions and Operators" under "The SQL Language" in the PostgreSQL Documentation for information on SUBSTRING.

Example

In the following example, part of the string "ABCDEFG" is extracted:

```
SELECT SUBSTR('ABCDEFG',3,4) "Substring" FROM DUAL;
Substring
---------
CDEF
(1 row)

SELECT SUBSTR('ABCDEFG',-5,4) "Substring" FROM DUAL;
Substring
---------
(1 row)
```

9.4.3 NVL

Description

Returns a substitute value when a value is NULL.

Syntax

```
NVL(expr1, expr2)
```

General rules

- NVL returns a substitute value when the specified value is NULL. When expr1 is NULL, expr2 is returned. When expr1 is not NULL, expr1 is returned.
- Specify the same data types for `expr1` and `expr2`. However, if a constant is specified in `expr2`, and the data type can also be converted by `expr1`, different data types can be specified. When this happens, the conversion by `expr2` is done to suit the data type in `expr1`, so the value of `expr2` returned when `expr1` is a NULL value will be the value converted in the data type of `expr1`.

- When specifying literals, refer to "Table A.1 Data type combinations that contain literals and can be converted implicitly" in "A.3 Implicit Data Type Conversions" for information on the data types that can be converted.

**Example**

In the following example, "IS NULL" is returned if the value of col1 in table t1 is a NULL value.

```
SELECT col2, NVL(col1, 'IS NULL') "nvl" FROM t1;
```

<table>
<thead>
<tr>
<th>col2</th>
<th>nvl</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa</td>
<td>IS NULL</td>
</tr>
</tbody>
</table>

(1 row)

### 9.5 Package Reference

A "package" is a group of features, brought together by schemas, that have a single functionality, and are used by calling from PL/pgSQL.

The following packages are supported:

- DBMS_ALERT
- DBMS_ASSERTION
- DBMS_OUTPUT
- DBMS_PIPE
- DBMS_RANDOM
- DBMS_UTILITUY
- UTL_FILE
- DBMS_SQL

To call each feature from PL/pgSQL, use the PERFORM or SELECT statement and qualify the feature name with the package name. For more information on the calling format, refer to the feature-specific description for each package.

In the following, explain DBMS_SQL among the supported packages. For other packages, refer to the README stored in the installation location.

**See**

For packages other than DBMS_SQL, refer to the following file.

- **Linux:**
  
  `fujitsuEnterprisePostgresInstallDir/share/doc/extension/README.asciidoc`

- **Windows(R):**
  
  `fujitsuEnterprisePostgresInstallDir/doc/extension/README.asciidoc`

#### 9.5.1 DBMS_SQL

**Overview**

Dynamic SQL can be executed from PL/pgSQL.
Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_VARIABLE</td>
<td>Sets values in the host variable within the SQL statement.</td>
</tr>
<tr>
<td>CLOSE_CURSOR</td>
<td>Closes the cursor.</td>
</tr>
<tr>
<td>COLUMN_VALUE</td>
<td>Retrieves the value of the column in the select list extracted with FETCH_ROWS.</td>
</tr>
<tr>
<td>DEFINE_COLUMN</td>
<td>Defines the column from which values are extracted and the storage destination.</td>
</tr>
<tr>
<td>EXECUTE</td>
<td>Executes SQL statements.</td>
</tr>
<tr>
<td>FETCH_ROWS</td>
<td>Positions the specified cursor at the next row and extracts values from the row.</td>
</tr>
<tr>
<td>OPEN_CURSOR</td>
<td>Opens a new cursor.</td>
</tr>
<tr>
<td>PARSE</td>
<td>Parses SQL statements.</td>
</tr>
</tbody>
</table>

Note

- In DBMS_SQL, the data types supported in dynamic SQL are limited, and therefore the user must consider this. The supported data types are:
  - INTEGER
  - DECIMAL
  - NUMERIC
  - REAL
  - DOUBLE PRECISION
  - CHAR(*1)
  - VARCHAR(*1)
  - NCHAR(*1)
  - NCHAR VARYING(*1)
  - TEXT
  - DATE
  - TIMESTAMP WITHOUT TIME ZONE
  - TIMESTAMP WITH TIME ZONE
  - INTERVAL(*2)
  - SMALLINT
  - BIGINT

*1: The host variables with CHAR, VARCHAR, NCHAR, and NCHAR VARYING data types are treated as TEXT, to match the string function arguments and return values. Refer to "String Functions and Operators" in "Functions and Operators" in "The SQL Language" in the PostgreSQL Documentation for information on string functions.

When specifying the arguments of the features compatible with Oracle databases NVL and/or DECODE, use CAST to convert the data types of the host variables to ensure that data types between arguments are the same.

*2: When using COLUMN_VALUE to obtain an INTERVAL type value specified in the select list, use an INTERVAL type variable with a wide range such as when no interval qualifier is specified, or with a range that matches that of the variable in the select list. If an interval qualifier variable with a narrow range is specified, then the value within...
the interval qualifier range will be obtained, but an error that the values outside the range have been truncated will not occur.

Example

This example illustrates where a value expression that returns an INTERVAL value is set in the select list and the result is received with COLUMN_VALUE. Note that the SQL statement operation result returns a value within the INTERVAL DAY TO SECOND range.

**[Bad example]**

Values of MINUTE, and those after MINUTE, are truncated, because the variable(v_interval) is INTERVAL DAY TO HOUR.

```sql
v_interval     INTERVAL DAY TO HOUR;
...            
PERFORM DBMS_SQL.PARSE(cursor, 'SELECT CURRENT_TIMESTAMP - ''2010-01-01'' FROM DUAL', 1);
...            
SELECT value INTO v_interval FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_interval);
result:1324 days 09:00:00
```

**[Good example]**

By ensuring that the variable(v_interval) is INTERVAL, the values are received correctly.

```sql
v_interval     INTERVAL;
...            
PERFORM DBMS_SQL.PARSE(cursor, 'SELECT CURRENT_TIMESTAMP - ''2010-01-01'' FROM DUAL', 1);
...            
SELECT value INTO v_interval FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_interval);
result:1324 days 09:04:37.530623
```

Syntax

```
{ BIND_VARIABLE(cursor, varName, val [, len ])  
  | CLOSE_CURSOR(cursor)  
  | COLUMN_VALUE(cursor, colPos, varName)  
  | DEFINE_COLUMN(cursor, colPos, varName [, len ])  
  | EXECUTE(cursor)  
  | FETCH_ROWS(cursor)  
  | OPEN_CURSOR([parm1 ])  
  | PARSE(cursor, sqlStmt, parm1 [, parm2, parm3, parm4 ])
}
```

9.5.1.1 Description

This section explains each feature of DBMS_SQL.

BIND_VARIABLE

- BIND_VARIABLE sets values in the host variable within the SQL statement.
- Specify the cursor number to be processed.
- Specify the name of the host variable within the SQL statement using a string for the host variable name.
- Specify the value set in the host variable. The data type of the host variable is the same as that of the value expression - it is implicitly converted in accordance with its position within the SQL statement. Refer to "A.3 Implicit Data Type Conversions" for information on implicit conversions.
- If the value is a character type, the string length is the number of characters. If the string length is not specified, the size is the total length of the string.

- It is necessary to place a colon at the beginning of the host variable in SQL statements to identify the host variable. The colon does not have to be added to the host variable names specified at BIND_VARIABLE. The following shows examples of host variable names specified with SQL statements and host variable names specified with BIND_VARIABLE:

  ```sql
  PERFORM DBMS_SQL.PARSE(cursor, 'SELECT emp_name FROM emp WHERE sal > :x', 1);
  ```

  In this example, BIND_VARIABLE will be as follows:

  ```sql
  PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':x', 3500);
  ```

  Or,

  ```sql
  PERFORM DBMS_SQL.BIND_VARIABLE(cursor, 'x', 3500);
  ```

- The length of the host variable name can be up to 30 bytes (excluding colons).

- If the data type of the set value is string, specify the effective size of the column value as the fourth argument.

**Example**

If the data type of the value to be set is not a string:

```sql
PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':NO', 1);
```

If the data type of the value to be set is a string:

```sql
PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':NAME', h_memid, 5);
```

**CLOSE_CURSOR**

- CLOSE_CURSOR closes the cursor.

- Specify the cursor number to be processed.

- The value returned is a NULL value.

**Example**

```sql
cursor := DBMS_SQL.CLOSE_CURSOR(cursor);
```

**COLUMN_VALUE**

- COLUMN_VALUE retrieves the value of the column in the select list extracted with FETCH_ROWS.

- Specify the cursor number to be processed.

- Specify the position of the column of the select list in the SELECT statement. The position of the first column is 1.

- Specify the destination variable name.

- Use a SELECT statement to obtain the values of the value, column_error, and actual_length columns.

- The value column returns the value of the column specified at the column position. The data type of the variable name must match that of the column. If the data type of the column in the SELECT statement specified in PARSE is not compatible with DBMS_SQL, use CAST to convert to a compatible data type.
- The data type of the column_error column is NUMERIC. If the column value could not be set correctly in the value column, a value other than 0 will be returned:
  22001: The extracted string has been truncated
  22002: The extracted value contains a NULL value
- The data type of the actual_length column is INTEGER. If the extracted value is a character type, the number of characters will be returned (if the value was truncated, the number of characters prior to the truncation will be returned), otherwise, the number of bytes will be returned.

**Example**

When retrieving the value of the column, the error code, and the actual length of the column value:

```
SELECT value, column_error, actual_length INTO v_memid, v_col_err, v_act_len FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_memid);
```

When retrieving just the value of the column:

```
SELECT value INTO v_memid FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_memid);
```

**DEFINE_COLUMN**

- DEFINE_COLUMN defines the column from which values are extracted and the storage destination.
- Specify the cursor number to be processed.
- Specify the position of the column in the select list in the SELECT statement. The position of the first column is 1.
- Specify the destination variable name. The data type should be match with the data type of the column from which the value is to be extracted. If the data type of the column in the SELECT statement specified in PARSE is not compatible with DBMS_SQL, use CAST to convert to a compatible data type.
- Specify the maximum number of characters of character type column values.
- If the data type of the column value is string, specify the effective size of the column value as the fourth argument.

**Example**

When the data type of the column value is not a string:

```
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 1, v_memid);
```

When the data type of the column value is a string:

```
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 1, v_memid, 10);
```

**EXECUTE**

- EXECUTE executes SQL statements.
- Specify the cursor number to be processed.
- The return value is an INTEGER type, is valid only with INSERT statement, UPDATE statement, and DELETE statement, and is the number of rows processed. Anything else is invalid.

**Example**

```
ret := DBMS_SQL.EXECUTE(cursor);
```
FETCH_ROWS
- FETCH_ROWS positions at the next row and extracts values from the row.
- Specify the cursor number to be processed.
- The return value is an INTEGER type and is the number of rows extracted. 0 is returned if all are extracted.
- The extracted information is retrieved with COLUMN_VALUE.

Example

```sql
LOOP
  IF DBMS_SQL.FETCH_ROWS(cursor) = 0 THEN
    EXIT;
  END IF;
  ... 
END LOOP;
```

OPEN_CURSOR
- OPEN_CURSOR opens a new cursor.
- The parameter is used for compatibility with Oracle databases only, and is ignored by FUJITSU Enterprise Postgres. An INTEGER type can be specified, but it will be ignored. If migrating from an Oracle database, specify 1.
- Close unnecessary cursors by executing CLOSE_CURSOR.
- The return value is an INTEGER type and is the cursor number.

Example

```sql
cursor := DBMS_SQL.OPEN_CURSOR();
```

PARSE
- PARSE analyzes dynamic SQL statements.
- Specify the cursor number to be processed.
- Specify the SQL statement to be parsed.
- Parameters 1, 2, 3, and 4 are used for compatibility with Oracle databases only, and are ignored by FUJITSU Enterprise Postgres. If you are specifying values anyway, specify the following:
  - Parameter 1 is an INTEGER type. Specify 1.
  - Parameters 2 and 3 are TEXT types. Specify NULL.
  - Parameter 4 is a BOOLEAN type. Specify TRUE.
- If migrating from an Oracle database, the specified values for parameters 2, 3, and 4 do not need to be changed.
- Add a colon to the beginning of host variables in SQL statements.
- The DDL statement is executed when PARSE is issued. EXECUTE is not required for the DDL statement.
- If PARSE is called again for opened cursors, the content in the data regions within the cursors is reset, and the SQL statement is parsed anew.
9.5.1.2 Example

This section explains the flow of DBMS_SQL and provides an example.

Flow of DBMS_SQL

```
PERFORM DBMS_SQL.PARSE(cursor, 'SELECT memid, memnm FROM member WHERE memid = :NO', 1);
```
CREATE FUNCTION smp_00()
RETURNS INTEGER
AS $$
DECLARE
str_sql     VARCHAR(255);
cursor      INTEGER;
h_smpid     INTEGER;
v_smpid     INTEGER;
v_smpnm     VARCHAR(20);
v_smpage    INTEGER;
errcd       INTEGER;
length      INTEGER;
ret         INTEGER;
BEGIN
str_sql     := 'SELECT smpid, smpnm, smpage FROM smp_tbl WHERE smpid < :H_SMPID ORDER BY smpid';
h_smpid     := 3;
v_smpid     := 0;
v_smpnm     := '';
v_smpage    := 0;
cursor := DBMS_SQL.OPEN_CURSOR();
PERFORM DBMS_SQL.PARSE(cursor, str_sql, 1);
PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':H_SMPID', h_smpid);
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 1, v_smpid);
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 2, v_smpnm, 10);
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 3, v_smpage);
ret := DBMS_SQL.EXECUTE(cursor);
loop
if DBMS_SQL.FETCH_ROWS(cursor) = 0 then
EXIT;
end if;
SELECT value,column_error,actual_length INTO v_smpid,errcd,length FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_smpid);
RAISE NOTICE '--------------------------------------------------------';
RAISE NOTICE 'smpid       = %', v_smpid;
RAISE NOTICE 'errcd       = %', errcd;
RAISE NOTICE 'length      = %', length;
SELECT value,column_error,actual_length INTO v_smpnm,errcd,length FROM DBMS_SQL.COLUMN_VALUE(cursor, 2, v_smpnm);
RAISE NOTICE '--------------------------------------------------------';
RAISE NOTICE 'smpnm       = %', v_smpnm;
RAISE NOTICE 'errcd       = %', errcd;
RAISE NOTICE 'length      = %', length;
select value,column_error,actual_length INTO v_smpage,errcd,length FROM DBMS_SQL.COLUMN_VALUE(cursor, 3, v_smpage);
RAISE NOTICE '--------------------------------------------------------';
RAISE NOTICE 'smpage      = %', v_smpage;
RAISE NOTICE 'errcd       = %', errcd;
RAISE NOTICE 'length      = %', length;
RAISE NOTICE '';
end loop;
$$
cursor := DBMS_SQL.CLOSE_CURSOR(cursor);
RETURN 0;
END;
$$ LANGUAGE plpgsql;
Chapter 10 Application Connection Switch Feature

The application connection switch feature enables automatic connection to the target server when there are multiple servers with redundant configurations.

When using this feature, specify the primary server and secondary server as the connected servers in the application connection information. A standby server can optionally be prioritized over the primary server as the target server.

If an application connection switch occurs, explicitly close the connection and then reestablish the connection or reexecute the application. Refer to "Errors when an Application Connection Switch Occurs and Corresponding Actions" of the relevant client interface for information on how to confirm the switch.

10.1 Connection Information for the Application Connection Switch Feature

To use the application connection switch feature, set the information shown below when connecting the database.

IP address or host name
Specify the IP address or host name that will be used to configure the database multiplexing system.

Port number
A port number used by each database server to listen for connections from applications.

In each client interface, multiple port numbers can be specified, however in the format shown below, for example:

host1,host2:port2

JDBC and .NET
If only one port number is specified, it will be assumed that host1:27500 (the default value) and host2:port2 were specified.

Omit all port numbers, or specify only one per server.

Others
If only one port number is specified, it will be assumed that the same port is used for all the hosts.

Target server
From the specified connection destination server information, specify the selection sequence of the servers to which the application will connect. The values specified for the target server have the meanings shown below. If a value is omitted, "any" will be assumed.

Primary server
The primary server is selected as the connection target from the specified "IP addresses or host names". Specify this to perform tasks that can be performed only on the primary server, such as applications in line with updates, or management tasks such as REINDEX and VACUUM.

Standby server (this value can be used only when the JDBC or .NET Data Provider is used)
The standby server is selected as the connection target from the specified "IP addresses or host names". On standby server, the update will always fail. If the target server is not standby, the JDBC driver will throw an error stating that it is unable to find a server with the specified targetServerType.

Priority given to a standby server
The standby server is selected preferentially as the connection target from the specified "IP addresses or host names". If there is no standby server, the application will connect to the primary server.

Any
This method is not recommended in database multiplexing systems. This is because, although the connection destination server is selected in the specified sequence from the specified "IP addresses or host names", if the server that was successfully connected to first is the standby server, the write operations will always fail.
The table below shows the server selection order values to set for each driver:

<table>
<thead>
<tr>
<th>Server selection order</th>
<th>JDBC drivers</th>
<th>.NET Data Provider</th>
<th>Other drivers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary server</td>
<td>&quot;primary&quot;</td>
<td>&quot;primary&quot;</td>
<td>&quot;read-write&quot;</td>
</tr>
<tr>
<td>Standby server</td>
<td>&quot;secondary&quot;</td>
<td>&quot;standby&quot;</td>
<td>-</td>
</tr>
<tr>
<td>Priority given to a standby server</td>
<td>&quot;preferSecondary&quot;</td>
<td>&quot;preferStandby&quot;</td>
<td>&quot;prefer-read&quot;</td>
</tr>
<tr>
<td>Any</td>
<td>&quot;any&quot;</td>
<td>&quot;any&quot;</td>
<td>&quot;any&quot;</td>
</tr>
</tbody>
</table>

SSL server certificate Common Name (CN)

To perform SSL authentication by creating the same server certificate for each server in a multiplexing system, specify the SSL server certificate Common Name (CN) in this parameter. Accordingly, SSL authentication using the CN can be performed without having to consider the names of the multiple servers contained in the multiplexing system.

10.2 Using the Application Connection Switch Feature

This section explains how to set the connection destination server using the application connection switch feature.

Of the parameters used as connection information for each client interface, only the parameters specific to the application connection switch feature are explained here. Refer to "Setup" and "Connecting to the Database" for information on the other parameters of each client interface.

10.2.1 Using the JDBC Driver

Set the following information in the connection string of the DriverManager class, or in the data source.

Table 10.1 Information to be set

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1</td>
<td>Specify the IP address or host name.</td>
</tr>
<tr>
<td>host2</td>
<td></td>
</tr>
<tr>
<td>port1</td>
<td>Specify the port number for the connection. The port number can be omitted. If omitted, the default is 27500.</td>
</tr>
<tr>
<td>port2</td>
<td></td>
</tr>
<tr>
<td>database_name</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>targetServerType</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>sslmode</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows: disable: Connect without SSL require: Connect always with SSL verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1) verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>sslservercertcn</td>
<td>This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", the CA certificate file can be specified using connection string sslrootcert.
When using Driver Manager

Specify the following URL in the API of the DriverManager class:

```java
jdbc:postgresql://host1[:port1],host2[:port2]/dbName?targetServerType=(primary | secondary| preferSecondary | any)[&sslmode=verify-full&sslrootcert=cACertificateFile&sslservercertcn=targetServerCertificateCN]
```

- If the target server is omitted, the default value "any" is used.
- When using IPV6, specify the host in the "[host]" (with square brackets) format.

**Example**

```java
jdbc:postgresql://[2001:Db8::1234]:27500,192.168.1.1:27500/dbName
```

When using the data source

Specify the properties of the data source in the following format:

```java
source.setServerName("host1[:port1],host2[:port2]");
source.setTargetServerType("primary");
source.setSslmode("verify-full");
source.setSslrootcert("cACertificateFile");
source.setSslservercertcn("targetServerCertificateCN");
```

- If the port number is omitted, the value specified in the portNumber property will be used. Also, if the portNumber property is omitted, the default is 27500.
- If the target server is omitted, the value will be "any".
- When using IPV6, specify the host in the "[host]" (with square brackets) format.

**Example**

```java
source.setServerName("[2001:Db8::1234]:27500,192.168.1.1:27500");
```

**Note**

If using the connection parameter loginTimeout, the value will be applied for the time taken attempting to connect to all of the specified hosts.

### 10.2.2 Using the ODBC Driver

Set the following information in the connection string or data source.

#### Table 10.2 Information to be set

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Servername</td>
<td>Specify IP address 1 and IP address 2, or the host name, using a comma as the delimiter. Based on ODBC rules, it is recommended to enclose the whole string containing comma delimiters with {}. Format: {host1,host2}</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter. Based on ODBC rules, it is recommended to enclose the whole string containing comma delimiters with {}. Format: {port1,port2}</td>
</tr>
<tr>
<td>Parameter</td>
<td>Explanation</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Parameter</td>
<td>Specify the port number corresponding to the IP address or host specified for the nth Servername as the nth Port. The port number can be omitted. If omitted, the default is 27500. If n server names are specified, and m ports are specified then there will be error reported. The only exceptions are where m=n or m=1. In case only one port is specified, then the same is applied for all the hosts.</td>
</tr>
<tr>
<td>target_session_attrs</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>SSLMode</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for SSLMode are as follows: disable: Connect without SSL allow: Connect without SSL, and if it fails, connect with SSL prefer: Connect with SSL, and if it fails, connect without SSL require: Connect always with SSL verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1) verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>SSLServerCertCN</td>
<td>This parameter is enabled only to perform SSL authentication (SSLMode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in Servername.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT of your operating system to specify the CA certificate file as shown below.

   Example)
   Variable name: PGSSLROOTCERT
   Variable value: cACertificateFile

When specifying a connection string

Specify the following connection string:

```plaintext
...;Servername={host1,host2};Port={port1,port2};[target_session_attrs={read-write | prefer-read | any}];[SSLMode=verify-full;SSLServerCertCN=targetServerCertificateCN]...
```

- When using IPV6, specify the host in the "host" format.

   [Example]
   ```plaintext
   Servername={(2001:Db8::1234,192.168.1.1);Port={27500,27500};
   ```

When using the data source

Specify the properties of the data source in the following format:

```plaintext
Servername={host1,host2}
Port={port1,/port2}
target_session_attrs={read-write | prefer-read | any}
SSLMode=verify-full
SSLServerCertCN=targetServerCertificateCN
```
- When using IPV6, specify the host in the "host" format.

[Example]

Servername={2001:Db8::1234,192.168.1.1}

Registering the data source using the ODBC Data Source Administrator

Using the ODBC Data Source Administrator, specify the items within the red border below:

![Advanced Options (PostgreSQL) 1/3]

Note

If using the connection parameter login_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the login_timeout value elapses.

10.2.3 Using a .NET Data Provider

Set the following information in the connection string of NpgsqlConnection, or in the data source.
### Table 10.3 Information to be set

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1, host2</td>
<td>Specify the IP address or host name.</td>
</tr>
<tr>
<td>port1, port2</td>
<td>Specify the port number for the connection.</td>
</tr>
<tr>
<td>TargetServerType</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
</tbody>
</table>

When specifying a connection string

Specify the following connection string:

```plaintext
host1[:port1],host2[:port2];[TargetServerType={TargetServerType.primary | TargetServerType.preferStandby | TargetServerType.any}];
```

- If the port number is omitted from the host string, the value specified for the Port keyword of the connection string will be used. Refer to "4.3.4 Connection String" for information on the Port keyword.
- When using IPV6, specify the host in the "[host]" (with square brackets) format.
- If the target server type is omitted, the value will be any.

**Example**

```plaintext
host=[2001:Db8::1234]:27500,192.168.1.1:27500;
```

When specifying the NpgsqlConnectionStringBuilder property, or adding a connection in TableAdapter

Specify the Host property of the data source in the following format:

```plaintext
host1[:port1],host2[:port2]
```

- If the port number is omitted from the host string, the value specified in the Port property will be used. Also, if the Port property is omitted, the default is 27500.

Specify the TargetServerType property of the data source in the following format:

```plaintext
TargetServerType.primary | TargetServerType.preferStandby | TargetServerType.any
```

- If the target server type is omitted, the value will be any.

**Note**

If using the connection parameter Timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the Timeout value elapses.

### 10.2.4 Using a Connection Service File

Set the connection parameters as follows.

Table 10.4 Information to be set

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Specify the host names, using a comma as the delimiter.</td>
</tr>
<tr>
<td>hostaddr</td>
<td>Specify IP address 1 and IP address 2, using a comma as the delimiter.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Explanation</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| port               | Specify the connection destination port numbers, using a comma as the delimiter. Specify the port number for the server specified for the nth host or hostaddr as the nth port.  
The port number can be omitted. If omitted, the default is 27500.  
If n server names are specified, and m ports are specified then there will be error reported. The only exceptions are where m=n or m=1. In case only one port is specified, then the same is applied for all the hosts. |
| target_session_attrs| Specify the selection sequence of the servers to which the application will connect. Refer to "Target server" for details.                         |
| sslmode            | Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows:  
disable: Connect without SSL  
allow: Connect without SSL, and if it fails, connect with SSL  
prefer: Connect with SSL, and if it fails, connect without SSL  
require: Connect always with SSL  
verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1)  
verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1) |
| sslservercertcn    | This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host. |

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT (connection parameter sslrootcert) of your operating system to specify the CA certificate file as shown below.
Example)  
Variable name: PGSSLROOTCERT  
Variable value: cACertificateFile

**Note**

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

**Point**

If using the C Library, embedded SQL or psql commands (including other client commands that specify connection destinations), it is recommended to use a connection service file to specify connection destinations.
In the connection service file, a name (service name) is defined as a set, comprising information such as connection destination information and various types of tuning information set for connections. By using the service name defined in the connection service file when connecting to databases, it is no longer necessary to modify applications when the connection information changes.
10.2.5 Using the C Library (libpq)

It is recommended that you use a connection service file. Refer to “10.2.4 Using a Connection Service File” for details.

If a connection service file will not be used, set the following information for the database connection control functions (PQconnectdbParams, PQconnectdb, and so on) or environment variables.

Table 10.5 Information to be set

<table>
<thead>
<tr>
<th>Parameter (environment variable name)</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host(PGHOST)</td>
<td>Specify the host names, using a comma as the delimiter.</td>
</tr>
<tr>
<td>hostaddr(PGHOSTADDR)</td>
<td>Specify IP address 1 and IP address 2, using a comma as the delimiter.</td>
</tr>
</tbody>
</table>
| port(PGPORT)                          | Specify the connection destination port numbers, using a comma as the delimiter. Specify the port number for the server specified for the nth host or hostaddr as the nth port.
|                                       | The port number can be omitted. If omitted, the default is 27500. |
|                                       | If n server names are specified, and m ports are specified then there will be error reported. The only exceptions are where m=n or m=1. In case only one port is specified, then the same is applied for all the hosts. |
| target_session_attrs(PGTARGETSESSIONATTRS) | Specify the selection sequence of the servers to which the application will connect. Refer to “Target server” for details. |
| sslmode(PGSSLMODE)                    | Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows: disable: Connect without SSL allow: Connect without SSL, and if it fails, connect with SSL prefer: Connect with SSL, and if it fails, connect without SSL require: Connect always with SSL verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1) verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1) |
| sslservercertcn(PGXSSLSERVERCERTCN)   | This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host. |

*1: If specifying either "verify-ca” or "verify-full”, use the system environment variable PGSSLROOTCERT (connection parameter ssldiroots) of your operating system to specify the CA certificate file as shown below.

Example)
Variable name: PGSSLROOTCERT
Variable value: cACertificateFile

When using URI

```
postgres://host1[:port1],host2[:port2],.../database_name
[?target_session_attrs={read-write | prefer-read | any }]  
```

- When using IPV6, specify the host in the "[host]” (with square brackets) format.

[Example]

```
postgres://postgres@[2001:Db8::1234]:27500,192.168.1.1:27500/database_name
```
When using key-value:

```
host=host1[,host2] port=port1[,port2] user=user1 password=pwd1 dbname=mydb
[target_session_attrs={read-write | prefer-read | any }]
```

- When using IPV6, specify the host in the "host" format.

[Example]

```
host=2001:Db8::1234,192.168.1.1 port=27500,27500
```

**Note**

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

**Information**

If using a password file (.pgpass), describe the entries matching each server.

- Example 1:

  ```
  host1:port1:dbname:user:password
  host2:port2:dbname:user:password
  ```

- Example 2:

  ```
  *:port:dbname:user:password
  ```

---

**10.2.6 Using Embedded SQL**

It is recommended that you use a connection service file. Refer to "10.2.4 Using a Connection Service File" for details.

**Point**

If using a connection service file, either of the following methods is available:

- Set the service name as a string literal or host variable, as follows:

  ```
tcp:postgresql://?service=my_service
  ```

- Set the service name in the environment variable PGSERVICE, and use CONNECT TO DEFAULT

If a connection service file will not be used, use a literal or variable to specify the connection destination server information for target in the SQL statement below:

```
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name];
```

**Method used**

```
dbname@host1,host2[:[port1][,port2]]
tcp:postgresql://host1,host2[:[port1][,port2]] [/dbname] [?target_session_attrs={read-write | prefer-read | any}][&sslmode=verify-full&sslservercertcn=targetServerCertificateCN]
```
- The above format cannot be specified directly without using a literal or variable.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1</td>
<td>Specify the IP address or host name. IPv6 format addresses cannot be specified.</td>
</tr>
<tr>
<td>host2</td>
<td></td>
</tr>
<tr>
<td>port1</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter. The port number can be omitted. If omitted, the default is 27500.</td>
</tr>
<tr>
<td>port2</td>
<td></td>
</tr>
<tr>
<td>dbname</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>target_session_attrs</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to “Target server” for details.</td>
</tr>
</tbody>
</table>
| sslmode  | Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows:  
- disable: Connect without SSL  
- allow: Connect without SSL, and if it fails, connect with SSL  
- prefer: Connect with SSL, and if it fails, connect without SSL  
- require: Connect always with SSL  
- verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1)  
- verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1) |
| sslservercertcn | This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host. |

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLRootCERT (connection parameter sslrootcert) of your operating system to specify the CA certificate file as shown below.

Example)  
Variable name: PGSSLRootCERT  
Variable value: $CA Certificate File$

**Point**  
Environment variables can also be used. Refer to "10.2.5 Using the C Library (libpq)" for information on environment variables.

**Note**  
If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

**10.2.7 Using the psql Command**  
It is recommended that you use a connection service file. Refer to "10.2.4 Using a Connection Service File" for details.
If a connection service file will not be used, specify the following information in the psql command option/environment variable.

### Table 10.7 Information to be set

<table>
<thead>
<tr>
<th>Option (environment variable)</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--host(PGHOST/PGHOSTADDR)</td>
<td>Specify IP address 1 and IP address 2, or the host name, using a comma as the delimiter. This can also be specified for the environment variable PGHOST or PGHOSTADDR.</td>
</tr>
<tr>
<td>-p/--port(PGPORT)</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter. This can also be specified for the environment variable PGPORT. Specify the port number corresponding to the IP address specified for the nth -h option as the nth -p option. The port number can be omitted. If omitted, the default is 27500. If n -h options are specified, and m -p options are specified then there will be error reported. The only exception is where m=n or m=1. In case only one port is specified, then the same is applied for all the hosts.</td>
</tr>
<tr>
<td>(PGTARGETSESSIONATTR)</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>(PGSSLMODE)</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for PGSSLMODE are as follows:</td>
</tr>
<tr>
<td></td>
<td>disable: Connect without SSL</td>
</tr>
<tr>
<td></td>
<td>allow: Connect without SSL, and if it fails, connect with SSL</td>
</tr>
<tr>
<td></td>
<td>prefer: Connect with SSL, and if it fails, connect without SSL</td>
</tr>
<tr>
<td></td>
<td>require: Connect always with SSL</td>
</tr>
<tr>
<td></td>
<td>verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1)</td>
</tr>
<tr>
<td></td>
<td>verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>(PGXSSLSERVERCERTCN)</td>
<td>This environment variable is enabled only to perform SSL authentication (PGSSLMODE=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT (connection parameter ssrrootcert) of your operating system to specify the CA certificate file as shown below.

**Example**

Variable name: PGSSLROOTCERT
Variable value: cACertificateFile

---

**Note**

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.
Use the same method as for psql commands to specify connection destination server information for other client commands used to specify connection destinations.
Chapter 11 Performance Tuning

This chapter explains how to tune application performance.

11.1 Enhanced Query Plan Stability

FUJITSU Enterprise Postgres estimates the cost of query plans based on SQL statements and database statistical information, and selects the least expensive query plan. However, like other databases, FUJITSU Enterprise Postgres does not necessarily select the most suitable query plan. For example, it may suddenly select unsuitable query plan due to changes in the data conditions.

In mission-critical systems, stable performance is more important than improved performance, and changes in query plans case to be avoided. In this situation, by stabilizing the SQL statement query plan so that it does not change, deterioration of the application performance is suppressed.

11.1.1 Optimizer Hints

This section explains the basic feature content of the optimizer hint (pg_hint_plan).

Refer to the open-source software webpage for information on pg_hint_plan.

In FUJITSU Enterprise Postgres, the optimizer hints can be specified in all application interfaces.

Description

You can specify a query plan in each SQL statement.

List of Features

The main query plans that can be specified using this feature are as follows:

- Query methods
- Join methods
- Join sequences

Query methods

Specify which method to use to query the specified table.

The main features are as follows:

- SeqScan (tableName)
- BitMapScan (tableName [indexName ... ])
- IndexScan (tableName [indexName ... ])
- IndexOnlyScan (tableName [indexName ... ])

Note

- If the specified index does not exist, or is not related to the search condition column specified in the WHERE clause, for example, SeqScan will be used.
- Even if IndexOnlyScan is specified, IndexScan may be used if it is necessary to access the table because a row was updated, for example.
- If multiple query methods were specified for the same table, the method specified last will be used.
Join methods

Specify the join method.

The main features are as follows:

- NestLoop (tableName tableName [tableName ... ])
- MergeJoin (tableName tableName [tableName ... ])
- HashJoin (tableName tableName [tableName ... ])

Note

- These cannot be specified for view tables and subqueries.
- If multiple methods were specified for the same table combination, the method specified last will be used.

Join sequences

The tables will be joined in the specified table sequence.

Specify the information using the following method:

- Leading ((table table))

  The method used to specify [table] is as follows:

  \[\text{table} = \text{tableName} \text{ or ( table table )}\]

Note

If multiple sequences were specified for the same table combination, the sequence specified last will be used.

Usage method

The use of this feature is explained below.

Method used to define this feature

Define this feature by specifying the format (block comment) " /*+ ... */".

- To specify hint clauses in each SELECT statement, for example when there are multiple SELECT statements in the SQL statement, define all hint clauses in the first block comment.

Example

Specifying hint clauses for the emp table and the dept table

```
WITH /*+ IndexScan(emp emp_age_index) IndexScan(dept dept_deptno_index) */ age30
AS (SELECT * FROM emp WHERE age BETWEEN 30 AND 39)
SELECT * FROM age30, dept WHERE age30.deptno = dept.deptno;
```

- To specify separate hint clauses for the same object in the SQL statement, define aliases in each object, and then specify hint clauses for those aliases.

Example

Specifying separate hint clauses for the emp table

```
WITH /*+ SeqScan(ta) IndexScan(tb) */ over100 AS (SELECT empno FROM emp ta WHERE salary > 1000000)
SELECT * FROM emp tb, over100 WHERE tb.empno = over100.empno AND tb.age < 30

Usage notes
- When using embedded SQL in C, the locations in which the hint clause block comment is specified are restricted. Refer to "6.4.2 Compiling Applications" for details.

Usage notes
- If a hint clause was specified in multiple block comments in the SQL statement, the hint clause specified in the second block comment and thereafter will be ignored.
- If characters other than those listed below appear before the hint clause in the SQL statement, they will be invalid even for hint clause block comments.
  - Space, tab, line feed
  - Letter (uppercase and lowercase), number
  - Underscore, comma
  - Brackets ()

11.1.2 Locked Statistics
This section explains the basic feature content for locked statistics (pg_dbms_stats).
Refer to the open-source software webpage for information on pg_dbms_stats.

Description
Locks the statistics.

By using this feature to lock the statistics for performance obtained in job load testing in an environment that simulates a production environment, performance degradation caused by changes to the query plan after go-live can be suppressed.

Additionally, by using the export and import features, statistics that were checked in the test environment can also be reproduced in the production environment.

List of Features
The main features that can be specified using this feature are as follows.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock/unlock of the statistics</td>
<td>Lock</td>
<td>Locks the statistics so that the currently selected query plan remains selected.</td>
</tr>
<tr>
<td></td>
<td>Unlock</td>
<td>Unlocks the statistics.</td>
</tr>
<tr>
<td>Backup/restore of the statistics</td>
<td>Backup</td>
<td>Backs up the current statistics.</td>
</tr>
<tr>
<td></td>
<td>Restore</td>
<td>Restores the statistics to the point when they were backed up, and then locks them.</td>
</tr>
<tr>
<td></td>
<td>Purge</td>
<td>Deletes backups that are no longer necessary.</td>
</tr>
<tr>
<td>Backup/restore using external files</td>
<td>Export</td>
<td>Outputs the current statistics to an external file (binary format).</td>
</tr>
<tr>
<td></td>
<td>Import</td>
<td>Reads the statistics from an external file created by the export feature, and then locks them.</td>
</tr>
</tbody>
</table>

[Target object]
### Target resource | Range of feature
--- | ---
Database | In the database
Schema | In the schema
Table | In the table
Column | ID column

#### Usage method

The use of this feature is explained below.

#### Method used to specify this feature

Specify this feature as an SQL function.

The methods used to specify the main features are shown in the table below.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Object</th>
<th>Function specified</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock</td>
<td>Database</td>
<td>dbms_stats.lock_database_stats()</td>
</tr>
<tr>
<td></td>
<td>Schema</td>
<td>dbms_stats.lock_schema_stats('schemaName')</td>
</tr>
<tr>
<td></td>
<td>Table</td>
<td>dbms_stats.lock_table_stats('schemaName.tableName')</td>
</tr>
<tr>
<td>Unlock</td>
<td>Database</td>
<td>dbms_stats.unlock_database_stats()</td>
</tr>
<tr>
<td></td>
<td>Schema</td>
<td>dbms_stats.unlock_schema_stats('schemaName')</td>
</tr>
<tr>
<td></td>
<td>Table</td>
<td>dbms_stats.unlock_table_stats('schemaName.tableName')</td>
</tr>
<tr>
<td>Import</td>
<td>Database</td>
<td>dbms_stats.import_database_stats('fullPathOfExportedFile')</td>
</tr>
<tr>
<td>Backup</td>
<td>Database</td>
<td>dbms_stats.backup_database_stats('commentUsedForIdentification')</td>
</tr>
<tr>
<td>Restore</td>
<td>Database</td>
<td>[Format 1] dbms_stats.restore_database_stats('timestamp') [Timestamp] Specify in the same format as the time column of the backup_history table. Backups earlier than the specified time will be restored. [Format 2] dbms_stats.restore_stats(backupId) [Backup ID] Specify a value in the id column of the backup_history table. The specified backup will be restored.</td>
</tr>
<tr>
<td>Purge</td>
<td>Backup</td>
<td>dbms_stats.purge_stats(backupId,flagUsedForDeletion) [Backup ID] Specify a value in the id column of the backup_history table. [Flag used for deletion] true: The target backup is forcibly deleted. false: The target backup is deleted only when there are also backups for the entire database.</td>
</tr>
</tbody>
</table>

| Remark 1: The export feature is executed using the COPY statement, not the SQL function. |
Example

Example 1: Locking the statistics of the entire database

```sql
userdb=# SELECT dbms_stats.lock_database_stats();
lock_database_stats
-----------------------
tbl1
tbl1_pkey
```

Note that the locked information can be referenced as follows:

```sql
userdb=# select relname from dbms_stats.relation_stats_locked;
relname
-----------------------
tbl1
tbl1_pkey
```

Example 2: Unlocking the statistics of the entire database

```sql
userdb=# SELECT dbms_stats.unlock_database_stats();
unlock_database_stats
-----------------------
tbl1
tbl1_pkey
```

Example 3: Backing up the statistics of the entire database

```sql
userdb=# SELECT dbms_stats.backup_database_stats('backup1');
backup_database_stats
-----------------------
1
```

Note that the backed up statistics can be referenced as follows:

```sql
userdb=# select id,comment,time,unit from dbms_stats.backup_history;
id | comment |             time              | unit
----+----------+-------------------------------+------
1 | backup1  | 2014-03-04 11:08:40.315948+09 | d
```

The ID:1 backup "backup1" is obtained for each database at "2014-03-04 11:08:40.315948+09".

[Meaning of unit] d: database s: schema t: table c: column

Example 4: Exporting the statistics of the entire database

```bash
$ psql -d userdb -f export.sql
BEGIN
COMMIT
```

`export.sql` is the file in which the COPY statement is defined.

Refer to "export_effective_stats-<x>.sql_sample" for information on the content of the COPY statement. "<x>" indicates the product version.

"export_effective_stats-<x>.sql_sample" is stored as follows:

*fujitsuEnterprisePostgresInstallDir/share/doc/extension*

Example 5: Importing the statistics of the entire database
Usage notes

- You must run the ANALYZE command once for the target tables of this feature. If the ANALYZE command is not run, the statistics cannot be locked. Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on the ANALYZE command.

- To use this feature to delete an object that has locked the statistics, use the unlock feature to delete the object lock information first.

- This feature does not specify the statistics value directly. It reproduces the status that has actually occurred. For this reason, if the text format is specified in the COPY statement when the export occurs, restore will not be possible. Always use the binary format when performing the export.
This chapter describes scanning using a VCI.

**Note**

This feature can only be used in Advanced Edition.

### 12.1 Operating Conditions

Faster aggregation can be achieved by using a VCI defined for all columns to be referenced.

This section describes the conditions under which a scan can use a VCI.

Whether to use VCI is determined based on cost estimation in the same way as normal indexes. Therefore, another execution plan will be selected if it is cheaper than a VCI even if a VCI is available.

**SQL statements that can use VCIs**

In addition to general SELECT statements, VCIs can be used for the SQL statements below (as long as they do not specify any of the elements listed in "SQL statements that cannot use VCIs" below):

- SELECT INTO
- CREATE TABLE AS SELECT
- CREATE MATERIALIZED VIEW ... AS SELECT
- CREATE VIEW ... AS SELECT
- COPY (SELECT ...) TO

**SQL statements that cannot use VCIs**

VCIs cannot be used for SQL statements that specify any of the following:

- Subquery to reference the column in which the parent query is referencing is specified
- Lock clause (such as FOR UPDATE)
- Cursor declared with WITH HOLD or scrollable
- SERIALIZABLE transaction isolation level
- Function or operator listed in "Functions and operators that do not use a VCI"
- User-defined function

**Table 12.1 Functions and operators that cannot use VCIs**

<table>

## 12.2 Usage

This section describes how to use a VCI in line with the following steps:
12.2.1 Designing

Design as follows before using a VCI.

- Execution multiplicity and number of parallel processes
- Parameters

Execution multiplicity and number of parallel processes

Determine the maximum number of SQL statements that can be executed simultaneously and the number of parallel processes based on the number of CPU cores that can be allocated for scans that use VCI to perform aggregate processing. Design in advance the multiplicity of SQL statements for executing scans that use VCI and the number of parallel processes for scans that use VCI.

For example, if the number of CPUs that can be allocated is 32 cores, then the maximum number of SQL statements that can be executed simultaneously is 8 and the number of parallel processes is 4.

Note

A temporary file is created in /dev/shm or in a directory specified for the vci.smc_directory parameter as the dynamic shared memory for each SQL statement during a scan using a VCI.

A temporary file is created in a directory under the data storage directory or in a directory specified for the vci.smc_directory parameter as the dynamic shared memory for each SQL statement during a scan using a VCI.

Ensure that this directory has sufficient space to meet the memory requirements estimated for the execution multiplicity and number of parallel processes of SQL statements (refer to "Memory used per scanning" in "VCI Memory Requirements" in the Installation and Setup Guide for Server for details). If it does not have sufficient space when a scan is performed, SQL statements will return errors due to the insufficient memory.

Parameters

The VCI parallel scan feature cannot be used for setting parameters immediately after creating an instance.

Therefore, set the parameters below based on the values determined in “Execution multiplicity and number of parallel processes of SQL statements” above.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Default</th>
<th>Value index</th>
</tr>
</thead>
<tbody>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of VCI parallel processes</td>
<td>0</td>
<td>Specify the number of parallel processes.</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Description</td>
<td>Default</td>
<td>Value index</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>vci.smc_directory</td>
<td>Directory name in which a temporary file is created as the dynamic shared memory during a scan using a VCI.</td>
<td>/dev/shm</td>
<td>A directory (dataStorageDir\base\pgsql_tmp) under the data storage directory</td>
</tr>
<tr>
<td>max_worker_processes</td>
<td>Maximum number of background processes that the system supports.</td>
<td>8</td>
<td>Add the value of the maximum number of SQL statements that can be executed simultaneously for scans that use VCI multiplied by vci.max_parallel_degree.</td>
</tr>
</tbody>
</table>

See

Refer to "Parameters" in the Operation Guide for information on the details of and how to set the parameters.

12.2.2 Checking

Execute the SQL statement with "EXPLAIN ANALYZE" to check the following:

- If a VCI was used
  "Custom Scan (VCI...)" is displayed in the plan if a VCI was used.

- Number of parallel processes
  The number of parallel processes when the SQL statement is executed is displayed in "Allocated Workers". Check that it is running the designed number of parallel processes.

- Response
  Check if the execution time displayed in "Execution time" is as estimated.

The following shows an example of the output result of EXPLAIN ANALYZE:

```
EXPLAIN ANALYZE SELECT COUNT(*) FROM test WHERE x > 10000;

PLAN                                                                                          QUERY
---------------------------------------------------------------------------------------------
Custom Scan (VCI Aggregate)  (cost=19403.15..19403.16 rows=1 width=0) (actual  
time=58.505..58.506 rows=1 loops=1)  
  Allocated Workers: 4  
->  Custom Scan (VCI Scan) using test_x_idx on test (cost=0.00..16925.00 rows=991261  
  width=0) (never executed)  
    Filter: (x > 10000)  
    Planning time: 0.151 ms  
  Execution time: 86.910 ms  
  (6 rows)
```
A cost output by the execution plan that uses a VCI may be inaccurate. A VCI works if all or part of the best execution plan when the SQL statement was executed is replaced with an execution plan that uses a VCI. If the cost of the execution plan to be replaced is lower than a certain value (vci.cost_threshold parameter), it will not be replaced or recalculated. Therefore, the cost of the original execution plan is output as is.

12.2.3 Evaluating

If the results in “12.2.2 Checking” is any of the following, tune accordingly:

If a VCI is not used

- Check if the "12.1 Operating Conditions” are met.
- Check if vci.enable is set to "on".
- A VCI may not be appropriately used when statistics are outdated, such as immediately after inserting a large amount of data. In such cases, execute the VACUUM ANALYZE statement or the ANALYZE statement.
- A VCI is not used if there is insufficient memory for VCI scan. This may occur during time-consuming transactions involving tables for which VCIs were defined. Set vci.log_query to "on", and check if either ‘could not use VCI: local ROS size (%zu) exceeds limit (%zu)” or “out of memory during local ROS generation” is output. If it is, then increase the value of the vci.max_local_ros.

Response is not as expected

Tuning may improve response. Check the following:

- If vci.max_parallel_degree is not set or is set to 0, set an appropriate value according to “12.2.1 Designing”.
- If there is a margin in the CPU usage, increase the value of vci.max_parallel_degree and check again. In addition, if the value that of max_worker_processes is lower than the maximum number of SQL statements that can be executed simultaneously for parallel scan multiplied by vci.max_parallel_degree, increase it and check again.

12.3 Usage Notes

This section provides notes on using VCI.

- Regardless of whether VCI is used, the content of the result does not change. However, records may be returned in a different order if the ORDER BY clause is not specified.
- To reduce resource consumption, edit postgresql.conf or use the SET statement to enable/disable vci.enable when you use this feature only for specific times or jobs (SQL applications).
- The optimizer hint (pg_hint_plan) cannot be specified for a VCI. The hint clause is ignored if it is specified.
- If a plan other than VCI is specified for the optimizer hint (pg_hint_plan), a VCI may be used. Therefore, if you specify a query plan with the hint clause, use the SET statement to set vci.enable to "off".
- The message below may be output when a scan that uses VCI is performed on the streaming replication standby server:

```
"LOG: recovery has paused"
"HINT: Execute pg_wal_replay_resume() to continue."
```

This message is output because application of the WAL to the VCI temporarily pauses due to the scan being performed.

- Even if a scan is performed using a VCI, information in the idx_scan, idx_tup_read, and idx_tup_fetch columns of the collected statistics views, pg_stat_all_indexes and pg_stat_user_indexes, will not be updated.
Currently, it is not possible to replace the query plan for parallel aggregation with the query plan using VCI. Therefore, if you create a VCI on a column of a partition table and aggregate (sum() etc.) on that column, one of the following plans will be selected. Use different setting parameters according to the situation of the target table.

- Plan of the parallel aggregations using scan methods other than VCI scan

It is selected when `max_parallel_workers_per_gather` is 1 or more.

```
explain select sum(value) from test;
```

```
QUERY PLAN
-----------------------------------------------------------------------------------
Finalize Aggregate (cost=99906.30..99906.31 rows=1 width=8)
  ->  Gather (cost=99906.08..99906.29 rows=2 width=8)
      Workers Planned: 2
      ->  Partial Aggregate (cost=98906.08..98906.09 rows=1 width=8)
          ->  Parallel Append (cost=0.00..94739.83 rows=1666500 width=4)
              ->  Parallel Seq Scan on test_1 (cost=0.00..43203.67 rows=833250 width=4)
              ->  Parallel Seq Scan on test_2 (cost=0.00..43203.67 rows=833250 width=4)
This plan is fast when the number of records to be aggregated (number of records that hit the search conditions) is very large. This is because the benefit of parallelizing aggregation is important, not the performance of scanning. For example, each parallel worker will perform a sequential scan and aggregate most of the scanned records.

- Plan that aggregates VCI scan results by a single aggregator node

It is selected by setting `max_parallel_workers_per_gather` to 0 and not creating a query plan of parallel aggregate.

```
explain select sum(value) from test;
```

```
QUERY PLAN
-----------------------------------------------------------------------------------
Aggregate (cost=145571.00..145571.01 rows=1 width=8)
  ->  Append (cost=0.00..135572.00 rows=3999600 width=4)
      ->  Custom Scan (VCI Scan) using test_1_id_value_idx on test_1
          (cost=0.00..57787.00 rows=1999800 width=4)
          Filter: (id < 1000001)
          Allocated Workers: 2
      ->  Custom Scan (VCI Scan) using test_2_id_value_idx on test_2
          (cost=0.00..57787.00 rows=1999800 width=4)
          Allocated Workers: 2
This plan is fast when the number of aggregated items is not large or when the size of the aggregated column is smaller than the record size. This is because the scan performance is more important, so it is faster to aggregate the results of VCI scans of each partition.

- Originally, if there is only one partition to be accessed, the following VCI aggregation plan can be used. Below is an example of scanning only one partition with partition pruning.

```
explain select sum(value) from test where id < 1000001;
```

```
QUERY PLAN
-----------------------------------------------------------------------------------
Custom Scan (VCI Aggregate) (cost=62786.50..62786.51 rows=1 width=8)
  Allocated Workers: 2
  ->  Custom Scan (VCI Scan) using test_1_id_value_idx on test_1
      (cost=0.00..57787.00 rows=1999800 width=4)
      Filter: (id < 1000001)
```

However, the current planner does not try to choose VCI aggregation because it creates a plan for parallel aggregation if the table is partitioned. So in this case, set `max_parallel_workers_per_gather` to 0 to force the planner to choose VCI aggregation.
Appendix A Precautions when Developing Applications

This appendix describes precautions when developing applications with FUJITSU Enterprise Postgres.

A.1 Precautions when Using Functions and Operators

This section describes notes for using functions and operators.

A.1.1 General rules of Functions and Operators

This section describes general rules for using functions and operators. Ensure the general rules are followed when using functions and operators to develop applications.

General rules

- Specify the stated numbers for arguments when specifying numbers for arguments in functions.
- Specify the stated data types when specifying data types for functions. If you use a data type other than the stated data types, use CAST to explicitly convert the data type.
- Specify data types that can be compared when specifying data types for operators. If you use a data type that cannot be compared, use CAST to explicitly convert the data type.

See

Refer to “Functions and Operators” under "The SQL Language” in the PostgreSQL Documentation for information on the functions and operators available with FUJITSU Enterprise Postgres.

A.1.2 Errors when Developing Applications that Use Functions and/or Operators

This section provides examples of problems that may occur when developing applications that use functions and/or operators, and describes how to deal with them.

The error "Function ***** does not exist" occurs when executing SQL

The following error will occur when executing an SQL statement that does not abide by the general rules for functions:

```
ERROR: Function ***** does not exist
```

Note: "*****" denotes the function for which the error occurred, and the data type of its arguments.

The cause of the error will be one of the following:

- The specified function does not exist.
- The wrong number of arguments or wrong argument data type was specified

Corrective action

Check the following points and correct any errors:

- Check if there are any errors in the specified function name, number of arguments, or argument data type, and revise accordingly.
- Check the argument data type of the function displayed in the message. If an unintended data type is displayed, use a function such as CAST to convert it.
The error "Operator does not exist" occurs when executing SQL

The following error will occur when executing an SQL statement that specifies a data type in the operator that cannot be compared:

```
ERROR:  Operator does not exist: *****
```

Note: "*****" denotes the operator for which the error occurred, and the data type of the specified value.

Corrective action

Ensure the data type of the expressions specified on the left and right sides of the operator can be compared. If required, revise to ensure these data types can be compared by using a function such as CAST to explicitly convert them.

A.2 Notes when Using Temporary Tables

In standard SQL, a temporary table can be defined in advance to enable an empty temporary table to be created automatically when the application connects to the database. However, in FUJITSU Enterprise Postgres, a temporary table must be created when the application connects to the database by explicitly using the CREATE TABLE statement.

If the same temporary table is repeatedly created and deleted during the same session, the system table might expand, and memory usage might increase. To prevent this, specify the CREATE TABLE statement to ensure the temporary table is reused.

For example, in cases where a temporary table would be created and deleted for repeatedly executed transactions, specify the CREATE TABLE statement as shown below:

- Specify "IF NOT EXISTS" to create a temporary table only if none exists when the transaction starts.
- Specify "ON COMMIT DELETE ROWS" to ensure all rows are deleted when the transaction ends.

See

Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on the CREATE TABLE statement.

Examples of SQL using a temporary table are shown below:

Example of bad use (creating and deleting a temporary table)

```
BEGIN;
CREATE TEMPORARY TABLE mytable(col1 CHAR(4), col2 INTEGER) ON COMMIT DROP;
    (mytable processes)
COMMIT;
```

Example of good use (reusing a temporary table)

```
BEGIN;
CREATE TEMPORARY TABLE IF NOT EXISTS mytable(col1 CHAR(4), col2 INTEGER) ON COMMIT
DELETE ROWS;
    (mytable processes)
COMMIT;
```

A.3 Implicit Data Type Conversions

An implicit data type conversion refers to a data type conversion performed automatically by FUJITSU Enterprise Postgres, without the need to explicitly specify the data type to convert to.
The combination of possible data type conversions differs, depending on whether the expression in the conversion source is a literal.

For non-literals, data types can only be converted to other types within the same range.

For literals, character string literal types can be converted to the target data type. Numeric literals are implicitly converted to specific numeric types. These implicitly converted numeric literals can then have their types converted to match the conversion target data type within the numeric type range. For bit character string literals, only the bit column data type can be specified. The following shows the range of type conversions for literals.

Table A.1 Data type combinations that contain literals and can be converted implicitly

<table>
<thead>
<tr>
<th>Conversion target</th>

</tr>
</tbody>
</table>

Y: Can be converted  
N: Cannot be converted  

\(^1\): Only strings that can be converted to the data type of the conversion target can be specified (such as "1" if the conversion target is a numeric type)  

\(^2\): "Y" indicates specific numeric types that are converted first.  

\(^3\): Integers that can be expressed as INTEGER types can be specified  

\(^4\): Integers that cannot be expressed as INTEGER types, but can be expressed as BIGINT types, can be specified  

\(^5\): Integers that cannot be expressed as INTEGER or BIGINT types, but that can be expressed as NUMERIC types, or numeric literals that contain a decimal point or the exponent symbol (e), can be specified  

Implicit data type conversions can be used when comparing or storing data.  
The conversion rules differ, depending on the reason for converting. Purpose-specific explanations are provided below.  

### A.3.1 Function Argument  
Value expressions specified in a function argument will be converted to the data type of that function argument.  

See  

Refer to "Functions and Operators" under "The SQL Language" in the PostgreSQL Documentation for information on data types that can be specified in function arguments.  

### A.3.2 Operators  
Comparison operators, BETWEEN, IN  
Combinations of data types that can be compared using comparison operators, BETWEEN, or IN are shown below.
Table A.2 Combinations of comparable data type

<table>
<thead>
<tr>
<th>Left side</th>
<th>Right side</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Numeric type</td>
</tr>
<tr>
<td>Numeric type</td>
<td>Y</td>
</tr>
<tr>
<td>Character type</td>
<td>N</td>
</tr>
<tr>
<td>Date/time type</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be compared  
N: Cannot be compared

When strings with different lengths are compared, the shorter one is padded with spaces to make the lengths match.

When numeric values with different precisions are compared, data will be converted to the type with the higher precision.

Set operation and CASE also follow the same rules.

Other operators

Value expressions specified in operators will be converted to data types that are valid for that operator.

See

Refer to “Functions and Operators” under “The SQL Language” in the PostgreSQL Documentation for information on data types that can be specified in operators.

A.3.3 Storing Values

Value expressions specified in the VALUES clause of the INSERT statement or the SET clause of the UPDATE statement will be converted to the data type of the column in which they will be stored.

A.4 Notes on Using Index

This section explains the notes on using the following indexes:

- SP-GiST index

A.4.1 SP-GiST Index

If more than 2 concurrent updates are performed on a table in which the SP-GiST index is defined, applications may stop responding. When this occur, all system processes including the Check Pointer process will also be in the state of no response. For these reasons, use of the SP-GiST index is not recommended.

A.5 Notes on Using Multibyte Characters in Definition Names

Do not use multibyte characters in database names or user names if using a Windows database server.

Multibyte characters must not be used in database names or user names on non-Windows database servers, because certain conditions may apply or it may not be possible to connect to some clients.

Related notes and constraints are described below.
1) Configuring the client encoding system

The client encoding system must be configured when the names are created.

See

Refer to "Character Set Support" in "Server Administration" in the PostgreSQL Documentation for information on how to configure the client encoding system.

2) Encoding system of names used for connection

Ensure that the encoding system of names used for connection is the same as that of the database that was connected when these names were created.

The reasons for this are as follows:
- Storage system for names in FUJITSU Enterprise Postgres
  The system catalog saves encoded names by using the encoding system of the database at the time the names were created.
- Encoding conversion policy when connected
  When connected, names sent from the client are matched with names in the system catalog without performing encoding conversion.

Accordingly, if the database that was connected when the names were defined uses the EUC_JP encoding system, but the database name is specified using UTF-8 encoding, then the database will be considered to be non-existent.

3) Connection constraints

The table below shows the connection constraints for each client type, based on the following assumptions:
- The conditions described in 1) and 2) above are satisfied.
- The database name and user names use the same encoding system.

<table>
<thead>
<tr>
<th>Client type</th>
<th>Client operating system</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Windows(R)</td>
</tr>
<tr>
<td>JDBC driver</td>
<td>Cannot be connected</td>
</tr>
<tr>
<td>ODBC driver</td>
<td>Cannot be connected</td>
</tr>
<tr>
<td>.NET Data Provider</td>
<td>Can only connect when the encoding system used for definitions is UTF-8</td>
</tr>
<tr>
<td>SQL Embedded SQL in C</td>
<td>Can only connect when the connection service file (pg_service.conf) is used</td>
</tr>
<tr>
<td>psql command</td>
<td>Can only connect when the connection service file (pg_service.conf) is used</td>
</tr>
</tbody>
</table>
Appendix B Conversion Procedures Required due to Differences from Oracle Database

This appendix explains how to convert from an Oracle database to FUJITSU Enterprise Postgres, within the scope noted in "Chapter 9 Compatibility with Oracle Databases" from the following perspectives:
- Feature differences
- Specification differences

This document assumes that the version of the Oracle database to be converted is 7-10.2g.

B.1 Outer Join Operator (Perform Outer Join)

Features
In the WHERE clause conditional expression, by adding the plus sign (+), which is the outer join operator, to the column of the table you want to add as a table join, it is possible to achieve an outer join that is the same as a joined table (OUTER JOIN).

B.1.1 Comparing with the ^= Comparison Operator

Oracle database

```
SELECT *
FROM t1, t2
WHERE t1.col1(+) ^= t2.col1;
```

* col1 is assumed to be CHAR(4) type

FUJITSU Enterprise Postgres

```
SELECT *
FROM t1, t2
WHERE t1.col1(+) != t2.col1;
```

* col1 is assumed to be CHAR(4) type

Feature differences

Oracle database

The ^= comparison operator can be specified.

FUJITSU Enterprise Postgres

The ^= comparison operator cannot be specified.

Conversion procedure

Convert using the following procedure:
1. Locate the places where the keyword "^=" is used.
2. Ensure that the keyword, "^(+)", is either on the right or left-hand side.
3. Change "^=" to " != ".
B.2 DECODE (Compare Values and Return Corresponding Results)

Features

DECODE compares values of the conversion target value expression and the search values one by one, and if the values of the conversion target value expression and the search values match, a corresponding result value is returned.

B.2.1 Comparing Numeric Data of Character String Types and Numeric Characters

Oracle database

```sql
SELECT DECODE(
col1,
    1000, 'ITEM-A',
    2000, 'ITEM-B',
    'ITEM-C')
FROM t1;
```

* col1 is assumed to be CHAR(4) type

FUJITSU Enterprise Postgres

```sql
SELECT DECODE( CAST(col1 AS INTEGER),
    1000, 'ITEM-A',
    2000, 'ITEM-B',
    'ITEM-C')
FROM t1;
```

* col1 is assumed to be CHAR(4) type

Feature differences

Oracle database

When the value expression is a string and the search value is a numeric, the string value will be converted to the data type of the comparison target numeric, so that they can be compared.

FUJITSU Enterprise Postgres

If the conversion target value expression is a string value, then no search value can be specified with numbers.

Conversion procedure

Since the data type that can be specified for the conversion target value expression is unknown, use CAST to explicitly convert the conversion target value expression (col1 in the example) to a numeric (INTEGER type in the example).

B.2.2 Obtaining Comparison Result from more than 50 Conditional Expressions

Oracle database

```sql
SELECT DECODE(col1,
    1, 'A',
    2, 'B',
    ...,
    78, 'BZ',
    NULL, 'UNKNOWN',
    'OTHER')
FROM t1;
```
SELECT CASE
    WHEN col1 = 1 THEN 'A'
    WHEN col1 = 2 THEN 'B'
    WHEN col1 = 78 THEN 'BZ'
    WHEN col1 IS NULL THEN 'UNKNOWN'
    ELSE 'OTHER'
END
FROM t1;

Feature differences
Oracle database
Search value with a maximum of 127 items (up to 255 arguments in total) can be specified.
FUJITSU Enterprise Postgres
Search value with a maximum of 49 items (up to 100 arguments in total) only can be specified.

Conversion procedure
Convert to the CASE expression using the following procedure:

1. Specify the DECODE conversion target value expression (col1 in the first argument, in the example) and the search value (1 in the second argument, in the example) for the CASE expression search condition. Specify the DECODE result value ('A' in the third argument, in the example) for the CASE expression THEN (WHEN col1 = 1 THEN 'A', in the example). Note that if the search value is NULL, specify "IS NULL" for the search condition for the CASE expression.

2. If the DECODE default value ('OTHER' in the last argument, in the example) is specified, specify the default value for the CASE expression ELSE (ELSE 'OTHER', in the example).

### B.2.3 Obtaining Comparison Result from Values with Different Data Types

Oracle database

```sql
SELECT DECODE( col1,
    '1000', 'A',
    '2000', '1',
    'OTHER')
FROM t1;
```

* col1 is assumed to be CHAR(4) type

FUJITSU Enterprise Postgres

```sql
SELECT DECODE( col1,
    '1000', 'A',
    '2000', '1',
    'OTHER')
FROM t1;
```

* col1 is assumed to be CHAR(4) type
Feature differences

Oracle database

The data types of all result values are converted to the data type of the first result value.

FUJITSU Enterprise Postgres

Results in an error.

Conversion procedure

Convert using the following procedure:

1. Check the literal data type for the first result value specified.
2. Change the literals specified for each result value to the literal data type checked in the step 1.

B.3 SUBSTR (Extract a String of the Specified Length from Another String)

Features

SUBSTR returns the number of characters specified in the third argument (starting from the position specified in the second argument) from the string specified in the first argument.

Refer to "9.2.1 Notes on SUBSTR" for details on precautions when using SUBSTR.

B.3.1 Specifying a Value Expression with a Data Type Different from the One that can be Specified for Function Arguments

Oracle database

```
SELECT SUBSTR( col1,
    1,
    col2)
FROM DUAL;
```

* col1 and col2 are assumed to be CHAR type

FUJITSU Enterprise Postgres

```
CREATE CAST (CHAR AS INTEGER) WITH INOUT AS IMPLICIT;
SELECT SUBSTR( col1,
    1,
    col2)
FROM DUAL;
# No changes to SELECT statement;
```

* col1 and col2 are assumed to be CHAR type

Feature differences

Oracle database

If the type can be converted to a data type that can be specified for function arguments, conversion is performed implicitly.

FUJITSU Enterprise Postgres

If the data types are different from each other, or if loss of significance occurs, implicit conversion is not performed.
Conversion procedure

Since the data type of the string length is clear, first execute the following CREATE CAST only once so that the CHAR type value (col2 in the example) specified for the string length is implicitly converted to INTEGER type.

```
CREATE CAST (CHAR AS INTEGER) WITH INOUT AS IMPLICIT;
```

## B.3.2 Extracting a String with the Specified Format from a Datetime Type Value

### Oracle database

```
SELECT SUBSTR( CURRENT_TIMESTAMP, 1, 8) FROM DUAL;
```

### FUJITSU Enterprise Postgres

```
SELECT SUBSTR( TO_CHAR(CURRENT_TIMESTAMP, 'DD-MON-YY HH.MI.SS.US PM'), 1, 8) FROM DUAL;
```

### Feature differences

**Oracle database**

A datetime value such as CURRENT_TIMESTAMP can be specified for character value expressions.

**FUJITSU Enterprise Postgres**

A datetime value such as CURRENT_TIMESTAMP cannot be specified for character value expressions.

### Conversion procedure

First, specify TO_CHAR for the SUBSTR character value expression.

Specify datetime type (CURRENT_TIMESTAMP, in the example) in firstArg of TO_CHAR, and specify the format template pattern ('DD-MON-YY HH.MI.SS.US PM', in the example) for secondArg to match with the result of SUBSTR before conversion.

TO_CHAR specification format: `TO_CHAR(firstArg, secondArg)`

### Information

Refer to “Data Type Formatting Functions” in the PostgreSQL Documentation for information on format template patterns that can be specified for TO_CHAR in FUJITSU Enterprise Postgres.

## B.3.3 Concatenating a String Value with a NULL value

### Oracle database

```
SELECT SUBSTR( col1 || col2, 2, 5) FROM t1;
```

* col1 and col2 are assumed to be character string type, and col2 may contain NULL
**FUJITSU Enterprise Postgres**

```sql
SELECT SUBSTR( col1 || NVL(col2, ''), 2, 5)
FROM t1;
```

* col1 and col2 are assumed to be character string type, and col2 may contain NULL

**Feature differences**

**Oracle database**

NULL is handled as an empty string, and strings are joined.

**FUJITSU Enterprise Postgres**

NULL is not handled as an empty string, and the result of joining the strings becomes NULL.

**Conversion procedure**

Convert using the following procedure:

1. Locate the places where the keyword "||" is used.
2. Check if any of the value expressions can contain NULL - if they can, then execute step 3.
3. Modify to NVL(valExpr, '').

### B.4 NVL (Replace NULL)

**Features**

NVL converts NULL values.

#### B.4.1 Obtaining Result from Arguments with Different Data Types

**Oracle database**

```sql
SELECT NVL( col1, col2)
FROM t1;
```

* col1 is assumed to be VARCHAR(100) type, and col2 is assumed to be CHAR(100) type

**FUJITSU Enterprise Postgres**

```sql
SELECT NVL( col1, CAST(col2 AS VARCHAR(100)))
FROM t1;
```

* col1 is assumed to be VARCHAR(100) type, and col2 is assumed to be CHAR(100) type

**Feature differences**

**Oracle database**

Value expressions with different data types can be specified. If the first argument is a string value, then VARCHAR2 is returned, and if it is a numeric, then a numeric type with greater range is returned.

**FUJITSU Enterprise Postgres**

Value expressions with different data types cannot be specified.
Conversion procedure

Since the data types that can be specified for the expressions in the two arguments are unknown, use the following steps to convert:

1. Check the data types specified for each of the two expressions.
2. Using the data type that is to be received as a result, explicitly convert the other argument with CAST.

B.4.2 Operating on Datetime/Numeric, Including Adding Number of Days to a Particular Day

Oracle database

```sql
SELECT NVL(col1 + 10, CURRENT_DATE)
FROM t1;
```

* col1 is assumed to be TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type

FUJITSU Enterprise Postgres

```sql
SELECT NVL(CAST(col1 AS DATE) + 10, CURRENT_DATE)
FROM t1;
```

* col1 is assumed to be TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type

Feature differences

Oracle database

Numbers can be operated (added to or subtracted from) with either TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type. Operation result will be DATE type.

FUJITSU Enterprise Postgres

Numbers cannot be operated (added to or subtracted from) with neither TIMESTAMP WITHOUT TIME ZONE type nor TIMESTAMP WITH TIME ZONE type. However, numbers can be operated (added to or subtracted from) with DATE type.

Conversion procedure

Convert using the following procedure:

1. Search locations where the keyword "+" or "-" is used in addition or subtraction, and check if these operations are between numbers and TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type.
2. If they are, use CAST to explicitly convert TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type to DATE type.

B.4.3 Calculating INTERVAL Values, Including Adding Periods to a Date

Oracle database

```sql
SELECT NVL(CURRENT_DATE + (col1 * 1.5), col2)
FROM t1;
```

* col1 and col2 are assumed to be INTERVAL YEAR TO MONTH types

FUJITSU Enterprise Postgres

```sql
SELECT NVL(CURRENT_DATE + CAST(col1 * 1.5 AS
```

- 132 -
INTERVAL YEAR TO MONTH), col2)
FROM t1;

* col1 and col2 are assumed to be INTERVAL YEAR TO MONTH types

Feature differences
Oracle database
INTERVAL YEAR TO MONTH type multiplication and division result in INTERVAL YEAR TO MONTH type and any fraction (number of days) will be truncated.
FUJITSU Enterprise Postgres
INTERVAL YEAR TO MONTH type multiplication and division result in INTERVAL type and fractions (number of days) will not be truncated.

Conversion procedure
Convert using the following procedure:
1. Search locations where the keywords "*" or "/" are used in multiplication or division, and check if the specified value is INTERVAL YEAR TO MONTH type.
2. If the value is INTERVAL YEAR TO MONTH type, use CAST to explicitly convert the operation result to INTERVAL YEAR TO MONTH type.

B.5 DBMS_OUTPUT (Output Messages)
Features
DBMS_OUTPUT sends messages to clients such as psql from PL/pgSQL.

B.5.1 Outputting Messages Such As Process Progress Status

```
set serveroutput on;...(1)
DECLARE
  v_col1        CHAR(20);
  v_col2        INTEGER;
CURSOR c1 IS
  SELECT col1, col2 FROM t1;
BEGIN
  DBMS_OUTPUT.PUT_LINE('-- BATCH_001 Start --');
  OPEN c1;
  DBMS_OUTPUT.PUT_LINE('-- LOOP Start --');
  LOOP
    FETCH c1 INTO v_col1, v_col2;
    EXIT WHEN c1%NOTFOUND;
    DBMS_OUTPUT.PUT('.');
  END LOOP;
  DBMS_OUTPUT.NEW_LINE; ...(2)
  DBMS_OUTPUT.PUT_LINE('-- LOOP End --');
  CLOSE c1;
  DBMS_OUTPUT.PUT_LINE('-- BATCH_001 End --');
EXCEPTION
  WHEN OTHERS THEN
    DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
    DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
```
DO $$
DECLARE
  v_col1      CHAR(20);
  v_col2      INTEGER;
  c1 CURSOR FOR
      SELECT col1, col2 FROM t1;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE); ...(1)
  PERFORM DBMS_OUTPUT.ENABLE(NULL); ...(1)
  PERFORM DBMS_OUTPUT.PUT_LINE('-- BATCH_001 Start --');
  OPEN c1;
  PERFORM DBMS_OUTPUT.PUT_LINE('-- LOOP Start --');
  LOOP
    FETCH c1 INTO v_col1, v_col2;
    EXIT WHEN FOUND = false;
  PERFORM DBMS_OUTPUT.PUT('.');
  END LOOP;
  PERFORM DBMS_OUTPUT.NEW_LINE(); ...(2)
  PERFORM DBMS_OUTPUT.PUT_LINE('-- LOOP End --');
  CLOSE c1;
  PERFORM DBMS_OUTPUT.PUT_LINE('-- BATCH_001 End --');
EXCEPTION
  WHEN OTHERS THEN
    PERFORM DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
    PERFORM DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM );
END;
$$

(1) SERVEROUTPUT/ENABLE

Specification differences
Oracle database
  Use SET statement and specify SERVEROUTPUT ON.
FUJITSU Enterprise Postgres
  Specify DBMS_SQL.SERVEROUTPUT(TRUE).

Conversion procedure
  Convert using the following procedure:
  1. Check if a SET SERVEROUTPUT statement is specified before the PL/SQL block of a stored procedure.
  2. If a SET SERVEROUTPUT statement is specified, specify DBMS_SQL.SERVEROUTPUT straight after BEGIN of PL/pgSQL. If ON is specified to have messages output to a window, then specify TRUE. If OFF is specified, then specify FALSE.
  3. Specify DBMS_SQL.ENABLE only if SET SERVEROUTPUT is ON. The values to be specified for the argument are as follows:
     - If SIZE is specified for the SET SERVEROUTPUT statement, specify this size for the argument.
- If SIZE is not specified for the SET SERVEROUTPUT statement, then specify 2000 for Oracle10.1g or earlier, NULL for Oracle10.2g or later.

If DBMS_SQL.ENABLE is specified for the PL/SQL block of the stored procedure, specify the same value as that argument.

(2) NEW_LINE

Specification differences

Oracle database

If there is no argument for packageName.featureName, parenthesis can be omitted.

FUJITSU Enterprise Postgres

Even if there is no argument for packageName.featureName, parenthesis cannot be omitted.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_OUTPUT.NEW_LINE" is used in the stored procedure.
2. If there is no parenthesis after packageName.featureName, add the parenthesis.

B.5.2 Receiving a Return Value from a Procedure (PL/SQL) Block
(For GET_LINES)

Oracle database

```
set serveroutput off;

DECLARE
  v_num        INTEGER;
BEGIN
  DBMS_OUTPUT.DISABLE; ...(3)
  DBMS_OUTPUT.ENABLE(20000); ...(4)
  DBMS_OUTPUT.PUT_LINE('-- ITEM CHECK --');

  SELECT count(*) INTO v_num FROM t1;
  IF v_num = 0 THEN
    DBMS_OUTPUT.PUT_LINE('-- NO ITEM --');
  ELSE
    DBMS_OUTPUT.PUT_LINE('-- IN ITEM(' || v_num || ') --');
  END IF;
END;
/

set serveroutput on;

DECLARE
  v_buffs      DBMSOUTPUT_LINESARRAY; ...(5)
  v_num        INTEGER := 10;
BEGIN
  DBMS_OUTPUT.GET_LINES(v_buffs, v_num); ...(5)
  FOR i IN 1..v_num LOOP
    DBMS_OUTPUT.PUT_LINE('LOG : ' || v_buffs(i)); ...(5)
  END LOOP;
```

- 135 -
FUJITSU Enterprise Postgres

DO $$
DECLARE
  v_num        INTEGER;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(FALSE);
  PERFORM DBMS_OUTPUT.DISABLE(); ...(3)
  PERFORM DBMS_OUTPUT.ENABLE(20000); ...(4)
  PERFORM DBMS_OUTPUT.PUT_LINE('-- ITEM CHECK --');

  SELECT count(*) INTO v_num FROM t1;
  IF v_num = 0 THEN
    PERFORM DBMS_OUTPUT.PUT_LINE('-- NO ITEM --');
  ELSE
    PERFORM DBMS_OUTPUT.PUT_LINE('-- IN ITEM(' || v_num || ') --');
  END IF;
END;
$$

DO $$
DECLARE
  v_buffs      VARCHAR[]; ...(5)
  v_num        INTEGER := 10;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
  SELECT lines, numlines INTO v_buffs, v_num FROM DBMS_OUTPUT.GET_LINES(v_num); ...(5)
  FOR i IN 1..v_num LOOP
    PERFORM DBMS_OUTPUT.PUT_LINE('LOG : ' || v_buffs[i]); ...(5)
  END LOOP;
END;
$$

(3) DISABLE
Same as the NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE for information on specification differences and conversion procedures associated with specification differences.

(4) ENABLE
Same as NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE for information on specification differences and conversion procedures associated with specification differences.

(5) GET_LINES
Specification format for Oracle database

DBMS_OUTPUT.GET_LINES(firstArg, secondArg)

Specification differences
Oracle database

  Obtained values are received with variables specified for arguments.
Since obtained values are the search results for DBMS_OUTPUT.GET_LINES, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_OUTPUT.GET_LINES" is used in the stored procedure.

2. Change the data type (DBMS_OUTPUT_LINESARRAY in the example) of the variable (v_buffs in the example) specified as firstArg of DBMS_OUTPUT.GET_LINES into a VARCHAR type array (VARCHAR[] in the example).

3. Replace the DBMS_OUTPUT.GET_LINES location called with a SELECT INTO statement.
   - Use the literal "lines, numlines" in the select list.
   - Specify firstArg (v_buffs in the example) and secondArg (v_num in the example) configured in DBMS_OUTPUT.GET_LINES, in the INTO clause.
   - Use DBMS_OUTPUT.GET_LINES in the FROM clause. Specify only secondArg (v_num in the example) before modification.

4. Identify the location that references firstArg (v_buffs in the example), and change it to the PL/pgSQL array reference format (v_buffs[i] in the example).

**B.5.3 Receiving a Return Value from a Procedure (PL/SQL) Block (For GET_LINE)**

Oracle database

```sql
set serveroutput on;

DECLARE
  v_buff1 VARCHAR2(100);
  v_buff2 VARCHAR2(1000);
  v_num INTEGER;
BEGIN
  v_buff2 := '';
  LOOP
    DBMS_OUTPUT.GET_LINE(v_buff1, v_num); ...(6)
    EXIT WHEN v_num = 1;
    v_buff2 := v_buff2 || v_buff1;
  END LOOP;
  DBMS_OUTPUT.PUT_LINE(v_buff2);
END;
/
```

* Only the process to obtain a value is stated

FUJITSU Enterprise Postgres

```sql
DO $$
DECLARE
  v_buff1 VARCHAR(100);
  v_buff2 VARCHAR(1000);
  v_num INTEGER;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
  v_buff2 := '';
  LOOP
```

-137-
SELECT line, status INTO v_buff1, v_num FROM DBMS_OUTPUT.GET_LINE(); ...(6)
EXIT WHEN v_num = 1;
v_buff2 := v_buff2 || v_buff1;
END LOOP;
PERFORM DBMS_OUTPUT.PUT_LINE(v_buff2);
END;
$$

* Only the process to obtain a value is stated

(6) GET_LINE

Specification format for Oracle database

DBMS_OUTPUT.GET_LINE(firstArg, secondArg)

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the search results for DBMS_OUTPUT.GET_LINES, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_OUTPUT.GET_LINE" is used in the stored procedure.

2. Replace the DBMS_OUTPUT.GET_LINE location called with a SELECT INTO statement.

   - Use the literal "line, status" in the select list.
   - Specify firstArg (v_buff1 in the example) and secondArg (v_num in the example) configured in DBMS_OUTPUT.GET_LINE, in the INTO clause.
   - Use DBMS_OUTPUT.GET_LINE in the FROM clause. Although arguments are not specified, parenthesis must be specified.

B.6 UTL_FILE (Perform File Operation)

Features

UTL_FILE reads and writes text files from PL/pgSQL.

B.6.1 Registering a Directory to Load and Write Text Files

Oracle database

[Oracle9i or earlier]
Configure the following with initialization parameter

```
UTL_FILE_DIR='/home/fsep' ...(1)
```

[Oracle9.2i or later]
Configure the following with CREATE DIRECTORY statement

```
CREATE DIRECTORY DIR AS '/home/fsep'; ...(1)
```
(1) UTL_FILE_DIR/CREATE DIRECTORY

Feature differences

Oracle database

Configure the directory to be operated, using the CREATE DIRECTORY statement or the initialization parameter UTL_FILE_DIR.

FUJITSU Enterprise Postgres

The directory to be operated cannot be configured using the CREATE DIRECTORY statement or the initialization parameter UTL_FILE_DIR.

Conversion procedure

Configure the target directory information in the UTL_FILE.UTL_FILE_DIR table using the INSERT statement. Note that this conversion procedure should be performed only once before executing the PL/pgSQL function.

- When using the initialization parameter UTL_FILE_DIR:
  1. Check the initialization parameter UTL_FILE_DIR value ('/home/fsep' in the example).
  2. Using the INSERT statement, specify and execute the directory name checked in step 1.
     - Specify UTL_FILE.UTL_FILE_DIR(dir) for the INTO clause.
     - Using the character string literal ('/home/fsep' in the example), specify the target directory name for the VALUES clause.
     - If multiple directories are specified, execute the INSERT statement for each directory.

- When using the CREATE DIRECTORY statement:
  1. Check the directory name ('/home/fsep' in the example) registered with the CREATE DIRECTORY statement. To check, log in SQL*Plus as a user with DBA privileges, and execute ”show ALL_DIRECTORIES;”.
  2. Using the INSERT statement, specify and execute the directory name checked in step 1. Same steps are used to specify the INSERT statement as when using the initialization parameter UTL_FILE_DIR.

B.6.2 Checking File Information

Oracle database

CREATE PROCEDURE read_file(fname VARCHAR2) AS
  v_file      UTL_FILE.FILE_TYPE;
  v_exists    BOOLEAN;
  v_length    NUMBER;
  v_bsize     INTEGER;
  v_rbuff     VARCHAR2(1024);
BEGIN

  UTL_FILE.FGETATTR('DIR', fname, v_exists, v_length, v_bsize); ...(2)

  IF v_exists <> true THEN
    DBMS_OUTPUT.PUT_LINE('-- FILE NOT FOUND --');
    RETURN;
  END IF;

END read_file;

- 139 -
DBMS_OUTPUT.PUT_LINE('-- FILE DATA --');

v_file := UTL_FILE.FOPEN('DIR', fname, 'r', 1024); ...(3)
FOR i IN 1..3 LOOP
    UTL_FILE.GET_LINE(v_file, v_rbuff, 1024); ...(4)
    DBMS_OUTPUT.PUT_LINE(v_rbuff);
END LOOP;
DBMS_OUTPUT.PUT_LINE('... more');
DBMS_OUTPUT.PUT_LINE('-- READ END --');

UTL_FILE.FCLOSE(v_file); ...(5)
RETURN;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.PUT_LINE('-- FILE END --');
        UTL_FILE.FCLOSE(v_file);
        RETURN;
    WHEN OTHERS THEN
        DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
        DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
        UTL_FILE.FCLOSE_ALL; ...(6)
        RETURN;
END;
/

set serveroutput on
call read_file('file01.txt');

CREATE FUNCTION read_file(fname VARCHAR) RETURNS void AS $$
DECLARE
    v_file      UTL_FILE.FILE_TYPE;
    v_exists    BOOLEAN;
    v_length    NUMERIC;
    v_bsize     INTEGER;
    v_rbuff     VARCHAR(1024);
BEGIN
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);

    SELECT fexists, file_length, blocksize
    INTO v_exists, v_length, v_bsize
    FROM UTL_FILE.FGETATTR('/home/fsep', fname); ...(2)
    IF v_exists <> true THEN
        PERFORM DBMS_OUTPUT.PUT_LINE('-- FILE NOT FOUND --');
        RETURN;
    END IF;

    PERFORM DBMS_OUTPUT.PUT_LINE('-- FILE DATA --');
    v_file := UTL_FILE.FOPEN('/home/fsep', fname, 'w', 1024); ...(3)
    FOR i IN 1..3 LOOP
        v_rbuff := UTL_FILE.GET_LINE(v_file, 1024); ...(4)
        PERFORM DBMS_OUTPUT.PUT_LINE(v_rbuff);
    END LOOP;
    PERFORM DBMS_OUTPUT.PUT_LINE('... more');
    PERFORM DBMS_OUTPUT.PUT_LINE('-- READ END --');

    v_file := UTL_FILE.FCLOSE(v_file); ...(5)
$$
-- 140 --
(2) FGETATTR

Specification format for Oracle database

UTL_FILE.FGETATTR(firstArg, secondArg, thirdArg, fourthArg, fifthArg)

Feature differences

Oracle database

If using a CREATE DIRECTORY statement (Oracle9.2i or later), specify a directory object name for the directory name.

FUJITSU Enterprise Postgres

A directory object name cannot be specified for the directory name.

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the search results for UTL_FILE.FGETATTR, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure. Refer to UTL_FILE_DIR/CREATE DIRECTORY for information on how to check if the directory object name corresponds to the actual directory name.

1. Locate the places where the keyword "UTL_FILE.FOPEN" is used in the stored procedure.

2. Check the actual directory name ('/home/fsep' in the example) that corresponds to the directory object name ('DIR' in the example).

3. Replace the directory object name ('DIR' in the example) in firstArg with the actual directory name ('/home/fsep' in the example) verified in step 2.

4. Replace the UTL_FILE.FGETATTR location called with a SELECT INTO statement.

   - Use the literal "fexists, file_length, blocksize" in the select list.
   - Specify thirdArg, fourthArg, and fifthArg (v_exists, v_length, v_bsize, in the example) specified for UTL_FILE.FGETATTR to the INTO clause in the same order as that of the arguments.
   - Use UTL_FILE.FGETATTR in the FROM clause. Specify only the actual directory name for firstArg ('/home/fsep' in the example) and secondArg (fname in the example) before modification for the arguments.
(3) FOPEN
Specification format for Oracle

UTL_FILE.FOPEN(firstArg, secondArg, thirdArg, fourthArg, fifthArg)

Feature differences

Oracle database

If using a CREATE DIRECTORY statement (Oracle9.2i or later), specify a directory object name for the directory name.

FUJITSU Enterprise Postgres

A directory object name cannot be specified for the directory name.

Conversion procedure

Convert using the following procedure. Refer to UTL_FILE_DIR/CREATE DIRECTORY for information on how to check if the directory object name corresponds to the actual directory name.

1. Locate the places where the keyword "UTL_FILE.FOPEN" is used in the stored procedure.
2. Check the actual directory name ('/home/fsep' in the example) that corresponds to the directory object name ('DIR' in the example).
3. Replace the directory object name ('DIR' in the example) in firstArg with the actual directory name ('/home/fsep' in the example) checked in step 1.

(4) GET_LINE
Specification format for Oracle database

UTL_FILE.GET_LINE(firstArg, secondArg, thirdArg, fourthArg)

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the returned value of UTL_FILE.GET_LINE, they are received with variables specified for substitution statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "UTL_FILE.GET_LINE" is used in the stored procedure.
2. Replace the UTL_FILE.GET_LINE location called with a value assignment (:=).
   - On the left-hand side, specify secondArg (v_rbuff in the example) specified for UTL_FILE.GET_LINE.
   - Use UTL_FILE.GET_LINE in the right-hand side. Specify only firstArg (v_file in the example) and thirdArg (1024 in the example) before modification.

(5) FCLOSE
Specification format for Oracle database

UTL_FILE.FCLOSE(firstArg)

Specification differences

Oracle database

After closing, the file handler specified for the argument becomes NULL.
FUJITSU Enterprise Postgres

After closing, set the file handler to NULL by assigning the return value of UTL_FILE.FCLOSE to it.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "UTL_FILE.FCLOSE" is used in the stored procedure.
2. Replace the UTL_FILE.FCLOSE location called with a value assignment (:=) so that the file handler (v_file in the example) becomes NULL.
   - On the left-hand side, specify the argument (v_file in the example) specified for UTL_FILE.FCLOSE.
   - Use UTL_FILE.FCLOSE in the right-hand side. For the argument, specify the same value (v_file in the example) as before modification.

(6) FCLOSE_ALL

Same as NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE in the DBMS_OUTPUT for information on specification differences and conversion procedures associated with specification differences.

B.6.3 Copying Files

Oracle database

```
CREATE PROCEDURE copy_file(fromname VARCHAR2, toname VARCHAR2) AS
BEGIN
    UTL_FILE.FCOPY('DIR1', fromname, 'DIR2', toname, 1, NULL); ...(7)
    RETURN;
END;
/
```

```
set serveroutput on
call copy_file('file01.txt','file01_bk.txt');
```

FUJITSU Enterprise Postgres

```
CREATE FUNCTION copy_file(fromname VARCHAR, toname VARCHAR) RETURNS void AS $$
BEGIN
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);

    PERFORM UTL_FILE.FCOPY('/home/fsep', fromname, '/home/backup', toname, 1, NULL); ...(7)
    RETURN;
END;
$$
```

```
set serveroutput on
call copy_file('file01.txt','file01_bk.txt');
```
(7) FCOPY

Specification format for Oracle database

UTL_FILE.FCOPY(firstArg, secondArg, thirdArg, fourthArg, fifthArg, sixthArg)

Feature differences

Oracle database

If using a CREATE DIRECTORY statement (Oracle9.2i or later), specify a directory object name for the directory name.

FUJITSU Enterprise Postgres

A directory object name cannot be specified for the directory name.

Conversion procedure

Convert using the following procedure. Refer to UTL_FILE_DIR/CREATE DIRECTORY for information on how to check if the directory object name corresponds to the actual directory name.

1. Locate the places where the keyword "UTL_FILE.FCOPY" is used in the stored procedure.
2. Check the actual directory names ('/home/fsep' and '/home/backup', in the example) that correspond to the directory object names ('DIR1' and 'DIR2', in the example) of firstArg and thirdArg argument.
3. Replace the directory object name ('DIR1' and 'DIR2', in the example) with the actual directory names ('/home/fsep' in the example) checked in step 1.

B.6.4 Moving/Renaming Files

Oracle database

```
CREATE PROEDURE move_file(fromname VARCHAR2, toname VARCHAR2) AS
BEGIN
    UTL_FILE.FRENAME('DIR1', fromname, 'DIR2', toname, FALSE); ...(8)
    RETURN;
EXCEPTION
    WHEN OTHERS THEN
        DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
    RETURN;
END;
/

set serveroutput on
call move_file('file01.txt','file02.txt');
```

FUJITSU Enterprise Postgres

```
CREATE FUNCTION move_file(fromname VARCHAR, toname VARCHAR) RETURNS void AS $$
BEGIN
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
$$
```
PERFORM UTL_FILE.FRENAME('/home/fsep', fromname, '/home/backup', toname, FALSE); ...(8)
RETURN;

EXCEPTION
WHEN OTHERS THEN
    PERFORM DBMS_OUTPUT.PUT_LINE('--- SQL Error ---');
    PERFORM DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM );
RETURN;
END;
$$
LANGUAGE plpgsql;

SELECT move_file('file01.txt','file02.txt');

(8) FRENAME
Same as FCOPY for the UTL_FILE package. Refer to FCOPY in the UTL_FILE package for information on specification differences and conversion procedures associated with specification differences.

B.7 DBMS_SQL (Execute Dynamic SQL)

Features
For DBMS_SQL, dynamic SQL can be executed from PL/pgSQL.

B.7.1 Searching Using a Cursor

Oracle database

CREATE PROCEDURE search_test(h_where CLOB) AS

    str_sql    CLOB;
    v_cnt      INTEGER;
    v_array    DBMS_SQL.VARCHAR2A;
    v_cur      INTEGER;
    v_smpid    INTEGER;
    v_smpnm    VARCHAR2(20);
    v_smpage   VARCHAR2(20);
    v_addbuff  VARCHAR2(20);
    v_smpage   INTEGER;
    errcd      INTEGER;
    length     INTEGER;
    ret        INTEGER;
BEGIN

    str_sql := 'SELECT smpid, smpnm FROM smp_tbl WHERE ' || h_where || ' ORDER BY smpid';
    v_smpid := 0;
    v_smpnm := '';
    v_smpage := 0;

    v_cur := DBMS_SQL.OPEN_CURSOR; ...(1)

    v_cnt :=
        CEIL(DBMS_LOB.GETLENGTH(str_sql)/1000);
FOR idx IN 1 .. v_cnt LOOP
    v_array(idx) :=
        DBMS_LOB.SUBSTR(str_sql,
                        1000,
                        (idx-1)*1000+1));

- 145 -
BEGIN LOOP;
  DBMS_SQL.PARSE(v_cur, v_array, 1, v_cnt, FALSE, DBMS_SQL.NATIVE); ...(2)
  DBMS_SQL.DEFINE_COLUMN(v_cur, 1, v_smpid);
  DBMS_SQL.DEFINE_COLUMN(v_cur, 2, v_smpnm, 10);
  ret := DBMS_SQL.EXECUTE(v_cur);
  LOOP
    v_addbuff := '';
    IF DBMS_SQL.FETCH_ROWS(v_cur) = 0 THEN
      EXIT;
    END IF;
    DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
    DBMS_SQL.COLUMN_VALUE(v_cur, 1, v_smpid, errcd, length); ...(3)
    IF errcd = 1405 THEN ...(3)
      DBMS_OUTPUT.PUT_LINE('smpid       = (NULL)');
    ELSE
      DBMS_OUTPUT.PUT_LINE('smpid       = ' || v_smpid);
    END IF;
    DBMS_SQL.COLUMN_VALUE(v_cur, 2, v_smpnm, errcd, length);
    IF errcd = 1406 THEN
      v_addbuff := '... [len=' || length || '];
    END IF;
    IF errcd = 1405 THEN
      DBMS_OUTPUT.PUT_LINE('v_smpnm     = (NULL)');
    ELSE
      DBMS_OUTPUT.PUT_LINE('v_smpnm     = ' || v_smpnm || v_addbuff );
    END IF;
    DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
    DBMS_OUTPUT.NEW_LINE;
  END LOOP;
  DBMS_SQL.CLOSE_CURSOR(v_cur); ...(4)
  RETURN;
END;
/
Set serveroutput on
call search_test('smpid < 100');

FUJITSU Enterprise Postgres

CREATE FUNCTION search_test(h_where text) RETURNS void AS $5
DECLARE
  str_sql    text;
  v_cur      INTEGER;
v_smpid     INTEGER;
v_smpnm     VARCHAR(20);
v_addbuff   VARCHAR(20);
v_smpage    INTEGER;
errcd       INTEGER;
length      INTEGER;
ret         INTEGER;

BEGIN
PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
str_sql := 'SELECT smpid, smpnm FROM smp_tbl WHERE ' || h_where || ' ORDER BY smpid';
v_smpid := 0;
v_smpnm := '';
v_smpage := 0;

v_cur := DBMS_SQL.OPEN_CURSOR(); ...(1)
PERFORM DBMS_SQL.PARSE(v_cur, str_sql, 1); ...(2)
PERFORM DBMS_SQL.DEFINE_COLUMN(v_cur, 1, v_smpid);
PERFORM DBMS_SQL.DEFINE_COLUMN(v_cur, 2, v_smpnm, 10);
ret := DBMS_SQL.EXECUTE(v_cur);
LOOP
  v_addbuff := '';
  IF DBMS_SQL.FETCH_ROWS(v_cur) = 0 THEN
    EXIT;
  END IF;
  PERFORM
  DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
  SELECT value,column_error,actual_length
  INTO v_smpid, errcd, length
  FROM DBMS_SQL.COLUMN_VALUE(v_cur, 1, v_smpid); ...(3)
  IF errcd = 22002 THEN ...(3)
    PERFORM DBMS_OUTPUT.PUT_LINE('smpid       = (NULL)');
  ELSE
    PERFORM DBMS_OUTPUT.PUT_LINE('smpid       = ' || v_smpid);
  END IF;
  SELECT value,column_error,actual_length INTO v_smpnm, errcd, length FROM
  DBMS_SQL.COLUMN_VALUE(v_cur, 2, v_smpnm);
  IF errcd = 22001 THEN
    v_addbuff := '...' [len=' || length || ']';
  END IF;
  IF errcd = 22002 THEN

  ELSE
    PERFORM DBMS_OUTPUT.PUT_LINE('smpnm       = ' || v_smpnm || v_addbuff);
  END IF;
  PERFORM
  DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
  PERFORM DBMS_OUTPUT.NEW_LINE();
END LOOP;

v_cur := DBMS_SQL.CLOSE_CURSOR(v_cur); ...(4)
RETURN;
END;
$$
LANGUAGE plpgsql;
SELECT search_test('smpid < 100');

(1) OPEN_CURSOR
   Same as NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE in the DBMS_OUTPUT package for information on specification differences and conversion procedures associated with specification differences.

(2) PARSE
   Specification format for Oracle database
   DBMS_SQL.PARSE(firstArg, secondArg, thirdArg, fourthArg, fifthArg)
   Feature differences
   Oracle database
      SQL statements can be specified with string table types (VARCHAR2A type, VARCHAR2S type). Specify this for secondArg.
      DBMS_SQL.NATIVE, DBMS_SQL.V6, DBMS_SQL.V7 can be specified for processing SQL statements.
   FUJITSU Enterprise Postgres
      SQL statements cannot be specified with string table types.
      DBMS_SQL.NATIVE, DBMS_SQL.V6, DBMS_SQL.V7 cannot be specified for processing SQL statements.
   Conversion procedure
      Convert using the following procedure:
      1. Locate the places where the keyword "DBMS_SQL.PARSE" is used in the stored procedure.
      2. Check the data type of the SQL statement specified for secondArg (v_array in the example).
         - If the data type is either DBMS_SQL.VARCHAR2A type or DBMS_SQL.VARCHAR2S type, then it is a table type specification. Execute step 3 and continue the conversion process.
         - If the data type is neither DBMS_SQL.VARCHAR2A type nor DBMS_SQL.VARCHAR2S type, then it is a string specification. Execute step 7 and continue the conversion process.
      3. Check the SQL statement (str_sql in the example) before it was divided into DBMS_SQL.VARCHAR2A type and DBMS_SQL.VARCHAR2S type.
      4. Delete the sequence of the processes (processes near FOR idx in the example) where SQL is divided into DBMS_SQL.VARCHAR2A type and DBMS_SQL.VARCHAR2S type.
      5. Replace secondArg with the SQL statement (str_sql in the example) before it is divided, that was checked in step 2.
      6. Delete thirdArg, fourthArg, and fifthArg (v_cnt, FALSE, DBMS_SQL.NATIVE, in the example).
      7. If DBMS_SQL.NATIVE, DBMS_SQL.V6, and DBMS_SQL.V7 are specified, then replace thirdArg with a numeric literal 1.
         - If either DBMS_SQL.VARCHAR2A type or DBMS_SQL.VARCHAR2S type is used, then sixthArg becomes relevant.
         - If neither DBMS_SQL.VARCHAR2A type nor DBMS_SQL.VARCHAR2S type is used, then thirdArg becomes relevant.

(3) COLUMN_VALUE
   Specification format for Oracle database
   DBMS_SQL.COLUMN_VALUE(firstArg, secondArg, thirdArg, fourthArg, fifthArg)
Feature differences

Oracle database

The following error codes are returned for column_error.
- 1406: fetched column value was truncated
- 1405: fetched column value is NULL

FUJITSU Enterprise Postgres

The following error codes are returned for column_error.
- 22001: string_data_right_truncation
- 22002: null_value_no_indicator_parameter

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the search results for DBMS_SQL.COLUMN_VALUE, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_SQL.COLUMN_VALUE" is used in the stored procedure.
2. Replace the DBMS_SQL.COLUMN_VALUE location called with a SELECT INTO statement.
   - Check the number of arguments (v_smpid, errcd, and length in the example) specified after secondArg (1 in the example) of DBMS_SQL.COLUMN_VALUE.
   - Specify "value", "column_error", and "actual_length" in the select list, according to the number of arguments checked in the previous step (for example, if only thirdArg is specified, then specify "value" only.)
   - Specify thirdArg, fourthArg, and fifthArg (v_smpid, errcd, length in the example) configured for DBMS_SQL.COLUMN_VALUE, for the INTO clause.
   - Use DBMS_SQL.COLUMN_VALUE in the FROM clause. Specify firstArg, secondArg, and thirdArg (v_cur, 1, v_smpid, in the example) before modification.
3. If the fourthArg (column_error value in the example) is used, then check the location of the target variable (errcd in the example).
4. If a decision process is performed in the location checked, then modify the values used in the decision process as below:
   - 1406 to 22001
   - 1405 to 22002

(4) CLOSE_CURSOR

Specification format for Oracle database

DBMS_SQL.CLOSE_CURSOR(firstArg)

Specification differences

Oracle database

After closing, the cursor specified in firstArg becomes NULL.
FUJITSU Enterprise Postgres

After closing, set the cursor to NULL by assigning the return value of DBMS_SQL.CLOSE_CURSOR to it.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_SQL.CLOSE_CURSOR" is used in the stored procedure.
2. Set the cursor to NULL by assigning (=) the return value of DBMS_SQL.CLOSE_CURSOR to it.
   - On the left-hand side, specify the argument (v_cur in the example) specified for DBMS_SQL.CLOSE_CURSOR.
   - Use DBMS_SQL.CLOSE_CURSOR in the right-hand side. For the argument, specify the same value (v_cur in the example) as before modification.
This chapter describes the tables used by the features compatible with Oracle databases.

C.1 UTL_FILE.UTL_FILE_DIR

Register the directory handled by the UTL_FILE package in the UTL_FILE.UTL_FILE_DIR table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>text</td>
<td>Name of the directory handled by the UTL_FILE package</td>
</tr>
</tbody>
</table>
Appendix D  ECOBPG - Embedded SQL in COBOL

This appendix describes application development using embedded SQL in COBOL.

D.1 Precautions when Using Functions and Operators

An embedded SQL program consists of code written in an ordinary programming language, in this case COBOL, mixed with SQL commands in specially marked sections. To build the program, the source code (*.pco) is first passed through the embedded SQL preprocessor, which converts it to an ordinary COBOL program (*.cob), and afterwards it can be processed by a COBOL compiler. (For details about the compiling and linking see "D.9 Processing Embedded SQL Programs".) Converted ECOBPG applications call functions in the libpq library through the embedded SQL library (ecpglib), and communicate with the PostgreSQL server using the normal frontend-backend protocol.

Embedded SQL has advantages over other methods for handling SQL commands from COBOL code. First, it takes care of the tedious passing of information to and from variables in your C program. Second, the SQL code in the program is checked at build time for syntactical correctness. Third, embedded SQL in COBOL is specified in the SQL standard and supported by many other SQL database systems. The PostgreSQL implementation is designed to match this standard as much as possible, and it is usually possible to port embedded SQL programs written for other SQL databases to PostgreSQL with relative ease.

As already stated, programs written for the embedded SQL interface are normal COBOL programs with special code inserted to perform database-related actions. This special code always has the form:

```
EXEC SQL ... END-EXEC
```

These statements syntactically take the place of a COBOL statement. Depending on the particular statement, they can appear at the data division or at the procedure division. Actual executable SQLs need to be placed at the procedure division, and host variable declarations need to be placed at data division. However, the precompiler does not validate their placements. Embedded SQL statements follow the case-sensitivity rules of normal SQL code, and not those of COBOL.

For COBOL code notation, "fixed" or "variable" can be used. In each line, columns 1 to 6 constitute the line number area, and column 7 is the indicator area. Embedded SQL programs also should be placed in area B (column 12 and beyond).

Note that sample code in this document omits indents for each area.

ECOBPG processes or outputs programs according to the COBOL code notation. COBOL code notation is specified using the ecobpg command. Note, however, that the following restrictions apply:

- For "fixed" notation, area B is from columns 12 to 72. Characters in column 73 and beyond are deleted in the precompiled source.
- For "variable" notation, area B is from column 12 to the last column of that record (up to column 251). Characters in column 252 and beyond are deleted in the precompiled source.

ECOBPG accepts as many COBOL statements as possible. Note, however, that the following restrictions apply:

- In declaring host variable section, you can't use debug line.
- Outside of declaring host variable section, you can use debug line, but you can't contain any SQL in debug lines.
- In declaring host variable section, you can't use commas or semicolons as separator. Use space instead.
- EXEC SQL VAR command, it can be used in ECPG, is not available in ECOBPG. Use REDEFINE clause of COBOL instead.

The following sections explain all the embedded SQL statements.
D.2 Managing Database Connections

This section describes how to open, close, and switch database connections.

D.2.1 Connecting to the Database Server

One connects to a database using the following statement:

```sql
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name] END-EXEC.
```

The target can be specified in the following ways:

- `dbname[@hostname][:port]`
- `tcp:postgresql://hostname[:port][/dbname][?options]`
- `unix:postgresql://hostname[:port][/dbname][?options]`
- an SQL string literal containing one of the above forms
- a reference to a character variable containing one of the above forms (see examples)
- `DEFAULT`

If you specify the connection target literally (that is, not through a variable reference) and you don't quote the value, then the case-insensitivity rules of normal SQL are applied. In that case you can also double-quote the individual parameters separately as needed. In practice, it is probably less error-prone to use a (single-quoted) string literal or a variable reference. The connection target `DEFAULT` initiates a connection to the default database under the default user name. No separate user name or connection name can be specified in that case.

There are also different ways to specify the user name:

- `username`
- `username/password`
- `username IDENTIFIED BY password`
- `username USING password`

As above, the parameters `username` and `password` can be an SQL identifier, an SQL string literal, or a reference to a character variable.

The connection-name is used to handle multiple connections in one program. It can be omitted if a program uses only one connection. The most recently opened connection becomes the current connection, which is used by default when an SQL statement is to be executed (see later in this chapter).

Here are some examples of CONNECT statements:

```sql
EXEC SQL CONNECT TO mydb@sql.mydomain.com END-EXEC.

EXEC SQL CONNECT TO tcp:postgresql://sql.mydomain.com/mydb AS myconnection USER john END-EXEC.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 TARGET PIC X(25).
  01 USER PIC X(5).
EXEC SQL END DECLARE SECTION END-EXEC.

  ...  
  MOVE "mydb@sql.mydomain.com" TO TARGET.
  MOVE "john" TO USER.
EXEC SQL CONNECT TO :TARGET USER :USER END-EXEC.
```
The last form makes use of the variant referred to above as character variable reference. For this purpose, only fixed-length string (no VARYING) variable can be used. Trailing spaces are ignored. You will see in later sections how COBOL variables can be used in SQL statements when you prefix them with a colon.

Be advised that the format of the connection target is not specified in the SQL standard. So if you want to develop portable applications, you might want to use something based on the last example above to encapsulate the connection target string somewhere.

D.2.2 Choosing a Connection

SQL statements in embedded SQL programs are by default executed on the current connection, that is, the most recently opened one. If an application needs to manage multiple connections, then there are two ways to handle this.

The first option is to explicitly choose a connection for each SQL statement, for example:

```
EXEC SQL AT connection-name SELECT ... END-EXEC.
```

This option is particularly suitable if the application needs to use several connections in mixed order.

If your application uses multiple threads of execution, they cannot share a connection concurrently. You must either explicitly control access to the connection (using mutexes) or use a connection for each thread. If each thread uses its own connection, you will need to use the AT clause to specify which connection the thread will use.

The second option is to execute a statement to switch the current connection. That statement is:

```
EXEC SQL SET CONNECTION connection-name END-EXEC.
```

This option is particularly convenient if many statements are to be executed on the same connection. It is not thread-aware.

Here is an example program managing multiple database connections:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
    DBNAME PIC X(7).
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL CONNECT TO testdb1 AS con1 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb2 AS con2 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb3 AS con3 USER testuser END-EXEC.
*   This query would be executed in the last opened database "testdb3".
    EXEC SQL SELECT current_database() INTO :DBNAME END-EXEC.
    DISPLAY "current=" DBNAME " (should be testdb3)".
*   Using "AT" to run a query in "testdb2"
    EXEC SQL AT con2 SELECT current_database() INTO :DBNAME END-EXEC.
    DISPLAY "current=" DBNAME " (should be testdb2)".
*   Switch the current connection to "testdb1".
    EXEC SQL SET CONNECTION con1 END-EXEC.
    EXEC SQL SELECT current_database() INTO :DBNAME END-EXEC.
    DISPLAY "current=" DBNAME " (should be testdb1)".
EXEC SQL DISCONNECT ALL END-EXEC.
```

This example would produce this output:

```
current=testdb3 (should be testdb3)
current=testdb2 (should be testdb2)
current=testdb1 (should be testdb1)
```
D.2.3 Closing a Connection

To close a connection, use the following statement:

```
EXEC SQL DISCONNECT [connection] END-EXEC.
```

The connection can be specified in the following ways:

- connection-name
- DEFAULT
- CURRENT
- ALL

If no connection name is specified, the current connection is closed.

It is good style that an application always explicitly disconnect from every connection it opened.

D.3 Running SQL Commands

Any SQL command can be run from within an embedded SQL application. Below are some examples of how to do that.

D.3.1 Executing SQL Statements

Creating a table:

```
EXEC SQL CREATE TABLE foo (number integer, ascii char(16)) END-EXEC.
EXEC SQL CREATE UNIQUE INDEX num1 ON foo(number) END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

Inserting rows:

```
EXEC SQL INSERT INTO foo (number, ascii) VALUES (9999, 'doodad') END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

Deleting rows:

```
EXEC SQL DELETE FROM foo WHERE number = 9999 END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

Updates:

```
EXEC SQL UPDATE foo
    SET ascii = 'foobar'
    WHERE number = 9999 END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

SELECT statements that return a single result row can also be executed using EXEC SQL directly. To handle result sets with multiple rows, an application has to use a cursor; see "D.3.2 Using Cursors" below. (As a special case, an application can fetch multiple rows at once into an array host variable; see "Arrays".)

Single-row select:

```
EXEC SQL SELECT foo INTO :FooBar FROM table1 WHERE ascii = 'doodad' END-EXEC.
```

Also, a configuration parameter can be retrieved with the SHOW command:

```
EXEC SQL SHOW search_path INTO :var END-EXEC.
```

The tokens of the form :something are host variables, that is, they refer to variables in the COBOL program. They are explained in "D.4 Using Host Variables".
D.3.2 Using Cursors

To retrieve a result set holding multiple rows, an application has to declare a cursor and fetch each row from the cursor. The steps to use a cursor are the following: declare a cursor, open it, fetch a row from the cursor, repeat, and finally close it.

Select using cursors:

```
EXEC SQL DECLARE foo_bar CURSOR FOR
    SELECT number, ascii FROM foo
    ORDER BY ascii END-EXEC.
EXEC SQL OPEN foo_bar END-EXEC.
EXEC SQL FETCH foo_bar INTO :FooBar, :DooDad END-EXEC.
...
EXEC SQL CLOSE foo_bar END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

For more details about declaration of the cursor, see "D.11.4 DECLARE", and refer to "SQL Commands" in “Reference” in the PostgreSQL Documentation for information on FETCH command.

Note: The ECOBPG DECLARE command does not actually cause a statement to be sent to the PostgreSQL backend. The cursor is opened in the backend (using the backend's DECLARE command) at the point when the OPEN command is executed.

D.3.3 Managing Transactions

In the default mode, statements are committed only when EXEC SQL COMMIT is issued. The embedded SQL interface also supports autocommit of transactions (similar to libpq behavior) via the -t command-line option to ecobpg or via the EXEC SQL SET AUTOCOMMIT TO ON statement. In autocommit mode, each command is automatically committed unless it is inside an explicit transaction block. This mode can be explicitly turned off using EXEC SQL SET AUTOCOMMIT TO OFF.

Refer to "ecpg" in "PostgreSQL Client Applications" in the PostgreSQL Documentation for information on -t command-line option to ecobpg.

The following transaction management commands are available:

- EXEC SQL COMMIT END-EXEC
  Commit an in-progress transaction.
- EXEC SQL ROLLBACK END-EXEC
  Roll back an in-progress transaction.
- EXEC SQL SET AUTOCOMMIT TO ON END-EXEC
  Enable autocommit mode.
- EXEC SQL SET AUTOCOMMIT TO OFF END-EXEC
  Disable autocommit mode. This is the default.

D.3.4 Prepared Statements

When the values to be passed to an SQL statement are not known at compile time, or the same statement is going to be used many times, then prepared statements can be useful.

The statement is prepared using the command PREPARE. For the values that are not known yet, use the placeholder "?":

```
EXEC SQL PREPARE stmt1 FROM "SELECT oid, datname FROM pg_database WHERE oid = ?" END-EXEC.
```

If a statement returns a single row, the application can call EXECUTE after PREPARE to execute the statement, supplying the actual values for the placeholders with a USING clause:
EXEC SQL EXECUTE stmt1 INTO :dboid, :dbname USING 1 END-EXEC.

If a statement returns multiple rows, the application can use a cursor declared based on the prepared statement. To bind input parameters, the cursor must be opened with a USING clause:

EXEC SQL PREPARE stmt1 FROM "SELECT oid, datname FROM pg_database WHERE oid > ?" END-EXEC.
EXEC SQL DECLARE foo_bar CURSOR FOR stmt1 END-EXEC.

* when end of result set reached, break out of while loop
EXEC SQL WHENEVER NOT FOUND GOTO FETCH-END END-EXEC.

EXEC SQL OPEN foo_bar USING 100 END-EXEC.

...  
PERFORM NO LIMIT  
   EXEC SQL FETCH NEXT FROM foo_bar INTO :dboid, :dbname END-EXEC
END-PERFORM.
EXEC SQL CLOSE foo_bar END-EXEC.

When you don't need the prepared statement anymore, you should deallocate it:

EXEC SQL DEALLOCATE PREPARE name END-EXEC.

For more details about PREPARE, see "D.11.10 PREPARE". Also see "D.5 Dynamic SQL" for more details about using placeholders and input parameters.

D.4 Using Host Variables

In "D.3 Running SQL Commands" you saw how you can execute SQL statements from an embedded SQL program. Some of those statements only used fixed values and did not provide a way to insert user-supplied values into statements or have the program process the values returned by the query. Those kinds of statements are not really useful in real applications. This section explains in detail how you can pass data between your COBOL program and the embedded SQL statements using a simple mechanism called host variables. In an embedded SQL program we consider the SQL statements to be guests in the COBOL program code which is the host language. Therefore the variables of the COBOL program are called host variables.

Another way to exchange values between PostgreSQL backends and ECOBPG applications is the use of SQL descriptors, described in "D.6 Using Descriptor Areas".

D.4.1 Overview

Passing data between the COBOL program and the SQL statements is particularly simple in embedded SQL. Instead of having the program paste the data into the statement, which entails various complications, such as properly quoting the value, you can simply write the name of a COBOL variable into the SQL statement, prefixed by a colon. For example:

EXEC SQL INSERT INTO sometable VALUES (:v1, 'foo', :v2) END-EXEC.

This statement refers to two COBOL variables named v1 and v2 and also uses a regular SQL string literal, to illustrate that you are not restricted to use one kind of data or the other.

This style of inserting COBOL variables in SQL statements works anywhere a value expression is expected in an SQL statement.

D.4.2 Declare Sections

To pass data from the program to the database, for example as parameters in a query, or to pass data from the database back to the program, the COBOL variables that are intended to contain this data need to be declared in specially marked sections, so the embedded SQL preprocessor is made aware of them.

This section starts with:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
and ends with:

```
EXEC SQL END DECLARE SECTION END-EXEC.
```

Between those lines, there must be normal COBOL variable declarations, such as:

```
01 INTX PIC S9(9) COMP VALUE 4.
01 FOO PIC X(15).
01 BAR PIC X(15).
```

As you can see, you can optionally assign an initial value to the variable. The variable’s scope is determined by the location of its declaring section within the program.

You can have as many declare sections in a program as you like.

The declarations are also echoed to the output file as normal COBOL variables, so there’s no need to declare them again. Variables that are not intended to be used in SQL commands can be declared normally outside these special sections.

The definition of a group item also must be listed inside a DECLARE section. Otherwise the preprocessor cannot handle these types since it does not know the definition.

### D.4.3 Retrieving Query Results

Now you should be able to pass data generated by your program into an SQL command. But how do you retrieve the results of a query? For that purpose, embedded SQL provides special variants of the usual commands SELECT and FETCH. These commands have a special INTO clause that specifies which host variables the retrieved values are to be stored in. SELECT is used for a query that returns only single row, and FETCH is used for a query that returns multiple rows, using a cursor.

Here is an example:

```cobol
* * assume this table:
* CREATE TABLE test (a int, b varchar(50)); *

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 V1 PIC S9(9).
01 V2 PIC X(50) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
...
EXEC SQL SELECT a, b INTO :V1, :V2 FROM test END-EXEC.
```

So the INTO clause appears between the select list and the FROM clause. The number of elements in the select list and the list after INTO (also called the target list) must be equal.

Here is an example using the command FETCH:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 V1 PIC S9(9).
01 V2 PIC X(50) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
...
EXEC SQL DECLARE foo CURSOR FOR SELECT a, b FROM test END-EXEC.
...
PERFORM WITH
...
  EXEC SQL FETCH NEXT FROM foo INTO :V1, :V2 END-EXEC
```

- 158 -
Here the INTO clause appears after all the normal clauses.

D.4.4 Type Mapping

When ECOBPG applications exchange values between the PostgreSQL server and the COBOL application, such as when retrieving query results from the server or executing SQL statements with input parameters, the values need to be converted between PostgreSQL data types and host language variable types (specifically COBOL language data types). One of the main points of ECOBPG is that it takes care of this automatically in most cases.

In this respect, there are two kinds of data types: Some simple PostgreSQL data types, such as integer and text, can be read and written by the application directly. Other PostgreSQL data types, such as timestamp and date can only be accessed through character strings. special library functions does not exist in ecobpg. (pgtypes, exists in ECPG, for COBOL is not implemented yet)

"Table D.1 Mapping Between PostgreSQL Data Types and COBOL Variable Types" shows which PostgreSQL data types correspond to which COBOL data types. When you wish to send or receive a value of a given PostgreSQL data type, you should declare a COBOL variable of the corresponding COBOL data type in the declare section.

Table D.1 Mapping Between PostgreSQL Data Types and COBOL Variable Types

<table>
<thead>
<tr>
<th>PostgreSQL data type</th>
<th>COBOL Host variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>smallint</td>
<td>PIC S9([1-4]) {BINARY</td>
</tr>
<tr>
<td>integer</td>
<td>PIC S9([5-9]) {BINARY</td>
</tr>
<tr>
<td>bigint</td>
<td>PIC S9([10-18]) {BINARY</td>
</tr>
<tr>
<td>decimal</td>
<td>PIC S9(m) V9(n) {PACKED-DECIMAL</td>
</tr>
<tr>
<td>numeric</td>
<td>(same with decimal)</td>
</tr>
<tr>
<td>real</td>
<td>COMP-1</td>
</tr>
<tr>
<td>double precision</td>
<td>COMP-2</td>
</tr>
<tr>
<td>small serial</td>
<td>PIC S9([1-4]) {BINARY</td>
</tr>
<tr>
<td>serial</td>
<td>PIC S9([1-9]) {BINARY</td>
</tr>
<tr>
<td>bigserial</td>
<td>PIC S9([10-18]) {BINARY</td>
</tr>
<tr>
<td>oid</td>
<td>PIC 9(9) {BINARY</td>
</tr>
<tr>
<td>character(n), varchar(n), text</td>
<td>PIC X(n), PIC X(n) VARYING</td>
</tr>
<tr>
<td>name</td>
<td>PIC X(NAMEDATALEN)</td>
</tr>
<tr>
<td>boolean</td>
<td>BOOL(*2)</td>
</tr>
<tr>
<td>bytea</td>
<td>BYTEA(n)</td>
</tr>
<tr>
<td>other types(e.g. timestamp)</td>
<td>PIC X(n), PIC X(n) VARYING</td>
</tr>
</tbody>
</table>

*1: If no USAGE is specified, host variable is regarded as DISPLAY.
*2: Type definition is added automatically on pre-compiling.
Body of BOOL is PIC X(1). '1' for true and '0' for false.

You can use some pattern of digits for integer(see table), but if database sends big number with more digits than specified, behavior is undefined.
### Handling Character Strings

To handle SQL character string data types, such as varchar and text, there is a possible way to declare the host variables. The way is using the PIC X(n) VARYING type (we call it VARCHAR type from now on), which is a special type provided by ECOBPG. The definition on type VARCHAR is converted into a group item consists of named variables. A declaration like:

```
01 VAR PIC X(180) VARYING.
```

is converted into:

```
01 VAR.
49 LEN PIC S9(4) COMP-5.
49 ARR PIC X(180).
```

If --varchar-with-named-member option is used, it is converted into:

```
01 VAR.
49 VAR-LEN PIC S9(4) COMP-5.
49 VAR-ARR PIC X(180).
```

You can use level 1 to 48 for VARCHAR. Don’t use level 49 variable right after VARCHAR variable. To use a VARCHAR host variable as an input for SQL statement, LEN must be set the length of the string included in ARR.

To use a VARCHAR host variable as an output of SQL statement, the variable must be declared in a sufficient length. If the length is insufficient, it can cause a buffer overrun.

PIC X(n) and VARCHAR host variables can also hold values of other SQL types, which will be stored in their string forms.

### Accessing Special Data Types

ECOBPG doesn’t have special support for date, timestamp, and interval types. (ECPG has pgtypes, but ECOBPG doesn’t.)

You can use PIC X(n) or VARCHAR for DB I/O with these types. See “Data Types” section in PostgreSQL’s document.

- **bytea**

  Handling of bytea types is similar to VARCHAR. The definition of an array of type bytea is converted into a group item consists of named variables.

  A declaration like:

  ```
  01 var bytea(100).
  ```

  is converted into:

  ```
  01 var.
  49 LEN PIC S9(9) COMP-5.
  49 ARR PIC X(100).
  ```

  If bytea-with-named-member option is used, it is converted into:

  ```
  01 var.
  49 var-LEN PIC S9(9) COMP-5.
  49 var-ARR PIC X(100).
  ```

  The data item ARR holds binary format data. Unlike VARCHAR, it is not affected by the locale or character encoding when processing data.
Other usage and prohibitions are the same as VARCHAR.

**Note**

The bytea variable can only be used if byta_output is set to hex.

### Host Variables with Nonprimitive Types

As a host variable you can also use arrays, typedefs, and group items.

#### Arrays

To create and use array variables, OCCURENCE syntax is provided by COBOL.

The typical use case is to retrieve multiple rows from a query result without using a cursor. Without an array, to process a query result consisting of multiple rows, it is required to use a cursor and the FETCH command. But with array host variables, multiple rows can be received at once. The length of the array has to be defined to be able to accommodate all rows, otherwise a buffer overrun will likely occur.

Following example scans the pg_database system table and shows all OIDs and names of the available databases:

```cobol
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
  05 DBID PIC S9(9) COMP OCCURS 8.
  05 DBNAME PIC X(16) OCCURS 8.
01 I PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL CONNECT TO testdb END-EXEC.

*   Retrieve multiple rows into arrays at once.
EXEC SQL SELECT oid,datname INTO :DBID, :DBNAME FROM pg_database END-EXEC.
PERFORM VARYING I FROM 1 BY 1 UNTIL I > 8
   DISPLAY "oid=" DBID(I) ", dbname=" DBNAME(I)
END-PERFORM.
EXEC SQL COMMIT END-EXEC.
EXEC SQL DISCONNECT ALL END-EXEC.
```

You can use member of array as simple host variable by specifying subscript of array. For specifying subscript, use C-style "[1]", not COBOL-style "(1)". But subscript starts with 1, according to COBOL syntax.

```cobol
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
  05 DBID PIC S9(9) COMP OCCURS 8.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL CONNECT TO testdb END-EXEC.

EXEC SQL SELECT oid INTO :DBID[1] FROM pg_database WHERE oid=1 END-EXEC.

DISPLAY "oid=" DBID(1)
EXEC SQL COMMIT END-EXEC.
EXEC SQL DISCONNECT ALL END-EXEC.
```

#### Group Item

A group item whose subordinate item names match the column names of a query result, can be used to retrieve multiple columns at once. The group item enables handling multiple column values in a single host variable.
The following example retrieves OIDs, names, and sizes of the available databases from the `pg_database` system table by using the `pg_database_size()` function. In this example, a group item variable `dbinfo_t` with members whose names match each column in the SELECT result is used to retrieve one result row without putting multiple host variables in the FETCH statement.

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 DBINFO-T TYPEDEF.
    02 OID PIC S9(9) COMP.
    02 DATNAME PIC X(65).
    02 DBSIZE PIC S9(18) COMP.
  01 DBVAL TYPE DBINFO-T.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT oid, datname, pg_database_size(oid) AS size
FROM pg_database END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.

*   when end of result set reached, break out of loop
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
*       Fetch multiple columns into one structure.
  EXEC SQL FETCH FROM cur1 INTO :DBVAL END-EXEC
*       Print members of the structure.
  DISPLAY "oid=" OID ", datname=" DATNAME ", size=" DBSIZE
END-PERFORM.
END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.
```

Group item host variables "absorb" as many columns as the group item as subordinate items. Additional columns can be assigned to other host variables. For example, the above program could also be restructured like this, with the size variable outside the group item:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 DBINFO-T TYPEDEF.
    02 OID PIC S9(9) COMP.
    02 DATNAME PIC X(65).
    01 DBVAL TYPE DBINFO-T.
    01 DBSIZE PIC S9(18) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT oid, datname, pg_database_size(oid) AS size
FROM pg_database END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.

*   when end of result set reached, break out of loop
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
*       Fetch multiple columns into one structure.
  EXEC SQL FETCH FROM cur1 INTO :DBVAL, :DBSIZE END-EXEC
*       Print members of the structure.
  DISPLAY "oid=" OID ", datname=" DATNAME ", size=" DBSIZE
END-PERFORM.
END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.
```
You can use only non-nested group items for host variable of SQL statement. Declaration of nested group items are OK, but you must specify non-nested part of group items for SQL. (VARCHAR, is translated to group item on pre-compilation, is not considered as offense of this rule.) When using inner item of group item in SQL, use C-struct like period separated syntax (not COBOL’s A OF B). Here is example.

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 NESTED-GROUP.
  02 CHILD1.
    03 A PIC X(10).
    03 B PIC S9(9) COMP.
  02 CHILD2.
    03 A PIC X(10).
    03 B PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL SELECT * INTO :NESTED-GROUP.CHILD1 FROM TABLE1 END-EXEC.
```

For specifying basic item of group items, full specification is not needed if the specification is enough for identifying the item. This is from COBOL syntax. For more detail, see resources of COBOL syntax.

**TYPEDEF**

Use the typedef keyword to map new types to already existing types.

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 MYCHARTYPE TYPEDEF PIC X(40).
  01 SERIAL-T TYPEDEF PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.
```

This declaration does not need to be part of a declare section.

## D.4.5 Handling Nonprimitive SQL Data Types

This section contains information on how to handle nonscalar and user-defined SQL-level data types in ECOBPG applications. Note that this is distinct from the handling of host variables of nonprimitive types, described in the previous section.

### Arrays

SQL-level arrays are not directly supported in ECOBPG. It is not possible to simply map an SQL array into a COBOL array host variable. This will result in undefined behavior. Some workarounds exist, however.

If a query accesses elements of an array separately, then this avoids the use of arrays in ECOBPG. Then, a host variable with a type that can be mapped to the element type should be used. For example, if a column type is array of integer, a host variable of type PIC S9(9) COMP can be used. Also if the element type is varchar or text, a host variable of type VARCHAR can be used.

Here is an example. Assume the following table:
CREATE TABLE t3 (  
   ii integer[]  
)

testdb=> SELECT * FROM t3;  
   ii         
  --------  
{1,2,3,4,5}  
(1 row)

The following example program retrieves the 4th element of the array and stores it into a host variable of type PIC S9(9) COMP-5:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 II PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT ii[4] FROM t3 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.

EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
   EXEC SQL FETCH FROM cur1 INTO :II  END-EXEC
      DISPLAY "ii=" II
END-PERFORM.

END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.

To map multiple array elements to the multiple elements in an array type host variables each element of array column and each element of the host variable array have to be managed separately, for example:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
   05 II_A PIC S9(9) COMP OCCURS 8.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT ii[1], ii[2], ii[3], ii[4] FROM t3 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.

EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
      ...
END-PERFORM.

Note again that.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
   05 II_A PIC S9(9) COMP OCCURS 8.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT ii FROM t3 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
Another workaround is to store arrays in their external string representation in host variables of type VARCHAR. For more details about this representation.

Refer to "Arrays" in "Tutorial" in the PostgreSQL Documentation for information more details about this representation.

Note that this means that the array cannot be accessed naturally as an array in the host program (without further processing that parses the text representation).

Composite Types

Composite types are not directly supported in ECOBPG, but an easy workaround is possible. The available workarounds are similar to the ones described for arrays above: Either access each attribute separately or use the external string representation.

For the following examples, assume the following type and table:

```sql
CREATE TYPE comp_t AS (intval integer, textval varchar(32));
CREATE TABLE t4 (compval comp_t);
INSERT INTO t4 VALUES ((256, 'PostgreSQL'));
```

The most obvious solution is to access each attribute separately. The following program retrieves data from the example table by selecting each attribute of the type comp_t separately:

```sql
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 INTVAL PIC S9(9) COMP.
01 TEXTVAL PIC X(33) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.

* Put each element of the composite type column in the SELECT list.
EXEC SQL DECLARE curl CURSOR FOR SELECT (compval).intval, (compval).textval FROM t4 END-EXEC.
EXEC SQL OPEN curl END-EXEC.

EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
* Fetch each element of the composite type column into host variables.
  EXEC SQL FETCH FROM curl INTO :INTVAL, :TEXTVAL END-EXEC
  DISPLAY "intval=" INTVAL ", textval=" ARR OF TEXTVAL
END-PERFORM.

END-FETCH.
EXEC SQL CLOSE curl END-EXEC.
```

To enhance this example, the host variables to store values in the FETCH command can be gathered into one group item. For more details about the host variable in the group item form, see "Group Item". To switch to the group item, the example can be modified as below. The two host variables, intval and textval, become subordinate items of the comp_t group item, and the group item is specified on the FETCH command.
Although a group item is used in the FETCH command, the attribute names in the SELECT clause are specified one by one. This can be enhanced by using a * to ask for all attributes of the composite type value.

This way, composite types can be mapped into structures almost seamlessly, even though ECOBPG does not understand the composite type itself.

Finally, it is also possible to store composite type values in their external string representation in host variables of type VARCHAR. But that way, it is not easily possible to access the fields of the value from the host program.

**User-defined Base Types**

New user-defined base types are not directly supported by ECOBPG. You can use the external string representation and host variables of type VARCHAR, and this solution is indeed appropriate and sufficient for many types.

Here is an example using the data type complex.

Refer to “User-defined Types” in “Server Programming” in the PostgreSQL Documentation for information on the data type complex.

The external string representation of that type is (%lf,%lf), which is defined in the functions complex_in() and complex_out() functions. The following example inserts the complex type values (1,1) and (3,3) into the columns a and b, and select them from the table after that.
Another workaround is avoiding the direct use of the user-defined types in ECOBPG and instead create a function or cast that converts between the user-defined type and a primitive type that ECOBPG can handle. Note, however, that type casts, especially implicit ones, should be introduced into the type system very carefully.

For example:

```
CREATE FUNCTION create_complex(r double precision, i double precision) RETURNS complex
LANGUAGE SQL
IMMUTABLE
AS $$ SELECT $1 * complex '(1,0)' + $2 * complex '(0,1)' $$;
```

After this definition, the following:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 A COMP-2.
01 B COMP-2.
01 C COMP-2.
01 D COMP-2.
EXEC SQL END DECLARE SECTION END-EXEC.

MOVE 1 TO A.
MOVE 2 TO B.
MOVE 3 TO C.
MOVE 4 TO D.
EXEC SQL INSERT INTO test_complex VALUES (create_complex(:A, :B), create_complex(:C, :D)) END-EXEC.
```

has the same effect as

```
EXEC SQL INSERT INTO test_complex VALUES ('(1,2)', '(3,4)') END-EXEC.
```

### D.4.6 Indicators

The examples above do not handle null values. In fact, the retrieval examples will raise an error if they fetch a null value from the database. To be able to pass null values to the database or retrieve null values from the database, you need to append a second host variable specification to each host variable that contains data. This second host variable is called the indicator and contains a flag that tells whether the datum is null, in which case the value of the real host variable is ignored. Here is an example that handles the retrieval of null values correctly:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 VAL PIC X(50) VARYING.
01 VAL_IND PIC S9(9) COMP-5.
EXEC SQL INSERT INTO test_complex VALUES ('(1,1)', '(3,3)') END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT a, b FROM test_complex END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.
PERFORM NO LIMIT
  EXEC SQL FETCH FROM cur1 INTO :A, :B END-EXEC
  DISPLAY "a=" ARR OF A ", b=" ARR OF B
END-PERFORM.
END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.
```
The indicator variable val_ind will be zero if the value was not null, and it will be negative if the value was null.

The indicator has another function: if the indicator value is positive, it means that the value is not null, but it was truncated when it was stored in the host variable.

### D.5 Dynamic SQL

In many cases, the particular SQL statements that an application has to execute are known at the time the application is written. In some cases, however, the SQL statements are composed at run time or provided by an external source. In these cases you cannot embed the SQL statements directly into the COBOL source code, but there is a facility that allows you to call arbitrary SQL statements that you provide in a string variable.

#### D.5.1 Executing Statements without a Result Set

The simplest way to execute an arbitrary SQL statement is to use the command EXECUTE IMMEDIATE. For example:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 STMT PIC X(30) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "CREATE TABLE test1 (...);" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL EXECUTE IMMEDIATE :STMT END-EXEC.
```

EXECUTE IMMEDIATE can be used for SQL statements that do not return a result set (e.g., DDL, INSERT, UPDATE, DELETE). You cannot execute statements that retrieve data (e.g., SELECT) this way. The next section describes how to do that.

#### D.5.2 Executing a Statement with Input Parameters

A more powerful way to execute arbitrary SQL statements is to prepare them once and execute the prepared statement as often as you like. It is also possible to prepare a generalized version of a statement and then execute specific versions of it by substituting parameters. When preparing the statement, write question marks where you want to substitute parameters later. For example:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 STMT PIC X(40) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "INSERT INTO test1 VALUES(?, ?);" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL PREPARE MYSTMT FROM :STMT END-EXEC.
...
EXEC SQL EXECUTE MYSTMT USING 42, 'foobar' END-EXEC.
```

When you don't need the prepared statement anymore, you should deallocate it:

```sql
EXEC SQL DEALLOCATE PREPARE name END-EXEC.
```

#### D.5.3 Executing a Statement with a Result Set

To execute an SQL statement with a single result row, EXECUTE can be used. To save the result, add an INTO clause.

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 STMT PIC X(50) VARYING.
```
D.6 Using Descriptor Areas

An SQL descriptor area is a more sophisticated method for processing the result of a SELECT, FETCH or a DESCRIBE statement. An SQL descriptor area groups the data of one row of data together with metadata items into one data group item. The metadata is particularly useful when executing dynamic SQL statements, where the nature of the result columns might not be known ahead of time. PostgreSQL provides a way to use Descriptor Areas: the named SQL Descriptor Areas.

D.6.1 Named SQL Descriptor Areas

A named SQL descriptor area consists of a header, which contains information concerning the entire descriptor, and one or more item descriptor areas, which basically each describe one column in the result row.

Before you can use an SQL descriptor area, you need to allocate one:
EXEC SQL ALLOCATE DESCRIPTOR identifier END-EXEC.

The identifier serves as the "variable name" of the descriptor area. When you don't need the descriptor anymore, you should deallocate it:

EXEC SQL DEALLOCATE DESCRIPTOR identifier END-EXEC.

To use a descriptor area, specify it as the storage target in an INTO clause, instead of listing host variables:

EXEC SQL FETCH NEXT FROM mycursor INTO SQL DESCRIPTOR mydesc END-EXEC.

If the result set is empty, the Descriptor Area will still contain the metadata from the query, i.e. the field names.

For not yet executed prepared queries, the DESCRIBE statement can be used to get the metadata of the result set:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 SQL-STMT PIC X(30) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "SELECT * FROM table1" TO ARR OF SQL-STMT.
COMPUTE LEN OF SQL-STMT = FUNCTION STORED-CHAR-LENGTH ( ARR OF SQL-STMT ) .
EXEC SQL PREPARE STMT1 FROM :SQL-STMT END-EXEC.
EXEC SQL DESCRIBE STMT1 INTO SQL DESCRIPTOR MYDESC END-EXEC.

Before PostgreSQL 9.0, the SQL keyword was optional, so using DESCRIPTOR and SQL DESCRIPTOR produced named SQL Descriptor Areas. Now it is mandatory, omitting the SQL keyword is regarded as the syntax that produces SQLDA Descriptor Areas. However, ecobpg does not support SQLDA and it causes an error.

In DESCRIBE and FETCH statements, the INTO and USING keywords can be used to similarly: they produce the result set and the metadata in a Descriptor Area.

Now how do you get the data out of the descriptor area? You can think of the descriptor area as a group item with named fields. To retrieve the value of a field from the header and store it into a host variable, use the following command:

EXEC SQL GET DESCRIPTOR name :hostvar = field END-EXEC.

Currently, there is only one header field defined: COUNT, which tells how many item descriptor areas exist (that is, how many columns are contained in the result). The host variable needs to be of an integer type as PIC S9(9) COMP-5. To get a field from the item descriptor area, use the following command:

EXEC SQL GET DESCRIPTOR name VALUE num :hostvar = field END-EXEC.

num can be a host variable containing an integer as PIC S9(9) COMP-5.
hostvar must be PIC S9(9) COMP-5 if type of the field is integer. Possible fields are:

- CARDINALITY (integer)
  number of rows in the result set
- DATA
  actual data item (therefore, the data type of this field depends on the query)
- DATETIME_INTERVAL_CODE (integer)
  When TYPE is 9, DATETIME_INTERVAL_CODE will have a value of 1 for DATE, 2 for TIME, 3 for TIMESTAMP, 4 for TIME WITH TIME ZONE, or 5 for TIMESTAMP WITH TIME ZONE.
- DATETIME_INTERVAL_PRECISION (integer)
  not implemented
- INDICATOR (integer)
  the indicator (indicating a null value or a value truncation)
- KEY_MEMBER (integer)
  not implemented
LENGTH (integer)
    length of the datum in characters
NAME (string)
    name of the column
NULLABLE (integer)
    not implemented
OCTET_LENGTH (integer)
    length of the character representation of the datum in bytes
PRECISION (integer)
    precision (for type numeric)
RETURNED_LENGTH (integer)
    length of the datum in characters
RETURNED_OCTET_LENGTH (integer)
    length of the character representation of the datum in bytes
SCALE (integer)
    scale (for type numeric)
TYPE (integer)
    numeric code of the data type of the column

In EXECUTE, DECLARE and OPEN statements, the effect of the INTO and USING keywords are different. A Descriptor Area can also be manually built to provide the input parameters for a query or a cursor and USING SQL DESCRIPTOR name is the way to pass the input parameters into a parametrized query. The statement to build a named SQL Descriptor Area is below:

```
EXEC SQL SET DESCRIPTOR name VALUE num field = :hostvar END-EXEC.
```

PostgreSQL supports retrieving more than one record in one FETCH statement and storing the data in host variables in this case assumes that the variable is an array. E.g.:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
   05 IDNUM PIC S9(9) COMP OCCURS 5.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL FETCH 5 FROM mycursor INTO SQL DESCRIPTOR mydesc END-EXEC.
EXEC SQL GET DESCRIPTOR mydesc VALUE 1 :IDNUM = DATA END-EXEC.
```

**D.7 Error Handling**

This section describes how you can handle exceptional conditions and warnings in an embedded SQL program. There are two nonexclusive facilities for this.

- Callbacks can be configured to handle warning and error conditions using the WHENEVER command.
- Detailed information about the error or warning can be obtained from the sqlca variable.

**D.7.1 Setting Callbacks**

One simple method to catch errors and warnings is to set a specific action to be executed whenever a particular condition occurs. In general:
EXEC SQL WHENEVER condition action END-EXEC.

condition can be one of the following:

SQLERROR
The specified action is called whenever an error occurs during the execution of an SQL statement.

SQLWARNING
The specified action is called whenever a warning occurs during the execution of an SQL statement.

NOT FOUND
The specified action is called whenever an SQL statement retrieves or affects zero rows. (This condition is not an error, but you might be interested in handling it specially.)

action can be one of the following:

CONTINUE
This effectively means that the condition is ignored. This is the default.

GOTO label
Jump to the specified label (using a COBOL goto statement).

SQLPRINT
Print a message to standard error. This is useful for simple programs or during prototyping. The details of the message cannot be configured.

STOP
Call STOP, which will terminate the program.

CALL name usingargs
DO name usingargs
Call the specified functions with the following characters including arguments. Thus, syntaxes (including compiler depending) are able to be placed as well as the arguments. Though, there are some limitation as following:

- You can't use RETURNING, ON EXCEPTION or OVER FLOW clauses.
- In the called subprogram, you must specify CONTINUE for every action with WHENEVER statement.

The SQL standard only provides for the actions CONTINUE and GOTO (and GO TO).

Here is an example that you might want to use in a simple program. It prints a simple message when a warning occurs and aborts the program when an error happens:

EXEC SQL WHENEVER SQLWARNING SQLPRINT END-EXEC.
EXEC SQL WHENEVER SQLERROR STOP END-EXEC.

The statement EXEC SQL WHENEVER is a directive of the SQL preprocessor, not a COBOL statement. The error or warning actions that it sets apply to all embedded SQL statements that appear below the point where the handler is set, unless a different action was set for the same condition between the first EXEC SQL WHENEVER and the SQL statement causing the condition, regardless of the flow of control in the COBOL program. So neither of the two following COBOL program excerpts will have the desired effect:

* * * WRONG
* ...
  IF VERBOSE = 1 THEN
    EXEC SQL WHENEVER SQLWARNING SQLPRINT END-EXEC
  END-IF.
D.7.2 sqlca

For more powerful error handling, the embedded SQL interface provides a global variable with the name sqlca (SQL communication area) that has the following group item:

```
01 sqlca_t.
   10 sqlcaid PIC X(8).
   10 sqlabc PIC S9(9) COMP-5.
   10 sqlcode PIC S9(9) COMP-5.
   10 sqlerm.
      20 sqlerrm PIC S9(9) COMP-5.
      20 sqlerrmc PIC X(150).
   10 sqllerr PIC X(8).
   10 sqllerrd PIC S9(9) COMP-5 OCCURS 6.
   10 sqlwarn PIC X(8).
   10 sqlstate PIC X(5).
```

(In a multithreaded program, every thread automatically gets its own copy of sqlca. This works similarly to the handling of the standard C global variable errno.)

sqlca covers both warnings and errors. If multiple warnings or errors occur during the execution of a statement, then sqlca will only contain information about the last one.

If no error occurred in the last SQL statement, SQLCODE will be 0 and SQLSTATE will be "00000". If a warning or error occurred, then SQLCODE will be negative and SQLSTATE will be different from "00000". A positive SQLCODE indicates a harmless condition, such as that the last query returned zero rows. SQLCODE and SQLSTATE are two different error code schemes; details appear below.

If the last SQL statement was successful, then SQLERRD(2) contains the OID of the processed row, if applicable, and SQLERRD(3) contains the number of processed or returned rows, if applicable to the command.

In case of an error or warning, SQLERRMC will contain a string that describes the error. The field SQLERRML contains the length of the error message that is stored in SQLERRMC (the result of FUNCTION STORED-CHAR-LENGTH. Note that some messages are too long to fit in the fixed-size sqlerrmc array; they will be truncated.

In case of a warning, the 3rd character of SQLWARN is set to W. (In all other cases, it is set to something different from W.)

If the 2nd character of SQLWARN is set to W, then a value was truncated when it was stored in a host variable. The 1st character of SQLWARN is set to W if any of the other elements are set to indicate a warning.

The fields sqlcaid, sqlabc, sqllerr, and the remaining elements of sqllerrd and sqlwarn currently contain no useful information.

The structure sqlca is not defined in the SQL standard, but is implemented in several other SQL database systems. The definitions are similar at the core, but if you want to write portable applications, then you should investigate the different implementations carefully.

Here is one example that combines the use of WHENEVER and sqlca, printing out the contents of sqlca when an error occurs. This is perhaps useful for debugging or prototyping applications, before installing a more "user-friendly" error handler.

```
EXEC SQL WHENEVER SQLERROR GOTO PRINT_SQLCA END-EXEC.
PRINT_SQLCA.
```
D.7.3 SQLSTATE vs. SQLCODE

The fields SQLSTATE and SQLCODE are two different schemes that provide error codes. Both are derived from the SQL standard, but SQLCODE has been marked deprecated in the SQL-92 edition of the standard and has been dropped in later editions. Therefore, new applications are strongly encouraged to use SQLSTATE.

SQLSTATE is a five-character array. The five characters contain digits or upper-case letters that represent codes of various error and warning conditions. SQLSTATE has a hierarchical scheme: the first two characters indicate the general class of the condition, the last three characters indicate a subclass of the general condition. A successful state is indicated by the code 00000. The SQLSTATE codes are for the most part defined in the SQL standard. The PostgreSQL server natively supports SQLSTATE error codes; therefore a high degree of consistency can be achieved by using this error code scheme throughout all applications.

SQLCODE, the deprecated error code scheme, is a simple integer. A value of 0 indicates success, a positive value indicates success with additional information, and a negative value indicates an error. The SQL standard only defines the positive value +100, which indicates that the last command returned or affected zero rows, and no specific negative values. Therefore, this scheme can only achieve poor portability and does not have a hierarchical code assignment. Historically, the embedded SQL processor for PostgreSQL has assigned some specific SQLCODE values for its use, which are listed below with their numeric value and their symbolic name. Remember that these are not portable to other SQL implementations. To simplify the porting of applications to the SQLSTATE scheme, the corresponding SQLSTATE is also listed. There is, however, no one-to-one or one-to-many mapping between the two schemes (indeed it is many-to-many), so you should consult the global SQLSTATE in each case.

These are the assigned SQLCODE values:

0
   Indicates no error. (SQLSTATE 00000)

100
   This is a harmless condition indicating that the last command retrieved or processed zero rows, or that you are at the end of the cursor. (SQLSTATE 02000)
When processing a cursor in a loop, you could use this code as a way to detect when to abort the loop, like this:

```
PERFORM NO LIMIT
  EXEC SQL FETCH ... END-EXEC
  IF SQLCODE = 100 THEN
    GO TO FETCH-END
  END-IF
END-PERFORM.
```

But WHENEVER NOT FOUND GOTO ... effectively does this internally, so there is usually no advantage in writing this out explicitly.

-12
Indicates that your virtual memory is exhausted. The numeric value is defined as -ENOMEM. (SQLSTATE YE001)

-200
Indicates the preprocessor has generated something that the library does not know about. Perhaps you are running incompatible versions of the preprocessor and the library. (SQLSTATE YE002)

-201
This means that the command specified more host variables than the command expected. (SQLSTATE 07001 or 07002)

-202
This means that the command specified fewer host variables than the command expected. (SQLSTATE 07001 or 07002)

-203
This means a query has returned multiple rows but the statement was only prepared to store one result row (for example, because the specified variables are not arrays). (SQLSTATE 21000)

-204
The host variable is of type signed int and the datum in the database is of a different type and contains a value that cannot be interpreted as a signed int. The library uses strtol() for this conversion. (SQLSTATE 42804)

-205
The host variable is of type unsigned int and the datum in the database is of a different type and contains a value that cannot be interpreted as an unsigned int. The library uses strtoul() for this conversion. (SQLSTATE 42804)

-206
The host variable is of type float and the datum in the database is of another type and contains a value that cannot be interpreted as a float. The library uses strtod() for this conversion. (SQLSTATE 42804)

-207
The host variable is of type DECIMAL and the datum in the database is of another type and contains a value that cannot be interpreted as a DECIMAL or DISPLAY value. For the case of DISPLAY, this error happens if values in the database is too large for converting to DISPLAY value. (SQLSTATE 42804)

-208
The host variable is of type interval and the datum in the database is of another type and contains a value that cannot be interpreted as an interval value. (SQLSTATE 42804)

-209
The host variable is of type date and the datum in the database is of another type and contains a value that cannot be interpreted as a date value. (SQLSTATE 42804)

-210
The host variable is of type timestamp and the datum in the database is of another type and contains a value that cannot be interpreted as a timestamp value. (SQLSTATE 42804)

-211
This means the host variable is of type bool and the datum in the database is neither ‘t’ nor ‘f’. (SQLSTATE 42804)
The statement sent to the PostgreSQL server was empty. (This cannot normally happen in an embedded SQL program, so it might point to an internal error.) (SQLSTATE YE002)

A null value was returned and no null indicator variable was supplied. (SQLSTATE 22002)

An ordinary variable was used in a place that requires an array. (SQLSTATE 42804)

The database returned an ordinary variable in a place that requires array value. (SQLSTATE 42804)

The program tried to access a connection that does not exist. (SQLSTATE 08003)

The program tried to access a connection that does exist but is not open. (This is an internal error.) (SQLSTATE YE002)

The statement you are trying to use has not been prepared. (SQLSTATE 26000)

The descriptor specified was not found. The statement you are trying to use has not been prepared. (SQLSTATE 33000)

The descriptor index specified was out of range. (SQLSTATE 07009)

An invalid descriptor item was requested. (This is an internal error.) (SQLSTATE YE002)

During the execution of a dynamic statement, the database returned a numeric value and the host variable was not numeric. (SQLSTATE 07006)

During the execution of a dynamic statement, the database returned a non-numeric value and the host variable was numeric. (SQLSTATE 07006)

Some error caused by the PostgreSQL server. The message contains the error message from the PostgreSQL server.

The PostgreSQL server signaled that we cannot start, commit, or rollback the transaction. (SQLSTATE 08007)

The connection attempt to the database did not succeed. (SQLSTATE 08001)

Duplicate key error, violation of unique constraint. (SQLSTATE 23505)

A result for the subquery is not single row. (SQLSTATE 21000)

An invalid cursor name was specified. (SQLSTATE 34000)

Transaction is in progress. (SQLSTATE 25001)
There is no active (in-progress) transaction. (SQLSTATE 25P01)

An existing cursor name was specified. (SQLSTATE 42P03)

### D.8 Preprocessor Directives

Several preprocessor directives are available that modify how the ecobpg preprocessor parses and processes a file.

#### D.8.1 Including Files

To include an external file into your embedded SQL program, use:

- `EXEC SQL INCLUDE filename END-EXEC.`
- `EXEC SQL INCLUDE <filename> END-EXEC.`
- `EXEC SQL INCLUDE "filename" END-EXEC.`

The embedded SQL preprocessor will look for a file named filename.pco, preprocess it, and include it in the resulting COBOL output. Thus, embedded SQL statements in the included file are handled correctly.

By default, the ecobpg preprocessor will search a file at the current directory. This behavior can be changed by the ecobpg commandline option.

First, the preprocessor tries to locate a file by specified file name at the current directory. If it fails and the file name does not end with .pco, the preprocessor also tries to locate a file with the suffix at the same directory.

The difference between `EXEC SQL INCLUDE` and `COPY` statement is whether precompiler processes embedded SQLs in the file, or not. If the file contains embedded SQLs, use `EXEC SQL INCLUDE`.

**Note**

The include file name is case-sensitive, even though the rest of the `EXEC SQL INCLUDE` command follows the normal SQL case-sensitivity rules.

#### D.8.2 The define and undef Directives

Similar to the directive `#define` that is known from C, embedded SQL has a similar concept:

- `EXEC SQL DEFINE name END-EXEC.`
- `EXEC SQL DEFINE name value END-EXEC.`

So you can define a name:

- `EXEC SQL DEFINE HAVE_FEATURE END-EXEC.`

And you can also define constants:

- `EXEC SQL DEFINE MYNUMBER 12 END-EXEC.`
- `EXEC SQL DEFINE MYSTRING 'abc' END-EXEC.`

Use `undef` to remove a previous definition:

- `EXEC SQL UNDEF MYNUMBER END-EXEC.`

Note that a constant in the SQL statement is only replaced by `EXEC SQL DEFINE`. The replacement may change the number of characters in a line, but ecobpg does not validate it after the replacement. Pay attention to the limitation of the number of characters in a line.
D.8.3 ifdef, ifndef, else, elif, and endif Directives

You can use the following directives to compile code sections conditionally:

EXEC SQL ifdef name END-EXEC.
Checks a name and processes subsequent lines if name has been created with EXEC SQL define name.

EXEC SQL ifndef name END-EXEC.
Checks a name and processes subsequent lines if name has not been created with EXEC SQL define name.

EXEC SQL else END-EXEC.
Starts processing an alternative section to a section introduced by either EXEC SQL ifdef name or EXEC SQL ifndef name.

EXEC SQL elif name END-EXEC.
Checks name and starts an alternative section if name has been created with EXEC SQL define name.

EXEC SQL endif END-EXEC.
Ends an alternative section.

Example:

EXEC SQL ifdef TZVAR END-EXEC.
EXEC SQL SET TIMEZONE TO 'GMT' END-EXEC.
EXEC SQL elif TZNAME END-EXEC.
EXEC SQL SET TIMEZONE TO TZNAME END-EXEC.
EXEC SQL else END-EXEC.
EXEC SQL SET TIMEZONE TO TZVAR END-EXEC.
EXEC SQL endif END-EXEC.

D.9 Processing Embedded SQL Programs

Now that you have an idea how to form embedded SQL COBOL programs, you probably want to know how to compile them. Before compiling you run the file through the embedded SQL COBOL preprocessor, which converts the SQL statements you used to special function calls. After compiling, you must link with a special library that contains the needed functions. These functions fetch information from the arguments, perform the SQL command using the libpq interface, and put the result in the arguments specified for output.

The preprocessor program is called ecobpg and is included in a normal PostgreSQL installation. Embedded SQL programs are typically named with an extension .pco. If you have a program file called prog1.pco, you can preprocess it by simply calling:

```
ecobpg prog1.pco
```

This will create a file called prog1.cob. If your input files do not follow the suggested naming pattern, you can specify the output file explicitly using the -o option.

The preprocessed file can be compiled normally, following the usage of the compiler.

The generated COBOL source files include library files from the PostgreSQL installation, so if you installed PostgreSQL in a location that is not searched by default, you have to add an option such as -I/usr/local/pgsql/include to the compilation command line.

To link an embedded SQL program, you need to include the libecpg library.

Again, you might have to add an option for library search like -L/usr/local/pgsql/lib to that command line.

If you manage the build process of a larger project using make, it might be convenient to include the following implicit rule to your makefiles:
The complete syntax of the ecobpg command is detailed in "D.12.1 ecobpg".
Currently, ecobpg does not support multi threading.

D.10 Large Objects

Large objects are not supported by ECOBPG.
If you need to access large objects, use large objects interfaces of libpq instead.

D.11 Embedded SQL Commands

This section describes all SQL commands that are specific to embedded SQL.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOCATE DESCRIPTOR</td>
<td>Allocate an SQL descriptor area</td>
</tr>
<tr>
<td>CONNECT</td>
<td>Establish a database connection</td>
</tr>
<tr>
<td>DEALLOCATE DESCRIPTOR</td>
<td>Deallocate an SQL descriptor area</td>
</tr>
<tr>
<td>DECLARE</td>
<td>Define a cursor</td>
</tr>
<tr>
<td>DESCRIBE</td>
<td>Obtain information about a prepared statement or result set</td>
</tr>
<tr>
<td>DISCONNECT</td>
<td>Terminate a database connection</td>
</tr>
<tr>
<td>EXECUTE IMMEDIATE</td>
<td>Dynamically prepare and execute a statement</td>
</tr>
<tr>
<td>GET DESCRIPTOR</td>
<td>Get information from an SQL descriptor area</td>
</tr>
<tr>
<td>OPEN</td>
<td>Open a dynamic cursor</td>
</tr>
<tr>
<td>PREPARE</td>
<td>Prepare a statement for execution</td>
</tr>
<tr>
<td>SET AUTOCOMMIT</td>
<td>Set the autocommit behavior of the current session</td>
</tr>
<tr>
<td>SET CONNECTION</td>
<td>Select a database connection</td>
</tr>
<tr>
<td>SET DESCRIPTOR</td>
<td>Set information in an SQL descriptor area</td>
</tr>
<tr>
<td>TYPE</td>
<td>Define a new data type</td>
</tr>
<tr>
<td>VAR</td>
<td>Define a variable</td>
</tr>
<tr>
<td>WHenever</td>
<td>Specify the action to be taken when an SQL statement causes a specific class condition to be raised</td>
</tr>
</tbody>
</table>

See

Refer to the SQL commands listed in "SQL Commands" under "Reference" in the PostgreSQL Documentation, which can also be used in embedded SQL, unless stated otherwise.

D.11.1 ALLOCATE DESCRIPTOR

Name

ALLOCATE DESCRIPTOR -- allocate an SQL descriptor area
**Synopsis**

ALLOCATE DESCRIPTOR name

**Description**

ALLOCATE DESCRIPTOR allocates a new named SQL descriptor area, which can be used to exchange data between the PostgreSQL server and the host program.

Descriptor areas should be freed after use using the DEALLOCATE DESCRIPTOR command.

**Parameters**

name

A name of SQL descriptor. This can be an SQL identifier or a host variable.

**Examples**

EXEC SQL ALLOCATE DESCRIPTOR mydesc END-EXEC.

**Compatibility**

ALLOCATE DESCRIPTOR is specified in the SQL standard.

**See Also**

DEALLOCATE DESCRIPTOR, GET DESCRIPTOR, SET DESCRIPTOR

---

**D.11.2 CONNECT**

**Name**

CONNECT -- establish a database connection

**Synopsis**

CONNECT TO connection_target [ AS connection_name ] [ USER connection_user_name ]

CONNECT TO DEFAULT

CONNECT connection_user_name

DATABASE connection_target

**Description**

The CONNECT command establishes a connection between the client and the PostgreSQL server.

**Parameters**

connection_target

connection_target specifies the target server of the connection on one of several forms.

[ database_name ] [ @host ] [ :port ]

Connect over TCP/IP

unix:postgresql://host [:port] / [ database_name ] [ ?connection_option ]

Connect over Unix-domain sockets

tcp:postgresql://host [:port] / [ database_name ] [ ?connection_option ]

Connect over TCP/IP
SQL string constant
containing a value in one of the above forms

host variable
host variable of fixed-length string (trailing spaces are ignored) containing a value in one of the above forms

connection_name
An optional identifier for the connection, so that it can be referred to in other commands. This can be an SQL identifier or a host variable.

connection_user_name
The user name for the database connection.

This parameter can also specify user name and password, using one the forms user_name/password, user_name IDENTIFIED BY password, or user_name USING password.

User name and password can be SQL identifiers, string constants, or host variables (fixed-length string, trailing spaces are ignored).

DEFAULT
Use all default connection parameters, as defined by libpq.

Examples
Here a several variants for specifying connection parameters:

EXEC SQL CONNECT TO "connectdb" AS main END-EXEC.
EXEC SQL CONNECT TO "connectdb" AS second END-EXEC.
EXEC SQL CONNECT TO "unix:postgresql://localhost/connectdb" AS main USER connectuser END-EXEC.
EXEC SQL CONNECT TO 'connectdb' AS main END-EXEC.
EXEC SQL CONNECT TO 'unix:postgresql://localhost/connectdb' AS main USER :user END-EXEC.
EXEC SQL CONNECT TO :dbname AS :idt END-EXEC.
EXEC SQL CONNECT TO :dbname USER connectuser USING :pw END-EXEC.
EXEC SQL CONNECT TO @localhost AS main USER connectdb END-EXEC.
EXEC SQL CONNECT TO REGRESSDB1 as main END-EXEC.
EXEC SQL CONNECT TO connectdb AS :idt END-EXEC.
EXEC SQL CONNECT TO connectdb AS main USER connectuser/connectdb END-EXEC.
EXEC SQL CONNECT TO connectdb@localhost AS main END-EXEC.
EXEC SQL CONNECT TO tcp:postgresql://localhost/ USER connectdb END-EXEC.
EXEC SQL CONNECT TO tcp:postgresql://localhost/connectdb USER connectuser IDENTIFIED BY connectpw END-EXEC.
EXEC SQL CONNECT TO tcp:postgresql://localhost:20/connectdb USER connectuser IDENTIFIED BY connectpw END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/ AS main USER connectdb END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb AS main USER connectuser END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb USER connectuser IDENTIFIED BY "connectpw" END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb USER connectuser USING "connectpw" END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb?connect_timeout=14 USER connectuser END-EXEC.

Here is an example program that illustrates the use of host variables to specify connection parameters:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
*   database name
    01 DBNAME PIC X(6).
*   connection user name

- 181 -
01 USER PIC X(8).
*   connection string
 01 CONNECTION PIC X(38).

01 VER PIC X(256).
EXEC SQL END DECLARE SECTION END-EXEC.

MOVE "testdb" TO DBNAME.
MOVE "testuser" TO USER.
MOVE "tcp:postgresql://localhost:5432/testdb" TO CONNECTION.

EXEC SQL CONNECT TO :DBNAME USER :USER END-EXEC.
EXEC SQL SELECT version() INTO :VER END-EXEC.
EXEC SQL DISCONNECT END-EXEC.

DISPLAY "version: " VER.

EXEC SQL CONNECT TO :CONNECTION USER :USER END-EXEC.
EXEC SQL SELECT version() INTO :VER END-EXEC.
EXEC SQL DISCONNECT END-EXEC.

DISPLAY "version: " VER.

Compatibility
CONNECT is specified in the SQL standard, but the format of the connection parameters is implementation-specific.

See Also
DISCONNECT, SET CONNECTION

D.11.3 DEALLOCATE DESCRIPTOR

Name
DEALLOCATE DESCRIPTOR -- deallocate an SQL descriptor area

Synopsis
DEALLOCATE DESCRIPTOR name

Description
DEALLOCATE DESCRIPTOR deallocates a named SQL descriptor area.

Parameters
name

The name of the descriptor which is going to be deallocated. This can be an SQL identifier or a host variable.

Examples
EXEC SQL DEALLOCATE DESCRIPTOR mydesc END-EXEC.

Compatibility
DEALLOCATE DESCRIPTOR is specified in the SQL standard.

See Also
ALLOCATE DESCRIPTOR, GET DESCRIPTOR, SET DESCRIPTOR
D.11.4 DECLARE

Name

DECLARE -- define a cursor

Synopsis

DECLARE cursor_name [ BINARY ] [ INSENSITIVE ] [ [ NO ] SCROLL ] CURSOR [ { WITH | WITHOUT } HOLD ] FOR prepared_name

DECLARE cursor_name [ BINARY ] [ INSENSITIVE ] [ [ NO ] SCROLL ] CURSOR [ { WITH | WITHOUT } HOLD ] FOR query

Description

DECLARE declares a cursor for iterating over the result set of a prepared statement. This command has slightly different semantics from the direct SQL command DECLARE: Whereas the latter executes a query and prepares the result set for retrieval, this embedded SQL command merely declares a name as a "loop variable" for iterating over the result set of a query; the actual execution happens when the cursor is opened with the OPEN command.

Parameters

cursor_name

A cursor name. This can be an SQL identifier or a host variable.

prepared_name

The name of a prepared query, either as an SQL identifier or a host variable.

query

A SELECT or VALUES command which will provide the rows to be returned by the cursor.

For the meaning of the cursor options, see DECLARE.

See

Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on the SELECT, VALUES and DECLARE command.

Examples

Examples declaring a cursor for a query:

EXEC SQL DECLARE C CURSOR FOR SELECT * FROM My_Table END-EXEC.
EXEC SQL DECLARE C CURSOR FOR SELECT Item1 FROM T END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT version() END-EXEC.

An example declaring a cursor for a prepared statement:

EXEC SQL PREPARE stmt1 AS SELECT version() END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR stmt1 END-EXEC.

Compatibility

DECLARE is specified in the SQL standard.

See Also

OPEN, CLOSE, DECLARE
Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on the CLOSE and DECLARE command.

D.11.5 DESCRIBE

Name
DESCRIBE -- obtain information about a prepared statement or result set

Synopsis

DESCRIBE [ OUTPUT ] prepared_name USING SQL DESCRIPTOR descriptor_name

DESCRIBE [ OUTPUT ] prepared_name INTO SQL DESCRIPTOR descriptor_name

Description
DESCRIBE retrieves metadata information about the result columns contained in a prepared statement, without actually fetching a row.

Parameters

prepared_name
The name of a prepared statement. This can be an SQL identifier or a host variable.

descriptor_name
A descriptor name. It can be an SQL identifier or a host variable.

Examples

EXEC SQL ALLOCATE DESCRIPTOR mydesc END-EXEC.
EXEC SQL PREPARE stmt1 FROM :sql_stmt END-EXEC.
EXEC SQL DESCRIBE stmt1 INTO SQL DESCRIPTOR mydesc END-EXEC.
EXEC SQL GET DESCRIPTOR mydesc VALUE 1 :charvar = NAME END-EXEC.
EXEC SQL DEALLOCATE DESCRIPTOR mydesc END-EXEC.

Compatibility
DESCRIBE is specified in the SQL standard.

See Also
ALLOCATE DESCRIPTOR, GET DESCRIPTOR

D.11.6 DISCONNECT

Name
DISCONNECT -- terminate a database connection

Synopsis

DISCONNECT connection_name

DISCONNECT [ CURRENT ]

DISCONNECT DEFAULT
DISCONNECT ALL

Description

DISCONNECT closes a connection (or all connections) to the database.

Parameters

connection_name

A database connection name established by the CONNECT command.

CURRENT

Close the "current" connection, which is either the most recently opened connection, or the connection set by the SET CONNECTION command. This is also the default if no argument is given to the DISCONNECT command.

DEFAULT

Close the default connection.

ALL

Close all open connections.

Examples

EXEC SQL CONNECT TO testdb AS DEFAULT USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb AS con1 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb AS con2 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb AS con3 USER testuser END-EXEC.

*   close con3
EXEC SQL DISCONNECT CURRENT END-EXEC.
*   close DEFAULT
EXEC SQL DISCONNECT DEFAULT END-EXEC.
*   close con2 and con1
EXEC SQL DISCONNECT ALL END-EXEC.

Compatibility

DISCONNECT is specified in the SQL standard.

See Also

CONNECT, SET CONNECTION

D.11.7 EXECUTE IMMEDIATE

Name

EXECUTE IMMEDIATE -- dynamically prepare and execute a statement

Synopsis

EXECUTE IMMEDIATE string

Description

EXECUTE IMMEDIATE immediately prepares and executes a dynamically specified SQL statement, without retrieving result rows.
Parameters

string

A literal string or a host variable containing the SQL statement to be executed.

Examples

Here is an example that executes an INSERT statement using EXECUTE IMMEDIATE and a host variable named command:

```
MOVE "INSERT INTO test (name, amount, letter) VALUES ('db: 'r1'' , 1, 'f')" TO ARR OF cmd.
COMPUTE LEN OF cmd = FUNCTION STORED-CHAR-LENGTH(ARR OF cmd).
EXEC SQL EXECUTE IMMEDIATE :cmd END-EXEC.
```

Compatibility

EXECUTE IMMEDIATE is specified in the SQL standard.

D.11.8 GET DESCRIPTOR

Name

GET DESCRIPTOR -- get information from an SQL descriptor area

Synopsis

GET DESCRIPTOR descriptor_name :hostvariable = descriptor_header_item [, ... ]

GET DESCRIPTOR descriptor_name VALUE column_number :hostvariable = descriptor_item [, ... ]

Description

GET DESCRIPTOR retrieves information about a query result set from an SQL descriptor area and stores it into host variables. A descriptor area is typically populated using FETCH or SELECT before using this command to transfer the information into host language variables.

This command has two forms: The first form retrieves descriptor “header” items, which apply to the result set in its entirety. One example is the row count. The second form, which requires the column number as additional parameter, retrieves information about a particular column. Examples are the column name and the actual column value.

Parameters

descriptor_name

A descriptor name.

descriptor_header_item

A token identifying which header information item to retrieve. Only COUNT, to get the number of columns in the result set, is currently supported.

column_number

The number of the column about which information is to be retrieved. The count starts at 1.

descriptor_item

A token identifying which item of information about a column to retrieve. See Section 33.7.1 for a list of supported items.

hostvariable

A host variable that will receive the data retrieved from the descriptor area.

Examples

An example to retrieve the number of columns in a result set:
EXEC SQL GET DESCRIPTOR d :d_count = COUNT END-EXEC.

An example to retrieve a data length in the first column:
EXEC SQL GET DESCRIPTOR d VALUE 1 :d_returned_octet_length = RETURNED_OCTET_LENGTH END-EXEC.

An example to retrieve the data body of the second column as a string:
EXEC SQL GET DESCRIPTOR d VALUE 2 :d_data = DATA END-EXEC.

Here is an example for a whole procedure of executing SELECT current_database(); and showing the number of columns, the column data length, and the column data:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 D-COUNT PIC S9(9) COMP-5.
  01 D-DATA PIC X(1024).
  01 D-RETURNED-OCTET-LENGTH PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL CONNECT TO testdb AS con1 USER testuser END-EXEC.
EXEC SQL ALLOCATE DESCRIPTOR d END-EXEC.

* Declare, open a cursor, and assign a descriptor to the cursor
EXEC SQL DECLARE cur CURSOR FOR SELECT current_database() END-EXEC.
EXEC SQL OPEN cur END-EXEC.
EXEC SQL FETCH NEXT FROM cur INTO SQL DESCRIPTOR d END-EXEC.

* Get a number of total columns
EXEC SQL GET DESCRIPTOR d :D-COUNT = COUNT END-EXEC.
DISPLAY "d_count                 = " D-COUNT.

* Get length of a returned column
EXEC SQL GET DESCRIPTOR d VALUE 1 :D-RETURNED-OCTET-LENGTH = RETURNED_OCTET_LENGTH END-EXEC.
DISPLAY "d_returned_octet_length = " D-RETURNED-OCTET-LENGTH.

* Fetch the returned column as a string
EXEC SQL GET DESCRIPTOR d VALUE 1 :D-DATA = DATA END-EXEC.
DISPLAY "d_data                  = " D-DATA.

* Closing
EXEC SQL CLOSE cur END-EXEC.
EXEC SQL COMMIT END-EXEC.
EXEC SQL DEALLOCATE DESCRIPTOR d END-EXEC.
EXEC SQL DISCONNECT ALL END-EXEC.

When the example is executed, the result will look like this:

<table>
<thead>
<tr>
<th>d_count</th>
<th>+000000001</th>
</tr>
</thead>
<tbody>
<tr>
<td>d_returned_octet_length</td>
<td>+000000006</td>
</tr>
<tr>
<td>d_data</td>
<td>testdb</td>
</tr>
</tbody>
</table>

**Compatibility**

GET DESCRIPTOR is specified in the SQL standard.
D.11.9 OPEN

Name

OPEN -- open a dynamic cursor

Synopsis

OPEN cursor_name

OPEN cursor_name USING value [, ... ]

OPEN cursor_name USING SQL DESCRIPTOR descriptor_name

Description

OPEN opens a cursor and optionally binds actual values to the placeholders in the cursor's declaration. The cursor must previously have been declared with the DECLARE command. The execution of OPEN causes the query to start executing on the server.

Parameters

cursor_name

The name of the cursor to be opened. This can be an SQL identifier or a host variable.

value

A value to be bound to a placeholder in the cursor. This can be an SQL constant, a host variable, or a host variable with indicator.

descriptor_name

The name of a descriptor containing values to be bound to the placeholders in the cursor. This can be an SQL identifier or a host variable.

Examples

EXEC SQL OPEN a END-EXEC.
EXEC SQL OPEN d USING 1, 'test' END-EXEC.
EXEC SQL OPEN c1 USING SQL DESCRIPTOR mydesc END-EXEC.
EXEC SQL OPEN :curname1 END-EXEC.

Compatibility

OPEN is specified in the SQL standard.

See Also

DECLARE, CLOSE

See Also

ALLOCATE DESCRIPTOR, SET DESCRIPTOR
Name
PREPARE -- prepare a statement for execution

Synopsis
PREPARE name FROM string

Description
PREPARE prepares a statement dynamically specified as a string for execution. This is different from the direct SQL statement PREPARE, which can also be used in embedded programs. The EXECUTE command is used to execute either kind of prepared statement.

Parameters
prepared_name
An identifier for the prepared query.

string
A literal string or a host variable containing a preparable statement, one of the SELECT, INSERT, UPDATE, or DELETE.

Examples
MOVE "SELECT * FROM test1 WHERE a = ? AND b = ?" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL ALLOCATE DESCRIPTOR indesc END-EXEC.
EXEC SQL ALLOCATE DESCRIPTOR outdesc END-EXEC.
EXEC SQL PREPARE foo FROM :STMT END-EXEC.
EXEC SQL EXECUTE foo USING SQL DESCRIPTOR indesc INTO SQL DESCRIPTOR outdesc END-EXEC.

Compatibility
PREPARE is specified in the SQL standard.

See Also
EXECUTE

Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on the EXECUTE command.

D.11.11 SET AUTOCOMMIT

Name
SET AUTOCOMMIT -- set the autocommit behavior of the current session

Synopsis
SET AUTOCOMMIT { = | TO } { ON | OFF }

Description
SET AUTOCOMMIT sets the autocommit behavior of the current database session. By default, embedded SQL programs are not in autocommit mode, so COMMIT needs to be issued explicitly when desired. This command can change the session to autocommit mode, where each individual statement is committed implicitly.
**Compatibility**

SET AUTOCOMMIT is an extension of PostgreSQL ECOBPG.

### D.11.12 SET CONNECTION

**Name**

SET CONNECTION -- select a database connection

**Synopsis**

```
SET CONNECTION [ TO | = ] connection_name
```

**Description**

SET CONNECTION sets the "current" database connection, which is the one that all commands use unless overridden.

**Parameters**

- `connection_name`
  - A database connection name established by the CONNECT command.
  - `DEFAULT`
    - Set the connection to the default connection.

**Examples**

```
EXEC SQL SET CONNECTION TO con2 END-EXEC.
EXEC SQL SET CONNECTION = con1 END-EXEC.
```

**Compatibility**

SET CONNECTION is specified in the SQL standard.

**See Also**

CONNECT, DISCONNECT

### D.11.13 SET DESCRIPTOR

**Name**

SET DESCRIPTOR -- set information in an SQL descriptor area

**Synopsis**

```
SET DESCRIPTOR descriptor_name descriptor_header_item = value [, ... ]
SET DESCRIPTOR descriptor_name VALUE number descriptor_item = value [, ...]
```

**Description**

SET DESCRIPTOR populates an SQL descriptor area with values. The descriptor area is then typically used to bind parameters in a prepared query execution.

This command has two forms: The first form applies to the descriptor "header", which is independent of a particular datum. The second form assigns values to particular datums, identified by number.
**Parameters**

*descriptor_name*

A descriptor name.

*descriptor_header_item*

A token identifying which header information item to set. Only COUNT, to set the number of descriptor items, is currently supported.

*number*

The number of the descriptor item to set. The count starts at 1.

*descriptor_item*

A token identifying which item of information to set in the descriptor. See Section 33.7.1 for a list of supported items.

*value*

A value to store into the descriptor item. This can be an SQL constant or a host variable.

**Examples**

```
EXEC SQL SET DESCRIPTOR indescr COUNT = 1 END-EXEC.
EXEC SQL SET DESCRIPTOR indescr VALUE 1 DATA = 2 END-EXEC.
EXEC SQL SET DESCRIPTOR indescr VALUE 1 DATA = :val1 END-EXEC.
EXEC SQL SET DESCRIPTOR indescr VALUE 2 DATA = 'some string', INDICATOR = :val1 END-EXEC.
EXEC SQL SET DESCRIPTOR indescr VALUE 2 INDICATOR = :val2null, DATA = :val2 END-EXEC.
```

**Compatibility**

SET DESCRIPTOR is specified in the SQL standard.

**See Also**

ALLOCATE DESCRIPTOR, GET DESCRIPTOR

---

**D.11.14 TYPE**

**Name**

TYPE -- define a new data type

**Synopsis**

```
TYPE type_name IS ctype
```

**Description**

The TYPE command defines a new COBOL type. It is equivalent to putting a typedef into a declare section.

This command is only recognized when ecobpgpg is run with the -c option.

A level number of 01 is automatically added to type_name item. Thus, the level number must not to be specified externally.

To define a group item, a level number needs to be specified to the each subordinate items.

For reasons of internal implementation, "TYPE" must be placed just after "EXEC SQL", without containing newline. For other place, you can use newline.

**Parameters**

*type_name*

The name for the new type. It must be a valid COBOL type name.
**ctype**

A COBOL type specification (including expression format specification).

**Examples**

```sql
EXEC SQL TYPE CUSTOMER IS
  02 NAME PIC X(50) VARYING.
  02 PHONE PIC S9(9) COMP. END-EXEC.

EXEC SQL TYPE CUST-IND IS
  02 NAME_IND PIC S9(4) COMP.
  02 PHONE_IND PIC S9(4) COMP. END-EXEC.

EXEC SQL TYPE INTARRAY IS
  02 INT PIC S9(9) OCCURS 20. END-EXEC.

EXEC SQL TYPE STR IS PIC X(50) VARYING. END-EXEC.

EXEC SQL TYPE STRING IS PIC X(10). END-EXEC.
```

Here is an example program that uses EXEC SQL TYPE:

```sql
EXEC SQL TYPE TT IS
  02 V PIC X(256) VARYING.
  02 I PIC S9(9) COMP. END-EXEC.

EXEC SQL TYPE TT-IND IS
  02 V-IND PIC S9(4) COMP.
  02 I-IND PIC S9(4) COMP. END-EXEC.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 T TYPE TT.
  01 T-IND TYPE TT-IND.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL CONNECT TO testdb AS con1 END-EXEC.

EXEC SQL SELECT current_database(), 256 INTO :T :T-IND LIMIT 1 END-EXEC.

DISPLAY "t.v = " ARR OF V OF T.
DISPLAY "t.i = " I OF T.

DISPLAY "t_ind.v_ind = " V-IND OF T-IND.
DISPLAY "t_ind.i_ind = " I-IND OF T-IND.

EXEC SQL DISCONNECT con1 END-EXEC.
```

**Compatibility**

The TYPE command is a PostgreSQL extension.

**D.11.15 VAR**

**Name**

VAR—define a variable

**Synopsis**

VAR varname IS ctype
Description
The VAR command defines a host variable. It is equivalent to an ordinary COBOL variable definition inside a declare section. When translating, a level number 01 is added. Thus, the level number must not to be specified externally.
To define a group item, a level number needs to be specified to the each subordinate items.
For reasons of internal implementation, "VAR" must be placed just after "EXEC SQL", without containing newline. For other place, you can use newline.

Parameters

  varname
  A COBOL variable name.

  ctype
  A COBOL type specification.

Examples

EXEC SQL VAR VC IS PIC X(10) VARYING. END-EXEC.
EXEC SQL VAR BOOL-VAR IS BOOL. END-EXEC.

Compatibility
The VAR command is a PostgreSQL extension.

D.11.16 WHENEVER

Name
WHENEVER -- specify the action to be taken when an SQL statement causes a specific class condition to be raised

Synopsis
WHENEVER { NOT FOUND | SQLERROR | SQLWARNING } action

Description
Define a behavior which is called on the special cases (Rows not found, SQL warnings or errors) in the result of SQL execution.

Parameters
See Section "D.7.1 Setting Callbacks" or a description of the parameters.

Examples

EXEC SQL WHENEVER NOT FOUND CONTINUE END-EXEC.
EXEC SQL WHENEVER SQLWARNING SQLPRINT END-EXEC.
EXEC SQL WHENEVER SQLERROR DO "warn" END-EXEC.
EXEC SQL WHENEVER SQLERROR sqlprint END-EXEC.
EXEC SQL WHENEVER SQLERROR CALL "print2" END-EXEC.
EXEC SQL WHENEVER SQLERROR DO handle_error USING "select" END-EXEC.
EXEC SQL WHENEVER SQLERROR DO sqlnotice USING 0 1 END-EXEC.
EXEC SQL WHENEVER SQLERROR GOTO error_label END-EXEC.
EXEC SQL WHENEVER SQLERROR STOP END-EXEC.

A typical application is the use of WHENEVER NOT FOUND GOTO to handle looping through result sets:
EXEC SQL CONNECT TO testdb AS con1 END-EXEC.
EXEC SQL ALLOCATE DESCRIPTOR d END-EXEC.
EXEC SQL DECLARE cur CURSOR FOR SELECT current_database(), 'hoge', 256 END-EXEC.
EXEC SQL OPEN cur END-EXEC.

* when end of result set reached, break out of while loop
EXEC SQL WHENEVER NOT FOUND GOTO NOTFOUND END-EXEC.

PERFORM NO LIMIT
   EXEC SQL FETCH NEXT FROM cur INTO SQL DESCRIPTOR d END-EXEC
...
END-PERFORM.

NOTFOUND.
EXEC SQL CLOSE cur END-EXEC.
EXEC SQL COMMIT END-EXEC.
EXEC SQL DEALLOCATE DESCRIPTOR d END-EXEC.
EXEC SQL DISCONNECT ALL END-EXEC.

---

Compatibility
WHENEVER is specified in the SQL standard, but most of the actions are PostgreSQL extensions.

D.12 PostgreSQL Client Applications
This part contains reference information for PostgreSQL client applications and utilities. Not all of these commands are of
general utility; some might require special privileges. The common feature of these applications is that they can be run on any
host, independent of where the database server resides.

When specified on the command line, user and database names have their case preserved
— the presence of spaces or special
characters might require quoting. Table names and other identifiers do not have their case preserved, except where
documented, and might require quoting.

D.12.1 ecobpg

Name
ecobpg -- embedded SQL COBOL preprocessor

Synopsis
ecobpg [option...] file...

Description
ecobpg is the embedded SQL preprocessor for COBOL programs. It converts COBOL programs with embedded SQL
statements to normal COBOL code by replacing the SQL invocations with special function calls. The output files can then
be processed with any COBOL compiler tool chain.

ecobpg will convert each input file given on the command line to the corresponding COBOL output file. Input files preferably
have the extension .pco, in which case the extension will be replaced by .cob to determine the output file name. If the extension
of the input file is not .pco, then the output file name is computed by appending .cob to the full file name. The output file name
can also be overridden using the -o option.

Options
ecobpg accepts the following command-line arguments:

-\C

   Automatically generate certain COBOL code from SQL code. Currently, this works for EXEC SQL TYPE.
-I directory

Specify an additional include path, used to find files included via EXEC SQL INCLUDE. Defaults are: (current directory), /usr/local/include, the PostgreSQL include directory which is defined at compile time (default: /usr/local/pgsql/include), and /usr/include, in that order.

-o filename

Specifies that ecobpg should write all its output to the given filename.

-f format

Specifies the COBOL code notation. For "format", specify either of the following. If omitted, "fixed" is used.

fixed

Specifies fixed format notation. Up to 72 columns can be specified for area B. Characters in column 73 and beyond are deleted in the precompiled source.

variable

Specifies variable format notation. Up to 251 columns can be specified for area B. Characters in column 252 and beyond are deleted in the precompiled source.

-r option

Selects run-time behavior. Option can be one of the following:

prepare

Prepare all statements before using them. Libecpg will keep a cache of prepared statements and reuse a statement if it gets executed again. If the cache runs full, libecpg will free the least used statement.

questionmarks

Allow question mark as placeholder for compatibility reasons. This used to be the default long ago.

-t

Turn on autocommit of transactions. In this mode, each SQL command is automatically committed unless it is inside an explicit transaction block. In the default mode, commands are committed only when EXEC SQL COMMIT is issued.

--varchar-with-named-member

When converting VARCHAR host variable, adding name of the variable to members as prefix. Instead of LEN and ARR, (varname)-ARR and (varname)-LEN will be used.

--bytea-with-named-member

When converting bytea host variable, adding name of the variable to members as prefix. Instead of LEN and ARR, (varname)-ARR and (varname)-LEN will be used.

-E encode

Specify the COBOL source encoding: "UTF8", "SJIS", or "EUC_JP".

If this option is omitted, the encoding is processed based on the locale.

-v

Print additional information including the version and the "include" path.

--version

Print the ecobpg version and exit.

-?

--help

Show help about ecobpg command line arguments, and exit.

Notes

When compiling the preprocessed COBOL code files, the compiler needs to be able to find the library files in the PostgreSQL include directory.
Programs using COBOL code with embedded SQL have to be linked against the libecpg library, for example using the linker options.

The value of either of these directories that is appropriate for the installation can be found out using pg_config.

See

Refer to "pg_config" in "Reference" in the PostgreSQL Documentation.

Examples

If you have an embedded SQL COBOL source file named prog1.pco, you can create an executable program using the following command:

```
ecobpg prog1.pco
```
## Appendix E  Quantitative Limits

This appendix lists the quantitative limits of FUJITSU Enterprise Postgres.

### Table E.1 Length of identifier

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Schema name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>View name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Index name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table space name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cursor name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Aggregate function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Trigger name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Constraint name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Role name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cast name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Collation sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Encoding method conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Domain name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Extension name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator class name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator family name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Rewrite rule name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search settings name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search dictionary name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search parser name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search template name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Data type name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Enumerator type label</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

*2: If an identifier that exceeds 63 bytes in length is specified, the excess characters are truncated and it is processed.

### Table E.2 Database object

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of databases</td>
<td>Less than 4,294,967,296 (*1)</td>

</tr>
<tr>
<td>Number of index access methods</td>
<td>Less than 4,294,967,296 (*1)</td>
</tr>
</tbody>
</table>

*1: The total number of all database objects must be less than 4,294,967,296.

### Table E.3 Schema element

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns that can be defined in one table</td>
<td>From 250 to 1600 (according to the data type)</td>
</tr>
<tr>
<td>Table row length</td>
<td>Up to 400 gigabytes</td>
</tr>
<tr>
<td>Number of columns comprising a unique constraint</td>
<td>Up to 32 columns</td>
</tr>
<tr>
<td>Data length comprising a unique constraint</td>
<td>Less than 2,000 bytes (*1) (*2)</td>
</tr>
</tbody>
</table>
### Table E.4 Index

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns comprising a key (including VCI)</td>
<td>Up to 32 columns</td>
</tr>
<tr>
<td>Key length (other than VCI)</td>
<td>Less than 2,000 bytes (*1)</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

### Table E.5 Data types and attributes that can be handled

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td>Data types and attributes that can be handled (*1)</td>
</tr>
<tr>
<td>Specification length (n)</td>
<td>Up to 10,485,760 characters (*1)</td>
</tr>
<tr>
<td>Numeric</td>
<td>External decimal expression</td>
</tr>
<tr>
<td>Internal binary expression</td>
<td>2 bytes From -32,768 to 32,767</td>
</tr>
<tr>
<td></td>
<td>4 bytes From -2,147,483,648 to 2,147,483,647</td>
</tr>
<tr>
<td></td>
<td>8 bytes From -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807</td>
</tr>
<tr>
<td>Internal decimal expression</td>
<td>Up to 13,1072 digits before the decimal point, and up to 16,383 digits after the decimal point</td>
</tr>
<tr>
<td>Floating point expression</td>
<td>4 bytes From -3.4E+38 to -7.1E-46, 0, or from 7.1E-46 to 3.4E+38</td>
</tr>
<tr>
<td></td>
<td>8 bytes From -1.7E+308 to -2.5E-324, 0, or from 2.5E-324 to 1.7E+308</td>
</tr>
<tr>
<td>bytea</td>
<td>Up to one gigabyte minus 53 bytes</td>
</tr>
<tr>
<td>Large object</td>
<td>Up to two gigabytes</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

### Table E.6 Function definition

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of arguments that can be specified</td>
<td>Up to 100</td>
</tr>
<tr>
<td>Number of variable names that can be specified in the declarations section</td>
<td>No limit</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.

*2: This is the character string byte length when converted by the server character set character code.
<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of SQL statements or control statements that can be specified in a function processing implementation</td>
<td>No limit</td>
</tr>
</tbody>
</table>

### Table E.7 Data operation statement

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of connections for one process in an application (remote access)</td>
<td>4,000 connections</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a selection list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of tables that can be specified in a FROM clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of unique expressions that can be specified in a selection list/DISTINCT clause/ORDER BY clause/GROUP BY clause within one SELECT statement</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a GROUP BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an ORDER BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of SELECT statements that can be specified in a UNION clause/INTERSECT clause/EXCEPT clause</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of nestings in joined tables that can be specified in one view</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of functions or operator expressions that can be specified in one expression</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row constructor</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an UPDATE statement SET clause</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row of a VALUES list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a RETURNING clause</td>
<td>Up to 1,664</td>
</tr>
<tr>

F.3 .NET Data Provider

There are the following ways to develop applications using Fujitsu Npgsql .NET Data Provider:

- Use the Fujitsu Npgsql.NET Data Provider API (classes and methods) directly.
  
  Fujitsu Npgsql .NET Data Provider is created based on the open source software Npgsql. Refer to the “Npgsql - .Net Data Provider for Postgresql” for information on the APIs:

  ![See](https://example.com/see.png)

  Refer to the Installation and Setup Guide for Client for the version of Npgsql that Fujitsu Npgsql .NET Data Provider is based on.

- Use the API of the .NET System.Data.Common namespace
  
  It is possible to create applications that do not rely on a provider when you use the System.Data.Common namespace. Refer to the “Writing Provider-Independent Code in ADO.NET” in MSDN Library for information.

  ![See](https://example.com/see.png)

  Refer to the Npgsql API Reference for information on Npgsql API classes and methods.

F.4 C Library (libpq)

![See](https://example.com/see.png)

Refer to “libpq - C Library” in “Client Interfaces” in the PostgreSQL Documentation.

F.5 Embedded SQL in C

![See](https://example.com/see.png)

Refer to “ECPG - Embedded SQL in C” in “Client Interfaces” in the PostgreSQL Documentation.

Preface

Purpose of this document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Linux platform. This document is the FUJITSU Enterprise Postgres Operation Guide.

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres. Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Linux

Structure of this document
This document is structured as follows:

Chapter 1 Operating FUJITSU Enterprise Postgres
Describes how to operate FUJITSU Enterprise Postgres.

Chapter 2 Starting an Instance and Creating a Database
Describes how to start a FUJITSU Enterprise Postgres instance, and how to create a database.

Chapter 3 Backing Up the Database
Describes how to back up the database.

Chapter 4 Configuring Secure Communication Using Secure Sockets Layer
Describes communication data encryption between the client and the server.

Chapter 5 Protecting Storage Data Using Transparent Data Encryption
Describes how to encrypt the data to be stored in the database.

Chapter 6 Data Masking
Describes the data masking feature.

Chapter 7 Periodic Operations
Describes the periodic database operations that must be performed on FUJITSU Enterprise Postgres.

Chapter 8 Streaming Replication Using WebAdmin
Describes how to create a streaming replication cluster using WebAdmin.

Chapter 9 Installing and Operating the In-memory Feature
Describes how to install and operate the in-memory feature.

Chapter 10 Parallel Query
Describes the factors taken into consideration by FUJITSU Enterprise Postgres when performing parallel queries.

Chapter 11 High-Speed Data Load
Describes how to install and operate high-speed data load.

Chapter 12 Global Meta Cache
Describes how to use Grobal Meta Cache feature.

Chapter 13 Local Meta Cache Limit
Describes how to use Local Meta Cache Limit feature.
Chapter 14 Backup/Recovery Using the Copy Command
Describes backup and recovery using the copy command created by the user.

Chapter 15 Actions when an Error Occurs
Describes how to perform recovery when disk failure or data corruption occurs.

Appendix A Parameters
Describes the FUJITSU Enterprise Postgres parameters.

Appendix B System Administration Functions
Describes the system administration functions of FUJITSU Enterprise Postgres.

Appendix C System Views
Describes how to use the system view in FUJITSU Enterprise Postgres.

Appendix D Tables Used by Data Masking
Describes the tables used by the data masking feature.

Appendix E Tables Used by High-Speed Data Load
Describes the tables used by high-speed data load.

Appendix F Starting and Stopping the Web Server Feature of WebAdmin
Describes how to start and stop WebAdmin (Web server feature).

Appendix G WebAdmin Wallet
Describes how to use the Wallet feature of WebAdmin.

Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters
Describes characters not allowed in WebAdmin.

Appendix I Copy Command Samples that Use the Advanced Copy Feature of the ETERNUS Disk Array
Describes copy command samples that use the advanced copy feature of the ETERNUS disk array.

Appendix J Collecting Failure Investigation Data
Describes how to collect information for initial investigation.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Operating FUJITSU Enterprise Postgres

This chapter describes how to operate FUJITSU Enterprise Postgres.

1.1 Operating Methods

There are two methods of managing FUJITSU Enterprise Postgres operations:

- Operation management using GUI tools
- Operation management using commands

See

Before performing database multiplexing using database multiplexing, refer to "Database Multiplexing Mode" in the Cluster Operation Guide (Database Multiplexing).

Operation management using GUI tools

This involves managing operations using the WebAdmin and pgAdmin GUI tools.

- Management using WebAdmin
  This removes the requirement for complex environment settings and operational design for backup and recovery that is usually required for running a database. It enables you to easily and reliably monitor the state of the database, create a streaming replication cluster, back up the database, and restore it even if you do not have expert knowledge of databases.

- Management using pgAdmin
  When developing applications and maintaining the database, you can use pgAdmin to perform simple operations on database objects, such as:
  - Rebuild indexes and update statistics
  - Create, delete, and update database objects

In addition, from pgAdmin of FUJITSU Enterprise Postgres, you can use the expanded features provided by FUJITSU Enterprise Postgres on the PostgreSQL SQL commands.

See

Refer to pgAdmin Help for information on the expanded features of pgAdmin provided by FUJITSU Enterprise Postgres.

Operation management using commands

You can use commands for configuring and operating the database and managing operations.

Note

- You cannot combine WebAdmin and server commands to perform the following operations:
  - Use commands to operate an instance created using WebAdmin.
  - Use WebAdmin to recover a database backed up using commands.

For instances created with WebAdmin, however, backup can be obtained with the pgx_dmpall command. Also, WebAdmin can perform recovery by using the backup obtained with the pgx_dmpall command.

- To operate an instance created using the initdb command in WebAdmin, the instance needs to be imported using WebAdmin.
You can perform backup and restoration in pgAdmin, but the backup data obtained with WebAdmin and pgx_dmpall is not compatible with the backup data obtained with pgAdmin.

- Refer to pgAdmin Help for other notes on pgAdmin.

---

### Features used in each phase

The following table lists the features used in each phase for GUI-based operations and command-based operations.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
</table>
| Setup                      | Creating an instance
WebAdmin is used. The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically. | The configuration file is edited directly using the initdb command.                     |
|                            | Creating a standby instance
WebAdmin is used. WebAdmin performs a base backup of the source instance and creates a standby instance. | A standby instance is created using the pg_basebackup command.                          |
|                            | Changing the configuration files
WebAdmin is used. | The configuration file is edited directly.                                              |
| Starting and stopping an instance | WebAdmin is used. | The pg_ctl command is used.                                                             |
| Creating a database        | This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement. |                                                                                         |
| Backing up the database    | WebAdmin, or the pgx_dmpall command, is used.                                            | It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed. |
| Database recovery          | WebAdmin is used.                                                                         | To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used. |
| Monitoring                 | Database errors
The status in the WebAdmin window can be checked. (*1)                                   | The messages that are output to the database server log are monitored (*1)               |
|                            | Disk space
The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. (*1) | This is monitored using the df command of the operating system, for example. (*1)         |
|                            | Connection status
This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application. |                                                                                         |

*1: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

### 1.2 Starting WebAdmin

This section describes how to start and log in to WebAdmin.

#### 1.2.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.
User environment

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build41 or later)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.

Startup URL for WebAdmin

In the browser address bar, type the startup URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- `hostNameOrIpAddress`: The host name or IP address of the server where WebAdmin is installed.
- `portNumber`: The port number of WebAdmin. The default port number is 27515.

Example

For a server with IP address "192.0.2.0" and port number "27515"

```
http://192.0.2.0:27515/
```

The startup URL window shown below is displayed. From this window you can log in to WebAdmin or access the product documentation.

FUJITSU Enterprise Postgres

Note

- You must start the Web server feature of WebAdmin before using WebAdmin.
- Refer to "Appendix F Starting and Stopping the Web Server Feature of WebAdmin" for information on how to start the Web server feature of WebAdmin.
Log in to WebAdmin

Click [Launch WebAdmin] in the startup URL window to start WebAdmin and display the login window.

To log in, specify the following values:

- [User name]: User name (OS user account) of the instance administrator
- [Password]: Password corresponding to the user name

Point

Use the OS user account as the user name of the instance administrator. Refer to “Creating an Instance Administrator” in the Installation and Setup Guide for Server for details.

1.3 Starting pgAdmin

This section describes how to start pgAdmin, how to add an instance required for managing a database, and how to connect to and disconnect from the instance.

You can use pgAdmin on the Windows client.

1.3.1 Starting pgAdmin

This section explains how to start pgAdmin if you are using it from the product “FUJITSU Enterprise Postgres Client (AAbit) x SPz” (where A4 is “32” or “64”, “x” is the product version, and “z” is the product level (x SPz)).

Windows Server(R) 2012

From the [Start] screen, start [pgAdmin 4 (AAbit) (x SPz)].

Windows(R) 8.1 or Windows Server(R) 2012 R2

From the [Apps] view, start [pgAdmin 4 (AAbit) (x SPz)].

Windows(R) 10, Windows Server(R) 2016, or Windows Server(R) 2019

Click [Start] >> [All apps] >> [FUJITSU Enterprise Postgres Client(AAbit) x SPz] and start [pgAdmin 4 (AAbit) (x SPz)].

Note

- You must start the instance to be connected to before using pgAdmin.
- Refer to “2.1 Starting and Stopping an Instance” for information on how to start an instance.
- When using pgAdmin4 with Microsoft Edge, enable network access by loopback in Microsoft Edge. Also, add Microsoft Edge to the loopback exclusion list.

1.3.2 Adding an Instance

This section describes how to add an instance to be connected to.

Note

If you use a link-local address with version 6 of the TCP/IP protocol, you may encounter the following error when registering the server with pgAdmin. Therefore, do not use link-local addresses.

 unsupported format character ’’’ (0x22) at index 96

1. In the [Browser] pane, right-click [Servers], and then click [Create] >> [Server].
2. In the [Create - Server] window, specify a value for each item.

[General] tab
- [Name]: Name of the instance to be managed

[Connection] tab
- [Host name/address]: Host name or IP address of the server where FUJITSU Enterprise PostgreSQL is installed
- [Port]: Port number of the instance
- [Username]: User name of the instance administrator
- [Password]: Password for the user name specified in [Username]

When you add an instance using pgAdmin, the instance is automatically connected to immediately after the addition is completed.

**Note**

If you select [Save password], the FUJITSU Enterprise PostgreSQL connection password is stored in the following location. Set the appropriate access permissions for the password file to protect it from unauthorized access.

- `%APPDATA%\Roaming\pgAdmin\pgadmin4.db`
1.3.3 Connecting/Disconnecting an Instance

This section describes how to connect pgAdmin to an instance, and how to disconnect it.

**Note**

To connect to an instance created using WebAdmin, you must first configure the settings in the [Client authentication] window of WebAdmin to permit connection from pgAdmin.

**See**

### Connecting to an instance

Starting pgAdmin does not connect it to any instance.

To connect to an instance, in the [Browser] pane, right-click the instance, and then click [Connect Server].

If a password was not saved when the instance was added, enter a password in the password entry window that is displayed.

### Disconnecting from an instance

To disconnect from an instance, in the [Browser] pane, right-click the server, and then click [Disconnect Server].

1.4 Operations Using Commands

You can operate and manage the database using the following commands:

- **Server commands**
  
  This group of commands includes commands for creating a database cluster and controlling the database. You can run these commands on the server where the database is operating.

  To use these commands, you must configure the environment variables.

**See**

- Refer to "PostgreSQL Server Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on server commands.

- Refer to "Configure the environment variables" in the procedure to create instances in "Using the initdb Command" in the Installation and Setup Guide for Server for information on configuring the environment variables.

- **Client commands**

  This group of commands includes the psql command and commands for extracting the database cluster to a script file. These commands can be executed on the client that can connect to the database, or on the server on which the database is running.

  To use these commands, you must configure the environment variables.

**See**

- Refer to "PostgreSQL Client Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on client commands.
1.5 Operating Environment of FUJITSU Enterprise Postgres

This section describes the operating environment and the file composition of FUJITSU Enterprise Postgres.

1.5.1 Operating Environment

The following figure shows the configuration of the FUJITSU Enterprise Postgres operating environment. The tables given below list the roles of the OS resources and FUJITSU Enterprise Postgres resources.

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.

**Table 1.1 OS resources**

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared memory</td>
<td>Used when a database process exchanges information with an external process.</td>
</tr>
<tr>
<td>Semaphore</td>
<td></td>
</tr>
</tbody>
</table>
Table 1.2 FUJITSU Enterprise Postgres client resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection service file</td>
<td>Specifies information, such as the host name, user name, and password, for connecting to FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>Password file</td>
<td>Securely manages the password for connecting to FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>CA certificate file</td>
<td>CA (certificate authority) certificate used for server authentication when encrypting communication data.</td>
</tr>
</tbody>
</table>

Table 1.3 Server resources of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>Database storage area on the database storage disk. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>System catalog</td>
<td>Contains information required for the system to run, including the database definition information and the operation information created by the user.</td>
</tr>
<tr>
<td>Default tablespace</td>
<td>Contains table files and index files stored by default.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Contains log information in case of a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
<tr>
<td>Work file</td>
<td>Work file used when executing applications or commands.</td>
</tr>
<tr>
<td>postgresql.conf</td>
<td>Contains information that defines the operating environment of FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>pg_hba.conf</td>
<td>FUJITSU Enterprise Postgres uses this file to authenticate individual client hosts.</td>
</tr>
<tr>
<td>Server certificate file</td>
<td>Contains information about the server certificate to be used when encrypting communication data and authenticating a server.</td>
</tr>
<tr>
<td>Server private key file</td>
<td>Contains information about the server private key to be used when encrypting communication data and authenticating a server.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster. Specify a space other than that under the database cluster.</td>
</tr>
<tr>
<td>Backup</td>
<td>Stores the data required for recovering the database when an error, such as disk failure, occurs.</td>
</tr>
<tr>
<td>Database backup</td>
<td>Contains the backup data for the database.</td>
</tr>
<tr>
<td>Archive log</td>
<td>Contains the log information for recovery.</td>
</tr>
<tr>
<td>Mirrored transaction log (mirrored WAL)</td>
<td>Enables a database cluster to be restored to the state immediately before an error even if both the database cluster and transaction log fail when performing backup/recovery operations using the pgx_dmpall command or WebAdmin.</td>
</tr>
<tr>
<td>Core file</td>
<td>FUJITSU Enterprise Postgres process core file that is output when an error occurs during a FUJITSU Enterprise Postgres process.</td>
</tr>
<tr>
<td>Key management server or key management storage</td>
<td>Server or storage where the master encryption key file is located.</td>
</tr>
<tr>
<td>Master encryption key file</td>
<td>Contains the master encryption key to be used when encrypting storage data. The master encryption key file is managed on the key management server or key management storage.</td>
</tr>
</tbody>
</table>
1.5.2 File Composition

FUJITSU Enterprise Postgres consists of the following files for controlling and storing the database. The table below shows the relationship between the number of such files and their location within a single instance.

Table 1.4 Number of files within a single instance and how to specify their location

<table>
<thead>
<tr>
<th>File type</th>
<th>Required</th>
<th>Quantity</th>
<th>How to specify the location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program files</td>
<td>Y</td>
<td>Multiple</td>
<td>Note that &quot;&lt;x&gt;&quot; indicates the product version. /opt/fsepv&lt;x&gt;server64</td>
</tr>
<tr>
<td>Database cluster</td>
<td>Y</td>
<td>1</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify a space other than that under the database cluster, using pgAdmin or the DDL statement.</td>
</tr>
<tr>
<td>Backup</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Core file</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin, server commands, or postgresql.conf.</td>
</tr>
<tr>
<td>Server certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Server private key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Master encryption key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify the directory created as the key store using postgresql.conf.</td>
</tr>
<tr>
<td>Connection service file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>Password file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>CA certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
</tbody>
</table>

Y: Mandatory
N: Optional

*1: Set manually when using the applicable feature.

Note

- Do not use an NFS for files used in FUJITSU Enterprise Postgres except when creating a database space in a storage device on a network.
- If anti-virus software is used, set scan exception settings for directories so that none of the files that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the files that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop FUJITSU Enterprise Postgres and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

1.6 Notes on Compatibility of Applications Used for Operations

When you upgrade FUJITSU Enterprise Postgres to a newer version, there may be some effect on applications due to improvements or enhancements in functionality.

Take this into account when creating applications so that you can maintain compatibility after upgrading to a newer version of FUJITSU Enterprise Postgres.

See

Refer to "Notes on Application Compatibility" in the Application Development Guide for details.
1.7 Notes on Upgrading Database Instances

When upgrading FUJITSU Enterprise Postgres 9.4 or newer database instances to FUJITSU Enterprise Postgres 10 or later using pg_upgrade, there are certain steps you need to follow.

Before using pg_upgrade, remove the following extensions from all databases in the instance, except "template0":

- pg_stat_statements
- pgx_io
- pgx_paging
- pgx_network
- pgx_network_err
- pgx_cpu
- pgx_memory
- pgx_swap
- pgx_disk
- pgx_process
- pgx_log
- oracle_compatible
- pg_dbms_stats
- pg_hint_plan

For all databases except "template0", execute the following command to remove these extensions:

```sql
DROP EXTENSION extensionName;
```

Once the pg_upgrade operation is complete, for all databases except "template0", execute the following command to re-create these extensions as required:

```sql
CREATE EXTENSION extensionName;
```

**Note**

- It is strongly recommended to back up the database using pg_dump before performing pg_upgrade or using DROP EXTENSION.
- If there are any columns created in the user tables using a data type from these extensions, then DROP EXTENSION will also drop these columns. Therefore, it is essential that alternate upgrade mechanisms are considered instead of pg_upgrade, in such scenarios. These may include pg_dump/pg_restore.

1.7.1 Additional Steps for upgrading to FUJITSU Enterprise Postgres with Vertical Clustered Index (VCI) Enabled

When upgrading FUJITSU Enterprise Postgres 11.0 or earlier instances that are using the VCI extension to FUJITSU Enterprise Postgres 12 or later using pg_upgrade, additional steps must be performed because of the incompatibility of the VCI extension between FUJITSU Enterprise Postgres 12 or later and FUJITSU Enterprise Postgres 11 or earlier.

Follow the procedure below in all databases in the FUJITSU Enterprise Postgres 11 or earlier instance, except "template0".
Before upgrading

1. Obtain the CREATE INDEX Definitions

Run the query below to list all the VCI indexes created in the database. Ensure that these indexes are re-created in the FUJITSU Enterprise Postgres 12 or later instance after pg_upgrade has finished.

```
SELECT nspname || '.' || relname AS index_relname,* FROM pg_class, pg_namespace
WHERE relnamespace = pg_namespace.oid AND relam IN (SELECT oid FROM pg_am WHERE amname='vci');
```

For each index_relname listed above, execute the commands below to obtain the CREATE INDEX definition (to use the same SQL syntax while re-creating the indexes on the FUJITSU Enterprise Postgres 12 or later instance).

```
SELECT pg_get_indexdef('indexName'::regclass);
```

2. Drop the VCI indexes and VCI extension along with all its dependencies.

To remove all the VCI indexes and VCI internal objects that are created in FUJITSU Enterprise Postgres, execute the commands below. VCI internal objects will be created in FUJITSU Enterprise Postgres 12 or later automatically when CREATE EXTENSION for VCI is executed.

```
DROP EXTENSION VCI CASCADE;
```

Note

To restore the VCI extension in the FUJITSU Enterprise Postgres 11 or earlier instance, execute CREATE EXTENSION.

---

After upgrading

Once the pg_upgrade operation is complete, for all databases except "template0", execute CREATE EXTENSION to create the VCI extension, and then execute CREATE INDEX for all the VCI indexes as required.
Chapter 2 Starting an Instance and Creating a Database

This chapter describes basic operations, from starting an instance to creating a database.

2.1 Starting and Stopping an Instance

This section describes how to start and stop an instance.

- 2.1.1 Using WebAdmin
- 2.1.2 Using Server Commands

**Point**

To automatically start or stop an instance when the operating system on the database server is started or stopped, refer to "Configuring Automatic Start and Stop of an Instance" in the Installation and Setup Guide for Server and configure the settings.

**Note**

The collected statistics are initialized if an instance is stopped in the "Immediate" mode or if it is abnormally terminated. To prepare for such initialization of statistics, consider regular collection of the statistics by using the SELECT statement. Refer to "The Statistics Collector" in "Server Administration" in the PostgreSQL Documentation for information on the statistics.

2.1.1 Using WebAdmin

WebAdmin enables you to start or stop an instance and check its operating status.

**Starting an instance**

Start an instance by using the [Instances] tab in WebAdmin.

- is displayed when an instance is stopped.
  
  To start a stopped instance, click .

**Stopping an instance**

Stop an instance by using the [Instances] tab in WebAdmin.

- is displayed when an instance is active.
  
  To stop an active instance, click .

**Stop mode**

Select the mode in which to stop the instance. The following describes the operations of the modes:

<table>
<thead>
<tr>
<th>Stop mode</th>
<th>Connected clients</th>
<th>Backup being executed using the command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart mode (*)</td>
<td>Waits for all connected clients to be disconnected.</td>
<td>Waits for backups being executed using the command to finish.</td>
</tr>
<tr>
<td>Fast mode</td>
<td>Rolls back all transactions being executed and forcibly disconnects clients.</td>
<td>Terminates backups being executed using the command.</td>
</tr>
<tr>
<td>Immediate mode</td>
<td>All server processes are terminated immediately. Crash recovery is executed the next time the instance is started.</td>
<td></td>
</tr>
</tbody>
</table>
### Stop mode

<table>
<thead>
<tr>
<th>Stop mode</th>
<th>Connected clients</th>
<th>Backup being executed using the command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kill process mode</td>
<td>Send SIGKILL to the process and abort all active transactions. This will lead to a crash-recovery run at the next restart.</td>
<td></td>
</tr>
</tbody>
</table>

*1: When the processing to stop the instance in the Smart mode has started and you want to stop immediately, use the following procedure:

1. Restart the Web server feature of WebAdmin.
2. In the [Instances] tab, click 🔄.
3. In the [Instances] tab, click 🔄, and select the Immediate mode to stop the instance.

### Checking the operating status of an instance

You can check the operating status of an instance by using the [Instances] tab. The following indicators are used to show the status of a resource.

<table>
<thead>
<tr>
<th>Status indicator</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>🟢</td>
<td>The resource is operating normally.</td>
</tr>
<tr>
<td>🟦</td>
<td>The resource is stopped.</td>
</tr>
<tr>
<td>🔴</td>
<td>There is an error in the resource.</td>
</tr>
<tr>
<td>⬨</td>
<td>An operation is in progress on this resource or the status is being checked.</td>
</tr>
<tr>
<td>🚨</td>
<td>The resource is not operating optimally and needs intervention.</td>
</tr>
</tbody>
</table>

If an instance stops abnormally, remove the cause of the stoppage and start the instance by using WebAdmin.

**Figure 2.1 Example of operating status indicators**
When operating WebAdmin, click to update the status. WebAdmin will reflect the latest status of the operation or the instance resources from the server.

If an error occurs while communicating with the server, there may be no response from WebAdmin. When this happens, close the browser and then log in again. If this does not resolve the issue, check the system log of the server and confirm whether a communication error has occurred.

The following message is output during startup of an instance when the startup process is operating normally, therefore, the user does not need to be aware of this message:

```
FATAL: the database system is starting up
```

### 2.1.2 Using Server Commands

Server commands enable you to start or stop an instance and check its operating status.

To use sever commands, configure the environment variables.

Refer to "Configure the environment variables" in the procedure to create instances in "Using the initdb Command" in the Installation and Setup Guide for Server for information on configuring the environment variables.

#### Starting an instance

Use the `pg_ctl` command to start an instance.

Specify the following values in the `pg_ctl` command:

- Specify "start" as the mode.
- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

If an application, command, or process tries to connect to the database while the instance is starting up, the message "FATAL: the database system is starting up(11189)" is output. However, this message may also be output if the instance is started without the `-W` option specified. This message is output by the `pg_ctl` command to check if the instance has started successfully. Therefore, ignore this message if there are no other applications, commands, or processes that connect to the database.

**Example**

```
> pg_ctl start -D /database/inst1
```

**Note**

If the `-W` option is specified, the command will return without waiting for the instance to start. Therefore, it may be unclear as to whether the instance startup was successful or failed.

#### Stopping an instance

Use the `pg_ctl` command to stop an instance.

Specify the following values in the `pg_ctl` command:

- Specify "stop" as the mode.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pg_ctl stop -D /database/inst1
```

Checking the operating status of an instance

Use the pg_ctl command to check the operating status of an instance.

Specify the following values in the pg_ctl command:

- Specify "status" as the mode.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

When the instance is active:

```
> pg_ctl status -D /database/inst1
pg_ctl: server is running (PID: 1234)
```

When the instance is inactive:

```
> pg_ctl status -D /database/inst1
pg_ctl: no server running.
```

See

Refer to "pg_ctl" under "Reference" in the PostgreSQL Documentation for information on pg_ctl command.

### 2.2 Creating a Database

This section explains how to create a database.

- 2.2.1 Using pgAdmin
- 2.2.2 Using Client Commands

#### 2.2.1 Using pgAdmin

Follow the procedure below to define a database using pgAdmin.

1. In the pgAdmin window, right-click [Databases] in the [Browser] pane, and then click [Create] >> [Database] to display a [Create - Database] window.
2. Specify appropriate values for the following items in the [Create - Database] window.
   - [General] tab
   - [Database]: Name of the database to be managed
3. Click [Save] to create the database.
2.2.2 Using Client Commands

Follow the procedure below to define a database using client commands.

An example of operations on the server is shown below.

1. Use psql command to connect to the postgres database.
   Execute `psql postgres`.
   
   ```
   > psql postgres
   psql (13.1)
   Type "help" for help.
   ```

2. Create the database.
   To create the database, execute the `CREATE DATABASE databaseName;` statement.
   
   ```
   postgres=# CREATE DATABASE db01;
   CREATE DATABASE
   ```

3. Confirm that the database is created.
   Execute `\l+`, and confirm that the name of the database created in step 2 is displayed.
   
   ```
   postgres=# \l+
   ```

4. Disconnect from the postgres database.
   Execute `\q` to terminate the psql command.
   
   ```
   postgres=# \q
   ```

You can create a database using the `createdb` command.

**See**

Refer to "Creating a Database" in "Tutorial" in the PostgreSQL Documentation for information on creating a database using the `createdb` command.
Chapter 3 Backing Up the Database

This chapter describes how to back up the database.

Backup methods

The following backup methods enable you to recover data to a backup point or to the state immediately preceding disk physical breakdown or data logical failure.

- Backup using WebAdmin
  
  This method enables you to back up data through intuitive window operations using the GUI. WebAdmin is used for recovery.

- Backup using the pgx_dmpall command
  
  Execute the pgx_dmpall command with a script to perform automatic backup.

  To back up data automatically, you must register the process in the automation software of the operating system. Follow the procedure given in the documentation for your operating system.

  The pgx_rcvall command is used for recovery.

**Information**

By using a copy command created by the user, the pgx_dmpall command and the pgx_rcvall command can back up database clusters and tablespaces to any destination and recover them from any destination using any copy method. Refer to "Chapter 14 Backup/Recovery Using the Copy Command" for details.

Approximate backup time

The formula for deriving the approximate backup time when you use WebAdmin or the pgx_dmpall command is as follows:

\[
\text{backupTime} = \frac{\text{dataStorageDestinationUsage}}{\text{diskWritePerformance}} \times 1.5
\]

- \textit{dataStorageDestinationUsage}: Disk usage at the data storage destination
- \textit{diskWritePerformance}: Maximum data volume (bytes/second) that can be written per second in the system environment where operation is performed
- 1.5: Coefficient to factor in tasks other than disk write (which is the most time-consuming step)

If using the copy command with the pgx_dmpall command, the backup time will depend on the implementation of the copy command.

**Note**

- Backup operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.
- Use the selected backup method continuously.

  There are several differences, such as the data format, across the backup methods. For this reason, the following restrictions apply:

  - It is not possible to use one method for backup and another for recovery.
  - It is not possible to convert one type of backup data to a different type of backup data.
- Mirrored WALs can be used only for backup/recovery using the pgx_dmpall command or WebAdmin.
- There are several considerations for the backup of the keystore and backup of the database in case the data stored in the database is encrypted. Refer to the following for details:
  - 5.6.4 Backing Up and Recovering the Keystore
  - 5.7 Backing Up and Restoring/Recovering the Database
- If you have defined a tablespace, back it up. If you do not back it up, directories for the tablespace are not created during recovery, which may cause the recovery to fail. If the recovery fails, refer to the system log, create the tablespace, and then perform the recovery process again.

---

**Information**

The following methods can also be used to perform backup. Performing a backup using these methods allows you to restore to the point when the backup was performed.

- Backup using an SQL-based dump
  - Dump the data by using SQL. This backup method also enables data migration.
- File system level backup
  - This backup method requires you to stop the instance and use OS commands to backup database resources as files.
- Backup by continuous archiving
  - This is the standard backup method for PostgreSQL.

Refer to "Backup and Restore" in "Server Administration" in the PostgreSQL Documentation for information on these backup methods.

---

### 3.1 Periodic Backup

It is recommended that you perform backup periodically.

Backing up data periodically using WebAdmin or the pgx_dmpall command has the following advantages:

- This method reduces disk usage, because obsolete archive logs (transaction logs copied to the backup data storage destination) are deleted. It also minimizes the recovery time when an error occurs.

**Backup cycle**

The time interval when backup is performed periodically is called the backup cycle. For example, if backup is performed every morning, the backup cycle is 1 day.

The backup cycle depends on the jobs being run, but on FUJITSU Enterprise Postgres it is recommended that operations are run with a backup cycle of at least once per day.

### 3.2 Backup Methods

This section describes the methods for backing up the database.

- 3.2.1 Using WebAdmin
- 3.2.2 Using Server Commands

#### 3.2.1 Using WebAdmin

You can use WebAdmin to perform backup and check the backup status.

**Note**

- If backup is disabled for an instance, you will not be able to back up or restore the instance. Refer to "[Backup]" in "Creating an Instance" in the Installation and Setup Guide for Server for details.
- If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.
Backup operation

Follow the procedure below to back up the database.

1. Select the database to back up
   In the [Instances] tab, select the instance to be backed up and click.

2. Back up the database
   The [Backup] dialog box is displayed. To perform backup, click [Yes]. An instance is automatically started when backup is performed.

Backup status

If an error occurs and backup fails, [Error] is displayed adjacent to [Data storage status] or [Backup storage status] in the [Instances] tab. An error message is also displayed in the message list.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, [Solution] appears to the right of the error message. Clicking this button displays information explaining how to resolve the cause of the error. Remove the cause of failure, and perform backup again.

3.2.2 Using Server Commands

Use the pgx_dmpall command and pgx_revcall command to perform backup and check the backup result.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Follow the procedure below.

See

Refer to “Preparing Directories to Deploy Resources” in the Installation and Setup Guide for Server for information on the location of directories required for backup and for points to take into account.

1. Prepare the backup data storage disk
   For backup, prepare a separate disk unit from the database storage disk and mount it using the operating system commands.

2. Create a directory where the backup data will be stored
   Create an empty directory.
   Set appropriate permissions so that only the instance administrator can access the directory.
   Example
   ```
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```

3. Specify the settings required for backup
   Stop the instance, and set the following parameters in the postgresql.conf file.
   Start the instance after editing the postgresql.conf file.
### Parameter | Setting | Description
---|---|---
backup_destination | Name of the directory where the backup data will be stored | Specify the name of the directory where the backup data will be stored. Appropriate privileges that allow only the instance administrator to access the directory must already be set. Place the backup data storage destination directory outside the data storage destination directory, the tablespace directory, and the transaction log storage destination directory.
archive_mode | on | Specify the archive log mode. Specify [on] (execute).
archive_command | 'installationDirectory/bin/pgx_walcopy.cmd %p "backupDataStorageDestinationDirectory/archived_wal/%f" | Specify the path name of the command that will save the transaction log and the storage destination.

Refer to "Appendix A Parameters" and "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

#### Backup operation (file backup)

Use the pgx_dmpall command to perform file backup. You can even embed the pgx_dmpall command in OS automation software to perform backup.

The backup data is stored in the directory specified in the backup_destination parameter of postgresql.conf.

Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

```
> pgx_dmpall -D /database/inst1
```

**Note**

Backup stores the data obtained during the backup and the backup data of the data obtained during previous backup.

If the data to be stored in the database is encrypted, refer to the following and back up the keystore:

- 5.6.4 Backing Up and Recovering the Keystore

#### Backup status

Use the pgx_rcvall command to check the backup status.

Specify the following values in the pgx_rcvall command:

- The -l option indicates backup data information.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
If an error occurs and backup fails, a message is output to the system log.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, remove the cause of failure and perform backup again.

See

Refer to "pgx_dmpall" and "pgx_rcvall" in the Reference for information on the pgx_dmpall command and pgx_rcvall command.

Setting a restore point

In case you want to recover your database to a certain point in time, you can name this particular point in time, which is referred to as the restore point, by using the psql command.

By setting a restore point before executing an application, it becomes easy to identify up to which point in time the data will be reverted.

A restore point can be set to any point in time after a backup is executed. However, if a restore point is set before a backup is executed, the database cannot be recovered to that point in time. This is because restore points are recorded in the archive logs, and the archive logs are discarded when backups are executed.

Example

The following example uses the psql command to connect to the database and execute the SQL statement to set a restore point.

However, when considering continued compatibility of applications, do not use functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

```
postgres=# SELECT pg_create_restore_point('batch_20200503_1');
LOG:  restore point "batch_20200503_1" created at 0/20000E8
STATEMENT:  select pg_create_restore_point('batch_20200503_1');
pg_create_restore_point
-------------------------
0/20000E8
(1 row)
```

Refer to "15.3.2 Using the pgx_rcvall Command" for information on using a restore point to recover the database.

Note

- Name restore points so that they are unique within the database. Add the date and time of setting a restore point to distinguish it from other restore points, as shown below:
  - YYMMDD_HHMMSS
    - YYMMDD: Indicates the date
    - HHMMSS: Indicates the time
  - There is no way to check restore points you have set. Keep a record in, for example, a file.

See

Refer to "System Administration Functions" under "Functions and Operators" in the PostgreSQL Documentation for information on pg_create_restore_point.
4.1 Configuring Communication Data Encryption

To encrypt communication data transferred between a client and a server, configure communication data encryption as described below. Communication data encryption not only protects the communication content, but it also guards against man-in-the-middle (MITM) attacks (for example, data and password theft through server impersonation).

Table 4.1 Configuration procedure

<table>
<thead>
<tr>
<th>Configuration procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Issue a certificate</td>
</tr>
<tr>
<td>2) Deploy a server certificate file and a server private key file</td>
</tr>
<tr>
<td>3) Distribute a CA certificate file to the client</td>
</tr>
<tr>
<td>4) Configure the operating environment for the database server</td>
</tr>
<tr>
<td>5) Configure the operating environment for the client</td>
</tr>
</tbody>
</table>

The following figure illustrates the environment for communication data encryption.

Figure 4.1 Environment for communication data encryption
4.1.1 Issuing a Certificate

For authenticating servers, you must acquire a certificate issued by the certificate authority (CA). FUJITSU Enterprise Postgres supports X.509 standard PEM format files. If the certificate authority issues a file in DER format, use a tool such as the openssl command to convert the DER format file to PEM format.

The following provides an overview of the procedure. Refer to the procedure published by the public or independent certificate authority (CA) that provides the certificate file for details.

a. Create a server private key file
b. Disable the passphrase for the server private key file
c. Create a CSR (signing request for obtaining a server certificate) from the server private key file
d. Apply to the certificate authority (CA) for a server certificate
e. Obtain a server certificate file and a CA certificate file from the certificate authority (CA)
f. Store the server certificate file and the CA certificate file
   Note: If you lose or destroy the certificates, you will need to have them re-issued.

The above procedure enables you to prepare the following files:
- Server private key file
- Server certificate file
- CA certificate file

4.1.2 Deploying a Server Certificate File and a Server Private Key File

Create a directory on the local disk of the database server and store the server certificate file and the server private key file in it. Use the operating system features to set access privileges for the server certificate file and the server private key file so that only the database administrator has load privileges. Back up the server certificate file and the server private key file in the event that data corruption occurs and store them securely.

4.1.3 Distributing a CA Certificate File to the Client

Create a directory on the local disk of the client and place the distributed CA certificate file there. Use the operating system features to set load privileges to protect the CA certificate file against accidental deletion.

4.1.4 Configuring the Operating Environment for the Database Server

Refer to "Secure TCP/IP Connections with SSL" under "Server Administration" in the PostgreSQL Documentation for details.

4.1.5 Configuring the Operating Environment for the Client

Refer to the following sections in the Application Development Guide for details, depending on your application development environment:
- “Settings for Encrypting Communication Data” under "Setup" in "JDBC Driver"
- “Settings for Encrypting Communication Data” under "Setup" in "C Library (libpq)"
- “Settings for Encrypting Communication Data” under "Setup" in "Embedded SQL in C"
4.1.6 Performing Database Multiplexing

When you perform communication that uses database multiplexing and a Secure Socket Layer server certificate, certificates with the same "Common Name" must be used. To ensure this, take one of the following actions:

- Create one server certificate, replicate it, and place a copy on each server used for database multiplexing.
- Create a server certificate with the same "Common Name" for each server used for database multiplexing.

See "Using the Application Connection Switch Feature" in the Application Development Guide for information on how to specify applications on the client.
Chapter 5 Protecting Storage Data Using Transparent Data Encryption

This chapter describes how to encrypt data to be stored in the database.

5.1 Protecting Data Using Encryption

With PostgreSQL, data in a database is protected from access by unauthorized database users through the use of authentication and access controls. However, the OS file is not protected from attackers who bypass the database server's authentication and access controls.

With FUJITSU Enterprise Postgres, data inside the OS file is encrypted, so valuable information is protected even if the file or disk is stolen. Data to be stored in a database is encrypted when it is written to the data file, and decrypted when it is read. This is performed automatically by the instance, so the user and the application need not be aware of key management and encryption or decryption. This process is called TDE (Transparent Data Encryption).

The characteristics of TDE are described below.

Encryption mechanisms

Two-layer encryption key and the keystore

In each tablespace, there is a tablespace encryption key that encrypts and decrypts all the data within. The tablespace encryption key is encrypted by the master encryption key and saved. Only one master encryption key exists in a database cluster. It is encrypted based on a passphrase specified by the user and stored in a keystore. FUJITSU Enterprise Postgres provides a file-based keystore. Attackers who do not know the passphrase cannot read the master encryption key from the keystore.

Strong encryption algorithms

TDE uses the Advanced Encryption Standard (AES) as its encryption algorithm. AES was adopted as a standard in 2002 by the United States Federal Government, and is used throughout the world.

Faster encryption and decryption based on hardware

TDE minimizes the overhead of encryption and decryption by using the AES-NI (Advanced Encryption Standard New Instructions) built into Intel(R) Xeon(R) processors since the 5600 series. This means that even in situations where previously the minimum encryption target was selected as a tradeoff between performance and security, it is now possible to encrypt all the data of an application. Refer to the Intel Corporation's website for information on the list of processors equipped with AES-NI.

Zero overhead storage areas

Encryption does not change the size of data stored in tables, indexes, or WAL. There is, therefore, no need for additional estimates or disks.

Scope of encryption

All user data within the specified tablespace

The tablespace is the unit for specifying encryption. All tables, indexes, temporary tables, and temporary indexes created in the encrypted tablespace are encrypted. There is no need for the user to consider which tables and strings to encrypt. Refer to "5.4 Encrypting a Tablespace" for details.

Backup data

The pgx_dmpall command and pg_basebackup command create backup data by copying the OS file. Backups of the encrypted data are, therefore, also encrypted. Information is protected from leakage even if the backup medium is stolen.

WAL and temporary files

WAL, which is created by updating encrypted tables and indexes, is encrypted with the same security strength as the update target. When large merges and sorts are performed, the encrypted data is written to a temporary file in encrypted format.
Streaming replication support

You can combine streaming replication and transparent data encryption. The data and WAL encrypted on the primary server is transferred to the standby server in its encrypted format and stored.

Note

The following are not encrypted:
- pg_dump and pg_dumpall output files
- Files output by the COPY command
- Notification event payloads that communicate using the LISTEN or NOTIFY command
- Checksum validation is not performed on encrypted tablespaces during backup and when using the pg_checksum utility.

5.2 Setting the Master Encryption Key

To use transparent data encryption, you must create a keystore and set the master encryption key.

1. In the keystore_location parameter of postgresql.conf, specify the directory to store the keystore.
   Specify a different location for each database cluster.

   keystore_location = '/key/store/location'

   Refer to "Appendix A Parameters" for information on postgresql.conf.

   After editing the postgresql.conf file, either start or restart the instance.
   - Using WebAdmin
     Refer to "2.1.1 Using WebAdmin", and restart the instance.
   - Using the pg_ctl command
     Specify the following in the pg_ctl command:
     - Specify "restart" as the mode.
     - Specify the data storage destination directory in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
     - Specify the -w option. This means that the command returns after waiting for the instance to start. If the -w option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

   Example

   > pg_ctl restart -w -D /database/inst1

2. Execute an SQL function, such as the one below, to set the master encryption key. This must be performed by the superuser. Execute it as the database superuser.

   SELECT pgx_set_master_key('passphrase');

   The value "passphrase" is the passphrase that will be used to open the keystore. The master encryption key is protected by this passphrase, so avoid specifying a short simple string that is easy to guess.

   Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.

Note

Note that if you forget the passphrase, you will not be able to access the encrypted data. There is no method to retrieve a forgotten passphrase and decrypt data. Do not, under any circumstances, forget the passphrase.
The pgx_set_master_key function creates a file with the name keystore.ks in the keystore storage destination. It also creates a master encryption key from random bit strings, encrypts it with the specified passphrase, and stores it in keystore.ks. At this point, the keystore is open.

5.3 Opening the Keystore

To create encrypted tablespaces and access the encrypted data, you must first open the keystore. When you open the keystore, the master encryption key is loaded into the database server memory and becomes usable for encryption and decryption.

You need to open the keystore each time you start the instance. To open the keystore, the database superuser must execute the following SQL function.

```
SELECT pgx_open_keystore('passphrase');
```

The value "passphrase" is the passphrase specified during creation of the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_open_keystore function.

Note that, in the following cases, the passphrase must be entered when starting the instance, because the encrypted WAL must be decrypted for recovery. In this case, the above-mentioned pgx_open_keystore function cannot be executed.

- If performing crash recovery at the time of starting the instance
- If performing recovery using continuous archiving

For the above cases, specify the --keystore-passphrase option in the pg_ctl command, and then start the instance. This will display the prompt for the passphrase to be entered, as shown below.

```
> pg_ctl --keystore-passphrase start
Enter the passphrase:
The server is starting
>
```

Point

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the database server starts. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.

5.4 Encrypting a Tablespace

The keystore must be open before you can create an encrypted tablespace.

When creating a tablespace that will be encrypted, configure the encryption algorithm in the runtime parameters. For example, to create a tablespace with the name secure_tablespace using AES with a key length of 256 bits as the encryption algorithm, configure as shown below.

```
-- Specify the encryption algorithm for the tablespace to be created below
SET tablespace_encryption_algorithm = 'AES256';
CREATE TABLESPACE secure_tablespace LOCATION '/My/Data/Dir';
```

Or

```
CREATE TABLESPACE secure_tablespace LOCATION '/My/Data/Dir' WITH (tablespace_encryption_algorithm = 'AES256');
```

When the tablespace is empty, the encryption algorithm can be modified with the command below.

```
ALTER TABLESPACE secure_tablespace SET (tablespace_encryption_algorithm=AES256);
```

Trying to set the encryption algorithm for a non-empty tablespace causes an error.
You can use AES with a key length of 128 bits or 256 bits as the encryption algorithm. It is recommended that you use 256-bit AES. Refer to "Appendix A Parameters" for information on how to specify the runtime parameters.

If user provides both GUC and command line options while creating the tablespace, the preference is given to the command line option.

The pg_default and pg_global tablespaces cannot be encrypted.

Create tables and indexes in the encrypted tablespace that you created. Relations created in the encrypted tablespace are automatically encrypted.

**Example**

**Example 1: Specifying an encrypted tablespace when creating it**

```sql
CREATE TABLE my_table (...)
    TABLESPACE secure_tablespace;
```

**Example 2: Not explicitly specifying a tablespace when creating it and instead using the default tablespace**

```sql
SET default_tablespace = 'secure_tablespace';
CREATE TABLE my_table (...);
```

The process is the same for encrypting temporary tables and temporary indexes. In other words, either explicitly specify the TABLESPACE clause or list encrypted tablespaces in the temp_tablespaces parameter, and then execute CREATE TEMPORARY TABLE or CREATE INDEX.

**Point**

If an encrypted tablespace is specified in the TABLESPACE clause of the CREATE DATABASE statement, relations created in the database without explicitly specifying a tablespace will be encrypted. Furthermore, the system catalog will also be encrypted, so the source code of user-defined functions is also protected.

**Example: Specifying a tablespace in a database definition statement**

```sql
CREATE DATABASE DB01 TABLESPACE=SP01 ... ;
```

Part of the data is also stored in the system catalog - to encrypt this data as well, specify an encrypted tablespace as above and create a database.

**Note**

An encrypted tablespace cannot be created from the window used for creating the pgAdmin tablespace, or from the query tool. To create an encrypted tablespace, click [PSQL Console] from the [Plugins] menu and create an encrypted tablespace in the psql console window.

### 5.5 Checking an Encrypted Tablespace

The pgx_tablespaces system view displays information about whether each tablespace has been encrypted, and about the encryption algorithm. Refer to "C.1 pgx_tablespaces" for information on strings.

You can discover which tablespaces have been encrypted by executing the following SQL statements.

However, when considering continued compatibility of applications, do not reference system catalogs (pg_tablespace) directly in SQL statements.

```sql
SELECT spcname, spcencalgo
FROM pg_tablespace ts, pgx_tablespaces tsx
WHERE ts.oid = tsx.spctablespace;
```
Example

```
postgres=# SELECT spcname, spcencalgo FROM pg_tablespace ts, pgx_tablespaces tsx WHERE ts.oid =
           tsx.spctablespace;

spcname      | spcencalgo
-------------------+------------
pg_default        | none
pg_global         | none
secure_tablespace | AES256
(3 rows)
```

See

Refer to “Notes on Application Compatibility” in the Application Development Guide for information on how to maintain application compatibility.

5.6 Managing the Keystore

This section describes how to manage the keystore and the master encryption key to guard against the threat of theft.

5.6.1 Changing the Master Encryption Key

Using the same encryption key for an extended period gives attackers an opportunity to decipher the encrypted data. It is recommended that you change the key at regular intervals, or whenever the key is exposed to risk.

Adhere to the industry's best practices for encryption algorithms and key management when considering how often the key should be changed. For example, the NIST in the United States has published "NIST Special Publication 800-57". The PCI DSS also refers to this publication. This publication recommends changing the master encryption key once a year.

To change the master encryption key, execute the pgx_set_master_key function, which is the same function used for configuring the key. Refer to "5.2 Setting the Master Encryption Key" for details.

After changing the master encryption key, you must immediately back up the keystore.

5.6.2 Changing the Keystore Passphrase

In security policies for organizations, it is usually a requirement that the passphrase be changed whenever a security administrator who knows the passphrase is removed from duties due to transfer or retirement. It is also recommended that the passphrase be changed if it is ever exposed to risks due to deception such as social engineering.

To change the keystore passphrase, execute the following SQL function as a superuser.

```
SELECT pgx_set_keystore_passphrase('oldPassphrase', 'newPassphrase');
```

After changing the passphrase, you must immediately back up the keystore.

Refer to “B.2 Transparent Data Encryption Control Functions” for information on the pgx_set_keystore_passphrase function.

5.6.3 Enabling Automatic Opening of the Keystore

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the instance starts. Execute the pgx_keystore command to enable automatic opening of the keystore.

```
> pgx_keystore --enable-auto-open /key/store/location/keystore.ks
Enter the passphrase:
Automatic opening of the keystore is now enabled
>
```
When automatic opening is enabled, an automatically opening keystore is created in the same directory as the original keystore. The file name of the automatically opening keystore is keystore.aks. The file keystore.aks is an obfuscated copy of the decrypted content of the keystore.ks file. As long as this file exists, there is no need to enter the passphrase to open the keystore when starting the instance.

Do not delete the original keystore file, keystore.ks. It is required for changing the master encryption key and the passphrase. When you change the master encryption key and the passphrase, keystore.aks is recreated from the original keystore file, keystore.ks.

Protect keystore.ks, keystore.aks, and the directory that stores the keystore so that only the user who starts the instance can access them.

Configure the permission of the files so that only the user who starts the instance can access the SQL functions and commands that create these files. Accordingly, manually configure the same permission mode if the files are restored.

Example

```
# chown -R fsepuser:fsepuser /key/store/location
# chmod 700 /key/store/location
# chmod 600 /key/store/location/keystore.ks
# chmod 600 /key/store/location/keystore.aks
```

An automatically opening keystore will only open on the computer where it was created.

To disable automatic opening of the keystore, delete keystore.aks.

Note

- To use WebAdmin for recovery, you must enable automatic opening of the keystore.
- Refer to "5.7 Backing Up and Restoring/Recovering the Database" after enabling or reconfiguring encryption to back up the database.
- Specify a different directory from those below as the keystore storage destination:
  - Data storage destination
  - Tablespace storage destination
  - Transaction log storage destination
  - Backup data storage destination

5.6.4 Backing Up and Recovering the Keystore

Back up the keystore at the following times in case it is corrupted or lost. Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen. A passphrase is not required to open an automatically opening keystore, so store this type of keystore in a safe location.

- When the master encryption key is first configured
- When the master encryption key is changed
- When the database is backed up
- When the keystore passphrase is changed

Point

Do not overwrite an old keystore when backing up a keystore. This is because during database recovery, you must restore the keystore to its state at the time of database backup. When the backup data of the database is no longer required, delete the corresponding keystore.
- Back up the database and the keystore on May 1, 2020.

```shell
> pgx_dmpall -D /database/inst1
> cp -p /key/store/location/keystore.ks /keybackup/keystore_20200501.ks
```

Specify the following in the `pgx_dmpall` command:
- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.

- Change the master encryption key, and back up the keystore on May 5, 2020.

```shell
> psql -c "SELECT pgx_set_master_key('passphrase')" postgres
> cp -p /key/store/location/keystore.ks /keybackup/keystore_20200505.ks
```

Specify the following in the `psql` command:
- Specify the SQL function that sets the master encryption key in the `-c` option.
- Specify the name of the database to be connected to as the argument.

If the keystore is corrupted or lost, restore the keystore containing the latest master encryption key. If there is no keystore containing the latest master encryption key, restore the keystore to its state at the time of database backup, and recover the database from the database backup. This action recovers the keystore to its latest state.

- Restore the keystore containing the latest master encryption key as of May 5, 2020.

```shell
> cp -p /keybackup/keystore_20200505.ks /key/store/location/keystore.ks
```

- If there is no backup of the keystore containing the latest master encryption key, recover the keystore by restoring the keystore that was backed up along with the database on 1 May 2020.

```shell
> cp -p /keybackup/keystore_20200501.ks /key/store/location/keystore.ks
> pgx_rcvall -B /backup/inst1 -D /database/inst1 --keystore-passphrase
```

Specify the following in the `pgx_rcvall` command:
- Specify the data storage directory in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage directory in the `-B` option.
- The `--keystore-passphrase` option prompts you to enter the passphrase to open the keystore.

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (`keystore.aks`) are identical to the contents of the restored keystore.

It is recommended that you do not back up the automatically opening keystore file, `keystore.aks`. If the database backup medium and the backup medium storing the automatically opening keystore are both stolen, the attacker will be able to read the data even without knowing the passphrase.

If the automatically opening keystore is corrupted or lost, you must again enable automatic opening. The `keystore.aks` file will be recreated from `keystore.ks` at this time.

Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the `pgx_rcvall` and `pgx_dmpall` commands.
Refer to "psql" under "Reference" in the PostgreSQL Documentation for information on the psql command.
Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.
Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

---

5.7 Backing Up and Restoring/Recovering the Database

FUJITSU Enterprise Postgres enables you to use the five backup and recovery methods described below. Regardless of the method you use, you must back up the keystore at the same time.

Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen.

Backup and recovery using WebAdmin

- Backup
  
  WebAdmin backs up encrypted data.
  
  Back up the key store after backing up the database.

- Recovery
  
  Restore the keystore to its state at the time of database backup. Refer to "5.6.4 Backing Up and Recovering the Keystore" for details.
  
  Enable automatic opening of the keystore in accordance with the procedure described in "5.6.3 Enabling Automatic Opening of the Keystore". Then, use WebAdmin to recover the database.

Backup and recovery using the pgx_dmpall and pgx_rcvall commands

- Backup
  
  The pgx_dmpall command backs up the encrypted data.
  
  Back up the key store after backing up the database.

- Recovery
  
  Restore the keystore to its state at the time of the database backup.
  
  Configure automatic opening of the key store as necessary.
  
  If automatic opening of the keystore is not enabled, execute the pgx_rcvall command with the --keystore-passphrase option specified.
  
  This will display the prompt for the passphrase to be entered.

Example

- Back up the database and the keystore on May 1, 2020.

  ```
  > pgx_dmpall -D /database/inst1
  > cp -p /key/store/location/keystore.ks /keybackup/keystore_20200501.ks
  ```

  Specify the following in the pgx_dmpall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Recover the database and the keystore from the backup taken on May 1, 2020.

  ```
  > cp -p /keybackup/keystore_20200501.ks /key/store/location/keystore.ks
  > pgx_keystore --enable-auto-open /key/store/location/keystore.ks  (Execute only when enabling automatic opening)
  > pgx_rcvall -B /backup/inst1 -D /database/inst1 --keystore-passphrase
  ```

  Specify the following in the pgx_rcvall command:
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage directory in the -B option.
- The --keystore-passphrase option prompts you to enter the passphrase to open the keystore.

Dump and restore using SQL

- Backup
  The files output by the pg_dump and pg_dumpall commands are not encrypted. You should, therefore, encrypt the files using OpenSSL commands or other means before saving them, as described in "5.8 Importing and Exporting the Database" below.
  Back up the key store after backing up the database.
- Restore
  If the backup data has been encrypted using, for example Open SSL commands, decrypt that data.
  The data generated by the pg_dumpall command includes a specification to encrypt tablespaces by default. For this reason, the psql command encrypts tablespaces during restoration.

File system level backup and restore

- Backup
  Stop the instance and backup the data directory and the tablespace directory using the file copy command of the operating system. The files of encrypted tablespaces are backed up in the encrypted state.
  Back up the key store after performing the backup.
- Restore
  Restore the key store to its state at the time of the database backup.
  Stop the instance and restore the data directory and the tablespace directory using the file copy command of the operating system.

Continuous archiving and point-in-time recovery

- Backup
  The pg_basebackup command backs up the encrypted data as is.
  Back up the key store after performing the backup.
- Recovery
  Restore the key store to its state at the time of the database backup.
  Configure automatic opening of the key store as necessary.
  If automatic opening of the keystore is not enabled, execute the pg_ctl command to start the instance with the --keystore-passphrase option specified. This will display the prompt for the passphrase to be entered.

See

- Refer to "pg_ctl" under "Reference" in the PostgreSQL Documentation for information on the pg_ctl command.
- Refer to "Reference" in the PostgreSQL Documentation for information on the following commands:
  - psql
  - pg_dump
  - pg_basebackup
- Refer to the Reference for information on the following commands:
  - pgx_rcvall

- 33 -
If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

5.8 Importing and Exporting the Database

The files output by the COPY command are not encrypted. Therefore, when transferring files to other systems, you should encrypt files using OpenSSL commands or other means and use scp or sftp to encrypt the data being transferred.

Use a safe method to delete obsolete plain text files.

You can use the following methods to safely delete files:
- shred command

Example

```bash
# Export the contents of the table my_table to a CSV file.
> psql -c "COPY my_table TO '/tmp/my_table.csv' (FORMAT CSV)" postgres

# Encrypt the exported file.
> openssl enc -e -aes256 -in my_table.csv -out my_table.csv.enc
(The user is prompted to enter the passphrase to be used for encryption)

# Safely delete plain text files.
> shred -u -x my_table.csv
(Transfer encrypted files to other systems)

# Decrypt the encrypted files on other systems.
> openssl enc -d -aes256 -in my_table.csv.enc -out my_table.csv
(The user is prompted to enter the passphrase to be used for decryption)
```

If you use COPY FROM to import data to tables and indexes in an encrypted tablespace, the imported data is automatically encrypted before being stored.

5.9 Encrypting Existing Data

You cannot encrypt existing unencrypted tablespaces. In addition, you cannot change encrypted tablespaces so that they do not encrypt. As an alternative, transfer the tables and indexes to other tablespaces. You can use the following SQL commands for this.

```sql
ALTER TABLE table_name SET TABLESPACE new_tablespace;
ALTER INDEX index_name SET TABLESPACE new_tablespace;
ALTER DATABASE database_name SET TABLESPACE new_tablespace;
```

See

Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on SQL commands.

5.10 Operations in Cluster Systems

This section describes how to use transparent data encryption on cluster systems such as high-availability systems, streaming replication, and database multiplexing.
5.10.1 HA Clusters that do not Use Database Multiplexing

Take the following points into account when using transparent data encryption in an HA cluster environment that does not use database multiplexing.

Placement and automatic opening of the keystore file

There are two alternatives for placing the keystore file:

- Sharing the keystore file
- Placing a copy of the keystore file

Sharing the keystore file

This involves using the same keystore file on the primary server and the standby server.

As the standby server is not active while the primary server is running, this file would not be accessed simultaneously, and therefore, it can be shared.

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location.

Enable the automatic opening of the keystore on both the primary and standby servers.

Placing a copy of the keystore file

This involves placing a copy of the primary server keystore file on the standby server.

You can do this if you cannot prepare a shared server or disk device that can be accessed from both the primary and standby servers. However, if you change the master encryption key and the passphrase on the primary server, you must copy the keystore file to the standby server again.

To manage the keystore file in a more secure manner, prepare the key management server or the key management storage isolated in a secure location for both the primary and standby servers, and place the keystore files there.

Enable the automatic opening of the keystore on both the primary and standby servers. Note that copying the automatically opening keystore file (keystore.aks) to the standby server does not enable the automatic opening of the keystore.

See

Refer to the Cluster Operation Guide (PRIMECLUSTER) for information on building a cluster system environment for performing failover using the failover feature integrated with the cluster software.

5.10.2 Database Multiplexing Mode

Note the following when using transparent data encryption in environments that use streaming replication, or database multiplexing with streaming replication.

Placing the keystore file

Place a copy of the primary server keystore file on the standby server.

This is required as the keystore file cannot be shared, and both servers may need to access it simultaneously.

Point

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location. A keystore used by both the primary and standby servers can be managed on the same key management server or key management storage.

However, create different directories for the keystores to be used by the primary server and the standby server. Then copy the keystore for the primary server to the directory used on the standby server.
Automatically opening the keystore

You must enable automatic opening of the keystore.

To do this, enable automatic opening of the keystore in all servers that make up database multiplexing. The settings for automatic opening of the keystore include information unique to each server, so simply copying the file does not enable it.

Changing the passphrase

Changes to the passphrase are reflected in all servers that make up database multiplexing, so no special operation is required.

Building and starting a standby server

Before using the pg_basebackup command or pgx_rcvall command to build a standby server, copy the keystore file from the primary server to the standby server. When using an automatically opening keystore, use the copied keystore file to enable automatic opening on the standby server.

Open the keystore each time you start the standby server. This step is necessary for decrypting and restoring encrypted WAL received from the primary server. To open the keystore, specify the --keystore-passphrase option in the pg_ctl command or pgx_rcvall command and enter the passphrase, or use an automatically opening keystore.

Changing the master encryption key and the passphrase

Change the master encryption key and the passphrase on the primary server. You need not copy the keystore from the primary server to the standby server. You need not even restart the standby server or reopen the keystore. Changes to the master encryption key and the passphrase are reflected in the keystore on the standby server.

5.11 Security-Related Notes

- Decrypted data is cached in the database server memory (shared buffer). As a result, unencrypted data is stored in a core file, which is a process memory dump. You should, therefore, safely delete the memory dump.
  You can safely delete files by using the following command:
  - shred command

- Unencrypted data may be written from the database server memory to the operating system's swap area. To prevent leakage of information from the swap area, consider either disabling the use of swap area or encrypting the swap area using a full-disk encryption product.

- The content of the server log file is not encrypted. Therefore, in some cases the value of a constant specified in a SQL statement is output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement.

- When executing an SQL function that opens the keystore and modifies the master encryption key, ensure that the SQL statement containing the passphrase is not output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement. If you are executing this type of SQL function on a different computer from the database server, encrypt the communication between the client and the database server with SSL.

- Starting with FEP 10, logical replication is available, which allows non-backed up clusters to subscribe to databases where transparent data encryption is enabled. Logical replication does not need to have the same encryption strategy between publisher and subscriber.
  In this scenario, if the user wants to encrypt the subscribed copy of data as well, then it is the user's responsibility to create encryption policies to the subscribed databases. By default, published encrypted tablespace data will not be encrypted in the subscriber side.
5.12 Tips for Installing Built Applications

With transparent data encryption, you can easily encrypt all the data in an application without modifying the application. Database administrators install built applications in the following manner. However, this procedure stores data to the default tablespace, so take necessary action if processing differs from the original design.

1. (Normal procedure) Create an owner and a database for the built application.

   CREATE USER crm_admin ...;
   CREATE DATABASE crm_db ...;

2. (Procedure for encryption) Create an encrypted tablespace to store the data for the built application.

   SET tablespace_encryption_algorithm = 'AES256';
   CREATE TABLESPACE crm_tablespace LOCATION '/crm/data';

3. (Procedure for encryption) Configure an encrypted tablespace as the default tablespace for the owner of the built application.

   ALTER USER crm_admin SET default_tablespace = 'crm_tablespace';
   ALTER USER crm_admin SET temp_tablespaces = 'crm_tablespace';

4. (Normal procedure) Install the built application. The application installer prompts you to enter the host name and the port number of the database server, the user name, and the database name. The installer uses the entered information to connect to the database server and execute the SQL script. For applications that do not have an installer, the database administrator must manually execute the SQL script.

   Normally, the application's SQL script includes logic definition SQL statements, such as CREATE TABLE, CREATE INDEX, and GRANT or REVOKE, converted from the entity-relationship diagram. It does not include SQL statements that create databases, users, and tablespaces. Configuring the default tablespace of the users who will execute the SQL script deploys the objects generated by the SQL script to the tablespace.
Chapter 6 Data Masking

Data masking is a feature that can change the returned data for queries generated by applications, so that it can be referenced by users. For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

Note

When using this feature, it is recommended that the changed data be transferred to another medium for users to reference. This is because, if users directly access the database to extract the masked data, there is a possibility that they can deduce the original data by analyzing the masking policy or query result to the masking target column.

6.1 Masking Policy

Masking policy is a method of changing data under specific conditions when it is returned for a query from an application. One masking policy can be created per table. You can configure masking target, masking type, masking condition and masking format in a masking policy.

Figure 6.1 Masking policy

Note

When a masking policy is defined, the search performance for the corresponding table may deteriorate.
6.1.1 Masking Target

Masking target refers to a column to which a masking policy will be applied. When referring to a masking target or a function that includes a masking target, the execution result will be changed and obtained.

The following commands can change the execution result:
- SELECT
- COPY
- pg_dump
- pg_dumpall

Note
- If a masking target is specified to INSERT...SELECT target columns, processing will be performed using data before change.
- If a masking target other than SELECT target columns is specified, processing will be performed using data before change.
- If a masking target is specified in a function where the data type will be converted, an error will occur.

6.1.2 Masking Type

Masking type is a method to change column data that is returned from queries. Specify the masking type in the function_type parameter. The following masking types can be specified and selected depending on the masking target data type.

**Full masking**
All the data in the specified column is changed. The changed value returned to the application that made the query varies depending on the column data type.
For example, 0 is used for a numeric type column and a space is used for a character type column.

**Partial masking**
The data in the specified column is partially changed.
For example, digits except the last four digits of an employee number can be changed to "*".

**Regular expression masking**
The data in the specified column is changed via a search that uses a regular expression.
For example, for strings such as email address that can have variable length, "*" can be used to change characters preceding "@" by using a regular expression. Regular expression masking can only be used for character type data.

Note
- If multiple valid masking targets are specified for a function, the masking type for the left-most masking target will be applied.
  For example, if "SELECT GREATEST(c1, c2) FROM t1" is executed for numeric type masking target c1 and c2, the masking type for c1 will be applied.
- When masking the data that includes multibyte characters, do not specify partial masking for masking type. The result may not be as expected.

6.1.3 Masking Condition

Masking condition refers to the conditions configured to perform masking. Specify the masking condition in the expression parameter. Changed or actual data can be displayed for different users by defining masking condition. An expression that returns a boolean type result needs to be specified in masking condition and masking is performed only when TRUE is returned. Refer to "Value Expressions" in the PostgreSQL Documentation for information on the expressions that can be specified. Note that expressions that include a column cannot
be specified. For example, when masking data only for "postgres" users, specify `current_user = "postgres"` in the masking condition.

---

**Information**

Specify `1=1` so the masking condition is always evaluated to be TRUE and masking is performed all the time.

---

### 6.1.4 Masking Format

Masking format is a combination of change method and displayed characters when the masking condition is met. Masking format varies depending on the masking type. The following describes the masking format.

#### Full masking

With full masking, all characters are changed to values as determined by the database. Changed characters can be referenced in the `pgx_confidential_values` table. Also, replacement characters can be changed using the `pgx_update_confidential_values` system management function.

#### Partial masking

With partial masking, data is changed according to the content in the `function_parameters` parameter. The method of specifying `function_parameters` varies depending on the data type.

<table>
<thead>
<tr>
<th>Category</th>
<th>Method of specifying <code>function_parameters</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td><code>'replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify the number to display. Specify a value from 0 to 9.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the start position of masking. Specify a positive integer.</td>
</tr>
<tr>
<td></td>
<td>- <code>endPosition</code>: Specify the end position of masking. Specify a positive integer that is greater than <code>startPosition</code>.</td>
</tr>
</tbody>
</table>

#### Example

Specify as below to change the values from the 1st to 5th digits to 9.

```
function_parameters := '9, 1, 5'
```

In this example, if the original data is "123456789", it will be changed to "999996789".

<table>
<thead>
<tr>
<th>Character type</th>
<th>Method of specifying <code>function_parameters</code></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>'inputFormat, outputFormat, replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>inputFormat</code>: Specify the current format of the data. Specify &quot;V&quot; for characters that will potentially be masked, and specify &quot;F&quot; for values such as spaces or hyphens that will not be masked.</td>
</tr>
<tr>
<td></td>
<td>- <code>outputFormat</code>: Define the method to format the displayed data. Specify &quot;V&quot; for characters that will potentially be masked. Any character to be output can be specified for each character &quot;F&quot; in <code>inputFormat</code>. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify any single character. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the position of &quot;V&quot; as the start position of masking. For example, to specify the position of the 4th &quot;V&quot; from the left, specify 4. Specify a positive integer.</td>
</tr>
</tbody>
</table>

---

See

Refer to "6.3 Data Types for Masking" for information on the data types for which data masking can be performed.

---

- 40 -
**Method of specifying function_parameters**

- **endPosition**: Specify the position of "V" as an end position of masking. When working out the end position, do not include positions of "F". For example, to specify the position of the 11th "V" from the left, specify 11. Specify a positive integer that is greater than startPosion.

**Example**

Specify as below to mask a telephone number other than the first three digits using *.

```
function_parameters := 'VVVFVVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11'
```

In this example, if the original data is "012-3156-7890", it will be changed to "012-****-****".

**Date/timestamp type**

'DMYHMS'

- **M**: Masks month. To mask month, enter the month from 1 to 12 after a lowercase letter m. Specify an uppercase letter M to not mask month.
- **D**: Masks date. To mask date, enter the date from 1 to 31 after a lowercase letter d. If a value bigger than the last day of the month is entered, the last day of the month will be displayed. Specify an uppercase letter D to not mask date.
- **Y**: Masks year. To mask year, enter the year from 1 to 9999 after a lowercase letter y. Specify an uppercase letter Y to not mask year.
- **H**: Masks hour. To mask hour, enter the hour from 0 to 23 after a lowercase letter h. Specify an uppercase letter H to not mask hour.
- **M**: Masks minute. To mask minute, enter the minute from 0 to 59 after a lowercase letter m. Specify an uppercase letter M to not mask minute.
- **S**: Masks second. To mask second, enter the second from 0 to 59 after a lowercase letter s. Specify an uppercase letter S to not mask second.

**Example**

Specify as below to mask hour, minute, and second and display 00:00:00.

```
function_parameters := 'MDYh0m0s0'
```

In this example, if the original data is "2010-10-10 10:10:10", it will be changed to "2010-10-10 00:00:00".

**Regular expression masking**

With regular expression masking, data is changed according to the content of the regexp_pattern, regexp_replacement and regexp_flags parameters. For regexp_pattern, specify the search pattern using a regular expression. For regexp_replacement, specify the replacement character to use when data matches the search pattern. For regexp_flags, specify the regular expression flags.

**Example**

Specify as below to change all three characters starting from b to X.

```
regexp_pattern := 'b..'
```
In this example, if the original data is "foobarbaz", it will be changed to "fooXX".

See

- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

Note

- When column data type is character(n) or char(n) and if the string length after change exceeds n, the extra characters will be truncated and only characters up to the nth character will be displayed.
- When column data type is character varying(n) or varchar(n) and if the string length after change exceeds the length before the change, the extra characters will be truncated and only characters up to the length before change will be displayed.

6.2 Usage Method

Preparation

The following preparation is required to use this feature.

1. Set the postgresql.conf file parameters.
   Prepend "pgx_datamasking" to the shared_preload_libraries parameter.
2. Restart the instance.
3. Execute CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

Example

```
postgres=# CREATE EXTENSION pgx_datamasking;
CREATE EXTENSION
```

Note

You must always prepend "pgx_datamasking" to the "shared_preload_libraries" parameter.

Information

- Specify "false" for pgx_datamasking.enable to not use this feature. Data will not be masked even if a masking policy is configured. This feature becomes available again once "true" is specified for pgx_datamasking.enable. This setting can be made
by specifying a SET statement or specifying a parameter in the postgresql.conf file.
Example

```
postgres=# SET pgx_datamasking.enable=false;
```

- Hereafter, also perform this preparatory task for the "template1" database, so that this feature can be used by default when creating a new database.

Usage

To perform masking, a masking policy needs to be configured. The masking policy can be created, changed, confirmed, enabled, disabled or deleted during operation.

The procedures to perform these tasks are explained below with examples.

1. Creating a masking policy
2. Changing a masking policy
3. Confirming a masking policy
4. Enabling and disabling a masking policy
5. Deleting a masking policy

Note

Only database superusers can configure masking policies.

6.2.1 Creating a Masking Policy

An example of the operation on the server is shown below.

1. Create a masking policy

Execute the `pgx_create_confidential_policy` system management function to create a masking policy.
The following values are configured in this example.
- Masking target: Numeric type c1
- Masking type: FULL
- Masking condition: '1=1'

```
postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c1', function_type := 'FULL');
```

2. Confirm the displayed data

Confirm that the masking target data (column c1) has been correctly changed.

```
posgres=# select * from t1;
c1 |      c2
----+---------------
0 | 012-3456-7890
0 | 012-3456-7891
0 | 012-3456-7892
(3 row)
```

See

- Refer to "B.3.2 pgx_create_confidential_policy" for information on the `pgx_create_confidential_policy` system management function.
6.2.2 Changing a Masking Policy

1. An example of the operation on the server is shown below.

2. Change a masking policy
   Execute the `pgx_alter_confidential_policy` system management function to change a masking policy.
   The following values are changed in this example.
   - Content of change: Add a masking target
   - Masking target: Character type c2
   - Masking type: PARTIAL
   - Masking condition: 'VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11'

   ```
   postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1',
   action := 'ADD_COLUMN', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
   'VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11');
   pgx_alter_confidential_policy
   -------------------------------
   t
   (1 row)
   ```

3. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   ```
   postgres=# select * from t1;
   c1 |      c2
  ----+---------------
   0 | 012-****-****
   0 | 012-****-****
   0 | 012-****-****
   (3 row)
   ```

See

- Refer to "B.3.1 pgx_alter_confidential_policy" for information on the `pgx_alter_confidential_policy` system management function.

6.2.3 Confirming a Masking Policy

An example of the operation on the server is shown below.

1. Confirm information about a masking target where a masking policy is set
   Refer to the `pgx_confidential_columns` table to confirm the masking target where the masking policy is set.

   ```
   postgres=# select * from pgx_confidential_columns;
   schema_name | table_name | policy_name | column_name | function_type | column_description
   ---------+--------------+-------------+-------------+---------------+-----------------------------
   public    | t1           | pl          | cl          | FULL          |
   ---------+--------------+-------------+-------------+---------------+-----------------------------
   ```
2. Confirm information about the masking policy content
   Refer to pgx_confidential_policies to confirm the masking policy content.

   postgres=# select * from pgx_confidential_policies;
<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>expression</th>
<th>enable</th>
<th>policy_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>1=1</td>
<td>t</td>
<td></td>
</tr>
</tbody>
</table>
   (1 row)

   See
   - Refer to "D.1 pgx_confidential_columns" for information on the pgx_confidential_columns table.
   - Refer to "D.2 pgx_confidential_policies" for information on the pgx_confidential_policies table.

6.2.4 Enabling and Disabling a Masking Policy

An example of the operation on the server is shown below.

1. Disable a masking policy
   Execute the pgx_enable_confidential_policy system management function to disable a masking policy.

   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 'f');
   pgx_enable_confidential_policy
   ---------------------------------
   t
   (1 row)

2. Confirm the displayed data
   Confirm that the original data is displayed by disabling the masking policy.

   postgres=# select * from t1;
<table>
<thead>
<tr>
<th>c1</th>
<th>c2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>012-3456-7890</td>
</tr>
<tr>
<td>2</td>
<td>012-3456-7891</td>
</tr>
<tr>
<td>3</td>
<td>012-3456-7892</td>
</tr>
</tbody>
</table>
   (3 row)

3. Enable a masking policy
   Execute the pgx_enable_confidential_policy system management function to enable a masking policy.

   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');
   pgx_enable_confidential_policy
   ---------------------------------
   t
   (1 row)

4. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   postgres=# select * from t1;
<table>
<thead>
<tr>
<th>c1</th>
<th>c2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>012-<strong><strong>-</strong></strong></td>
</tr>
<tr>
<td>0</td>
<td>012-<strong><strong>-</strong></strong></td>
</tr>
</tbody>
</table>
6.2.5 Deleting a Masking Policy

An example of the operation on the server is shown below.

1. Delete a masking policy
   Execute the `pgx_drop_confidential_policy` system management function to delete a masking policy.

   ```sql
   postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
   pgx_drop_confidential_policy
   ________________________
   t
   (1 row)
   ```

2. Confirm the displayed data
   Confirm that the original data is displayed by deleting the masking policy.

   ```sql
   postgres=# select * from t1;
   c1 | c2
   ----+----------------------------------
   1 | 012-3456-7890
   2 | 012-3456-7891
   3 | 012-3456-7892
   (3 row)
   ```

6.3 Data Types for Masking

The data types for which data masking can be performed are shown below.

<table>
<thead>
<tr>
<th>Category</th>
<th>Data type</th>
<th>Masking type</th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Full masking</td>
<td>Partial masking</td>
<td>Regular expression masking</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Numeric type</td>
<td>smallint</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>integer</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>bigint</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>decimal</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>numeric</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>float</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>real</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>double precision</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
6.4 Security Notes

- Starting with FEP 10, logical replication is available, which allows non-backed up clusters to subscribe to databases where data masking policies are enabled. Logical replication allows publisher and subscriber databases to have their own or the same data masking policies.

In this scenario, the user must disable data masking on the publisher database whenever a subscription is created. This ensures that subscribers are able to obtain the original data (initial copy) instead of the masked version. Then, it is the user's responsibility to set masking policies to each subscribed database.

- Take strong caution in publishing data masking's confidential tables (pgx_confidential_policies, pgx_confidential_columns, etc.) unless the user is publishing all tables of the database and wants to apply the same data masking's policies on the subscribed database for all of them.

Otherwise, as these confidential tables contain the masking policies for all tables of the database, confidential policies of unpublished tables may be unintentionally published. Additionally, it is not possible to apply different data masking policies on the subscriber database.

<table>

Chapter 7 Periodic Operations

This chapter describes the operations that must be performed periodically when running daily database jobs.

7.1 Configuring and Monitoring the Log

FUJITSU Enterprise Postgres enables you to output database errors and warnings to a log file. This information is useful for identifying if errors have occurred and the causes of those errors.

By default, this information is output to the system log. It is recommended that you configure FUJITSU Enterprise Postgres to collect logs from its log files (for example, log_destination) before operating FUJITSU Enterprise Postgres.

Periodically monitor the log files to check if any errors have occurred.

See

- Refer to "Error Reporting and Logging" under "Server Administration" in the PostgreSQL Documentation for information on logs.
- Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on log settings when operating with WebAdmin.

7.2 Monitoring Disk Usage and Securing Free Space

When a database is used for an extended period, free space on the disk is continuously consumed and in some cases the disk space runs out. When this happens, database jobs may stop and no longer run.

You should, therefore, periodically monitor the usage of disk space, and delete obsolete files located in the disk.

Monitor the disk usage of the disk where the following directories are located:

- Data storage destination directory
- Transaction log storage destination (if the transaction log is stored in a different directory from the data storage destination directory)
- Backup data storage destination directory
- Tablespace storage destination directory

7.2.1 Monitoring Disk Usage

To check the disk usage, use the following operating system commands:

- df command

You can even use SQL statements to check tables and indexes individually.

Refer to "Determining Disk Usage" under "Server Administration" in the PostgreSQL Documentation for information on this method.

Information

If you are using WebAdmin for operations, a warning is displayed when disk usage reaches 80%.

7.2.2 Securing Free Disk Space

Secure free disk space by using the following operating system commands to delete unnecessary files, other than the database, from the same disk unit.

- rm command

You can also secure disk space by performing the following tasks periodically:
To secure space on the data storage destination disk:

Execute the REINDEX statement. Refer to "7.5 Reorganizing Indexes" for details.

To secure space on the backup data storage destination disk:

Execute backup using WebAdmin or the pgx_dmpall command.

### 7.3 Automatically Closing Connections

If an application stops responding and abnormally terminates for any reason, the connection from the application may remain active on the database server. If this situation continues for an extended period, other applications attempting to connect to the database server may encounter an error, or an error indicating that the tables are unavailable may occur.

It is, therefore, recommended that idle connections be closed automatically at regular intervals.

Set the following parameters in the postgresql.conf file to indicate the time permitted to elapse before a connection is closed.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| tcp_keepalives_idle     | Time until keepalive is sent (seconds)  
                          | If 0, the default value of the system is used.                             |
|                         | Sends keepalive to an idle connection at the specified interval in seconds |
|                         | It is recommended to specify 30 seconds.                                   |
| tcp_keepalives_interval | keepalive send interval (seconds)   
                          | If 0, the default value of the system is used.                             |
|                         | Sends keepalive at the specified interval                                 |
|                         | It is recommended to specify 10 seconds.                                   |
| tcp_user_timeout        | Time to wait for a response from the server (milliseconds)                
                          | If 0, the default value of the system is used.                             |
|                         | If not set, the behavior is the same as if 0 were specified.               |
|                         | After establishing the connection, when sending from the client to the server, if the TCP resend process operates, specify the time until it is considered to be disconnected. |
|                         | If a value other than 0 is specified in this parameter, the time until automatic disconnection is determined by the waiting time specified in this parameter. The actual wait time is until the timing of the first keepalive retransmission after the time specified by this parameter has elapsed. |

**Note**

If a value other than 0 is specified for the tcp_user_timeout parameter, the waiting time set by the tcp_keepalives_idle parameter and tcp_keepalives_interval parameter will be invalid and the waiting time specified by the tcp_user_timeout parameter will be used.

**See**

Refer to "Connection Settings" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

### 7.4 Monitoring the Connection State of an Application

FUJITSU Enterprise Postgres does not immediately delete the updated or deleted data. If the VACUUM determines there are no transactions that reference the database, FUJITSU Enterprise Postgres collects obsolete data.

However, obsolete data is not collected if there are connections that have remained active for an extended period or connections occupying resources. In this case the database may expand, causing performance degradation.
See Refer to "Routine Vacuuming" under "Server Administration" in the PostgreSQL Documentation for information on the VACUUM command.

In such cases, you can minimize performance degradation of the database by monitoring problematic connections.
The following methods are supported for monitoring connections that have been in the waiting status for an extended period:

- 7.4.1 Using the View (pg_stat_activity)
- 7.4.2 Using pgAdmin

### 7.4.1 Using the View (pg_stat_activity)

Use the view (pg_stat_activity) to identify and monitor connections where the client has been in the waiting status for an extended period.

**Example**

The example below shows connections where the client has been in the waiting status for at least 60 minutes.

However, when considering continued compatibility of applications, do not reference system catalogs directly in the following SQL statements.

```
postgres=# select * from pg_stat_activity where state='idle in transaction' and current_timestamp >
cast(query_start + interval '60 minutes' as timestamp);
-[ RECORD 1 ]----------------------------------
| datid | 13003 |
| datname | db01 |
| pid | 4638 |
| leader_pid | |
| usesysid | 10 |
| usename | fsep |
| application_name | ap101 |
| client_addr | 192.33.44.15 |
| client_hostname | |
| client_port | 27500 |
| backend_start | 2020-02-24 09:09:21.730641+09 |
| xact_start | 2020-02-24 09:09:23.858727+09 |
| query_start | 2020-02-24 09:09:23.858727+09 |
| state_change | 2020-02-24 09:09:23.858834+09 |
| wait_event_type | Client |
| wait_event | ClientRead |
| state | idle in transaction |
| backend_xid | |
| backend_xmin | |
| query | begin; |
| backend_type | client backend |
```

See - Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

- Refer to "The Statistics Collector" under "Server Administration" in the PostgreSQL Documentation for information on pg_stat_activity.
7.4.2 Using pgAdmin

This section describes the procedure for monitoring connections using [Server Status] in pgAdmin.

1. In the [Browser] pane, click the database server for monitoring.
2. In the [Dashboard] tab, identify client connections that have been in the waiting state for an extended period.

![Image of pgAdmin](image)

7.5 Reorganizing Indexes

Normally, a database defines indexes in tables, but if data is frequently updated, indexes can no longer use free space in the disk efficiently. This situation can also cause a gradual decline in database access performance.

To rearrange used space on the disk and prevent the database access performance from declining, it is recommended that you periodically execute the REINDEX command to reorganize indexes.

Check the disk usage of the data storage destination using the method described in "7.2 Monitoring Disk Usage and Securing Free Space".

**Note**

Because the REINDEX command retrieves the exclusive lock for an index being processed and locks writing of tables that are the source of the index, other processes that access these may stop while waiting to be locked.

Therefore, it is necessary to consider measures such as executing the command after the task is completed.

**See**

Refer to "Routine Reindexing" under "Server Administration" in the PostgreSQL Documentation for information on reorganizing indexes by periodically executing the REINDEX command.

**Point**

Typically, reorganize indexes once a month at a suitable time such as when conducting database maintenance. Use SQL statements to check index usage. If this usage is increasing on a daily basis, adjust the frequency of recreating the index as compared to the free disk space.
The following example shows the SQL statements and the output.

However, when considering continued compatibility of applications, do not reference system catalogs and functions directly in the following SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

**[SQL statements]**

```sql
SELECT
    nspname AS schema_name,
    relname AS index_name,
    round(100 * pg_relation_size(indexrelid) / pg_relation_size(indrelid)) / 100 AS index_ratio,
    pg_size_pretty(pg_relation_size(indexrelid)) AS index_size,
    pg_size_pretty(pg_relation_size(indrelid)) AS table_size
FROM pg_index I
    LEFT JOIN pg_class C ON (C.oid = I.indexrelid)
    LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE
    C.relkind = 'i' AND
    pg_relation_size(indrelid) > 0
ORDER BY pg_relation_size(indexrelid) DESC, index_ratio DESC;
```

**[Output]**

<table>
<thead>
<tr>
<th>schema_name</th>
<th>index_name</th>
<th>index_ratio</th>
<th>index_size</th>
<th>table_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>pgbench_accounts_pkey</td>
<td>0.16</td>

<td>368 KB</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

### 7.6 Monitoring Database Activity

FUJITSU Enterprise Postgres enables you to collect information related to database activity. By monitoring this information, you can check changes in the database status.

This information includes wait information for resources such as internal locks, and is useful for detecting performance bottlenecks. Furthermore, you should collect this information in case you need to request Fujitsu technical support for an investigation.
1. Collect statistics at fixed intervals during work hours.
   Accumulate the collected information into a file.
   Wherever possible, collect data from the various statistics views using a single transaction, because it enables you to take a snapshot of system performance at a given moment.
   Refer to "7.6.1 Information that can be Collected" for information on the system views that can be collected.

2. Reset statistics after work hours, that is, after jobs have finished.
   Refer to "7.6.3 Information Reset" for information on how to reset statistics.

3. Save the file with collected information.
   Keep the file with collected information for at least two days, in order to check daily changes in performance and to ensure that the information is not deleted until you have sent a query to Fujitsu technical support.

   Where jobs run 24 hours a day, reset statistics and save the file with collected information when the workload is low, for example, at night.

---

**Note**

Statistics cumulatively add the daily database value, so if you do not reset them, the values will exceed the upper limit, and therefore will not provide accurate information.

---

The subsections below explain the following:
- Information that can be collected
- Collection configuration
- Information reset

### 7.6.1 Information that can be Collected

Information that can be collected is categorized into the following types:
- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

**Information common to PostgreSQL**
Information added by FUJITSU Enterprise Postgres

You can collect the following information added by FUJITSU Enterprise Postgres.

Table 7.1 Information added by FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>View name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>Displays statistic related to lightweight lock, with each type of content displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.2 pgx_stat_lwlock&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>Displays statistics related latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.3 pgx_stat_latch&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_walwriter</td>
<td>Displays statistics related to WAL writing, in a single line. Refer to &quot;C.4 pgx_stat_walwriter&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_sql</td>
<td>Displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line. Refer to &quot;C.5 pgx_stat_sql&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_gmc</td>
<td>Displays statistics related to Global Meta Cache hit ration and used memory size. Refer to “C.6 pgx_stat_gmc” for detail. Also refer to Chapter 12 Global Meta Cache” for information on the Global Meta Cache.</td>
</tr>
</tbody>
</table>

7.6.2 Collection Configuration

The procedure for configuring collection depends on the information content.
- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

Information common to PostgreSQL

Refer to "The Statistics Collector" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on information common to PostgreSQL.

Information added by FUJITSU Enterprise Postgres

Information added by FUJITSU Enterprise Postgres is collected by default.

To enable or disable information collection, change the configuration parameters in postgresql.conf. The following table lists the views for which you can enable or disable information collection, and the configuration parameters.

<table>
<thead>
<tr>
<th>View name</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>track_waits (*1)</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td></td>
</tr>
</tbody>
</table>
### 7.6.3 Information Reset

This section describes how to reset information.

**Information added by FUJITSU Enterprise Postgres**

You can reset information added by FUJITSU Enterprise Postgres by using the `pg_stat_reset_shared` function in the same way as for information common to PostgreSQL.

Configure the following parameters in the `pg_stat_reset_shared` function:

<table>
<thead>
<tr>
<th>Function</th>
<th>Type of return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pg_stat_reset_shared(text)</code></td>
<td>void</td>
<td>Reset some cluster-wide statistics counters to zero, depending on the argument (requires superuser privileges). Calling <code>pg_stat_reset_shared('lwlock')</code> will zero all counters shown in <code>pgx_stat_lwlock</code>. Similarly, in the following cases, all values of the pertinent statistics counter are reset:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('latch')</code> is called: All values displayed in <code>pgx_stat_latch</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('walwriter')</code> is called: All values displayed in <code>pgx_stat_walwriter</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('sql')</code> is called: All values displayed in <code>pgx_stat_sql</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('gmc')</code> is called: All values except size column in <code>pgx_stat_gmc</code></td>
</tr>
</tbody>
</table>

Refer to "Statistics Functions" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on other parameters of the `pg_stat_reset_shared` function.
Chapter 8 Streaming Replication Using WebAdmin

This chapter describes how to create a streaming replication cluster using WebAdmin.

Streaming replication allows the creation of one or more standby instances, which connect to the master instances and replicate the data using WAL records. The standby instance can be used for read-only operations.

WebAdmin can be used to create a streaming replication cluster. WebAdmin allows the creation of a cluster in the following configurations:

- Master-Standby Configuration: This configuration creates a master and standby instance together.
- Standby Only Configuration: This configuration creates a standby instance from an already existing instance.

**Point**

- A standby instance can be created from a standalone instance, a master instance, or even from another standby instance.
- If a streaming replication cluster is created using WebAdmin, the network with the host name (or IP address) specified in [Host name] will be used across sessions of WebAdmin, and also used as the log transfer network.
- To use a network other than the job network as the log transfer network, specify the host name other than the job network one in [Host name].

8.1 Creating a Standby Instance

Follow the procedure below to create a standby instance.

1. In the [Instances] tab, select the instance from which a standby instance is to be created.
2. Click 🔄.
3. Enter the information for the standby instance to be created. In the example below, a standby instance is created from instance “inst1”.

The instance name, host address and port of the selected instance are already displayed for easy reference.

Enter the following items:

- [Location]: Whether to create the instance in the server that the current user is logged in to, or in a remote server. The default is “Local”, which will create the instance in the server machine where WebAdmin is currently running.
- [Replication credential]: The user name and password required for the standby instance to connect to the master instance. The user name and password can be entered or selected from the Wallet. Refer to “Appendix G WebAdmin Wallet” for information on creating wallet entries.

- [Instance name]: Name of the standby database instance to create. The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- [Instance port]: Port number of the standby database instance.

- [Host IP address]: The IP address of the server machine where the standby instance is to be created. This information is needed to configure the standby instance to be connected to the master.

- [Data storage path]: Directory where the database data will be stored

- [Backup storage path]: Directory where the database backup will be stored

- [Transaction log path]: Directory where the transaction log will be stored

- [Encoding]: Database encoding system

- [Replication mode]: Replication mode of the standby instance to be created (“Asynchronous” or “Synchronous”)

- [Application name]: The reference name of the standby instance used to identify it to the master instance. The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

4. Click to create the standby instance.

5. Once the standby instance is created successfully, select standby instance in the [Instances] tab. The following page will be displayed:
- Backups are not possible for standby instances in WebAdmin. As a result, and are disabled and no value is shown for [Backup storage status] and [Backup time].

- If using WebAdmin to manage Mirroring Controller, the message below may be output to the server log or system log in the standby instance. No action is required, as the instance is running normally.

```
ERROR: pgx_rcvall failed (16491)
ERROR: pgx_rcvall: backup of the database has not yet been performed, or an incorrect backup storage directory was specified
```

- Replication credential (user name and password) should not contain hazardous characters. Refer to “Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters”.

### 8.2 Promoting a Standby Instance

Streaming replication between a master and standby instance can be discontinued using WebAdmin.

Follow the procedure below to promote a standby instance to a standalone instance, thereby discontinuing the streaming replication.

1. In the [Instances] tab, select the standby instance that needs to be promoted.
2. Click ![promotion button]
3. Click [Yes] from the confirmation dialog box.

The standby instance will be promoted and will become a standalone instance, which is not part of a streaming replication cluster.

Once the standby instance is promoted to become a standalone instance, the backup storage status will be "Error". This is because no backups are available when the instance is newly promoted to a standalone instance. The status will be reset if a new backup is performed by clicking [Solution] or ![solution button].

### 8.3 Converting an Asynchronous Replication to Synchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert an Asynchronous standby instance to Synchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.
2. Click ![settings button]
3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Add the "Application name" of the standby instance you want to be in Synchronous mode.
4. Click ![save button]
5. Select the master instance and click ![apply button]
6. Select the standby instance. [Instance type] will now show the updated status.

**Note**

- Converting an Asynchronous standby instance to Synchronous can cause the master instance to queue the incoming transactions until the standby instance is ready. For this reason, it is recommended that this operation be performed during a scheduled maintenance period.

- When adding a synchronous standby instance, FUJITSU Enterprise Postgres will only keep the first entry in [Synchronous standby names] in synchronous state.
8.4 Converting a Synchronous Replication to Asynchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous Mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert a Synchronous standby instance to Asynchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.
2. Click 
3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Remove the “Application name” of the standby instance you want to be in Asynchronous mode.
4. Click 
5. Select the master instance and click 
6. Select the standby instance. [Instance type] will now show the updated status.

Note

To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to “Streaming Replication” in “High Availability, Load Balancing, and Replication” in the PostgreSQL Documentation.

8.5 Joining a Replication Cluster

WebAdmin facilitates the joining of an old master of the cluster as a standby node.

1. In the [Instances] tab, select the remote instance (from where the new cluster node will stream WAL entries), and then click 
2. Configure the node to accept streaming requests from the new node.
3. In the [Instances] tab, select the new standby instance (which needs to be connected to the cluster), and then click 
4. Set [Replication host name] to the remote instance.
5. Enter [Replication credential].
   Specify the user name and password required for the standby instance to connect to the remote instance. The user name and password can be entered or selected from the Wallet. Refer to "Appendix G WebAdmin Wallet" for information on creating wallet entries. Replication credential (user name and password) should not contain hazardous characters. Refer to "Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters".
6. Enter [Host IP address].
   Specify the IP address of the node where the standby instance was created.
7. Click to open the [Join replication cluster] dialog box.
   For FUJITSU Enterprise Postgres 12 and earlier instances, select [Restart later] or [Restart now], and then click [Yes] to set up the standby instance.
   For FUJITSU Enterprise Postgres 13, click [Yes] or [Restart now], and then click [Yes] to set up the standby instance.
8. Upon successful completion, the confirmation dialog box will be displayed.
9. Click [Close] to return to the instance details window.
The instance will become a standby instance, and will be part of the streaming replication cluster. The replication diagram will display the relationship between the standby instance and the remote instance. The user can change the replication relationship of the remote instance from asynchronous to synchronous (and vice versa) using the [Configuration] window.
Chapter 9 Installing and Operating the In-memory Feature

The in-memory feature enables fast aggregation using Vertical Clustered Index (VCI) and memory-resident feature.

VCI has a data structure suitable for aggregation, and features parallel scan and disk compression, which enable faster aggregation through reduced disk I/O.

The memory-resident feature reduces disk I/O that occurs during aggregation. It consists of the preload feature that reads VCI data to memory in advance, and the stable buffer feature that suppresses VCI data eviction from memory. The stable buffer feature secures the proportion specified by parameter in the shared memory for VCI.

This chapter describes how to install and operate the in-memory feature.

Note
This feature can only be used in Advanced Edition.

9.1 Installing Vertical Clustered Index (VCI)

This section describes the installation of VCI.

1. Evaluating whether to Install VCI
2. Estimating Resources
3. Setting up

9.1.1 Evaluating whether to Install VCI

VCI uses available resources within the server to increase scan performance.

It speeds up processing in many situations, and can be more effective in the following situations:
- Single table processing
- Processing that handles many rows in the table
- Processing that handles some columns in the table
- Processing that performs very heavy aggregation such as simultaneous sum and average aggregation

VCI will not be used in the following cases, so it is necessary to determine its effectiveness in advance:
- The data type of the target table or column contains VCI restrictions.
- The SQL statement does not meet the VCI operating conditions
- VCI is determined to be slower based on cost estimation

Note
If performing operations that use VCI, the full_page_writes parameter setting in postgresql.conf must be enabled (on). For this reason, if this parameter is disabled (off), operations that use VCI return an error. In addition, to perform operations for tables that do not create a VCI when the full_page_writes parameter setting is temporarily disabled (off), do not create a VCI or perform operations to tables that created a VCI during that time.

See
- Refer to "9.1.4 Data that can Use VCI" for information on VCI restrictions.
Refer to “Scan Using a Vertical Clustered Index (VCI)” - “Operating Conditions” in the Application Development Guide for information on VCI operating conditions.

**9.1.2 Estimating Resources**

Estimate resources before setting up VCI.

Select the aggregation that you want to speed up and identify the required column data. The additional resources below are required according to the number of columns.

- **Memory**
  
  Secure additional capacity required for the disk space for the column for which VCI is to be created.

- **Disk**
  
  Secure additional disks based on the disk space required for the column for which VCI is to be created, as VCI stores column data as well as existing table data on the disk. It is recommended to provide a separate disk in addition to the existing one, and specify it as the tablespace to avoid impact on any other jobs caused by I/O.

**Information**

The operations on VCI can continue even if the memory configured for VCI is insufficient by using VCI data on the disk.

**See**

**9.1.3 Setting up**

This section describes how to set up VCI.

**Setup flow**

1. **Setting Parameters**
2. **Installing the Extensions**
3. **Creating VCI**
4. **Confirming that VCI has been Created**

**9.1.3.1 Setting Parameters**

Edit postgresql.conf to set the required parameters for VCI. After that, start or restart the instance.

The following table lists the parameters that need or are recommended to be configured in advance:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_preload_libraries</td>
<td>Literal ‘vci, pg_prewarm’</td>
<td>VCI and shared library to be preloaded at server start.</td>
<td>Y</td>
</tr>
<tr>
<td>session_preload_libraries</td>
<td>Literal ‘vci, pg_prewarm’</td>
<td>VCI and shared library to be preloaded at connection start.</td>
<td>Y</td>
</tr>
<tr>
<td>reserve_buffer_ratio</td>
<td>Percentage of shared memory to be used for stable buffer table</td>
<td>Proportion of shared memory to be used for a stable buffer table.</td>
<td>N</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Setting value</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>vci.control_max_workers</td>
<td>Number of background workers that manage VCI</td>
<td>Number of background workers that manage VCI. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of background workers used for parallel scan</td>
<td>Maximum number of background workers used for parallel scan. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
</tbody>
</table>

Example

```sql
shared_preload_libraries = 'vci, pg_prewarm'
session_preload_libraries = 'vci, pg_prewarm'
reserve_buffer_ratio = 20
vci.control_max_workers = 8
vci.max_parallel_degree = 4
max_worker_processes = 18 # Example: If the initial value was 6, 6 + 8 + 4 = 18
```

Note

An error occurs if you use VCI to start instances when procfs is not mounted. Ensure that procfs is mounted before starting instances.

See

- Refer to "Appendix A Parameters" for information on all parameters for VCI. Refer also to default value for each parameter and details such as specification range in the same chapter. Refer to "Server Configuration" under "Server Administration" in the PostgreSQL documentation for information on shared_preload_libraries, session_preload_libraries, and max_worker_processes.

9.1.3.2 Installing the Extensions

Execute CREATE EXTENSION to install the VCI and pg_prewarm extensions. Both extensions need to be installed for each database.

- Installing VCI

```sql
db01=# CREATE EXTENSION vci;
```

- Installing pg_prewarm

```sql
db01=# CREATE EXTENSION pg_prewarm;
```

Note

- Only superusers can install VCI extensions.
- VCI extensions can only be installed in public schema.
- Some operations cannot be performed for VCI extensions. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.

9.1.3.3 Creating a VCI

Execute the CREATE INDEX statement with the "USING vci" clause to create a VCI for the desired columns and the "WITH (stable_buffer=true)" clause to enable the stable buffer feature.

To use a separate disk for the VCI, specify the TABLESPACE clause.
CREATE INDEX idx_vci ON table01 USING vci (col01, col02) WITH (stable_buffer=true);

**Note**

- Some table types cannot be specified on the ON clause of CREATE INDEX. Refer to "9.1.4.1 Relation Types" for details.
- Some data types cannot be specified on the column specification of CREATE INDEX. Refer to "9.1.4.2 Data Types" for details.
- Some operations cannot be performed for VCI. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
- The same column cannot be specified more than once on the column specification of CREATE INDEX.
- VCI cannot be created for table columns that belong to the template database.
- CREATE INDEX creates multiple views named vci_10digitRelOid_5digitRelAttr_1charRelType alongside VCI itself. These are called VCI internal relations. Do not update or delete them as they are used for VCI aggregation.
- All data for the specified column will be replaced in columnar format when VCI is created, so executing CREATE INDEX on an existing table with data inserted takes more time compared with a general index (B-tree). Jobs can continue while CREATE INDEX is running.
- When CREATE INDEX USING VCI is invoked on a partitioned table, the default behavior is to recurse to all partitions to ensure they all have matching indexes. Each partition is first checked to determine whether an equivalent index already exists, and if so, that index will become attached as a partition index to the index being created, which will become its parent index. If no matching index exists, a new index will be created and automatically attached; the name of the new index in each partition will be determined as if no index name had been specified in the command. If the ONLY option is specified, no recursion is done, and the index is marked invalid. (ALTER INDEX ... ATTACH PARTITION marks the index valid, once all partitions acquire matching indexes.) Note, however, that any partition that is created in the future using CREATE TABLE ... PARTITION OF will automatically have a matching index, regardless of whether ONLY is specified.
- Parallel index build is not supported on VCI indexes.

**9.1.3.4 Confirming that the VCI has been Created**

Execute the SELECT statement to reference the pg_indexes catalog, and confirm that the VCI was created for the target columns.

```
CREATE INDEX idx_vci ON table01 USING vci (col01, col02)
```

**Example**

```
dbo1=# SELECT indexdef FROM pg_indexes WHERE indexdef LIKE '%vci%';
indexdef
----------------------------------------------------------
CREATE INDEX idx_vci ON table01 USING vci (col01, col02)
(1 row)
```

**9.1.4 Data that can Use VCI**

This section describes on which relation types and for which data types VCIs can be created.

**9.1.4.1 Relation Types**

VCIs cannot be created on some relation types.

The ON clause of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify relations on which VCIs cannot be created.

- Relations on which VCIs can be created
  - Normal tables
  - UNLOGGED TABLEs
- Relations on which VCIs cannot be created
  - Materialized views
  - Temporary tables
  - Views
  - Temporary views
  - Foreign tables

### 9.1.4.2 Data Types

VCIs cannot be created for some data types.

The column specification of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify a column with data type on which VCIs cannot be created.

<table>

## 9.2 Operating VCI

This section describes how to operate VCI.
9.2.1 Commands that cannot be Used for VCI

Some operations cannot be performed for VCI extensions and VCI itself.

This section describes SQL commands that cannot be executed for the VCI extensions and VCI itself, and client application commands.

SQL commands

- Operations that cannot be performed for the VCI extension

<table>
<thead>
<tr>
<th>Command</th>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER EXTENSION</td>
<td>UPDATE</td>
<td>The VCI extension cannot be specified.</td>
</tr>
<tr>
<td></td>
<td>SET SCHEMA</td>
<td>This operation is not required for VCI.</td>
</tr>
<tr>
<td></td>
<td>ADD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DROP</td>
<td></td>
</tr>
<tr>
<td>CREATE EXTENSION</td>
<td>SCHEMA</td>
<td>The subcommands on the left cannot be performed if the VCI extension is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This operation is not required for VCI.</td>
</tr>
</tbody>
</table>

- Operations that cannot be performed on relations containing a VCI

<table>
<thead>
<tr>
<th>Command</th>

</tr>
<tr>
<td>REINDEX</td>
<td>-</td>
<td>A VCI cannot be specified. This command is not required as VCI uses daemon's automatic maintenance to prevent disk space from increasing.</td>
</tr>
</tbody>
</table>

**Client application command**

- Operations that cannot be performed on relations containing a VCI

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterdb</td>
<td>Clustering cannot be performed for tables that contain a VCI.</td>
</tr>
<tr>
<td>reindexdb</td>
<td>VCIs cannot be specified on the --index option.</td>
</tr>
</tbody>
</table>

**9.2.2 Data Preload Feature**

The first aggregation using VCI immediately after an instance is started may take time, because the VCI data has not been loaded to buffer. Therefore, use the preload feature to load the VCI data to buffer in advance when performing VCI aggregation after an instance is started.

When using the preload feature, execute the function pgx_prewarm_vci to each VCI created with CREATE INDEX.

```sql
db01=# SELECT pgx_prewarm_vci('idx_vci');
```

See

Refer to "B.4 VCI Data Load Control Function" for information on pgx_prewarm_vci.
Chapter 10 Parallel Query

FUJITSU Enterprise Postgres enhances parallel queries, by taking into consideration the aspects below:
- CPU load calculation
- Increase of workers during runtime

10.1 CPU Load Calculation

There may be a case when the user tries to execute a parallel query but there is not enough CPU available.
Adding dynamic workers at this stage will provide no benefits - instead, it may add overhead due to context switching.
FUJITSU Enterprise Postgres takes into consideration the current CPU load when deciding on the number of workers for parallel query.

10.2 Increase of Workers during Runtime

This FUJITSU Enterprise Postgres enhancement allows systems to allocate additional workers during query execution (if there are workers available at the time). This improves query performance, which could otherwise starve of CPU if there were fewer or no workers when the query started.

Note

The ability to increase workers during runtime is available only with parallel sequence scan.
Chapter 11 High-Speed Data Load

High-speed data load uses the pgx_loader command to load data from files at high speed into FUJITSU Enterprise Postgres.

Note

- This feature is available only in the Advanced Edition.
- This feature is not available in single-user mode. This is because in single-user mode instances run in a single process, and it cannot start parallel workers.

11.1 Installing High-Speed Data Load

This section describes how to install high-speed data load.

Installation flow

1. Deciding whether to Install
2. Estimating Resources
3. Setup

11.1.1 Deciding whether to Install

The feature achieves high speed data load by executing the COPY FROM command in parallel. If the database system is unable to use sufficient resources due to the feature using more resources than the COPY FROM command of PostgreSQL, load performance may be inferior to that of the COPY FROM command of PostgreSQL. Therefore, determine if the feature will be effective by considering the factors below before deciding to install.

Database server memory

If the value of shared_buffers in postgresql.conf is small, fewer data pages are cached to the shared memory of the database server. This will result in multiple parallel workers more often having to wait for write exclusive locks to the same data page. Moreover, the smaller the number of data pages, the more often the table expands. During table expansion, access to the table is exclusive (standby event name: extend), so write time increases. To cater for that, increase the value of shared_buffers.

See

The standby event name is stored in the wait_event column of the pg_stat_activity view. Refer to "wait_event Description" in "The Statistics Collector" in the PostgreSQL Documentation for details.

Frequency of checkpoints

If checkpoints are issued at short intervals, write performance is reduced. If the messages below are output to the server log during data writes, increase the values of max_wal_size and checkpoint_timeout in postgresql.conf to reduce the frequency of checkpoints.

Example

| LOG: checkpoints are occurring too frequently (19 seconds apart) |
| HINT: Consider increasing the configuration parameter "max_wal_size". |

11.1.2 Estimating Resources

Estimate the memory requirements for high-speed data load.
Up to 128 parallel workers to perform data load can be specified for this feature. The additional resources below are required depending on the number of parallel workers.

- Dynamic shared memory created during data load

The feature creates shared memory and shared memory message queues during data load. These are used to send external data from the back end to the parallel workers, and for error notifications.

**Note**

If the value of shared_buffers in postgresql.conf is small, the system will often have to wait for write exclusive locks to the same data page (as described in "Database server memory" in "11.1.1 Deciding whether to Install"). Since input data cannot be loaded from the shared memory message queues during such waits, they will often be full. In these cases, it will not be possible to write to the shared memory message queues, resulting in degraded data load performance.

---

**See**

Refer to "High-Speed Data Load Memory Requirements" in the Installation and Setup Guide for Server for information on the formula for estimating memory requirements.

---

### 11.1.3 Setup

This section describes how to set up high-speed data load.

**Setup flow**

1. Setting Parameters
2. Installing the Extension

#### 11.1.3.1 Setting Parameters

Set the parameters required for high-speed data load in postgresql.conf. After that, start or restart the instance.

The table below lists the postgresql.conf parameters that must be changed, and the values that must be added to their current values. After editing postgresql.conf, start or restart the instance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max_prepared_transactions</code></td>
<td>Add the number of transactions that can be prepared by parallel workers during data load to the parameter's current value. The resulting value must be equal to or greater than the maximum number of parallel workers used with this feature.</td>
<td>Mandatory</td>
</tr>
<tr>
<td><code>max_worker_processes</code></td>
<td>Number of parallel workers to perform data load.</td>
<td>Mandatory</td>
</tr>
<tr>
<td><code>max_parallel_workers</code></td>
<td>Add the maximum number of parallel workers to be used in a parallel query by this feature to the parameter's current value. The resulting value must be equal to or greater than the number of parallel workers used with this feature.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

---

**Example**

The example below shows how to configure 2 instances of high-speed data load being executed simultaneously using a degree of parallelism of 4.

---

- 71 -
max_prepared_transactions = 13  #Example if the initial value was 5: 5 + 2 x 4 = 13
max_worker_processes = 16        #Example if the initial value was 8: 8 + 2 x 4 = 16
max_parallel_workers = 12        #Example if the initial value was 4: 4 + 2 x 4 = 12

Note
As shown in the example above, set the value of max_prepared_transactions, max_worker_processes and max_parallel_workers multiplied by the number of instances of this feature executed simultaneously.

The table below lists the postgresql.conf parameters that must also be checked.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_shared_memory_type</td>
<td>Implementation of dynamic shared memory to be used by the instance.</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>The default value is recommended.</td>
<td></td>
</tr>
</tbody>
</table>

See
Refer to “Resource Consumption” in the PostgreSQL Documentation for information on the parameters.

11.1.3.2 Installing the Extension
Execute CREATE EXTENSION to install the high-speed data load extension. The extension needs to be installed on each database.

Example
The example below installs the extension on the "postgres" database.

postgres=# CREATE EXTENSION pgx_loader;
CREATE EXTENSION

Note
- Only superusers can install the high-speed data load extension.
- The high-speed data load extension can only be installed on the public schema.

11.2 Using High-Speed Data Load
This section describes how to use high-speed data load.

11.2.1 Loading Data
To load data from a file into a FUJITSU Enterprise Postgres table, execute the pgx_loader command in load mode.

Example
The example below loads the file /path/to/data.csv (2000 records) into table tbl using a degree of parallelism of 3.
$ pgx_loader load -j 3 -c "COPY tbl FROM '/path/to/data.csv' WITH CSV"  
LOAD 2000

Point

If an external file contains data that violates the format or constraints, the data load may fail partway through, resulting in delays for routine tasks such as nightly batch processing. Therefore, it is recommended to remove the invalid data before executing the data load.

Note

The data inserted using this feature is dumped as a COPY command by the pg_dump command and the pg_dumpall command.

See

- Refer to "pgx_loader" in the Reference for information on the command.
- Refer to "COPY" in the PostgreSQL Documentation for information on the deployment destination and access privileges for external files.

11.2.2 Recovering from a Data Load that Ended Abnormally

If a system interruption such as a server failure occurs while high-speed data load is being performed, transactions prepared using this feature may be changed to the in-doubt state. At that point, resources occupied by the transaction will be locked, and access to the relevant resources from other transactions will be blocked, rendering them unusable.

In such cases, check transactions that are in an in-doubt state, and resolve them.

Checking for in-doubt transactions

This section describes how to check for in-doubt transactions.

1. Refer to the pgx_loader_state table in the pgx_loader schema.

   Retrieve the global transaction identifier (gid column) of in-doubt transactions. In-doubt transactions will contain "rollback" in the column "state".

   Example

   The example below retrieves the global transaction identifier (gid) of in-doubt transactions performed by the database role myrole and that used table tbl. The retrieved global transaction identifiers pgx_loader:9589 and pgx_loader:9590 identify in-doubt transactions.

   ```
   postgres=# SELECT gid, state FROM pgx_loader.pgx_loader_state WHERE role_oid IN (SELECT oid FROM pg_roles WHERE rolname = 'myrole') AND relation_oid IN (SELECT relid FROM pg_stat_all_tables WHERE relname = 'tbl');
   gid      | state
   -------------+-------------
   pgx_loader:9590 | rollback
   pgx_loader:9591 | commit
   pgx_loader:9589 | rollback
   (3 rows)
   ```

2. Refer to the pg_prepared_xacts system view.

   Check if the in-doubt transactions retrieved above exist.
Example

The example below checks if in-doubt transactions with the global transaction identifiers pgx_loader:9589 and pgx_loader:9590 exist.

```
postgres=# SELECT gid FROM pg_prepared_xacts WHERE gid IN ('pgx_loader:9589','pgx_loader:9590');
gid
------------------
pgx_loader:9590
pgx_loader:9589
(2 rows)
```

See

Refer to "E.1 pgx_loader_state" for information on the pgx_loader_state table.

Resolving in-doubt transactions

Execute the pgx_loader command in recovery mode to resolve in-doubt transactions.

After executing the pgx_loader command in recovery mode, perform the procedure described in "Checking for in-doubt transactions" to check if the in-doubt transactions have been resolved.

Example

The example below completes the in-doubt transactions prepared for table tbl.

```
$ pgx_loader recovery -t tbl
```

Point

The recovery mode of the pgx_loader command only resolves transactions prepared by high-speed data load. For transactions prepared by an application using distributed transactions other than this feature, follow the procedure described in "15.13 Actions in Response to Error in a Distributed Transaction".

11.3 Removing High-Speed Data Load

This section describes how to remove high-speed data load.

11.3.1 Removing the Extension

Execute DROP EXTENSION to remove the high-speed data load extension. The extension needs to be removed on each database.

Example

The example below removes the extension on the "postgres" database.

```
postgres=# DROP EXTENSION pgx_loader;
DROP EXTENSION
```
Note

- The information required for operation of high-speed data load is stored in the pgx_loader_state table of the pgx_loader schema. Do not remove the high-speed data load extension if the pgx_loader_state table is not empty.

- Only superusers can remove the high-speed data load extension.

- The high-speed data load extension can only be removed on the public schema.
Chapter 12 Global Meta Cache

The Global Meta Cache (GMC) feature loads a meta cache into shared memory using the pgx_global_metacache parameter. This reduces the amount of memory required throughout the system.

**Note**

This feature can only be used in Advanced Edition.

12.1 Usage

Describes how to use the Global Meta Cache feature.

12.1.1 Deciding Whether to Enable the Global Meta Cache Feature

Global Meta Cache is a mechanism for sharing meta caches between processes, so it works well on systems with a high number of resources accessed and SQL connections. The number of resources is primarily the number of tables accessed by a process, the number of indexes, or the total number of all columns in all tables accessed.

In particular, consider using Global Meta Cache if the total size of the meta cache for each process exceeds the amount of installed memory, or takes up a large portion of that memory, thereby squeezing memory allocations to the database cache or the Operating system file cache.

Using Global Meta Cache may slightly increase the time it takes to execute a single SQL to reference a meta cache on shared memory (For example, it will not exceed 5% of the execution time in a situation where all the data is located in the database cache), but you can expect a greater benefit from being able to allocate more memory, such as for the database cache.

If performance degradation using Global Meta Cache is not acceptable, you may want to limit the number of tables accessed by a process.

12.1.2 Estimating Memory for Global Meta Cache

To enable the Global Meta Cache feature, the pgx_global_metacache parameter must specify an upper limit on the size of the shared memory (Hereinafter, the GMC area) dedicated to Global Meta Cache. Ideally, this upper limit should be the size estimated in “Appendix A Parameters”. Values lower than this can still work, but refer to “12.1.3 How the GMC Memory Area Is Used” on using the GMC area to understand the disadvantages.

12.1.3 How the GMC Memory Area Is Used

At startup, the memory for the GMC area is not used much, but the GMC area grows as new meta caches are placed in the GMC area. If it does, it discards any meta caches that the system determines are not heavily used and places a new one in the GMC area.

Therefore, the GMC area will work even if it is smaller than the estimate, but the meta cache will be regenerated if the discarded meta cache needs to be reused. Note that if this happens frequently, it will degrade overall performance.

With this in mind, it may not be a problem if, for example, the tables to be accessed are different depending on the time zone, and the degradation of the time zone immediately after the change is acceptable.

In any case, be sure to test and tune the system thoroughly before running it.

12.1.4 Enabling the Global Meta Cache Feature

To enable the Global Meta Cache feature edit the postgresql.conf file and set the pgx_global_metacache parameter. Restarting the instance after editing the postgresql.conf file is required. Refer to "Appendix A Parameters" for information on the parameters.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_global_metacache</td>
<td>Specify the maximum amount of memory for the GMC area on shared memory. When it’s set to 0 (default value), the Global Meta Cache feature is disabled. When enabled, the minimum value allowed is 10MB.</td>
</tr>
</tbody>
</table>
When the cache is created, if the total amount of meta caches on shared memory exceeds the value specified by `pgx_global_metacache`, the inactive, unreferenced meta caches are removed from the GMC area. Note that if all GMC are in use and the cache cannot be created in the GMC area, the cache is temporarily created in the local memory of the backend process.

**Example**

Here is an example postgresql.conf configuration:

```bash
pgx_global_metacache = 800 MB
```

**Wait Events**

The Global Meta Cache feature may cause wait events. Wait events are identified in the `wait_event` column of the `pg_stat_activity` view. GMC specific wait events are described below.

<table>
<thead>
<tr>
<th>Wait Event Type</th>
<th>Wait Event Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LWLock</td>
<td>GlobalCatcache</td>
<td>Waiting to find, add, and remove meta caches in the GMC area.</td>
</tr>
<tr>
<td>IPC</td>
<td>GMCSweep</td>
<td>Waiting to select a meta cache that can be deleted when GMC space is low. If the GMC is fully referencing and there is no deletable meta cache, it is waiting for the reference to be removed and a deletable meta cache to be selected.</td>
</tr>
</tbody>
</table>

**Note**

If GMCSweep is happened frequently, increase the `pgx_global_metacache` setting.

**See**

Refer to “Viewing Statistics” in the PostgreSQL Documentation for information on the `pg_stat_activity` view.

### 12.1.5 Estimating Resources

Refer to “Global Meta Cache Memory Requirements” in the Installation and Setup Guide for Server for formulas to estimate the amount of memory used by the Global Meta Cache feature.

### 12.2 Statistics

Describes the statistics for the Global Meta Cache feature.

#### 12.2.1 System View

You can check the cache hit ratio and size of the GMC area in the system view `pgx_stat_gmc`. Refer to “C.6 pgx_stat_gmc” for information on the columns.

If the cache hit ratio is low and the current memory usage is close to `pgx_global_metacache`, increase the `pgx_global_metacache` setting because performance may be degraded.

Refer to “7.6 Monitoring Database Activity” in the Operations Guide for information on the statistics.
Chapter 13 Local Meta Cache Limit

Local Meta Cache Limit feature limits the size of a Local Meta Cache by removing it if it has not been accessed for a long time.

Note

This feature is available only in the Advanced Edition.

13.1 Usage

Describes how to use the Local Meta Cache Limit feature.

13.1.1 Deciding Whether to Enable the Local Meta Cache Limit Feature

Refer to “Appendix A Parameters”, after estimating the total amount of memory to be used as the catalog cache and relation cache, when the total amount of memory exceeds the amount of installed memory or occupies a large amount of installed memory, consider using this feature.

This feature adds the action of discarding the meta cache that has been held permanently. If you attempt to refer to a destroyed meta cache again, the meta cache is recreated, so using this feature will result in poor performance compared to not using it.

Therefore, read the following to understand how to discard a meta cache.

- 13.1.3 Cache Removal when Local Meta Cache Limit is Enabled
- 13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature
- Parameters for the Local Meta Cache Limit feature

How to set the upper limit with these considerations is described in detail in the estimation formula in “Appendix A Parameters”.

13.1.2 How to Set Parameters for the Local Meta Cache Limit Feature

To enable the Local Meta Cache Limit feature, set the pgx_catalog_cache_max_size and pgx_relation_cache_max_size parameters.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_catalog_cache_max_size</td>
<td>Specify the maximum amount of memory that the backend process should use as the catalog cache. You can enable catalog cache removal by setting it to 8 KB or more. When it is set to 0 (default value), the catalog cache removal is disabled.</td>
</tr>
<tr>
<td>pgx_relation_cache_max_size</td>
<td>Specify the maximum amount of memory that the backend process should use as the relation cache. You can enable relation cache removal by setting it to 8 KB or more. When it is set to 0 (default value), the relation cache removal is disabled.</td>
</tr>
</tbody>
</table>

Example

Here is an example postgresql.conf configuration:

```
pgx_catalog_cache_max_size = 1MB
pgx_relation_cache_max_size = 1MB
```

13.1.3 Cache Removal when Local Meta Cache Limit is Enabled

When this feature is enabled, the caching strategy is to keep the cache as long as possible within the specified upper limit. If holding a new cache exceeds the limit, consider locality of reference and remove the cache from the one with the longest unreferenced time.

However, because the cache used by active transactions cannot be removed, if a transaction uses a large number of caches, the cache may be held above the limit. In this case, remove the all caches at the end of the transaction. This is necessary to free up memory.
In PostgreSQL, in order to acquire memory at high speed, a memory block of a certain size is acquired from the OS, and a small memory is cut out from the block and used. The memory for the metacache is cut out in the same way. Therefore, it is possible to return the memory block to the OS by destroying all the meta caches scattered throughout the memory block. When this happens, the next SQL execution will be slowed down due to the re-creation of the meta cache. Therefore, upper limit of feature should be set to a value larger than the size of the meta cache used by at least one transaction.

When the size of the meta cache exceeds the upper limit, the following message is output:

```
WARNING: could not reduce Cat/RelCacheMemoryContext size to AA kilobytes, reduced to BB kilobytes
HINT: consider increasing the configuration parameter pgx_catalog/relation_cache_max_size
```

(\textit{AA}: Upper limit, \textit{BB}: Amount of memory actually used)

CatCacheMemoryContext and RelCacheMemoryContext are memory areas for storing the catalog cache and relation cache, respectively. If this message is output, consider increasing the upper limit.

If the memory consumption by the backend process exceeds the allowable value by increasing the upper limit, reconsider the SQL to be executed, such as reducing the number of tables accessed in one transaction, or add memory adjust to the amount of memory used.

### 13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature

By observing how much meta cache regeneration is taking place, you can determine if the low upper limit is the cause of the failure to achieve the desired performance.

From the message below, calculate the cache hit ratio as follows:

\[
\text{Cache hit ratio} = \frac{\text{Number of cache hits}}{\text{Number of times the cache was searched}}
\]

If the cache hit ratio is 80\% or higher, this feature will not be the main factor that impedes performance. If not, raise the upper limit and see if performance can reach the goal. In doing so, first try to shift the focus of allocation to the relations cache. This is because when executing SQL, the relation cache generated based on the catalog cache is mainly referenced, so it is advantageous to leave a large amount of relation cache.

```
Catalog cache:catalog cache hit stats: search XX, hits YY
Relation cache:relation cache hit stats: search XX, hits YY
```

(\textit{XX}: Number of times the cache was searched, \textit{YY}: Number of cache hits)

This message is printed when the transaction ends. However, if you output the message frequently, the performance will be degraded by itself, so you can adjust the output interval with the following parameters.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_cache_hit_log_interval</td>
<td>When the transaction ends, if the time set in this parameter has elapsed since the previous message was output, the message is output. If set to 0, a message will be output each time the transaction ends. Setting -1 disables the output. The default value is 10min. Even if pgx_catalog_cache_max_size and pgx_relation_cache_max_size are disabled, the message output of the corresponding cache will be invalid. Immediately after connecting to the server, a small transaction occurs before the request from the user application, such as for user authentication. Since it is meaningless to know the hit ratio for these, a message is output at the end of the transaction that started after the time set in this parameter has elapsed after connecting to the server. For the same reason, setting a small value such as 0 may result in a message being printed at the end of such a small transaction. You can check which transaction the message corresponds to from the information output at the beginning. This information depends on the setting of the parameter log_line_prefix.</td>
</tr>
</tbody>
</table>
Example

Here is an example postgresql.conf configuration:

```
pgx_cache_hit_log_interval=30min
```

Chapter 14 Backup/Recovery Using the Copy Command

By using a copy command created by the user, the pgx_dmpall command and the pgx_rcvall command can perform backup to any destination and can perform recovery from any destination using any copy method.

Copy commands must be created in advance as executable scripts for the user to implement the copy process on database clusters and tablespaces, and are called when executing the pgx_dmpall and pgx_rcvall commands.

This appendix describes backup/recovery using the copy command.

**Point**
- By using the high-speed copy feature of the storage device to copy the data storage destination, the processing time for backup of large databases can be greatly reduced.
- It is also possible to back up only some tablespaces using the copy command. However, database resources not backed up using the copy command are still backed up to the backup data storage destination.

**Note**
Both the backup data storage destination and the optional backup destination are necessary for recovery - if they are located in secondary media, combined management of these is necessary.

14.1 Configuration of the Copy Command

This section describes the configuration of the copy command for backup and recovery.
Cyclic usage of the backup area

Prepare two backup areas for the copy command in case an issue affects the data storage destination during backup. The copy command performs backup while cyclically using these backup areas.

![Diagram showing cyclic usage of backup areas]

**Note**

The backup data storage destination cannot be used as these backup areas used by the copy command.

Backup using the backup information file

The copy command must determine the backup destination on each backup, as it is necessary to cycle through the backup areas. Backup can be automated by using the backup information file, which contains information about the backup destination.
The backup information file is prepared in the backup data storage destination by the pgx_dmpall command, and contains information that can be read or updated by the copy command. This file is managed by associating it with the latest backup successfully completed by the pgx_dmpall command, so the latest backup information relating to the copy command registered by the user can be retrieved. Additionally, the content of the backup information file can be displayed using the pgx_rcvall command.

**Configuration of the copy command for backup**

The pgx_dmpall command calls the copy command for backup after execution for the three modes below. It is therefore necessary for the copy command for backup to implement the required processing for each of the modes.

- **prepare mode**
  - Determines which of the two backup areas will be used for the current backup.
  - The backup area to be used for the current backup is determined by reading the information relating to the latest backup destination where the backup information file was written to during the previous backup.

- **backup mode**
  - Performs backup on the backup area determined by prepare mode, using any copy method.

- **finalize mode**
  - Writes information relating to the destination of the current backup to the backup information file.
This enables the prepare mode to check the destination of the previous backup during the next backup.

**Note**

The user can use any method to hand over backup information between modes within the copy command, such as creating temporary files.

**Configuration of the copy command for recovery**

The pgx_rcvall command calls the copy command for recovery for the mode below. It is therefore necessary for the copy command for recovery to implement the required processing for the mode.

- **restore mode**

  Any copy method can be used to implement restore from the backup destination retrieved using the copy command for backup.

**Point**

By referring to the mode assigned to the copy command as an argument, backup and recovery can be implemented using a single copy command.

**Example**

**Using a bash script**

```bash
case $1 in
  prepare)
    processingRequiredForPrepareMode
    ;;
  backup)
    processingRequiredForBackupMode
    ;;
  finalize)
    processingRequiredForFinalizeMode
    ;;
  restore)
    processingRequiredForRestoreMode
    ;;
esac
```

**Point**

- A sample script that backs up the database cluster and tablespace directory to a specific directory is supplied to demonstrate how to write a copy command.
  
  The sample is stored in the directory below:

  ```bash
  /installDir/share/copy_command.archive.sh.sample
  ```

- A sample script that uses OPC (an advanced copy feature of Fujitsu Storage ETERNUS disk array) is supplied. Refer to "Appendix I Copy Command Samples that Use the Advanced Copy Feature of the ETERNUS Disk Array" for details.
  
  The samples cannot be used on SLES 12.
14.2 Backup Using the Copy Command

To perform backup using the copy command, in addition to performing the standard backup procedure, it is also necessary to create a copy command, and then execute the pgx_dmpall command specifying it. This section describes the procedure specific to using the copy command.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Perform the following procedure:

1. Determine the database resources to be backed up

   Determine the database resources to be backed up using the copy command. The copy command can back up the following resources:
   - Database cluster
   - Tablespace

   To back up only some tablespaces, create a file listing them. This file is not necessary to back up all tablespaces.

   Example

   To back up only tablespaces tblspc1 and tblspc2

   | tblspc1
   | tblspc2

2. Prepare a backup area

   Prepare a backup area to save the database resources to be backed up, as determined in step 1.

3. Create the copy command

   Create the copy commands for backup and recovery. Refer to "14.4 Copy Command Interface" for details.

Performing backup

Execute the pgx_dmpall command with the -Y option specifying the full path of the copy command for backup created in step 3 of preparation for backup.

The example below backs up only some tablespaces, but not the database cluster, using the copy command.

Example

```
$ pgx_dmpall -D /database/inst1 -Y '/database/command/backup.sh'
   --exclude-copy-cluster -P '/database/command/tablespace_list.txt'
```

Point

- To exclude up the database cluster from backup using the copy command, specify the --exclude-copy-cluster option.
- To back up only some tablespaces using the copy command, use the -P option specifying the full path of the file created in step 1 of preparation for backup.

See

- Refer to "pgx_dmpall" in the Reference for information on the command.
Checking backup status

Use the `pgx_rcvall` command to check the backup status. Execute the `pgx_rcvall` command with the `-l` option specified to output backup data information. If backup was performed using the copy command, the resources backed up using the copy command will also be output.

**Example**

```
$ pgx_rcvall -l -D /database/inst1
```

<table>
<thead>
<tr>
<th>Date</th>
<th>Status</th>
<th>Dir</th>
<th>Resources backed up by the copy command</th>
</tr>
</thead>
</table>

14.3 Recovery Using the Copy Command

To perform recovery using the copy command, in addition to performing the standard recovery procedure, it is also necessary to create a copy command, and then execute the `pgx_rcvall` command specifying it. This section describes the procedure specific to using the copy command.

Determining the backup area of the latest backup

Check the backup information file to determine the backup area used for the latest backup, and confirm that it is in a recoverable state. Execute the `pgx_rcvall` command with the `--view-results-of-copying` option to output the content of the backup information file.

**Example**

```
$ pgx_rcvall -D /database/inst1 --view-results-of-copying
```

Perform recovery

Execute the `pgx_rcvall` command with the `-Y` option specifying the full path of the copy command for recovery created in step 3 of the preparation for backup described in "14.2 Backup Using the Copy Command".

The example below recover only some tablespaces, but not the database cluster, using the copy command.

**Example**

```
$ pgx_rcvall -D /database/inst1 -B /backup/inst1 -Y '/database/command/recovery.sh'
```

**Point**

If the latest backup was performed using the copy command, the `pgx_rcvall` command automatically recognizes which database resources were backed up using the copy command, or whether resources were backed up to the backup data storage destination. Therefore, recovery can be performed by simply executing the `pgx_rcvall` command specifying the copy command for recovery.

**See**

Refer to "pgx_rcvall" in the Reference for information on the command.
14.4 Copy Command Interface

The following types of copy command are available:
- Copy command for backup
- Copy command for recovery

This appendix describes the interface of each copy command.

14.4.1 Copy Command for Backup

Feature
User exit (for the copy command) called from the pgx_dmpall command.

Format
The syntax for calling the copy command from the pgx_dmpall command is described below.

If the operation mode is "prepare"

```
copyCommandName prepare 'pathOfBackupInfoFile' 'pathOfBackupTargetListFile'
```

If the operation mode is "backup"

```
copyCommandName backup
```

If the operation mode is "finalize"

```
copyCommandName finalize 'pathOfBackupInfoFile'
```

Argument
- Operation mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prepare</td>
<td>Implements the preparation process for backing up using the copy command.</td>
</tr>
<tr>
<td></td>
<td>Called before the PostgreSQL online backup mode is started.</td>
</tr>
<tr>
<td>backup</td>
<td>Implements the backup process.</td>
</tr>
<tr>
<td></td>
<td>Called during the PostgreSQL online backup mode.</td>
</tr>
<tr>
<td>finalize</td>
<td>Implements the backup completion process.</td>
</tr>
<tr>
<td></td>
<td>Called after the PostgreSQL online backup mode is completed.</td>
</tr>
</tbody>
</table>

Point
If using high-speed copy of the storage device (which performs high-speed retrieval of snapshots and copies data to different physical areas), it is possible to invoke the snapshot process in backup mode, and the copy process in finalize mode.

- Full path of the backup information file
  Full path of the backup information file of the latest backup, enclosed in single quotation marks. If a backup has not been performed, specify `"`.

- Full path of the backup target list file
  Full path of the file containing the resources to be backed up using the copy command, enclosed in single quotation marks. One of the following is described in each resource name.
<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>pg_data</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Tablespace name</td>
</tr>
</tbody>
</table>

### Example

To back up the database cluster and the tablespaces dbspace and indexspace using the copy command, the file should contain the following:

```
pg_data
dbspace
indexspace
```

### Information

The encoding of resource names output to the backup target list file by the pgx_dmpall command is the encoding used when this command connects to the database with auto specified for the client_encoding parameter, and is dependent on the locale at the time of command execution.

The number of arguments vary depending on operation mode. The argument of each operation mode is as follows.

<table>
<thead>
<tr>
<th>Operation mode</th>
<th>First argument</th>
<th>Second argument</th>
<th>Third argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>prepare</td>
<td>Operation mode</td>
<td>Backup information file path name</td>
<td>Backup target list file path name</td>
</tr>
<tr>
<td>backup</td>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>finalize</td>
<td>Backup information file path name</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Additionally, the access permissions for the backup information file and backup target list file are different depending on the operation mode. The access permissions of each operation mode are as follows.

<table>
<thead>
<tr>
<th>Operation mode</th>
<th>Backup information file</th>
<th>Backup target list file</th>
</tr>
</thead>
<tbody>
<tr>
<td>prepare</td>
<td>Can be viewed by the instance administrator only</td>
<td>Can be viewed by the instance administrator only</td>
</tr>
<tr>
<td>backup</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>finalize</td>
<td>Can be viewed and updated by the instance administrator only</td>
<td>-</td>
</tr>
</tbody>
</table>

### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Normal end</td>
</tr>
<tr>
<td></td>
<td>The pgx_dmpall command continues processing.</td>
</tr>
<tr>
<td>Other than 0</td>
<td>Abnormal end</td>
</tr>
<tr>
<td></td>
<td>The pgx_dmpall command terminates in error.</td>
</tr>
</tbody>
</table>

### Description

- The copy command operates with the privileges of the operating system user who executed the pgx_dmpall command. Therefore, grant copy command execution privileges to users who will execute the pgx_dmpall command. Additionally, have the copy command change users as necessary.
- To write to the backup information file, use a method such as redirection from the copy command.
- Because the copy command is called for each mode, implement all processing for each one.
- To copy multiple resources simultaneously, have the copy command copy them in parallel.

**Note**

- The backup information file and backup target list file cannot be deleted. Additionally, the privileges cannot be changed.
- Standard output and standard error output of the copy command are output to the terminal where the pgx_dmpall command was executed.
- If the copy command becomes unresponsive, the pgx_dmpall command will also become unresponsive. If the copy command is deemed to be unresponsive by the operating system, use an operating system command to forcibly stop it.
- Output the copy command execution trace and the result to a temporary file, so that if it terminates in error, the cause can be investigated at a later time.
- For prepare mode only, it is possible to use the PostgreSQL client application to access the database using the copy command. For all other modes, do not execute FUJITSU Enterprise Postgres commands or PostgreSQL applications.
- Enable the fsync parameter in postgresql.conf, because data on the shared memory buffer needs to have been already written to disk when backup starts.

### 14.4.2 Copy Command for Recovery

**Feature**

User exit (for the copy command) called from the pgx_rcvall command.

**Format**

The syntax for calling the copy command from the pgx_rcvall command is described below.

```
copyCommandName restore 'pathOfBackupInfoFile' 'pathOfBackupTargetListFile'
```

**Argument**

- **Operation mode**
  
<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>restore</td>
<td>Performs restore.</td>
</tr>
</tbody>
</table>

- **Full path of the backup information file**
  
  Full path of the backup information file, enclosed in single quotation marks.

- **Full path of the backup target list file**
  
  Full path of the file containing the resources to be restored using the copy command, enclosed in single quotation marks.

The access permissions for the backup information file and backup target list file are as below.

<table>
<thead>
<tr>
<th>Backup information file</th>
<th>Backup target list file</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be viewed by the instance administrator only</td>

**Return value**

-
Return value | Description
---|---
0 | Normal end
| The pgx_rcvall command continues processing.
Other than 0 | Abnormal end
| The pgx_rcvall command terminates in error.

Description

- The copy command operates with the privileges of the operating system user who executed the pgx_rcvall command. Therefore, grant copy command execution privileges to users who will execute the pgx_rcvall command. Additionally, have the copy command change users as necessary.
- The copy command is called once only in restore mode.
- To copy multiple resources simultaneously, have the copy command copy them in parallel.

Note

- The backup information file and backup target list file cannot be deleted. Additionally, the privileges cannot be changed.
- Standard output and standard error output of the copy command are output to the terminal where the pgx_rcvall command was executed.
- If the copy command becomes unresponsive, the pgx_rcvall command will also become unresponsive. If the status of the copy command is deemed to be unresponsive by the operating system, use an operating system command to forcibly stop it.
- Output the copy command execution trace and the result to a temporary file, so that if it terminates in error, the cause can be investigated at a later time.
- Do not execute FUJITSU Enterprise Postgres commands or PostgreSQL applications in the copy command.
- There may be files and directories not required for recovery using the archive log included in the backup, such as postmaster.pid, pg_wal/subdirectory and pg_replslot in the database cluster. If such unnecessary files and directories exist, have the copy command delete them after the restore.
Chapter 15 Actions when an Error Occurs

This chapter describes the actions to take when an error occurs in the database or an application, while FUJITSU Enterprise Postgres is operating.

Depending on the type of error, it may be necessary to recover the database cluster. The recovery process recovers the following resources:

- Data storage destination
- Transaction log storage destination (if the transaction log is stored in a separate disk from the data storage destination)
- Backup data storage destination

**Note**

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output. The recovery actions differ for these error messages.

Check the status of the disk, and select one of the following actions:

- If the disk is defective
  Refer to "15.1 Recovering from Disk Failure (Hardware)", and take actions accordingly.
- If the disk is not defective
  Refer to "15.14 I/O Errors Other than Disk Failure", and take actions accordingly.

A few examples of errors generated even if the disk is not defective include:

- Network error with an external disk
- Errors caused by power failure or mounting issues

**Determining the cause of an error**

If an error occurs, refer to the WebAdmin message and the server log, and determine the cause of the error.

**See**

Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on server logs.

**Approximate recovery time**

The formulas for deriving the approximate recovery time of resources in each directory are given below.

If using the copy command with the pgx_rcvall command, the recovery time will depend on the implementation of the copy command.

- Data storage destination or transaction log storage destination

\[
\text{Recovery time} = \frac{(\text{usageByTheDataStorageDestination} + \text{usageByTheTransactionLogStorageDestination})}{\text{diskWritePerformance}} \times 1.5
\]

- \text{usageByTheDataStorageDestination}: Disk space used by the database cluster
- \text{usageByTheTransactionLogStorageDestination}: Disk space used by the transaction log stored outside the database cluster
- \text{diskWritePerformance}: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

- Backup data storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheBackupDataStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]
15.1 Recovering from Disk Failure (Hardware)

This section describes how to recover database clusters to a point immediately before failure, if a hardware failure occurs in the data storage disk or the backup data storage disk.

There are two methods of recovery:

- 15.1.1 Using WebAdmin
- 15.1.2 Using Server Command

**Point**

Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

15.1.1 Using WebAdmin

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

**Note**

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

**If failure occurred in the data storage disk or the transaction log storage disk**

Follow the procedure below to recover the data storage disk or the transaction log storage disk.

1. Stop applications

   Stop applications that are using the database.

2. Stop the instance

   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.

3. Recover the failed disk

   Replace the disk, and then recover the volume configuration information.

4. Create a tablespace directory

   If a tablespace was defined after backup, create a directory for it.

5. Recover the keystore, and enable automatic opening of the keystore

   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.
6. Recover the database cluster
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message in the lower-right corner.

7. Run recovery
   In the [Restore Instance] dialog box, click [Yes].
   Instance restore is performed. An instance is automatically started when recovery is successful.

**Note**

WebAdmin does not support recovery of hash index. If you are using a hash index, then after recovery, execute the REINDEX command to rebuild it. Use of hash indexes is not recommended.

8. Resume applications
   Resume applications that are using the database.

**Point**

WebAdmin may be unable to detect disk errors, depending on how the error occurred.
If this happens, refer to "15.10.3 Other Errors" to perform recovery.

---

**If failure occurred on the backup data storage disk**

Follow the procedure below to recover the backup data storage disk.

1. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

2. Recover the backup data
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

3. Run backup
   Perform backup to enable recovery of the backup data. In the [Backup] dialog box, click [Yes]. The backup is performed. An instance is automatically started when backup is performed.

**Point**

If you click [Recheck the status], the resources in the data storage destination and the backup data storage destination are reconfirmed. As a result, the following occurs:

- If an error is not detected
  The status of the data storage destination and the backup data storage destination returns to normal, and it is possible to perform operations as usual.

- If an error is detected
  An error message is displayed in the message list again. Click [Solution], and resolve the problem by following the resolution for the cause of the error displayed in the dialog box.

---

**15.1.2 Using Server Command**

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

**If failure occurred on the data storage disk or the transaction log storage directory**

Follow the procedure below to recover the data storage disk or the transaction log storage directory.
1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance, refer to "2.1.2 Using Server Commands" for details.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

4. Create a storage destination directory
   - If failure occurred on the data storage disk
     Create a data storage destination directory. If a tablespace was defined, also create a directory for it.
   - If failure occurred on the translation log storage disk
     Create a transaction log storage destination directory.

   Example
   To create a data storage destination directory:
   ```
   $ mkdir /database/instl
   $ chown fsepuser:fsepuser /database/instl
   $ chmod 700 /database/instl
   ```

   See
   Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on how to create a storage directory.

5. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

6. Recover the database cluster
   Recover the database cluster using the backup data.
   Specify the following in the pgx_rcvall command:
   - Specify the data storage location in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup data storage location in the -B option.

   Example
   ```
   > pgx_rcvall -D /database/instl -B /backup/instl
   ```

   Note
   If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.
   If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.
   The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).
7. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

8. Resume applications

Resume applications that are using the database.

If failure occurred on the backup data storage disk

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>

</tr>
<tr>
<td>11</td>
<td>Resume applications</td>
<td>N</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Required  
N: Not required

The procedure is as follows:

If an instance has not been stopped

1. Confirm that transaction log mirroring has stopped

Use the following SQL function to confirm that transaction log mirroring has stopped.

```sql
postgres=# SELECT pgx_is_wal_multiplexing_paused();
pgx_is_wal_multiplexing_paused
-------------------
t
(1 row)
```

If transaction log mirroring has not stopped, then stop it using the following SQL function.

```sql
postgres=# SELECT pgx_pause_wal_multiplexing();
LOG: multiplexing of transaction log files has been stopped
```
2. Stop output of archive logs

Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

To prevent this, use the following methods to stop output of archive logs.

- Changing archive_command
  Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.
  If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

- Reload the configuration file
  Execute the pg_ctl reload command or the pg_reload_conf SQL function to reload the configuration file.
  If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

Create a backup data storage destination.

Example

```
$ mkdir /database/inst1
$ chown fsepuser:fsepuser /database/inst1
$ chmod 700 /database/inst1
```

Refer to "3.2.2 Using Server Commands" for information on how to create a backup data storage destination.

5. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.

6. Resume transaction log mirroring

Execute the pgx_resume_wal_multiplexing SQL function.

Example

```
SELECT pgx_resume_wal_multiplexing()
```

7. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pgx_dmpall -D /database/inst1
```
If an instance has been stopped

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for details.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination
   Create a backup data storage destination.

   **Example**
   ```
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```
   Refer to "3.2.2 Using Server Commands" for details.

5. Start the instance
   Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

6. Run backup
   Use the pgx_dmpall command to back up the database cluster.
   Specify the following value in the pgx_dmpall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

   **Example**
   ```
   > pgx_dmpall -D /database/inst1
   ```

7. Resume applications
   Resume applications that are using the database.

---

**See**

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on pgx_resume_wal_multiplexing.

---

**15.2 Recovering from Data Corruption**

If data in a disk is logically corrupted and the database does not operate properly, you can recover the database cluster to its state at the time of backup.

There are two methods of recovery:

- 15.2.1 Using WebAdmin
- 15.2.2 Using the pgx_rcvall Command
- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.

15.2.1 Using WebAdmin

If using WebAdmin, recover the data to the point immediately prior to data corruption by using the backup data. Refer to "15.1.1 Using WebAdmin" for details.

15.2.2 Using the pgx_rcvall Command

Recover the database cluster by specifying in the pgx_rcvall command the date and time of the backup you want to read from. Then re-execute the transaction as required to recover the data.

Follow the procedure below to recover the data storage disk.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the backup date and time
   Execute the pgx_rcvall command to confirm the backup data saved in the backup data storage destination, and determine a date and time prior to data corruption.
   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup storage directory in the -B option.
   - The -l option displays the backup data information.
   
   Example

   ```
   > pgx_rcvall -D /database/inst1 -B /backup/inst1 -l
   Date       Status      Dir
   2020-05-20 10:00:00 COMPLETE /backup/inst1/2020-05-20_10-00-00
   ```

4. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster
   Use the pgx_rcvall command to recover the database cluster.
   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup storage directory in the -B option.
- Specify the recovery date and time in the -e option.

Example
In the following examples, "May 20, 2020 10:00:00" is specified as the recovery time.

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1 -e '2020-05-20 10:00:00'
```

Note
If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

```
FATAL: the database system is starting up
```

6. Start the instance
Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.
If necessary, re-execute transaction processing from the specified recovery time, and then resume database operations.

Note
The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

7. Resume applications
Resume applications that are using the database.

See
Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

15.3 Recovering from an Incorrect User Operation
This section describes how to recover database clusters when data has been corrupted due to erroneous user operations.
There are two methods of recovery:

- 15.3.1 Using WebAdmin
- 15.3.2 Using the pgx_rcvall Command

Note
- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.
- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.
An effective restore point is one created on a time series for which you have made a backup. That is, if you recover data to a point in the past, you cannot use any restore points set after that recovery point. Therefore, once you manage to recover your target past data, make a backup.

15.3.1 Using WebAdmin

You can use WebAdmin to recover data to a backup point.

**Note**

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

Follow the procedure below to recover the data in the data storage disk.

1. Stop applications
   - Stop applications that are using the database.

2. Stop the instance
   - Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.

3. Recover the keystore, and enable automatic opening of the keystore
   - Do the following if the data in the database has been encrypted:
     - Restore the keystore to its state at the time of the database backup.
     - Enable automatic opening of the keystore.

4. Recover the database cluster
   - Log in to WebAdmin, and in the [Instances] tab, select the instance to be recovered and click.

5. Recover to the backup point
   - In the [Restore Instance] dialog box, click [Yes].
   - Recovery is performed. An instance is automatically started when recovery is successful.

**Note**

WebAdmin cannot accurately recover a hash index. If you are using a hash index, then after recovery, execute the REINDEX command for the appropriate index.

6. Resume database operations
   - If necessary, re-execute transaction processing from the backup point to when an erroneous operation was performed, and then resume database operations.

15.3.2 Using the pgx_rcvall Command

The pgx_rcvall command recovers database clusters to the restore point created with the server command. Refer to "Setting a restore point" in "3.2.2 Using Server Commands" for information on how to create a restore point.

Follow the procedure below to recover the data in the data storage disk.
1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the restore point
   Execute the pgx_rcvall command to confirm the backup data saved in the backup data storage destination, and use a restore point recorded in an arbitrary file, as explained in "3.2.2 Using Server Commands", to determine a restore point prior to the erroneous operation.
   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup data storage destination in the -B option.
   - The -l option displays the backup data information.

   Example
   ```
   > pgx_rcvall -D /database/inst1 -B /backup/inst1 -l
   Date         Status         Dir
   2020-05-01 10:00:00 COMPLETE /backup/inst1/2020-05-01_10-00-00
   ```

4. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster
   Use the pgx_rcvall command to recover the database cluster.
   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup data storage destination in the -B option.
   - The -n option recovers the data to the specified restore point.

   Example
   The following example executes the pgx_rcvall command with the restore point "batch_20200503_1".
   ```
   > pgx_rcvall -D /database/inst1 -B /backup/inst1 -n batch_20200503_1
   ```

   Note
   If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.
   If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.
   The following message displayed during recovery is output as part of normal operation of pgx_rcvall (therefore the user does not need not be concerned).
   ```
   FATAL: the database system is starting up
   ```
6. Start the instance

Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

**Note**

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

7. Restart operation of the database

If necessary, re-execute transaction processing from the specified recovery time to the point when an erroneous operation was performed, and then resume database operations.

**See**

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

## 15.4 Actions in Response to an Application Error

If there is a connection from a client that has been in the waiting state for an extended period, you can minimize performance degradation of the database by closing the problematic connection.

The following methods are available for identifying a connection to be closed:
- view(pg_stat_activity) (refer to "15.4.1 When using the view (pg_stat_activity)"
- ps command (refer to "15.4.2 Using the ps Command"
- pgAdmin (refer to "15.4.3 Using pgAdmin"

Use the system management function (pg_terminate_backend) to disconnect connections.

### 15.4.1 When using the view (pg_stat_activity)

When using the view (pg_stat_activity), follow the procedure below to close a connection.

1. Use psql command to connect to the postgres database.

```
> psql postgres
psql (13.1)
Type "help" for help.
```

2. Close connections from clients that have been in the waiting state for an extended period.

Use pg_terminate_backend() to close connections that have been trying to connect for an extended period. However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

**Example**

The following example closes connections where the client has been in the waiting state for at least 60 minutes.

```
select pid, usename, application_name, client_hostname, pg_terminate_backend(pid) from
gp_stat_activity where state='idle in transaction' and current_timestamp > cast(query_start +
interval '60 minutes' as timestamp);
```

- [RECORD 1]-----------------------------
  pid | 4684
  usename | fsepuser
  application_name | apl1
Follow the procedure below to close a connection using a standard Unix tool (ps command).

1. Execute the ps command.
   Note that "<x>" indicates the product version.

   ```
   > ps axwfo user,pid,ppid,tty,command | grep postgres
   fsepuser 19174 18027 pts/1               __ grep postgres
   fsepuser 20517 1 ? /opt/fsepv<x>server64/bin/postgres -D /disk01/data
   fsepuser 20518 20517 ? __ postgres: logger
   fsepuser 20520 20517 ? __ postgres: checkpointer
   fsepuser 20521 20517 ? __ postgres: background writer
   fsepuser 20522 20517 ? __ postgres: walwriter
   fsepuser 20523 20517 ? __ postgres: autovacuum launcher
   fsepuser 20524 20517 ? __ postgres: archiver
   fsepuser 20525 20517 ? __ postgres: stats collector
   fsepuser 18673 20517 ? __ postgres: fsepuser postgres 192.168.100.1(49448) idle
   fsepuser 16643 20517 ? __ postgres: fsepuser db01 192.168.100.11(49449) UPDATE waiting
   fsepuser 16644 20517 ? __ postgres: fsepuser db01 192.168.100.12(49450) idle in transaction
   ```

   Process ID 16643 may be a connection that was established a considerable time ago by the UPDATE statement, or a connection that has occupied resources (waiting).

2. Close connections from clients that have been in the waiting state for an extended period.
   Use pg_terminate_backend() to close the connection with the process ID identified in step 1 above.
   The example below disconnects the process with ID 16643.

   However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements.

   ```
   postgres=# SELECT pg_terminate_backend (16643);
   pg_terminate_backend
   ---------------------
   t
   (1 row)
   ```

   - Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on pg_terminate_backend.
   - Refer to "Notes on Application Compatibility" in the Application Development Guide for information on how to maintain application compatibility.
15.4.3 Using pgAdmin

If using pgAdmin, follow the procedure below to close connections.

1. In the [Browser] pane, click the relevant database server.
2. Close the client connections that have been in a wait state for an extended period.

   Click the [Dashboard] tab. In the [Server activity] section, select the connections that have been in an "idle" or "idle in transaction" state for an extended period. For each of these connections, click to close the session.

![Image of pgAdmin](image)

15.5 Actions in Response to an Access Error

If access is denied, grant privileges allowing the instance administrator to operate the following directories, and then re-execute the operation. Also, refer to the event log and the server log, and confirm that the file system has not been mounted as read-only due to a disk error. If the file system has been mounted as read-only, mount it properly and then re-execute the operation.

- Data storage destination
- Tablespace storage destination
- Transaction log storage destination
- Backup data storage destination

See

Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on the privileges required for the directory.

15.6 Actions in Response to Insufficient Space on the Data Storage Destination

If the data storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.
If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

There are two methods of migrating data:
- 15.6.1 Using a Tablespace
- 15.6.2 Replacing the Disk with a Larger Capacity Disk

15.6.1 Using a Tablespace

FUJITSU Enterprise Postgres enables you to use a tablespace to change the storage destination of database objects, such as tables and indexes, to a different disk.

The procedure is as follows:
1. Create a tablespace
   Use the CREATE TABLESPACE command to create a new tablespace in the prepared disk.
2. Modify the tablespace
   Use the ALTER TABLE command to modify tables for the newly defined tablespace.

See
Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on the CREATE TABLESPACE command and ALTER TABLE command.

15.6.2 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the data storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:
- 15.6.2.1 Using WebAdmin
- 15.6.2.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the data storage destination.

Note
- Before replacing the disk, stop applications and instances that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

15.6.2.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using WebAdmin.
1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.
2. Stop applications
   Stop applications that are using the database.
3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.
4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablespace directory ") to 7 ("Run recovery") under "If failure occurred in the data storage disk or the transaction log storage disk" in "15.1.1 Using WebAdmin" for information on the procedure. An instance is automatically started when recovery is successful.

7. Resume applications
   Resume applications that are using the database.

8. Restore the files
   Restore the files backed up in step 1.

15.6.2.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using server commands.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.

2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.2 Using Server Commands" for details.

4. Stop the instance
   After backup is complete, stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a data storage destination
   Create a data storage destination. If a tablespace was defined, also create a directory for it.

Example

```
$ mkdir /database/inst1
$ chown fsepuser:fsepuser /database/inst1
$ chmod 700 /database/inst1
```

7. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

8. Recover the database cluster
   Use the pgx_recover command to recover the database cluster.
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup storage directory in the -B option.

Example
Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall (therefore the user does not need not be concerned).

FATAL: the database system is starting up

See

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

9. Start the instance
Start the instance.
Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

Note

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the pgx_rcvall command to end and then execute the REINDEX command for the appropriate index.

10. Resume applications
Resume applications that are using the database.

11. Restore files
Restore the files backed up in step 1.

15.7 Actions in Response to Insufficient Space on the Backup Data Storage Destination

If space runs out on the backup data storage destination, check if the disk contains any unnecessary files and delete them, and then make a backup as required.

If deleting unnecessary files does not solve the problem, take the following action:

- 15.7.1 Temporarily Saving Backup Data
- 15.7.2 Replacing the Disk with a Larger Capacity Disk

15.7.1 Temporarily Saving Backup Data

This method involves temporarily moving backup data to a different directory, saving it there, and securing disk space on the backup data storage destination so that a backup can be made normally.

Use this method if you need time to prepare a larger capacity disk.

If space runs out on the backup data storage destination, archive logs can no longer be stored in the backup data storage destination. As a result, transaction logs continue to accumulate in the data storage destination or the transaction log storage destination.
If action is not taken soon, the transaction log storage destination will become full, and operations may not be able to continue. To prevent this, secure space in the backup data storage destination, so that archive logs can be stored.

There are two methods of taking action:
- 15.7.1.1 Using WebAdmin
- 15.7.1.2 Using Server Commands

**15.7.1.1 Using WebAdmin**

Follow the procedure below to recover the backup data storage disk.

1. Temporarily save backup data
   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.
   **Example**
   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

2. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

3. Delete temporarily saved backup data
   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
   The following example deletes backup data that was temporarily saved in /mnt/usb.
   **Example**
   ```
   > rm -rf /mnt/usb/backup
   ```

**15.7.1.2 Using Server Commands**

The following describes the procedure for recovering the backup storage disk.

There are two methods of taking action:
- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Stop transaction log mirroring</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Temporarily save backup data</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Resume output of archive logs</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Resume transaction log mirroring</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>2</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>3</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>4</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>5</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>6</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>7</td>
<td>Y</td>
<td>N</td>
</tr>
</tbody>
</table>
Performing recovery while the instance is active

1. Stop transaction log mirroring

Stop transaction log mirroring.

```
postgres=# SELECT pgx_pause_wal_multiplexing();
LOG:  multiplexing of transaction log files has been stopped
pgx_pause_wal_multiplexing
------------------------
(1 row)
```

2. Stop output of archive logs

Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

To prevent this, use the following methods to stop output of archive logs.

- Changing the archive_command parameter

  Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.

  If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

- Reloading the configuration file

  Run the pg_ctl reload command or the pg_reload_conf SQL function.

  If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

3. Temporarily save backup data

Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

**Example**

```
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```

4. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.
5. Resume transaction log mirroring
   Execute the `pgx_resume_wal_multiplexing` SQL function.
   **Example**
   ```sql
   SELECT pgx_resume_wal_multiplexing()
   ```

6. Run backup
   Use the `pgx_dmpall` command to back up the database cluster.
   Specify the following option in the `pgx_dmpall` command:
   - Specify the directory of the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.
   **Example**
   ```sh
   > pgx_dmpall -D /database/inst1
   ```

7. Delete temporarily saved backup data
   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
   The following example deletes backup data that was temporarily saved in `/mnt/usb`.
   **Example**
   ```sh
   > rm -rf /mnt/usb/backup
   ```

If an instance has been stopped

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for details.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Temporarily save backup data
   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   The following example saves backup data from the backup data storage destination directory (`/backup/inst1`) under `/mnt/usb/backup`.
   **Example**
   ```sh
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

4. Start the instance
   Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

5. Run backup
   Use the `pgx_dmpall` command to back up the database cluster.
   Specify the following value in the `pgx_dmpall` command:
   - Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.
   **Example**
6. Resume applications
   Resume applications that are using the database.

7. Delete temporarily saved backup data
   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
   The following example deletes backup data that was temporarily saved in /mnt/usb.
   Example
   ```
   > rm -rf /mnt/usb/backup
   ```

---

**See**

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexing_paused and pgx_resume_wal_multiplexing.

---

**15.7.2 Replacing the Disk with a Larger Capacity Disk**

This method involves replacing the disk at the backup data storage destination with a larger capacity disk, so that it does not run out of free space again. After replacing the disk, back up data to obtain a proper backup.

There are two methods of performing backup:

- **15.7.2.1 Using WebAdmin**
- **15.7.2.2 Using Server Commands**

**Note**

Before replacing the disk, stop applications that are using the database.

---

**15.7.2.1 Using WebAdmin**

Follow the procedure below to recover the backup storage disk.

1. Back up files
   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data
   Save the backup data to a different directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.
   Example
   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```
3. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

4. Run backup
   Log in to WebAdmin, and perform recovery operations. Refer to steps 2 ("Recover the backup data") and 3 ("Run backup") under "If failure occurred on the backup storage disk" in "15.1.1 Using WebAdmin".

5. Restore files
   Restore the files backed up in step 1.

6. Delete temporarily saved backup data
   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
   The following example deletes backup data that was temporarily saved in /mnt/usb.

   Example
   ```
   > rm -rf /mnt/usb/backup
   ```

### 15.7.2.2 Using Server Commands

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:
- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>No</td>

<td>N</td>
</tr>
<tr>
<td>14</td>
<td>Restore files</td>
<td>Y</td>
</tr>
<tr>
<td>15</td>
<td>Delete temporarily saved backup data</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Required
N: Not required

The procedure is as follows:
If an instance has not been stopped

1. Back up files
   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data
   Save the backup data to a different directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

   Example
   
   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

3. Confirm that transaction log mirroring has stopped
   Use the following SQL function to confirm that transaction log mirroring has stopped.

   ```
   postgres=# SELECT pgx_is_wal_multiplexing_paused();
   pgx_is_wal_multiplexing_paused
   -------------------
   t
   (1 row)
   ```

   If transaction log mirroring has not stopped, then stop it using the following SQL function.

   ```
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   ------------------------------
   (1 row)
   ```

4. Stop output of archive logs
   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage destination disk or the transaction log storage destination disk becomes full, there is a risk that operations may not be able to continue.

   To prevent this, use the following methods to stop output of archive logs.

   - Changing the archive_command parameter
     Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.
     If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

   - Reloading the configuration file
     Run the pg_ctl reload command or the pg_reload_conf SQL function.
     If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string (*) in archive_command and reload the configuration file.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination
   Create a backup data storage destination.
Example

```bash
# mkdir /backup/inst1
# chown fsepuser:fsepuser /backup/inst1
# chmod 700 /backup/inst1
```

Refer to "3.2.2 Using Server Commands" for details.

7. Resume output of archive logs
   Return the archive_command setting to its original value, and reload the configuration file.

8. Resume transaction log mirroring
   Execute the `pgx_resume_wal_multiplexing` SQL function.

Example

```sql
SELECT pgx_resume_wal_multiplexing()
```

9. Run backup
   Use the `pgx_dmpall` command to back up the database cluster.
   Specify the following value in the `pgx_dmpall` command:
   - Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.

Example

```bash
> pgx_dmpall -D /database/inst1
```

10. Restore files
    Restore the files backed up in step 1.

11. Delete temporarily saved backup data
    If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
    The following example deletes backup data that was temporarily saved in `/mnt/usb`.

Example

```bash
> rm -rf /mnt/usb/backup
```

If an instance has been stopped

1. Back up files
   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data
   Save the backup data to a different directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   The following example saves backup data from the backup data storage destination directory (`/backup/inst1`) under `/mnt/usb` backup.

Example

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```
3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination
   Create a backup data storage destination.
   **Example**
   ```
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```
   Refer to "3.2.2 Using Server Commands" for details.

7. Start the instance
   Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

8. Run backup
   Use the pgx_dmpall command to back up the database cluster.
   Specify the following value in the pgx_dmpall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   **Example**
   ```
   > pgx_dmpall -D /database/inst1
   ```

9. Resume applications
   Resume applications that are using the database.

10. Restore files
    Restore the files backed up in step 1.

11. Delete temporarily saved backup data
    If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
    The following example deletes backup data that was temporarily saved in /mnt/usb.
    **Example**
    ```
    > rm -rf /mnt/usb/backup
    ```

---

See

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexing_paused and pgx_resume_wal_multiplexing.
15.8 Actions in Response to Insufficient Space on the Transaction Log Storage Destination

If the transaction log storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.

If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

15.8.1 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the transaction log storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:

- 15.8.1.1 Using WebAdmin
- 15.8.1.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the transaction log storage destination.

Note

- Before replacing the disk, stop applications that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

15.8.1.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using WebAdmin.

1. Back up files
   If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the transaction log storage destination.

2. Back up the database cluster
   Back up the latest data storage destination resources and transaction log storage destination resources (refer to "3.2.1 Using WebAdmin" for details).

3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a tablespace directory
   If a tablespace was defined after backing up, create a directory for it.

7. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
     - Restore the keystore to its state at the time of the database backup.
     - Enable automatic opening of the keystore.
8. Recover the database cluster

Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablespace directory ") to 7 ("Run Recovery") under "If failure occurred in the data storage disk or the transaction log storage disk " in "15.1.1 Using WebAdmin" for information on the procedure. An instance is automatically started when recovery is successful.

9. Resume applications

Resume applications that are using the database.

10. Restore files

Restore the files backed up in step 1.

15.8.1.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using server commands.

1. Back up files

If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the transaction log storage destination.

2. Back up the database cluster

Use server commands to back up the latest data storage destination resources and transaction log storage destination resources. Refer to "3.2.2 Using Server Commands" for information on how to perform backup.

3. Stop applications

Stop applications that are using the database.

4. Stop the instance

After backup is complete, stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.

If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk

Replace the disk. Then, recover the volume configuration information.

6. Create a transaction log storage destination

Create a transaction log storage destination. If a tablespace was defined, also create a directory for it.

Example

```
# mkdir /tranlog/inst1
# chown fsepuser:fsepuser /tranlog/inst1
# chmod 700 /tranlog/inst1
```

7. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

8. Recover the database cluster

Use the `pgx_rcvall` command to recover the database cluster.

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Specify the backup storage directory in the -B option.

Example

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1
```
If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the `pgx_rcvall` command.

If the message "`pgx_rcvall: an error occurred during recovery`" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the `pgx_rcvall` command.

The following message displayed during recovery is output as part of normal operation of `pgx_rcvall` command (therefore the user does not need not be concerned).

```
FATAL: the database system is starting up
```

Refer to "`pgx_rcvall`" in the Reference for information on the `pgx_rcvall` command.

9. Start the instance
   Start the instance.
   Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

Note
The `pgx_rcvall` command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the `REINDEX` command for the appropriate index.

10. Resume applications
    Resume applications that are using the database.

11. Restore files
    Restore the files backed up in step 1.

**15.9 Errors in More Than One Storage Disk**

If an error occurs in the storage destination disks or resources are corrupted, determine the cause of the error from system logs and server logs and remove the cause.

If errors occur in either of the following combinations, you cannot recover the database.

Recreate the instance, and rebuild the runtime environment.

<table>
<thead>
<tr>
<th>Data storage disk</th>
<th>Transaction log storage disk</th>
<th>Backup data storage disk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>-</td>
<td>Error</td>
</tr>
<tr>
<td>-</td>
<td>Error</td>
<td>Error</td>
</tr>
</tbody>
</table>

Refer to "Setup" in the Installation and Setup Guide for Server for information on how to create an instance and build the runtime environment.
15.10 Actions in Response to Instance Startup Failure

If an instance fails to start, refer to the system log and the server log, and determine the cause of the failure.

If using WebAdmin, remove the cause of the error. Then, click [Solution] and [Recheck the status] and confirm that the instance is in the normal state.

The following sections describe common causes of errors and the actions to take.

15.10.1 Errors in the Configuration File

If you have directly edited the configuration file using a text editor or changed the settings using WebAdmin, refer to the system log and the server log, confirm that no messages relating to the files below have been output.

- postgresql.conf
- pg_hba.conf

See

Refer to the following for information on the parameters in the configuration file:

- "Configuring Parameters" in the Installation and Setup Guide for Server
- "Appendix A Parameters"
- "Server Configuration" and "Client Authentication" under "Server Administration" in the PostgreSQL Documentation

15.10.2 Errors Caused by Power Failure or Mounting Issues

If mounting is cancelled after restarting the server, for example, because the disk device for each storage destination disk was not turned on, or because automatic mounting has not been set, then starting an instance will fail.

Refer to "15.14.2 Errors Caused by Power Failure or Mounting Issues", and take actions accordingly.

15.10.3 Other Errors

This section describes the recovery procedure to be used if you cannot take any action or the instance cannot start even after you have referred to the system log and the server log.

There are two methods of recovery:

- 15.10.3.1 Using WebAdmin
- 15.10.3.2 Using Server Commands

Note that recovery will not be possible if there is an error at the backup data storage destination. If the problem cannot be resolved, contact Fujitsu technical support.

15.10.3.1 Using WebAdmin

Follow the procedure below to perform recovery.

1. Delete the data storage destination directory and the transaction log storage destination directory
   Back up the data storage destination directory and the transaction log storage destination directory before deleting them.

2. Reconfirm the status
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.
   Click [Recheck the status] to reconfirm the storage destination resources.

3. Run recovery
   Restore the database cluster after WebAdmin detects an error.
Refer to "15.2.1 Using WebAdmin" for details.

15.10.3.2 Using Server Commands

Follow the procedure below to recover the database.

1. Delete the data storage destination directory and the transaction log storage destination directory
   Save the data storage destination directory and the transaction log storage destination directory, and then delete them.

2. Execute recovery
   Use the pgx_reval command to recover the database cluster.
   Refer to "15.2.2 Using the pgx_reval Command" for details.

15.11 Actions in Response to Failure to Stop an Instance

If an instance fails to stop, refer to the system log and the server log, and determine the cause of the failure.
If the instance cannot stop despite taking action, perform the following operation to stop the instance.
There are two methods of recovery:
- 15.11.1 Using WebAdmin
- 15.11.2 Using Server Commands

15.11.1 Using WebAdmin

In the [Instances] tab, click \[\] and select the Fast stop mode or the Immediate stop mode to stop the instance. Forcibly terminate the server process from WebAdmin if the instance cannot be stopped.
Refer to "2.1.1 Using WebAdmin" for information on the stop modes.

15.11.2 Using Server Commands

There are three methods:
- Stopping the Instance Using the Fast Mode
  If backup is in progress, then terminate it, roll back all executing transactions, forcibly close client connections, and then stop the instance.
- Stopping the Instance Using the Immediate Mode
  Forcibly terminate the instance immediately. A crash recovery is run when the instance is restarted.
- Forcibly Stopping the Server Process
  Reliably stops the server process when the other methods are unsuccessful.

15.11.2.1 Stopping the Instance Using the Fast Mode

Specify "-m fast" in the pg_ctl command to stop the instance.
If the instance fails to stop when you use this method, stop the instance as described in "15.11.2.2 Stopping the Instance Using the Immediate Mode" or "15.11.2.3 Forcibly Stopping the Server Process".

Example

```
> pg_ctl stop -D /database/inst1 -m fast
```

- 120 -
15.11.2.2 Stopping the Instance Using the Immediate Mode

Specify "-m immediate" in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "15.11.2.3 Forcibly Stopping the Server Process".

**Example**

```bash
> pg_ctl stop -D /database/inst1 -m immediate
```

15.11.2.3 Forcibly Stopping the Server Process

If both the Fast mode and the Immediate mode fail to stop the instance, use the kill command or the kill parameter of the pg_ctl command to forcibly stop the server process.

The procedure is as follows:

1. Execute the `ps` command
   
   Note that "<x>" indicates the product version.
   ```bash
   > ps axwfo user,pid,ppid,tty,command | grep postgres
   fsepuser 19174 18027 pts/1                __ grep postgres
   fsepuser 20517     1 ?        /opt/fsepv<x>
   > server64/bin/postgres -D /database/inst1
   fsepuser 20518 20517 ?                __ postgres: logger
   fsepuser 20520 20517 ?                __ postgres: checkpoint
   fsepuser 20521 20517 ?                __ postgres: background writer
   fsepuser 20522 20517 ?                __ postgres: walwriter
   fsepuser 20523 20517 ?                __ postgres: autovacuum launcher
   fsepuser 20524 20517 ?                __ postgres: archiver
   fsepuser 20525 20517 ?                __ postgres: stats collector
   ```
   
   The process ID (20517) indicates the server process.

2. Forcibly stop the server process
   
   As instance manager, forcibly stop the server process.
   ```bash
   > pg_ctl kill SIGQUIT 20517
   ```
   ```bash
   > kill -s SIGQUIT 20517
   ```

15.12 Actions in Response to Failure to Create a Streaming Replication Standby Instance

When creating a streaming replication standby instance using WebAdmin, if the instance creation fails, refer to the system log and the server log, and determine the cause of the failure.

When an error occurs in the creation of the standby instance using WebAdmin, it is unlikely that the partially created standby instance can be resumed to complete the operation.

In such a scenario, fix the cause of the error, delete the partially created standby instance, and then create a new standby instance. This recommendation is based on the following assumptions:

- As the instance is yet to be created completely, there are no applications connecting to the database.
- The standby instance is in error state and is not running.
- There are no backups for the standby instance and as a result, it cannot be recovered.
Refer to "Deleting Instances" in the Installation and Setup Guide for details on how to delete an instance.

### 15.13 Actions in Response to Error in a Distributed Transaction

If a system failure (such as server failure) occurs in an application that uses distributed transactions (such as .NET TransactionScope), then transactions may be changed to the in-doubt state.

At that point, resources accessed by the transaction will be locked, and rendered unusable by other transactions.

The following describes how to check for in-doubt transactions, and how to resolve them.

#### How to check for in-doubt transactions

The following shows how to check for them:

**If the server fails**

1. An in-doubt transaction will have occurred if a message similar to the one below is output to the log when the server is restarted.

   **Example**
   
   ```
   LOG: Restoring prepared transaction 2103.
   ```

2. Refer to system view `pg_prepared_xacts` to obtain information about the prepared transaction.

   If the transaction identifier of the prepared transaction in the list (in the transaction column of `pg_prepared_xacts`) is the same as the identifier of the in-doubt transaction obtained from the log output when the server was restarted, then that row is the information about the in-doubt transaction.

   **Example**
   
   ```
   postgres=# select * from pg_prepared_xacts;
   transaction |   gid     |   prepared |  owner   | database
   -------------+-----------+------------+----------+----------
   2103 | 374cc221-f6dc-4b73-9d62-d4f6ec9b430cd | 2020-05-06 16:28:48.471+08 | postgres |
   postgres (1 row)
   ```

   Information about the in-doubt transaction is output to the row with the transaction ID 2103 in the transaction column.

**If the client fails**

If there are no clients connected and there is a prepared transaction in `pg_prepared_xacts`, then you can determine that the transaction is in the in-doubt state.

If at least one client is connected and there is a prepared transaction in `pg_prepared_xacts`, you cannot determine whether there is a transaction in the in-doubt state. In this case, use the following query to determine the in-doubt transaction from the acquired database name, user name, the time PREPARE TRANSACTION was executed, and the information about the table name accessed.

```sql
select gid,x.database,owner,prepared,l.relation::regclass as relation from pg_prepared_xacts x
left join pg_locks l on l.virtualtransaction = '-1/'||x.transaction and l.locktype='relation';
```

If it still cannot be determined from this information, wait a few moments and then check `pg_prepared_xacts` again.

If there is a transaction that has continued since the last time you checked, then it is likely that it is the one in the in-doubt state.

#### Point

As you can see from the explanations in this section, there is no one way to definitively determine in-doubt transactions.

Consider collecting other supplementary information (for example, logging on the client) or performing other operations (for example, allocating database users per job).
How to resolve in-doubt transactions

From the system view pg_prepared_xacts mentioned above, obtain the global transaction identifier (in the gid column of pg_prepared_xacts) for the in-doubt transaction, and issue either a ROLLBACK PREPARED statement or COMMIT PREPARED statement to resolve the in-doubt transaction.

Example

- Rolling back in-doubt transactions

  postgres=# rollback prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';
  ROLLBACK PREPARED

- Committing in-doubt transactions

  postgres=# commit prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';
  COMMIT PREPARED

15.14 I/O Errors Other than Disk Failure

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output. A few examples of such errors are given below. The appropriate action for each error is explained respectively.

- 15.14.1 Network Error with an External Disk
- 15.14.2 Errors Caused by Power Failure or Mounting Issues

15.14.1 Network Error with an External Disk

This is an error that occurs in the network path to/from an external disk.

Determine the cause of the error by checking the information in the system log and the server log, the disk access LED, network wiring, and network card status. Take appropriate action to remove the cause of the error, for example, replace problematic devices.

15.14.2 Errors Caused by Power Failure or Mounting Issues

These are errors that occur when the disk device is not turned on, automatic mounting of the disk was not set, or mounting was accidentally cancelled.

In this case, check the information in the system log and the server log, the disk access LED, and whether the disk is mounted correctly. If problems are detected, take appropriate action.

If mounting has been cancelled, it is possible that mounting was accidentally cancelled, or automatic mounting at the time of starting the operating system is not set. In this case, set the mounting to be performed automatically.

15.15 Anomaly Detection and Resolution

The following operations performed via the command line interface will result in an anomaly in WebAdmin:

- Changes to the port and backup_destination parameters in postgresql.conf
- Changes to Mirroring Controller configuration of cluster replication added via WebAdmin

This section describes when WebAdmin checks for such anomalies, and what takes place when an anomaly is detected.

15.15.1 Port Number and Backup Storage Path Anomalies

An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of its corresponding parameter in postgresql.conf - port and backup_destination, respectively.
WebAdmin checks for anomalies when an instance is selected for viewing or any instance operation is performed. Anomalies will be identified for the selected instance only.

The following occurs when an anomaly is detected in port number and/or backup storage path:

- All instance operation buttons are disabled, except for “Edit instance”, “Refresh instance”, and “Delete Mirroring Controller”
- A red error status indicator is displayed on the instance icon
- For an anomaly specific to backup storage path, a red error status indicator is displayed on the [Backup storage] disk icon, and [Backup storage status] is set to “Error”
- The message, “WebAdmin has detected an anomaly with...”, is displayed in the [Message] section along with an associated [Solution] button

Click [Solution]. The [Anomaly Error] dialog box is displayed.

Select the required option, click [OK], and then resolve the anomaly error.

**Note**

Critical errors encountered during anomaly resolution will be displayed, however, rollback of the instance to its previous state is not supported.

### 15.15.2 Mirroring Controller Anomalies

The following conditions will cause a Mirroring Controller anomaly:

- The Mirroring Controller management folder or configuration files have been deleted
- The permissions to the Mirroring Controller management folder or configuration files have been changed such that:
  - The instance administrator's access to Mirroring Controller configuration is denied
  - Users other than an instance administrator have access privileges to Mirroring Controller configuration files
WebAdmin checks for anomalies when Mirroring Controller status check is performed.

The following occurs when a Mirroring Controller anomaly is detected:

- All Mirroring Controller functionality is disabled for the replication cluster, except for "Delete Mirroring Controller"
- [Mirroring Controller status] is set to "Error"
- Either of the following messages is displayed in the [Message] section

"Failed to access the Mirroring Controller management folder or configuration files 'path'. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again."

"Failed to find the Mirroring Controller management folder or configuration files 'path'. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again."
Appendix A Parameters

This appendix describes the parameters to be set in the postgresql.conf file of FUJITSU Enterprise Postgres.

The postgresql.conf file is located in the data storage destination.

Information

The maximum value that can be expressed as a 4-byte signed integer changes according to the operating system. Follow the definition of the operating system in use.

- core_directory (string)
  This parameter specifies the directory where the corefile is to be output. If this parameter is omitted, the data storage destination is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- core_contents (string)
  This parameter specifies the contents to be included in the corefile.
  - full: Outputs all contents of the server process memory to the corefile.
  - none: Does not output a corefile.
  - minimum: Outputs only non-shared memory server processes to the corefile. This reduces the size of the corefile. However, in some cases, this file may not contain sufficient information for examining the factor that caused the corefile to be output.

  If this parameter is omitted, "minimum" is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- keystore_location (string)
  This parameter specifies the directory that stores the keystore file. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- tablespace_encryption_algorithm (string)
  This parameter specifies the encryption algorithm for tablespaces that will be created. Valid values are "AES128", "AES256", and "none". If you specify "none", encryption is not performed. The default value is "none". To perform encryption, it is recommended that you specify "AES256". Only superusers can change this setting.

- backup_destination (string)
  This parameter specifies the absolute path of the directory where pgx_dmpall will store the backup data. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

  Place this directory on a different disk from the data directory to be backed up and the tablespace directory. Ensure that users do not store arbitrary files in this directory, because the contents of this directory are managed by the database system.

- search_path (string)
  When using the SUBSTR function compatible with Oracle databases, set "oracle" and "pg_catalog" in the search_path parameter. You must specify "oracle" before "pg_catalog".

Example

```sql
search_path = '"$user", public, oracle, pg_catalog'
```
- The search_path feature specifies the priority of the schema search path. The SUBSTR function in Oracle database is defined in the oracle schema.

- Refer to "Statement Behavior" under "Server Administration" in the PostgreSQL Documentation for information on search_path.

- track_waits (string)
  This parameter enables collection of statistics for pgx_stat_lwlock and pgx_stat_latch.
  - on: Enables collection of statistics.
  - off: Disables collection of statistics.
  If this parameter is omitted, "on" is assumed.
  Only superusers can change this setting.

- track_sql (string)
  This parameter enables collection of statistics for pgx_stat_sql.
  - on: Enables collection of statistics.
  - off: Disables collection of statistics.
  If this parameter is omitted, "on" is assumed.
  Only superusers can change this setting.

Parameters for the in-memory feature

- reserve_buffer_ratio (numerical value)
  This parameter specifies the proportion of shared memory to be used for a stable buffer table.
  - Minimum value: 0
  - Maximum value: 80
  If this parameter is omitted, 0 will be used.

- vci.cost_threshold (numerical value)
  This parameter specifies the lowest cost that selects an execution plan that uses a VCI. If the cost of the best execution plan that does not use a VCI is lower than this value, that execution plan will be selected.
  - Minimum value: 0
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  If this parameter is omitted or a value outside this range is specified, 18000 will be used.

- vci.control_max_workers (numerical value)
  This parameter specifies the number of background workers that manage VCI. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.
  - Minimum value: 1
  - Maximum value: 8388607
  If this parameter is omitted or a value outside this range is specified, 8 will be used.

- vci.enable (string)
  This parameter enables or disables VCI.
  - on: Enables VCI.
  - off: Disables VCI.
If this parameter is omitted, "on" will be used.

- vci.log_query (string)
  This parameter enables or disables log output when VCI is not used due to insufficient memory specified by vci.max_local_ros.
  - on: Enables log output.
  - off: Disables log output.
  If this parameter is omitted, "off" will be used.

- vci.maintenance_work_mem (numerical value)
  This parameter specifies the maximum memory size used for maintenance of VCI (when executing CREATE INDEX, for example).
  - Minimum value: 1 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  If this parameter is omitted or a value outside this range is specified, 256 MB will be used.

- vci.max_local_ros (numerical value)
  This parameter specifies the maximum memory size used for VCI scan.
  - Minimum value: 64 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  If this parameter is omitted or a value outside this range is specified, 64 MB will be used.

- vci.max_parallel_degree (numerical value)
  This parameter specifies the maximum number of background workers used for parallel scan. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.
  A value from -8388607 to 8388607 can be specified.
  - Integer (1 or greater): Parallel scan is performed using the specified degree of parallelism.
  - 0: Stops the parallel scan process.
  - Negative number: The specified value minus the maximum number of CPUs obtained from the environment is used as the degree of parallelism and parallel scan is performed.
  If this parameter is omitted or a value outside this range is specified, 0 will be used.

- vci.shared_work_mem (numerical value)
  This parameter specifies the maximum memory size used for VCI parallel scan.
  - Minimum value: 32 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  If this parameter is omitted or a value outside this range is specified, 1 GB will be used.

Parameters for the Global Meta Cache feature

- pgx_global_metacache (numerical value)
  Specifies the memory size of the GMC area.
  Specify a value calculated by the formula below.
  A value lower than the calculated value will still work, but the meta cache may not be able to fit into the GMC area.
  In this case, the system will discard the meta cache it thinks it is no longer needed, but if it is needed again, the meta cache will need to be expanded and will not perform well.
  If the value is less than 10 MB and is set to a nonzero value that disables the feature, the database startup fails because the Global Meta Cache feature cannot operate.
A setting of 0 disables the Global Meta Cache feature. The default is 0.
Changing this setting requires restarting the database.

Size of GMC area

\[
\text{Size of GMC area} = \max(10\text{MB}, (\text{All user table } \times 0.4 \text{ KB} + \text{All user Indexes } \times 0.3 \text{ KB} + \text{All user columns } \times 0.8 \text{ KB}) \times 1.5 (*1))
\]

*1) Safety Factor (1.5)
This value takes into account the case where both GMC before and after the change temporarily exist at the same time in shared memory when the table definition is changed or the row of the system catalog is changed.

- track_gmc (string)
This parameter enables collection of statistics for pgx_stat_gmc.
- on: Enables collection of statistics.
- off: Disables collection of statistics.
If this parameter is omitted, "on" is used.
Only superusers can change this setting.

Parameters for the Local Meta Cache Limit feature

- pgx_catalog_cache_max_size (numerical value)
  Specifies the maximum amount of memory that the backend process should use as the catalog cache.
  You can enable catalog cache deletion by setting it to 8 KB or more.
  A setting of 0 disables the catalog cache removal. The default is 0.
If no units are specified, they are treated as KB.
  - Minimum value: 8KB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
When calculating the parameter settings, the factors that determine the cache size are calculated as the number of tables, the number of indexes, and the number of columns. What is kept as a catalog cache or relation cache also includes objects such as databases, roles, or procedures, but these are small compared to the above factors and do not need to be factored into them. It also includes a calculation method for pgx_relacion_cache_max_size because the given memory is distributed between the catalog cache and the relation cache.

Note
The calculation method here assumes that all backends have similar access and that the transaction also has access to a similar number of resources. If you have a small number of singular backends or transactions, consider excluding them as errors.

1. Determine how much memory a backend process can use. Decide by subtracting the memory size required by the entire system such as the database cache from the installed memory and dividing the rest by the number of connections.
2. For best performance, use the following formula to calculate the total memory size of the catalog cache when the backend holds the catalog cache for all resources accessed during its lifetime.
   The amount of memory varies depending on whether Global Meta Cache is enabled or disabled. Enabling Global Meta Cache reduces the amount of memory required because most of the cache is located on shared memory.

   When Global Meta Cache is enabled:
   \[
   \left(\text{Number of tables to access} + \text{Number of indexes to access} + \text{Number of columns to access}\right) \times 0.1\text{KB} \times 1.5 (*1)
   \]
   When Global Meta Cache is disabled:
   \[
   \left(\text{Number of tables to access}\right) \times 0.5\text{KB}(\text{pg_class tuple size})
   \]
+ Number of indexes to access × 0.5KB (pg_index tuple size)
+ Number of columns to access × 1.0KB (pg_statistic tuple size)) × 1.5 (*1)

*1) Safety Factor (1.5)
The system catalog contains columns with variable-length types. For example, the tuple size in pg_class is a constant value multiplied by the number of tables, while rename in pg_class is variable length data.
It is not practical to calculate every definition in detail, so we added 50% to the above formula.

3. In the same way as in 2., calculate the relation cache using the following formula.

\[(1.4KB \times \text{Number of tables to access} + 2.4KB \times \text{Number of indexes to access}) \times 1.5 \times *1\]

*1) Safety Factor (1.5)
The relation cache is structured to facilitate the use of table and index definitions, holds pointers to various objects, and is sized to include them. It is variable length because the type of object allocated by the table definition and its size change. Since it is not realistic to calculate for all definitions, 50% is added.

4. If the value of 1. ≥ the value of 2. + the value of 3., the backend process can keep all caches to the extent allowed, so there is no need to limit the caches. If you want to cap for safety, set the value of 2. to pgx_catalog_cache_max_size and the value of 3. to pgx_relation_cache_max_size.

5. If the value of 1. < the value of 2. + the value of 3. then you need to limit the cache. However, this parameter does not limit the size of the cache used by a transaction. Therefore, take the following steps.

6. Calculate the catalog cache used by a transaction using the formula in 2.

7. Calculate the relation cache used by a transaction using the formula in 3.

8. If the value of 1. < the value of 6. + the value of 7., then the value of 1. needs to be increased. In other words, in some cases, it may be necessary to increase the installed memory or reduce the number of connections.

9. If the value of 1. ≥ the value of 6. + the value of 7., the condition of 1. can be satisfied by limiting the cache with this parameter. Divide the value of 1. by the ratio of 2. and 3. and set it as a parameter. Set the value distributed to 2. to pgx_catalog_cache_max_size and the value distributed to 3. to pgx_relation_cache_max_size.

10. The value calculated in 9. is a provisional value. If you cannot meet your target performance, first try to shift the focus of allocation to the relation cache. This is because when executing SQL, the relation cache generated based on the catalog cache is mainly referenced, so it is advantageous to leave a large amount of relation cache. If the performance is still not satisfied, adjust the parameters by referring to "13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature".

Note

Be careful when partitioning the table.
The cached definition changes depending on whether the parent table is specified in the SQL statement or the child table is specified. In particular, note that if you specify a parent table, the definitions of all child tables are cached. This is because when you specify a parent table in an SQL statement, you need to know the definitions of all the child tables in order to determine which child table will contain the desired data. Note that the column information of the parent table is not cached.

When specifying the parent table:

Number of tables to access = Number of parent tables to access + Number of defined child tables
Number of columns = Number of defined columns x number of defined child tables

When specifying the child table directly:

Number of tables to access = Number of child tables actually accessed
Number of columns = Number of defined columns x number of child tables actually accessed

Example)
Suppose the parent table $T$ (1 index, 3 columns) is split from child tables $T_1$ to $T_5$ (1 index, 3 columns, respectively). If the parent table $T$ is specified in SQL, when the child tables that contain the data to be queried are limited to $T_1$ and $T_2$, and when accessing the data using the indexes defined by $T_1$ and $T_2$, calculate as follows.

$$
\begin{align*}
\text{Number of tables} &= 1 (\text{parent table}) + 5 (\text{child table}) = 6 \\
\text{Number of indexes} &= 2 (\text{index to access}) \\
\text{Number of columns} &= 3 (\text{number of columns}) \times 5 (\text{child table}) = 15
\end{align*}
$$

If you specify child tables $T_1$ and $T_2$ in SQL and use the indexes defined on $T_1$ and $T_2$ when accessing data, the calculation is as follows.

$$
\begin{align*}
\text{Number of tables} &= 2 (\text{child table}) \\
\text{Number of indexes} &= 2 (\text{index to access}) \\
\text{Number of columns} &= 3 (\text{number of columns}) \times 2 (\text{child table}) = 6
\end{align*}
$$

---

- `pgx_relation_cache_max_size` (numerical value)
  - Specifies the maximum amount of memory that the backend process should use as the relation cache.
  - You can enable catalog cache deletion by setting it to 8 KB or more.
  - A setting of 0 disables the relation cache removal. The default is 0.
  - If no units are specified, they are treated as KB.
    - Minimum value: 8KB
    - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  - For the calculation method for parameter setting, refer to the calculation method of `pgx_catalog_cache_max_size`.

- `pgx_cache_hit_log_interval` (numerical value)
  - Specifies the time interval to output a message indicating the cache reference status for each backend process.
  - When the transaction ends, if the time set in this parameter has elapsed since the previous message was output, the message is output.
  - If set to 0, a message will be output each time the transaction ends.
  - Setting -1 disables the output. The default value is 10min.
  - If no units are specified, they are treated as ms.
  - Even if `pgx_catalog_cache_max_size` and `pgx_relation_cache_max_size` are disabled, the message output of the corresponding cache will be invalid.
  - Immediately after connecting to the server, a small transaction occurs before the request from the user application, such as for user authentication. Since it is meaningless to know the hit rate for these, a message will be output at the end of the transaction that started after the time set in this parameter has elapsed after connecting to the server.
  - For the same reason, setting a small value such as 0 may result in a message being printed at the end of such a small transaction.
  - You can check which transaction the message corresponds to from the information output at the beginning.
  - This information depends on the setting of the parameter `log_line_prefix`.
    - Minimum value: 0
    - Maximum value: 2147483647ms

See

Refer to “Server Configuration” under “Server Administration” in the PostgreSQL Documentation for information on other `postgresql.conf` parameters.
Appendix B  System Administration Functions

This appendix describes the system administration functions of FUJITSU Enterprise Postgres.

See

Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on other system administration functions.

B.1  WAL Mirroring Control Functions

The following table lists the functions that can be used for backup and recovery based on WAL mirroring.

Table B.1  WAL mirroring control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_pause_wal_multiplexing()</td>
<td>void</td>
<td>Stops WAL multiplexing</td>
</tr>
<tr>
<td>pgx_resume_wal_multiplexing()</td>
<td>void</td>
<td>Resumes WAL multiplexing</td>
</tr>
<tr>
<td>pgx_is_wal_multiplexing_paused()</td>
<td>boolean</td>
<td>Returns true if WAL multiplexing has stopped</td>
</tr>
</tbody>
</table>

If WAL multiplexing has not been configured, these functions return an error. Setting the backup_destination parameter in postgresql.conf configures WAL multiplexing.

Only superusers can execute these functions.

B.2  Transparent Data Encryption Control Functions

The following table lists the functions that can be used for transparent data encryption.

Table B.2  Transparent data encryption control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_open_keystore(passphrase)</td>
<td>void</td>
<td>Opens the keystore</td>
</tr>
<tr>
<td>pgx_set_master_key(passphrase)</td>
<td>void</td>
<td>Sets the master encryption key</td>
</tr>
<tr>
<td>pgx_set_keystore_passphrase(oldPassphrase, newPassphrase)</td>
<td>void</td>
<td>Changes the keystore passphrase</td>
</tr>
</tbody>
</table>

The pgx_open_keystore function uses the specified passphrase to open the keystore. When the keystore is opened, the master encryption key is loaded into the database server memory. In this way, you can access the encrypted data and create encrypted tablespaces. If the keystore is already open, this function returns an error.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block.

The pgx_set_master_key function generates a master encryption key and stores it in the keystore. If the keystore does not exist, this function creates a keystore. If the keystore already exists, this function modifies the master encryption key. If the keystore has not been opened, this function opens it.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.
The `pgx_set_keystore_passphrase` function changes the keystore passphrase. Specify the current passphrase in `oldPassphrase`, and a new passphrase in `newPassphrase`.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.

### B.3 Data Masking Control Functions

The table below lists the functions that can be used for data masking.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pgx_alter_confidential_policy</code></td>
<td>boolean</td>
<td>Changes masking policies</td>
</tr>
<tr>
<td><code>pgx_create_confidential_policy</code></td>
<td>boolean</td>
<td>Creates masking policies</td>
</tr>
<tr>
<td><code>pgx_drop_confidential_policy</code></td>
<td>boolean</td>
<td>Deletes masking policies</td>
</tr>
<tr>
<td><code>pgx_enable_confidential_policy</code></td>
<td>boolean</td>
<td>Enables or disables masking policies</td>
</tr>
<tr>
<td><code>pgx_update_confidential_values</code></td>
<td>boolean</td>
<td>Changes replacement characters when full masking is specified for masking type</td>
</tr>
</tbody>
</table>

#### B.3.1 `pgx_alter_confidential_policy`

**Description**

Changes masking policies

**Format**

The format varies depending on the content to be changed. The format is shown below.

- **Common format**

  ```
  common_arg:
  [schema_name := 'schemaName',]
  table_name := 'tableName',
  policy_name := 'policyName'
  ```

- **Add a masking target to a masking policy**

  ```
  pgx_alter_confidential_policy(
    commonArg,
    [action := 'ADD_COLUMN', ]
    column_name := 'colName'
    [, function_type := 'FULL'] |
    [, function_type := 'PARTIAL', partialOpt] |
    [, function_type := 'REGEXP', regexpOpt]
  )
  ```

  `partialOpt:`
  `function_parameters := 'maskingFmt'`

  `regexpOpt:
  regexp_pattern := 'regexpPattern',
  regexp_replacement := 'regexpReplacementChar',
  [, regexp_flags := 'regexpFlags']`
- Delete a masking target from a masking policy

```plaintext
gpx_alter_confidential_policy(
    commonArg,
    action := 'DROP_COLUMN',
    column_name := 'colName'
)
```

- Change the masking condition

```plaintext
gpx_alter_confidential_policy(
    commonArg,
    action := 'MODIFY_EXPRESSION',
    expression := 'expr'
)
```

- Change the content of a masking policy set for a masking target

```plaintext
gpx_alter_confidential_policy(
    commonArg,
    action := 'MODIFY_COLUMN',
    column_name := 'colName'
    [, function_type := 'FULL'] |
    [, function_type := 'PARTIAL', partialOpt] |
    [, function_type := 'REGEXP', regexpOpt] |
)

partialOpt:
    function_parameters := 'maskingFmt'

regexpOpt:
    regexp_pattern := 'regexpPattern',
    regexp_replacement := 'regexpReplacementChar',
    [, regexp_flags := 'regexpFlags']
```

- Change the masking policy description

```plaintext
gpx_alter_confidential_policy(
    commonArg,
    action := 'SET_POLICY_DESCRIPTION',
    policy_description := 'policyDesc'
)
```

- Change the masking target description

```plaintext
gpx_alter_confidential_policy(
    commonArg,
    action := 'SET_COLUMN_DESCRIPTION',
    column_name := 'colName',
    column_description := 'colDesc'
)
```

**Argument**

The argument varies depending on the content to be changed. Details are as follows.

- Common arguments
## Masking Type for Which an Argument Can Be Specified

| Argument         | Data type   | Description                                                         | Default value |
|------------------|-------------|                                                                    |               |
| schema_name      | varchar(63) | Schema name of table for which a masking policy is applied          | 'public'      |
| table_name       | varchar(63) | Name of table for which a masking policy is applied                 | Mandatory     |
| policy_name      | varchar(63) | Masking policy name                                                 | Mandatory     |

- Add a masking target to a masking policy

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>varchar(63)</td>
<td>'ADD_COLUMN'</td>
<td>'ADD_COLUMN'</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
</tr>
<tr>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Partial masking

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>

<td>Replacement character/string for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
<td>NULL</td>
</tr>
</tbody>
</table>

- Delete a masking target from a masking policy

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>varchar(63)</td>
<td>'DROP_COLUMN'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Change the masking condition

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>varchar(63)</td>
<td>'MODIFY_EXPRESSION'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition to be changed</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Change the content of a masking policy set for a masking target
<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>

<td>-</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified.

**Return value**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

**Execution example 1**

Adding masking policy p1 to masking target c2

```
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```

**Execution example 2**

Deleting masking target c1 from masking policy p1

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'DROP_COLUMN', column_name := 'c1');
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```
Execution example 3
Changing the masking condition for masking policy p1

```sql
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'MODIFY_EXPRESSION', expression := 'false');
pgx_alter_confidential_policy
--------------------------------
| t |
| 1 row |
```

Execution example 4
Changing the content of masking policy p1 set for masking target c2

```sql
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'MODIFY_COLUMN', column_name := 'c2', function_type := 'FULL');
pgx_alter_confidential_policy
--------------------------------
| t |
| 1 row |
```

Execution example 5
Changing the description of masking policy p1

```sql
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'SET_POLICY_DESCRIPTION', policy_description := 'this policy is an example.');
pgx_alter_confidential_policy
--------------------------------
| t |
| 1 row |
```

Execution example 6
Changing the description of masking target c2

```sql
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'SET_COLUMN_DESCRIPTION', column_name := 'c2', column_description := 'c2 column is FULL.');
pgx_alter_confidential_policy
--------------------------------
| t |
| 1 row |
```

Description

- The arguments for the `pgx_alter_confidential_policy` system management function can be specified in any order.
- The action parameters below can be specified. When action parameters are omitted, ADD_COLUMN is applied.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COLUMN</td>
<td>Adds a masking target to a masking policy.</td>
</tr>
<tr>
<td>DROP_COLUMN</td>
<td>Deletes a masking target to a masking policy.</td>
</tr>
<tr>
<td>MODIFY_EXPRESSION</td>
<td>Changes expression.</td>
</tr>
<tr>
<td>MODIFY_COLUMN</td>
<td>Changes the content of a masking policy set for a masking target.</td>
</tr>
<tr>
<td>SET_POLICY_DESCRIPTION</td>
<td>Changes policy_description.</td>
</tr>
<tr>
<td>SET_COLUMN_DESCRIPTION</td>
<td>Changes column_description.</td>
</tr>
</tbody>
</table>

- The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.

- 138 -
The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.

- regexp_pattern
- regexp_replacement
- regexp_flags

See

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

B.3.2  pgx_create_confidential_policy

Description
Creates masking policies

Format
The format varies depending on the masking type. The format is shown below.

```
pgx_create_confidential_policy(
    [schema_name := 'schemaName',]
    table_name := 'tableName',
    policy_name := 'policyName',
    expression := 'expr'
    [, enable := 'policyStatus']
    [, policy_description := 'policyDesc']
    [, column_name := 'colName'
        [, function_type := 'FULL']
        | [, function_type := 'PARTIAL', partialOpt]
        | [, function_type := 'REGEXP', regexpOpt]
        [, column_description := 'colDesc']
    ]
)
```

partialOpt:
function_parameters := 'maskingFmt'

regexpOpt:
regexp_pattern := 'regexpPattern',
regexp_replacement := 'regexpReplacementChar',
[, regexp_flags := 'regexpFlags']

Argument
Details are as follows.

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>

<tr>
<td>regexp_pattern</td>
<td>-</td>
<td>-</td>
<td>N</td>
</tr>
<tr>
<td>regexpreplacement</td>
<td>-</td>
<td>-</td>
<td>N</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>-</td>
<td>-</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified
Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example 1

Creating masking policy p1 that does not contain a masking target

```sql
postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
expression := '1=1');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Execution example 2

Creating masking policy p1 that contains masking target c1 of which the masking type is full masking

```sql
postgres=# select pgx_create_confidential_policy(schema_name := 'public', table_name := 't1',
policy_name := 'p1', expression := '1=1', enable := 't', policy_description := 'this policy is an
example.', column_name := 'c1', function_type := 'FULL', column_description := 'c1 column is FULL.);
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Execution example 3

Creating masking policy p1 that contains masking target c2 of which the masking type is partial masking

```sql
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
'VVVVFFVVVV, VVV-VVVV-VVVV, *, 4, 11');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Execution example 4

Creating masking policy p1 that contains masking target c3 of which the masking type is regular expression masking

```sql
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c3', function_type := 'REGEXP', regexp_pattern := '(.*)(@.*)',
regexp_replacement := 'xxx\2', regexp_flags := 'g');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Description

- The arguments for the `pgx_create_confidential_policy` system management function can be specified in any order.
- If `column_name` is omitted, only masking policies that do not contain masking target will be created.
- One masking policy can be created for each table. Use the `pgx_alter_confidential_policy` system management function to add a masking target to a masking policy.
- The `function_parameters` argument is enabled when the `function_type` is `PARTIAL`. If the `function_type` is other than `PARTIAL`, it will be ignored.

- The arguments below are enabled when the `function_type` is `REGEXP`. If the `function_type` is other than `REGEXP`, these arguments will be ignored.
  - `regexp_pattern`
  - `regexp_replacement`
  - `regexp_flags`

**Note**

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

---

**See**

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for `regexp_pattern`, `regexp_replacement`, and `regexp_flags`.

---

### B.3.3 `pgx_drop_confidential_policy`

**Description**

Deletes masking policies

**Format**

```ruby
pgx_drop_confidential_policy(
  [schema_name := 'schemaName', ],
  table_name := 'tableName',
  policy_name := 'policyName'
)
```

**Argument**

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is deleted</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is deleted</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted
Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Deleting masking policy p1

```
postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
pgx_drop_confidential_policy
-------------------------------
t
(1 row)
```

Description

The arguments for the pgx_drop_confidential_policy system management function can be specified in any order.

**Note**

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

**See**

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

### B.3.4 pgx_enable_confidential_policy

**Description**

Enables or disables masking policies

**Format**

```
pgx_enable_confidential_policy{
  [schema_name := 'schemaName', ]
  table_name := 'tableName',
  policy_name := 'policyName',
  enable := 'policyStatus'
}
```

**Argument**

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is enabled or disabled</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is enabled or disabled</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- 't': Enabled
Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
<tr>
<td>enable</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted

**Return value**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

**Execution example**

Enabling masking policy p1

```
postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');
pgx_enable_confidential_policy
-----------------  
t
(1 row)
```

**Description**

The arguments for the `pgx_enable_confidential_policy` system management function can be specified in any order.

**See**

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

**B.3.5 pgx_update_confidential_values**

**Description**

Changes replacement characters when full masking is specified for masking type

**Format**

```
pgx_update_confidential_values{
[ number_value := 'numberValue'
[, char_value := 'charValue']
[, varchar_value := 'varcharValue']
[, date_value := 'dateValue']
[, ts_value := 'tsValue']
}
```
Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Replacement character in numeric type</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>Replacement character in char type</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>Replacement character in varchar type</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>Replacement character in date type</td>
</tr>
<tr>
<td>ts_value</td>
<td>timestamp</td>
<td>Replacement character in timestamp type</td>
</tr>
</tbody>
</table>

Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Using '*' as a replacement character in char type and varchar type

```
postgres=# select pgx_update_confidential_values(char_value := '*', varchar_value := '*');
pgx_update_confidential_values
-------------------------------
t
(1 row)
```

Description

- The arguments for the `pgx_update_confidential_values` system management function can be specified in any order.
- Specify one or more arguments for the `pgx_update_confidential_values` system management function. A replacement character is not changed for an omitted argument.

See

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.4 VCI Data Load Control Function

The table below lists the function that loads VCI data to buffer cache.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_prewarm_vci(vci_index regclass)</td>
<td>int8</td>
<td>Loads the VCI data to buffer cache.</td>
</tr>
</tbody>
</table>

`pgx_prewarm_vci` loads the specified VCI data to buffer cache and returns the number of blocks of the loaded VCI data.

The aggregation process using VCI may take time immediately after an instance is started, because the VCI data has not been loaded to buffer cache. Therefore, the first aggregation process can be sped up by executing `pgx_prewarm_vci` after an instance is started.

The amount of memory required for preloading is the number of blocks returned by `pgx_prewarm_vci` multiplied by the size of one block.

This function can only be executed if the user has reference privilege to the VCI index and execution privilege to the `pg_prewarm` function.
B.5 High-Speed Data Load Control Functions

The table below lists the functions that can be used for high-speed data load.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_loader</td>
<td>bigint</td>
<td>Creates dynamic shared memory, starts parallel workers and loads data</td>
</tr>
<tr>
<td>pgx_loader_recovery</td>
<td>smallint</td>
<td>Resolves in-doubt transactions</td>
</tr>
</tbody>
</table>

The pgx_loader command executes the above functions internally.
Appendix C  System Views

This appendix describes how to use the system views in FUJITSU Enterprise Postgres.

See

Refer to “System Views” under “Internals” in the PostgreSQL Documentation for information on other system views.

C.1  pgx_tablespaces

The pgx_tablespaces catalog provides information related to the encryption of tablespaces.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>References</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spctablespace</td>
<td>oid</td>
<td>pg_tablespace.oid</td>
<td>Tablespace OID</td>
</tr>
<tr>
<td>spcencalgo</td>
<td>text</td>
<td></td>
<td>Tablespace encryption algorithm</td>
</tr>
</tbody>
</table>

The spcencalgo string displays one of the following values:
- none: Tablespace is not encrypted
- AES128: AES with key length of 128 bits
- AES256: AES with key length of 256 bits

C.2  pgx_stat_lwlock

The pgx_stat_lwlock view displays statistics related to lightweight locks, with each type of content displayed on a separate line.

Table C.1 pgx_stat_lwlock view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lwlock_name</td>
<td>name</td>
<td>Name of the lightweight lock</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused by the lightweight lock</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the lightweight lock</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistics was reset</td>
</tr>
</tbody>
</table>

C.3  pgx_stat_latch

The pgx_stat_latch view displays statistics related to latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line.

Table C.2 pgx_stat_latch view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>latch_name</td>
<td>name</td>
<td>Name of the latch</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused a wait</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the latch</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.4  pgx_stat_walwriter

The pgx_stat_walwriter view displays statistics related to WAL writing, in a single line.
Table C.3 pgx_stat_walwriter view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirty_writes</td>
<td>bigint</td>
<td>Number of times old WAL buffers were written to the disk because the WAL buffer was full when WAL records were added</td>
</tr>
<tr>
<td>writes</td>
<td>bigint</td>
<td>Number of WAL writes</td>
</tr>
<tr>
<td>write_blocks</td>
<td>bigint</td>
<td>Number of WAL write blocks</td>
</tr>
<tr>
<td>total_write_time</td>
<td>double precision</td>
<td>Number of milliseconds spent on WAL writing</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.5 pgx_stat_sql

The pgx_stat_sql view displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line.

Table C.4 pgx_stat_sql view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>selects</td>
<td>bigint</td>
<td>Number of SELECT statements executed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In database multiplexing mode, this number includes the SELECT statements executed in Mirroring Controller. Mirroring Controller executes the SELECT statement using the interval specified for the heartbeat_interval of the server definition file (milliseconds).</td>
</tr>
<tr>
<td>inserts</td>
<td>bigint</td>
<td>Number of INSERT statements executed</td>
</tr>
<tr>
<td>deletes</td>
<td>bigint</td>
<td>Number of DELETE statements executed</td>
</tr>
<tr>
<td>updates</td>
<td>bigint</td>
<td>Number of UPDATE statements executed</td>
</tr>
<tr>
<td>selects_with_parallelism</td>
<td>bigint</td>
<td>Number of times parallel scan was used in SELECT statements</td>
</tr>
<tr>
<td>inserts_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>deletes_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>updates_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>copies_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>declares</td>
<td>bigint</td>
<td>Number of DECLARE statements executed (number of cursor OPENs)</td>
</tr>
<tr>
<td>fetches</td>
<td>bigint</td>
<td>Number of FETCH statements executed</td>
</tr>
<tr>
<td>checkpoints</td>
<td>bigint</td>
<td>Number of CHECKPOINT statements executed</td>
</tr>
<tr>
<td>clusters</td>
<td>bigint</td>
<td>Number of CLUSTER statements executed</td>
</tr>
<tr>
<td>copies</td>
<td>bigint</td>
<td>Number of COPY statements executed</td>
</tr>
<tr>
<td>reindexes</td>
<td>bigint</td>
<td>Number of REINDEX statements executed</td>
</tr>
<tr>
<td>truncates</td>
<td>bigint</td>
<td>Number of TRUNCATE statements executed</td>
</tr>
<tr>
<td>locks</td>
<td>bigint</td>
<td>Number of times a lock occurred</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.6 pgx_stat_gmc

The pgx_stat_gmc view provides information about the GMC areas.
<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>searches</td>
<td>bigint</td>
<td>Number of times the cache table is searched.</td>
</tr>
<tr>
<td>hits</td>
<td>bigint</td>
<td>Number of times the cache table is hit.</td>
</tr>
<tr>
<td>size</td>
<td>bigint</td>
<td>The current amount of memory (bytes) used in the GMC area.</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time these statistics were reset.</td>
</tr>
</tbody>
</table>
Appendix D Tables Used by Data Masking

This appendix explains tables used by the data masking feature.

Note

These tables are updated by the data masking control function, so do not use SQL statements to directly update these tables.

D.1 pgx_confidential_columns

This table provides information on masking target for which masking policies are set.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ’FULL’: Full masking</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ’PARTIAL’: Partial masking</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ’REGEXP’: Regular expression masking</td>
</tr>
<tr>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
</tr>
<tr>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
</tr>
<tr>
<td>column_description</td>
<td>varchar(1024)</td>
<td>Masking target description</td>
</tr>
</tbody>
</table>

Execution example

```sql
postgres=# select * from pgx_confidential_columns;
<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>column_name</th>
<th>function_type</th>
<th>function_parameters</th>
<th>regexp_pattern</th>
<th>regexp_replacement</th>
<th>regexp_flags</th>
<th>column_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>c1</td>
<td>FULL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>c2</td>
<td>PARTIAL</td>
<td>VVVVVVVVVVVVV, VVVVVVVVVVVVV</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
(2 rows)
```

D.2 pgx_confidential_policies

This table provides information on masking policies.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
</tbody>
</table>
### D.3  pgx_confidential_values

This table provides information on replacement characters when full masking is specified for masking type.

<table>
<thead>
<tr>
<th>Column</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Numeric</td>
<td>0</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>char type</td>
<td>Spaces</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>varchar type</td>
<td>Spaces</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>date type</td>
<td>'1970-01-01'</td>
</tr>
<tr>
<td>timestamp_value</td>
<td>timestamp</td>
<td>timestamp type</td>
<td>'1970-01-01 00:00:00'</td>
</tr>
</tbody>
</table>

**Execution example**

```
postgres=# select * from pgx_confidential_values;
number_value | char_value | varchar_value | date_value | ts_value
--------------|------------|---------------|------------|---------------------
0 | | | 1970-01-01 | 1970-01-01 00:00:00
(1 row)
```
Appendix E  Tables Used by High-Speed Data Load

This appendix describes the tables used by high-speed data load.

E.1  pgx_loader_state

The pgx_loader_state table provides information about transactions prepared by high-speed data load.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>serial</td>
<td>Unique identifier. This value is assigned from the pgx_loader_state_id_seq sequence.</td>
</tr>
<tr>
<td>gid</td>
<td>text</td>
<td>Global transaction identifier assigned to a transaction.</td>
</tr>
<tr>
<td>state</td>
<td>text</td>
<td>State of the transaction. The value can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- commit: The prepared transaction has been committed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- rollback: The prepared transaction is in in-doubt state.</td>
</tr>
<tr>
<td>master_pid</td>
<td>integer</td>
<td>Process ID of the backend process (master process) that executed the pgx_loader control function.</td>
</tr>
<tr>
<td>role_oid</td>
<td>integer</td>
<td>Role identifier (OID). A prepared transaction can only be completed by the same user who executed the original transaction or by a superuser.</td>
</tr>
<tr>
<td>relation_oid</td>
<td>integer</td>
<td>Object identifier (OID).</td>
</tr>
</tbody>
</table>

Note

The pgx_loader_state table and pgx_loader_state_id_seq sequence are updated by high-speed data load. Do not update these database objects directly using SQL.
Appendix F  Starting and Stopping the Web Server Feature of WebAdmin

To use WebAdmin for creating and managing a FUJITSU Enterprise Postgres instance on a server where FUJITSU Enterprise Postgres is installed, you must first start the Web server feature of WebAdmin.

- Using WebAdmin in a single-server configuration
  You must start the Web server on the server on which FUJITSU Enterprise Postgres and WebAdmin are installed.

- Using WebAdmin in a multiserver configuration
  You must start the Web server on all servers on which WebAdmin has been installed.

This appendix describes how to start and stop the Web server feature of WebAdmin.

Note that "<x>" in paths indicates the product version.

See

Refer to "Installing WebAdmin in a Multiserver Configuration" in the Installation and Setup Guide for Server for information on multiserver installation.

F.1 Starting the Web Server Feature of WebAdmin

Follow the procedure below to start the Web server feature of WebAdmin.

1. Change to superuser
   Acquire superuser privileges on the system.
   
   Example
   
   ```
   $ su -
   Password:******
   ```

2. Start the Web server feature of WebAdmin
   Execute the WebAdminStart command to start the Web server feature of WebAdmin.
   
   Example
   
   ```
   # cd /opt/fsepv<x>webadmin/sbin
   # ./WebAdminStart
   ```

F.2 Stopping the Web Server Feature of WebAdmin

This section describes how to stop the Web server feature of WebAdmin.

Follow the procedure below to stop the Web server feature of WebAdmin.

1. Change to superuser
   Acquire superuser privileges on the system.
   
   Example
   
   ```
   $ su -
   Password:******
   ```

2. Stop the Web server feature of WebAdmin
   Execute the WebAdminStop command to stop the Web server feature of WebAdmin.
Example

If WebAdmin is installed in /opt/fsepv<name>webadmin:

```bash
# cd /opt/fsepv<name>webadmin/sbin
# ./WebAdminStop
```
This appendix describes how to use the Wallet feature of WebAdmin.

When a remote instance or a standby instance is created, it is necessary to provide user name and password for authentication with the remote machine or the database instance.

The Wallet feature in WebAdmin is a convenient way to create and store these credentials.

Once created, these credentials can be repeatedly used in one or more instances.

**Note**

It is not mandatory to create a credential in the Wallet. It is possible to create a remote instance or a standby instance without creating any credential in the Wallet.

If no credential is created beforehand, a user name and password can be entered in the instance creation page. When creating a “Remote” instance, if operating system credentials are entered without using a credential stored in the Wallet, WebAdmin automatically creates a credential with the given user name and password, and stores it in the user’s wallet for future use.

### G.1 Creating a Credential

1. In the [My Wallet] tab, click ![new credential](image). The [New credential] page will be displayed.
2. Enter the information for the credentials.

![New credential](image)

Enter the following items. Credential name, User name and Password should not contain hazardous characters. Refer to "Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters".

- **[Credential name]**: Name of the credential
  
  The name must meet the conditions below:
  
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters
- [User name]: The operating system user name or database instance user name that will be used later
- [Password]: Password for the user
- [Confirm password]: Reenter the password.

3. Click ✓ to store the credential.

G.2 Using a Credential

Once a credential is created in the Wallet, it can be used during remote instance creation or standby instance creation. The following page uses the credential that was created in the previous section.

When “Cred1” is selected in [Operating system credential], the user name and password are automatically populated from the credential.
Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters

WebAdmin considers the following as hazardous characters, which are not allowed in user inputs.

| (pipe sign)
& (ampersand sign)
; (semicolon sign)
$ (dollar sign)
% (percent sign)
@ (at sign)
' (single apostrophe)
" (quotation mark)
\' (backslash-escaped apostrophe)
\* (backslash-escaped quotation mark)
<> (triangular parenthesis)
() (parenthesis)
+ (plus sign)
CR (Carriage return, ASCII 0x0d)
LF (Line feed, ASCII 0x0a)
, (comma sign)
\ (backslash)
Appendix I  Copy Command Samples that Use the Advanced Copy Feature of the ETERNUS Disk Array

Backup/recovery scripts that use OPC, an advanced copy feature of the FUJITSU Storage ETERNUS disk array (hereafter referred to as ETERNUS disk array), are supplied as copy command samples for use by the pgx_dmpall and pgx_rcvall commands.

Users can copy the samples to any file and make changes appropriate to their environment or operations.

The samples are stored in the directories below:

- Basic version

```
/installDir/share/copy_command.esf_acm1.sh.sample
```

- Advanced version

```
/installDir/share/copy_command.esf_acm2.sh.sample
```

See

The samples use the replication management command of the FUJITSU Storage ETERNUS SF AdvancedCopy Manager (hereafter referred to as ACM) for operating the advanced copy features of the ETERNUS disk array. Refer to the relevant manual for details.

Prerequisite for using the samples

To use the samples, it is necessary to configure the settings of the advanced copy features of the ETERNUS disk array in advance. The samples assume that the replication source/volume has been configured, its contents have been physically copied to the replication volume, and that the tracking process has been started.

Sample content (advanced version)

The sample uses two replication volumes as the replication source on which the database cluster and tablespace are located, alternating between them for each backup. It then registers to the backup information file the replication volume (group) used for the latest backup. In addition, the backup information file is also used to determine the replication volume to restore during recovery.

The processing for each operation mode is described below:

**prepare mode**

1. The backup information file is read, and the replication volume to be used for the current backup is determined.
2. The completion status of physical copies to all replication volumes is checked using the swsrpstat command of ACM.
3. The replication volume determined in step 1 is written to a temporary file for later use by the backup mode.

**backup mode**

1. The temporary file is read, and the replication volume information is retrieved.
2. The file system buffer is written using the sync command of the operating system.
3. The file system targeted for backup is frozen using the fsfreeze command of the operating system.
4. Snapshot retrieval (implementation of a logical copy) is performed using the swsrpmake command of ACM.
5. The file system frozen in step 3 is unfrozen using the fsfreeze command of the operating system.

   Steps 3 to 5 are performed for all file systems targeted for backup.

**finalize mode**

1. The completion status of physical copies to all replication volumes is checked using the swsrpstat command of ACM.
2. Information about the replication volume used for the current backup is written to the backup information file.

**restore mode**

1. The backup information file is read, and the replication volume to be used for recovery is determined.
2. The file system targeted for recovery is unmounted using the `umount` command of the operating system.
3. Physical copy from the replication volume is performed using the `swsrpmake` command of ACM.
4. The file system targeted for recovery is mounted using the `mount` command of the operating system.
5. The completion status of physical copy from the replication volume is checked using the `swsrpstat` command of ACM.

Steps 2 to 5 are performed for all file systems targeted for recovery.
6. Files and directories not needed for archive recovery are deleted.

---

**Note**

- The samples cannot be used on SLES 12.
- The samples use the `sudo` command of the operating system so that operation of the commands and file systems of ACM is performed by the superuser of the operating system. Therefore, determine if these implementations satisfy the security standards on the database server, and if necessary, perform implementations using other means.
- The samples temporarily freeze the file system of the data storage destination (replication source volume) to protect the file system from copy processing by advanced copy features of the ETERNUS disk array. Therefore, consider the following:
  - Consider freeze time during the timeout period of an SQL statement.
    When using a feature that links with the database, such as a cluster feature that accesses the data storage destination, consider freeze time in relation to the timeout periods below.
  - When performing database multiplexing
    Misoperation may occur during abnormality monitoring, so it is necessary to consider the monitoring interval, timeout period and number of retries for abnormality monitoring, and consider temporarily stopping only the Mirroring Controller process during backup.
  - When performing failover operations using PRIMECLUSTER
    If a failure occurs while the file system is frozen, switching is triggered when PRIMECLUSTER detects an issue, but will be performed only after the system is unfrozen. In addition, if it takes time for the system to unfreeze, the active node may trigger operating system panic, resulting in a switch.
Appendix J  Collecting Failure Investigation Data

If the cause of an error that occurs while building the environment or during operations is unclear, data must be collected for initial investigation.

This appendix describes how to collect data for initial investigation.

Use FJQSS (Information Collection Tool) to collect data for initial investigation.

Refer to the FJQSS manual for information on how to use FJQSS.

Note

- When using FJQSS to collect data for initial investigation, you must set the following environment variables:
  - Environment variables required for using FUJITSU Enterprise Postgres
    Refer to "Configure the environment variables" under the procedure for creating an instance in "Using the initdb Command" in the Installation and Setup Guide for Server for information on the values to be set in the environment variables.
  - PGDATA
    Set the data storage destination.
  - PGDATABASE
    Set the database name from which you want to collect data for initial investigation.
  - PGPORT
    Set the instance port number. This does not need to be set if the default port number (27500) has not been changed.
  - PGUSER
    Set the database superuser.
    Set the database superuser so that client authentication is possible.
    FJQSS establishes a TCP/IP connection with the template1 database and collects data from the database.
  - FSEP_HOME
    Set the FUJITSU Enterprise Postgres installation directory.

- Refer to "Collecting Failure Investigation Data" in the Cluster Operation Guide (Database Multiplexing) for information on how to collect failure investigation data when performing database multiplexing.
Preface

Purpose of this document

The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Windows platform.

This document is the FUJITSU Enterprise Postgres Operation Guide.

Intended readers

This document is intended for those who install and operate FUJITSU Enterprise Postgres.

Readers of this document are assumed to have general knowledge of:

- PostgreSQL
- SQL
- Windows

Structure of this document

This document is structured as follows:

Chapter 1 Operating FUJITSU Enterprise Postgres
- Describes how to operate FUJITSU Enterprise Postgres.

Chapter 2 Starting an Instance and Creating a Database
- Describes how to start a FUJITSU Enterprise Postgres instance, and how to create a database.

Chapter 3 Backing Up the Database
- Describes how to back up the database.

Chapter 4 Configuring Secure Communication Using Secure Sockets Layer
- Describes communication data encryption between the client and the server.

Chapter 5 Protecting Storage Data Using Transparent Data Encryption
- Describes how to encrypt the data to be stored in the database.

Chapter 6 Data Masking
- Describes the data masking feature.

Chapter 7 Periodic Operations
- Describes the periodic database operations that must be performed on FUJITSU Enterprise Postgres.

Chapter 8 Streaming Replication Using WebAdmin
- Describes how to create a streaming replication cluster using WebAdmin.

Chapter 9 Installing and Operating the In-memory Feature
- Describes how to install and operate the in-memory feature.

Chapter 10 Parallel Query
- Describes the factors taken into consideration by FUJITSU Enterprise Postgres when performing parallel queries.

Chapter 11 High-Speed Data Load
- Describes how to install and operate high-speed data load.

Chapter 12 Global Meta Cache
- Describes how to use Grobal Meta Cache feature.

Chapter 13 Local Meta Cache Limit
- Describes how to use Local Meta Cache Limit feature.
Chapter 14 Backup/Recovery Using the Copy Command
Describes backup and recovery using the copy command created by the user.

Chapter 15 Actions when an Error Occurs
Describes how to perform recovery when disk failure or data corruption occurs.

Appendix A Parameters
Describes the FUJITSU Enterprise Postgres parameters.

Appendix B System Administration Functions
Describes the system administration functions of FUJITSU Enterprise Postgres.

Appendix C System Views
Describes how to use the system view in FUJITSU Enterprise Postgres.

Appendix D Tables Used by Data Masking
Describes the tables used by the data masking feature.

Appendix E Tables Used by High-Speed Data Load
Describes the tables used by high-speed data load.

Appendix F Starting and Stopping the Web Server Feature of WebAdmin
Describes how to start and stop WebAdmin (Web server feature).

Appendix G WebAdmin Wallet
Describes how to use the Wallet feature of WebAdmin.

Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters
Describes characters not allowed in WebAdmin.

Appendix I Collecting Failure Investigation Data
Describes how to collect information for initial investigation.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

### Chapter 1 Operating FUJITSU Enterprise Postgres

1.1 Operating Methods ................................................................. 1
1.2 Starting WebAdmin ................................................................. 2
  1.2.1 Logging in to WebAdmin ................................................... 3
1.3 Starting pgAdmin ................................................................. 4
  1.3.1 Starting pgAdmin ............................................................... 4
  1.3.2 Adding an Instance ......................................................... 4
  1.3.3 Connecting/Disconnecting an Instance ......................... 6
1.4 Operations Using Commands .................................................. 6
1.5 Operating Environment of FUJITSU Enterprise Postgres .......... 7
  1.5.1 Operating Environment .................................................... 7
  1.5.2 File Composition .............................................................. 9
1.6 Notes on Compatibility of Applications Used for Operations ...... 9
1.7 Notes on Upgrading Database Instances .................................. 10
  1.7.1 Additional Steps for upgrading to FUJITSU Enterprise Postgres with Vertical Clustered Index (VCI) Enabled ............. 10
1.8 Notes on Upgrading Database Instances (FUJITSU Enterprise Postgres with VCI Enabled) ......................... 10

### Chapter 2 Starting an Instance and Creating a Database

2.1 Starting and Stopping an Instance ........................................... 12
  2.1.1 Using WebAdmin ............................................................. 12
  2.1.2 Using Commands ......................................................... 14
2.2 Creating a Database ............................................................ 15
  2.2.1 Using pgAdmin .............................................................. 15
  2.2.2 Using Client Commands ............................................... 16

### Chapter 3 Backing Up the Database

3.1 Periodic Backup .................................................................. 17
3.2 Backup Methods .................................................................. 18
  3.2.1 Using WebAdmin ............................................................. 18
  3.2.2 Using Server Commands ............................................... 19

### Chapter 4 Configuring Secure Communication Using Secure Sockets Layer

4.1 Configuring Communication Data Encryption ...................... 23
  4.1.1 Issuing a Certificate ....................................................... 23
  4.1.2 Deploying a Server Certificate File and a Server Private Key File ................................................................. 24
  4.1.3 Distributing a CA Certificate File to the Client ................. 24
  4.1.4 Configuring the Operating Environment for the Database Server ......................................................... 24
  4.1.5 Configuring the Operating Environment for the Client .... 24
  4.1.6 Performing Database Multiplexing .................................. 25

### Chapter 5 Protecting Storage Data Using Transparent Data Encryption

5.1 Protecting Data Using Encryption ........................................ 26
5.2 Setting the Master Encryption Key ....................................... 27
5.3 Opening the Keystore ......................................................... 27
5.4 Encrypting a Tablespace ...................................................... 28
5.5 Checking an Encrypted Tablespace ...................................... 29
5.6 Managing the Keystore ....................................................... 30
  5.6.1 Changing the Master Encryption Key ............................ 30
  5.6.2 Changing the Keystore Passphrase ................................ 30
  5.6.3 Enabling Automatic Opening of the Keystore ............... 30
  5.6.4 Backing Up and Recovering the Keystore ...................... 31
5.7 Backing Up and Restoring/Recovering the Database ............ 33
5.8 Importing and Exporting the Database ............................... 35
5.9 Encrypting Existing Data .................................................... 35
5.10 Operations in Cluster Systems ........................................... 36
  5.10.1 HA Clusters that do not Use Database Multiplexing ....... 36
  5.10.2 Database Multiplexing Mode ........................................ 36
Chapter 6 Data Masking......................................................................................................................................................... 39
  6.1 Masking Policy.................................................................................................................................................................... 39
    6.1.1 Masking Target............................................................................................................................................................ 40
    6.1.2 Masking Type............................................................................................................................................................... 40
    6.1.3 Masking Condition...................................................................................................................................................... 40
    6.1.4 Masking Format............................................................................................................................................................ 41
  6.2 Usage Method..................................................................................................................................................................... 43
    6.2.1 Creating a Masking Policy ........................................................................................................................................... 44
    6.2.2 Changing a Masking Policy ......................................................................................................................................... 45
    6.2.3 Confirming a Masking Policy ...................................................................................................................................... 45
    6.2.4 Enabling and Disabling a Masking Policy ................................................................................................................... 46
    6.2.5 Deleting a Masking Policy .......................................................................................................................................... 47
  6.3 Data Types for Masking ..................................................................................................................................................... 47
  6.4 Security Notes.................................................................................................................................................................... 48

Chapter 7 Periodic Operations.................................................................................................................................................... 49
  7.1 Configuring and Monitoring the Log................................................................................................................................. 49
  7.2 Monitoring Disk Usage and Securing Free Space................................................................................................................. 49
    7.2.1 Monitoring Disk Usage................................................................................................................................................... 49
    7.2.2 Securing Free Disk Space............................................................................................................................................... 49
  7.3 Automatically Closing Connections........................................................................................................................................ 50
  7.4 Monitoring the Connection State of an Application............................................................................................................ 50
    7.4.1 Using the View (pg_stat_activity)... .................................................................................................................................. 51
    7.4.2 Using pgAdmin............................................................................................................................................................ 51
  7.5 Reorganizing Indexes............................................................................................................................................................. 52
  7.6 Monitoring Database Activity............................................................................................................................................... 53
    7.6.1 Information that can be Collected................................................................................................................................ 54
    7.6.2 Collection Configuration................................................................................................................................................ 55
    7.6.3 Information Reset........................................................................................................................................................ 55

Chapter 8 Streaming Replication Using WebAdmin.................................................................................................................. 57
  8.1 Creating a Standby Instance.................................................................................................................................................. 57
  8.2 Promoting a Standby Instance............................................................................................................................................... 59
  8.3 Converting an Asynchronous Replication to Synchronous................................................................................................... 59
  8.4 Converting a Synchronous Replication to Asynchronous.................................................................................................. 60
  8.5 Joining a Replication Cluster............................................................................................................................................... 60

Chapter 9 Installing and Operating the In-memory Feature........................................................................................................ 62
  9.1 Installing Vertical Clustered Index (VCI).............................................................................................................................. 62
    9.1.1 Evaluating whether to Install VCI................................................................................................................................ 62
    9.1.2 Estimating Resources.................................................................................................................................................... 63
    9.1.3 Setting up...................................................................................................................................................................... 63
      9.1.3.1 Setting Parameters.................................................................................................................................................. 63
      9.1.3.2 Installing the Extensions........................................................................................................................................ 64
    9.1.3.3 Creating a VCI........................................................................................................................................................ 65
      9.1.3.4 Confirming that the VCI has been Created............................................................................................................. 65
    9.1.4 Data that can Use VCI.................................................................................................................................................... 65
      9.1.4.1 Relation Types.................................................................................................................................................... 65
      9.1.4.2 Data Types........................................................................................................................................................ 66
  9.2 Operating VCI......................................................................................................................................................................... 68
    9.2.1 Commands that cannot be Used for VCI........................................................................................................................ 68
    9.2.2 Data Preload Feature.................................................................................................................................................... 69

Chapter 10 Parallel Query............................................................................................................................................................... 71
  10.1 CPU Load Calculation......................................................................................................................................................... 71
Chapter 11 High-Speed Data Load........................................................................................................................................ 72

11.1 Installing High-Speed Data Load............................................................................................................................. 72

11.1.1 Deciding whether to install................................................................................................................................... 72

11.1.2 Estimating Resources.............................................................................................................................................. 72

11.1.3 Setup........................................................................................................................................................................ 73

11.1.3.1 Setting Parameters............................................................................................................................................... 73

11.1.3.2 Installing the Extension....................................................................................................................................... 74

11.2 Using High-Speed Data Load...................................................................................................................................... 74

11.2.1 Loading Data........................................................................................................................................................... 74

11.2.2 Recovering from a Data Load that Ended Abnormally.......................................................................................... 75

11.3 Removing High-Speed Data Load.............................................................................................................................. 76

11.3.1 Removing the Extension........................................................................................................................................... 76

10.2 Increase of Workers during Runtime................................................................................................................................................................. 71

Chapter 12 Global Meta Cache........................................................................................................................................ 78

12.1 Usage........................................................................................................................................................................ 78

12.1.1 Deciding Whether to Enable the Global Meta Cache Feature...................................................................................... 78

12.1.2 Estimating Memory for Global Meta Cache.................................................................................................................. 78

12.1.3 How the GMC Memory Area Is Used.......................................................................................................................... 78

12.1.4 Enabling the Global Meta Cache Feature.................................................................................................................... 78

12.1.5 Estimating Resources................................................................................................................................................. 79

12.2 Statistics...................................................................................................................................................................... 79

12.2.1 System View............................................................................................................................................................... 79

Chapter 13 Local Meta Cache Limit...................................................................................................................................... 80

13.1 Usage........................................................................................................................................................................ 80

13.1.1 Deciding Whether to Enable the Local Meta Cache Limit Feature................................................................................ 80

13.1.2 How to Set Parameters for the Local Meta Cache Limit Feature............................................................................... 80

13.1.3 Cache Removal when Local Meta Cache Limit is Enabled....................................................................................... 80

13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature...................................................... 81

Chapter 14 Backup/Recovery Using the Copy Command...................................................................................................... 83

14.1 Configuration of the Copy Command.......................................................................................................................... 83

14.2 Backup Using the Copy Command................................................................................................................................... 86

14.3 Recovery Using the Copy Command.................................................................................................................................. 87

14.4 Copy Command Interface................................................................................................................................................ 88

14.4.1 Copy Command for Backup......................................................................................................................................... 88

14.4.2 Copy Command for Recovery....................................................................................................................................... 90

Chapter 15 Actions when an Error Occurs............................................................................................................................ 92

15.1 Recovering from Disk Failure (Hardware)..................................................................................................................... 93

15.1.1 Using WebAdmin.......................................................................................................................................................... 93

15.1.2 Using Server Command.............................................................................................................................................. 94

15.2 Recovering from Data Corruption................................................................................................................................. 98

15.2.1 Using WebAdmin.......................................................................................................................................................... 98

15.2.2 Using the pgx_rvcall Command................................................................................................................................... 99

15.3 Recovering from an Incorrect User Operation............................................................................................................... 100

15.3.1 Using WebAdmin.......................................................................................................................................................... 100

15.3.2 Using the pgx_rvcall Command................................................................................................................................... 101

15.4 Actions in Response to an Application Error................................................................................................................ 102

15.4.1 When using the view (pg_stat_activity)...................................................................................................................... 102

15.4.2 Using pgAdmin............................................................................................................................................................... 103

15.5 Actions in Response to an Access Error.......................................................................................................................... 104

15.6 Actions in Response to Insufficient Space on the Data Storage Destination....................................................................... 104

15.6.1 Using a Tablespace....................................................................................................................................................... 105

15.6.2 Replacing the Disk with a Larger Capacity Disk........................................................................................................ 105
This chapter describes how to operate FUJITSU Enterprise Postgres.

1.1 Operating Methods

There are two methods of managing FUJITSU Enterprise Postgres operations:

- Operation management using GUI tools
- Operation management using commands

See

Before performing database multiplexing using database multiplexing, refer to "Database Multiplexing Mode" in the Cluster Operation Guide (Database Multiplexing).

Operation management using GUI tools

This involves managing operations using the WebAdmin and pgAdmin GUI tools.

- Management using WebAdmin

  This removes the requirement for complex environment settings and operational design for backup and recovery that is usually required for running a database. It enables you to easily and reliably monitor the state of the database, create a streaming replication cluster, back up the database, and restore it even if you do not have expert knowledge of databases.

- Management using pgAdmin

  When developing applications and maintaining the database, you can use pgAdmin to perform simple operations on database objects, such as:
  - Rebuild indexes and update statistics
  - Create, delete, and update database objects

  In addition, from pgAdmin of FUJITSU Enterprise Postgres, you can use the expanded features provided by FUJITSU Enterprise Postgres on the PostgreSQL SQL commands.

Refer to pgAdmin Help for information on the expanded features of pgAdmin provided by FUJITSU Enterprise Postgres.

Operation management using commands

You can use commands for configuring and operating the database and managing operations.

Note

- You cannot combine WebAdmin and server commands to perform the following operations:
  - Use commands to operate an instance created using WebAdmin.
  - Use WebAdmin to recover a database backed up using commands.

  For instances created with WebAdmin, however, backup can be obtained with the pgx_dmpall command. Also, WebAdmin can perform recovery by using the backup obtained with the pgx_dmpall command.

- To operate an instance created using the initdb command in WebAdmin, the instance needs to be imported using WebAdmin.
- You can perform backup and restoration in pgAdmin, but the backup data obtained with WebAdmin and pgx_dmpall is not compatible with the backup data obtained with pgAdmin.
- Refer to pgAdmin Help for other notes on pgAdmin.

Features used in each phase

The following table lists the features used in each phase for GUI-based operations and command-based operations.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>
<td>Creating an instance WebAdmin is used. The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically.</td>
<td>The configuration file is edited directly using the initdb command.</td>
</tr>
<tr>
<td>Creating a standby instance</td>
<td>WebAdmin is used. WebAdmin performs a base backup of the source instance and creates a standby instance.</td>
<td>A standby instance is created using the pg_basebackup command.</td>
</tr>
<tr>
<td>Changing the configuration files</td>
<td>WebAdmin is used.</td>
<td>The configuration file is edited directly.</td>
</tr>
<tr>
<td>Starting and stopping an instance</td>
<td>WebAdmin is used.</td>
<td>The net command or sc command of the operating system is used.</td>
</tr>
<tr>
<td>Creating a database</td>
<td>This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement.</td>
<td></td>
</tr>
<tr>
<td>Backing up the database</td>
<td>WebAdmin, or the pgx_dmpall command, is used.</td>
<td>It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed.</td>
</tr>
<tr>
<td>Database recovery</td>
<td>WebAdmin is used.</td>
<td>To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used.</td>
</tr>
<tr>
<td>Monitoring</td>
<td>Database errors The status in the WebAdmin window can be checked. (*1)</td>
<td>The messages that are output to the database server log are monitored (*1)</td>
</tr>
<tr>
<td></td>
<td>Disk space The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. (*1)</td>
<td>This is monitored using the fsutil command (check free space), and the dir command (check used space), of the operating system, for example. (*1)</td>
</tr>
<tr>
<td></td>
<td>Connection status This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application.</td>
<td></td>
</tr>
</tbody>
</table>

*1: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

1.2 Starting WebAdmin

This section describes how to start and log in to WebAdmin.
1.2.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

User environment

It is recommended to use the following browsers with WebAdmin:
- Internet Explorer 11
- Microsoft Edge (Build41 or later)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.

Startup URL for WebAdmin

In the browser address bar, type the startup URL of the WebAdmin window in the following format:

http://hostNameOrIpAddress:portNumber/

- *hostNameOrIpAddress*: The host name or IP address of the server where WebAdmin is installed.
- *portNumber*: The port number of WebAdmin. The default port number is 27515.

Example

For a server with IP address "192.0.2.0" and port number "27515"

http://192.0.2.0:27515/

The startup URL window shown below is displayed. From this window you can log in to WebAdmin or access the product documentation.

**FUJITSU Enterprise Postgres**

- You must start the Web server feature of WebAdmin before using WebAdmin.
- Refer to "Appendix F Starting and Stopping the Web Server Feature of WebAdmin" for information on how to start the Web server feature of WebAdmin.

Log in to WebAdmin

Click [Launch WebAdmin] in the startup URL window to start WebAdmin and display the login window.

To log in, specify the following values:

- [User name]: User name (OS user account) of the instance administrator
- [Password]: Password corresponding to the user name

Point

Use the OS user account as the user name of the instance administrator. Refer to "Creating an Instance Administrator" in the Installation and Setup Guide for Server for details.

1.3 Starting pgAdmin

This section describes how to start pgAdmin, how to add an instance required for managing a database, and how to connect to and disconnect from the instance.

You can use pgAdmin on the Windows client.

1.3.1 Starting pgAdmin

This section explains how to start pgAdmin if you are using it from the product "FUJITSU Enterprise Postgres Client (AAbit) x SPz" (where AA is "32" or "64", "x" is the product version, and "z" is the product level (x SPz)).

Windows Server(R) 2012

From the [Start] screen, start [pgAdmin 4 (AAbit) (x SPz)].

Windows(R) 8.1 or Windows Server(R) 2012 R2

From the [Apps] view, start [pgAdmin 4 (AAbit) (x SPz)].

Windows(R) 10, Windows Server(R) 2016, or Windows Server(R) 2019

Click [Start] >> [All apps] >> [FUJITSU Enterprise Postgres Client(AAbit) x SPz] and start [pgAdmin 4 (AAbit) (x SPz)].

Note

- You must start the instance to be connected to before using pgAdmin.
- Refer to "2.1 Starting and Stopping an Instance" for information on how to start an instance.
- When using pgAdmin4 with Microsoft Edge, enable network access by loopback in Microsoft Edge. Also, add Microsoft Edge to the loopback exclusion list.

1.3.2 Adding an Instance

This section describes how to add an instance to be connected to.

Note

If you use a link-local address with version 6 of the TCP/IP protocol, you may encounter the following error when registering the server with pgAdmin. Therefore, do not use link-local addresses.
1. In the [Browser] pane, right-click [Servers], and then click [Create] >> [Server].

2. In the [Create - Server] window, specify a value for each item.

   ![Create - Server Window]

   **[General] tab**
   - [Name]: Name of the instance to be managed

   **[Connection] tab**
   - [Host name/address]: Host name or IP address of the server where FUJITSU Enterprise Postgres is installed
   - [Port]: Port number of the instance
   - [Username]: User name of the instance administrator
   - [Password]: Password for the user name specified in [Username]

When you add an instance using pgAdmin, the instance is automatically connected to immediately after the addition is completed.
If you select [Save password], the FUJITSU Enterprise Postgres connection password is stored in the following location. Set the appropriate access permissions for the password file to protect it from unauthorized access.

- %APPDATA%\Roaming\pgAdmin\pgadmin4.db

### 1.3.3 Connecting/Disconnecting an Instance

This section describes how to connect pgAdmin to an instance, and how to disconnect it.

**Note**

To connect to an instance created using WebAdmin, you must first configure the settings in the [Client authentication] window of WebAdmin to permit connection from pgAdmin.

**See**

**Connecting to an instance**

Starting pgAdmin does not connect it to any instance.

To connect to an instance, in the [Browser] pane, right-click the instance, and then click [Connect Server].

If a password was not saved when the instance was added, enter a password in the password entry window that is displayed.

**Disconnecting from an instance**

To disconnect from an instance, in the [Browser] pane, right-click the server, and then click [Disconnect Server].

### 1.4 Operations Using Commands

You can operate and manage the database using the following commands:

- **Server commands**

  This group of commands includes commands for creating a database cluster and controlling the database. You can run these commands on the server where the database is operating.

  To use these commands, you must configure the environment variables.

  **See**

  - Refer to "PostgreSQL Server Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on server commands.
  
  - Refer to "Configure the environment variables" in the procedure to create instances in "Using the initdb Command" in the Installation and Setup Guide for Server for information on configuring the environment variables.

- **Client commands**

  This group of commands includes the psql command and commands for extracting the database cluster to a script file. These commands can be executed on the client that can connect to the database, or on the server on which the database is running.

  To use these commands, you must configure the environment variables.
1.5 Operating Environment of FUJITSU Enterprise Postgres

This section describes the operating environment and the file composition of FUJITSU Enterprise Postgres.

1.5.1 Operating Environment

The following figure shows the configuration of the FUJITSU Enterprise Postgres operating environment. The tables given below list the roles of the OS resources and FUJITSU Enterprise Postgres resources.

*1. To distribute the I/O load, place the transaction log on a different disk from the data storage destination.
### Table 1.1 OS resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared memory</td>
<td>Used when a database process exchanges information with an external process.</td>
</tr>
<tr>
<td>Semaphore</td>
<td></td>
</tr>
</tbody>
</table>

### Table 1.2 FUJITSU Enterprise Postgres client resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection service file</td>
<td>Specifies information, such as the host name, user name, and password, for connecting to FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>Password file</td>
<td>Securely manages the password for connecting to FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>CA certificate file</td>
<td>CA (certificate authority) certificate used for server authentication when encrypting communication data.</td>
</tr>
</tbody>
</table>

### Table 1.3 Server resources of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>Database storage area on the database storage disk. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>System catalog</td>
<td>Contains information required for the system to run, including the database definition information and the operation information created by the user.</td>
</tr>
<tr>
<td>Default tablespace</td>
<td>Contains table files and index files stored by default.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Contains log information in case of a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
<tr>
<td>Work file</td>
<td>Work file used when executing applications or commands.</td>
</tr>
<tr>
<td>postgresql.conf</td>
<td>Contains information that defines the operating environment of FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>pg_hba.conf</td>
<td>FUJITSU Enterprise Postgres uses this file to authenticate individual client hosts.</td>
</tr>
<tr>
<td>Server certificate file</td>
<td>Contains information about the server certificate to be used when encrypting communication data and authenticating a server.</td>
</tr>
<tr>
<td>Server private key file</td>
<td>Contains information about the server private key to be used when encrypting communication data and authenticating a server.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster. Specify a space other than that under the database cluster.</td>
</tr>
<tr>
<td>Backup</td>
<td>Stores the data required for recovering the database when an error, such as disk failure, occurs.</td>
</tr>
<tr>
<td>Database backup</td>
<td>Contains the backup data for the database.</td>
</tr>
<tr>
<td>Archive log</td>
<td>Contains the log information for recovery.</td>
</tr>
<tr>
<td>Mirrored transaction log (mirrored WAL)</td>
<td>Enables a database cluster to be restored to the state immediately before an error even if both the database cluster and transaction log fail when performing backup/recovery operations using the pgx_dmpall command or WebAdmin.</td>
</tr>
<tr>
<td>Core file</td>
<td>FUJITSU Enterprise Postgres process core file that is output when an error occurs during a FUJITSU Enterprise Postgres process.</td>
</tr>
<tr>
<td>Key management server or key management storage</td>
<td>Server or storage where the master encryption key file is located.</td>
</tr>
</tbody>
</table>
### 1.5.2 File Composition

FUJITSU Enterprise Postgres consists of the following files for controlling and storing the database. The table below shows the relationship between the number of such files and their location within a single instance.

**Table 1.4 Number of files within a single instance and how to specify their location**

<table>
<thead>
<tr>
<th>File type</th>
<th>Required</th>
<th>Quantity</th>
<th>How to specify the location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program files</td>
<td>Y</td>
<td>Multiple</td>
<td>Note that &quot;&lt;x&gt;&quot; indicates the product version. By default, the following location is used: %Program Files%\Fujitsu\fserv&lt;.x&gt;\server64</td>
</tr>
<tr>
<td>Database cluster</td>
<td>Y</td>
<td>1</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify a space other than that under the database cluster, using pgAdmin or the DDL statement.</td>
</tr>
<tr>
<td>Backup</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Core file</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin, server commands, or postgresql.conf.</td>
</tr>
<tr>
<td>Server certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Server private key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Master encryption key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify the directory created as the key store using postgresql.conf.</td>
</tr>
<tr>
<td>Connection service file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>Password file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>CA certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
</tbody>
</table>

- Y: Mandatory
- N: Optional
- *1: Set manually when using the applicable feature.

**Note**

If anti-virus software is used, set scan exception settings for directories so that none of the files that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the files that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop FUJITSU Enterprise Postgres and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

### 1.6 Notes on Compatibility of Applications Used for Operations

When you upgrade FUJITSU Enterprise Postgres to a newer version, there may be some effect on applications due to improvements or enhancements in functionality.

Take this into account when creating applications so that you can maintain compatibility after upgrading to a newer version of FUJITSU Enterprise Postgres.
1.7 Notes on Upgrading Database Instances

When upgrading FUJITSU Enterprise Postgres 9.4 or newer database instances to FUJITSU Enterprise Postgres 10 or later using pg_upgrade, there are certain steps you need to follow.

Before using pg_upgrade, remove the following extensions from all databases in the instance, except "template0":

- pg_stat_statements
- pgx_io
- pgx_paging
- pgx_network
- pgx_network_err
- pgx_cpu
- pgx_memory
- pgx_swap
- pgx_disk
- pgx_process
- pgx_log
- oracle_compatible
- pg_dbms_stats
- pg_hint_plan

For all databases except "template0", execute the following command to remove these extensions:

```
DROP EXTENSION extensionName;
```

Once the pg_upgrade operation is complete, for all databases except "template0", execute the following command to re-create these extensions as required:

```
CREATE EXTENSION extensionName;
```

**Note**

- It is strongly recommended to back up the database using pg_dump before performing pg_upgrade or using DROP EXTENSION.
- If there are any columns created in the user tables using a data type from these extensions, then DROP EXTENSION will also drop these columns. Therefore, it is essential that alternate upgrade mechanisms are considered instead of pg_upgrade, in such scenarios. These may include pg_dump/pg_restore.

1.7.1 Additional Steps for upgrading to FUJITSU Enterprise Postgres with Vertical Clustered Index (VCI) Enabled

When upgrading FUJITSU Enterprise Postgres 11.0 or earlier instances that are using the VCI extension to FUJITSU Enterprise Postgres 12 or later using pg_upgrade, additional steps must be performed because of the incompatibility of the VCI extension between FUJITSU Enterprise Postgres 12 or later and FUJITSU Enterprise Postgres 11 or earlier.
Follow the procedure below in all databases in the FUJITSU Enterprise Postgres 11 or earlier instance, except "template0".

**Before upgrading**

1. Obtain the CREATE INDEX Definitions

   Run the query below to list all the VCI indexes created in the database. Ensure that these indexes are re-created in the FUJITSU Enterprise Postgres 12 or later instance after pg_upgrade has finished.

   ```sql
   SELECT nspname || '.' || relname AS index_relname,* FROM pg_class, pg_namespace
   WHERE relnamespace = pg_namespace.oid AND relam IN (SELECT oid FROM pg_am WHERE amname='vci');
   ```

   For each index_relname listed above, execute the commands below to obtain the CREATE INDEX definition (to use the same SQL syntax while re-creating the indexes on the FUJITSU Enterprise Postgres 12 or later instance).

   ```sql
   SELECT pg_get_indexdef('indexName'::regclass);
   ```

2. Drop the VCI indexes and VCI extension along with all its dependencies.

   To remove all the VCI indexes and VCI internal objects that are created in FUJITSU Enterprise Postgres, execute the commands below. VCI internal objects will be created in FUJITSU Enterprise Postgres 12 or later automatically when CREATE EXTENSION for VCI is executed.

   ```sql
   DROP EXTENSION VCI CASCADE;
   ```

**Note**

To restore the VCI extension in the FUJITSU Enterprise Postgres 11 or earlier instance, execute CREATE EXTENSION.

---

**After upgrading**

Once the pg_upgrade operation is complete, for all databases except "template0", execute CREATE EXTENSION to create the VCI extension, and then execute CREATE INDEX for all the VCI indexes as required.
Chapter 2 Starting an Instance and Creating a Database

This chapter describes basic operations, from starting an instance to creating a database.

2.1 Starting and Stopping an Instance

This section describes how to start and stop an instance.

- 2.1.1 Using WebAdmin
- 2.1.2 Using Commands

Point

To automatically start or stop an instance when the operating system on the database server is started or stopped, refer to "Configuring Automatic Start and Stop of an Instance" in the Installation and Setup Guide for Server and configure the settings.

Note

The collected statistics are initialized if an instance is stopped in the "Immediate" mode or if it is abnormally terminated. To prepare for such initialization of statistics, consider regular collection of the statistics by using the SELECT statement. Refer to "The Statistics Collector" in "Server Administration" in the PostgreSQL Documentation for information on the statistics.

2.1.1 Using WebAdmin

WebAdmin enables you to start or stop an instance and check its operating status.

Starting an instance

Start an instance by using the [Instances] tab in WebAdmin.

is displayed when an instance is stopped.

To start a stopped instance, click .

Stopping an instance

Stop an instance by using the [Instances] tab in WebAdmin.

is displayed when an instance is active.

To stop an active instance, click .

Stop mode

Select the mode in which to stop the instance. The following describes the operations of the modes:

<table>
<thead>
<tr>
<th>Stop mode</th>
<th>Connected clients</th>
<th>Backup being executed using the command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart mode (*1)</td>
<td>Waits for all connected clients to be disconnected.</td>
<td>Waits for backups being executed using the command to finish.</td>
</tr>
<tr>
<td>Fast mode</td>
<td>Rolls back all transactions being executed and forcibly disconnects clients.</td>
<td>Terminates backups being executed using the command.</td>
</tr>
<tr>
<td>Immediate mode</td>
<td>All server processes are terminated immediately. Crash recovery is executed the next time the instance is started.</td>
<td></td>
</tr>
</tbody>
</table>
Stop mode | Connected clients | Backup being executed using the command
---|---|---
Kill process mode | Send SIGKILL to the process and abort all active transactions. This will lead to a crash-recovery run at the next restart.

*1: When the processing to stop the instance in the Smart mode has started and you want to stop immediately, use the following procedure:

1. Restart the Web server feature of WebAdmin.
2. In the [Instances] tab, click [ ]
3. In the [Instances] tab, click [ ] and select the Immediate mode to stop the instance.

Checking the operating status of an instance

You can check the operating status of an instance by using the [Instances] tab. The following indicators are used to show the status of a resource.

<table>
<thead>
<tr>
<th>Status indicator</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Green" /></td>
<td>The resource is operating normally.</td>
</tr>
<tr>
<td><img src="image" alt="Blue" /></td>
<td>The resource is stopped.</td>
</tr>
<tr>
<td><img src="image" alt="Red" /></td>
<td>There is an error in the resource.</td>
</tr>
<tr>
<td><img src="image" alt="Yellow" /></td>
<td>An operation is in progress on this resource or the status is being checked.</td>
</tr>
<tr>
<td><img src="image" alt="Exclamation" /></td>
<td>The resource is not operating optimally and needs intervention.</td>
</tr>
</tbody>
</table>

If an instance stops abnormally, remove the cause of the stoppage and start the instance by using WebAdmin.

Figure 2.1 Example of operating status indicators
Note

- When operating WebAdmin, click to update the status. WebAdmin will reflect the latest status of the operation or the instance resources from the server.

- If an error occurs while communicating with the server, there may be no response from WebAdmin. When this happens, close the browser and then log in again. If this does not resolve the issue, check the event log of the server and confirm whether a communication error has occurred.

- The following message is output during startup of an instance when the startup process is operating normally, therefore, the user does not need to be aware of this message:

```
FATAL:  the database system is starting up
```

2.1.2 Using Commands

The Windows service-related commands enable you to start or stop an instance and to check its operating state.

If you are to use Windows services, you should register instances in Windows services.

See

Refer to “When an instance was created with WebAdmin” in "Configuring Automatic Start and Stop of an Instance" in the Installation Guide for Server for information on registering instances in Windows services.

Note

While it is also possible for you to execute the pg_ctl command to start and stop instances without having to register instances in Windows services, it is recommended that you use Windows services to start and stop instances for the following reason:

- If you use the pg_ctl command to start an instance, the instance will be started as a user process. Therefore, when you close the [Command Prompt] window in which you executed the command, Windows forces the postgres process to stop.

Starting an instance

You can start an instance by specifying the service name in the net start command or sc start command.

Also, you can use the following procedure to start an instance in the Windows services window:

1. Display the [Services] window
   In the [Administrative Tools], click [Services].

2. Start a service
   Select the instance name that you wish to start from the services list, and click [Start Service].

Stopping an instance

You can stop an instance by specifying the service name in the net stop command or sc stop command.

Also, you can use the following procedure to stop an instance in the Windows services window:

1. Display the [Services] window
   In the [Administrative Tools], click [Services].
2. Stop the service

Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.

Checking the operating state of an instance

Use the following procedure to check if an instance is operating correctly immediately after performing the operation to start an instance:

1. Display the [Services] window
   In the [Start] menu, select [Administrative Tools], and then click [Services].

2. Check the state of the service
   In the services list, check the state of the services for the applicable FUJITSU Enterprise Postgres.

To check the operating state of an instance during operation, use the pg_ctl command. Specify the following in the pg_ctl command:
- Specify "status" as the mode.
- Specify the data storage destination directory in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

When the instance is active:

```plaintext
> pg_ctl status -D D:\database\inst1
pg_ctl: server is running (PID: 1234)
```

When the instance is inactive:

```plaintext
> pg_ctl status -D D:\database\inst1
pg_ctl: no server running
```

Information

You can also use the net start command or sc query command to check the operating state of an instance.

See

Refer to "pg_ctl" in "Reference" in the PostgreSQL Documentation for information on the pg_ctl command.

2.2 Creating a Database

This section explains how to create a database.

- 2.2.1 Using pgAdmin

- 2.2.2 Using Client Commands

2.2.1 Using pgAdmin

Follow the procedure below to define a database using pgAdmin.
1. In the pgAdmin window, right-click [Databases] in the [Browser] pane, and then click [Create] >> [Database] to display a [Create - Database] window.

2. Specify appropriate values for the following items in the [Create - Database] window.
   - [General] tab
     - [Database]: Name of the database to be managed
   3. Click [Save] to create the database.

### 2.2.2 Using Client Commands

Follow the procedure below to define a database using client commands.

An example of operations on the server is shown below.

1. Use psql command to connect to the postgres database.
   Execute psql postgres.

   ```
   > psql postgres
   psql (13.1)
   Type "help" for help.
   ```

2. Create the database.
   To create the database, execute the CREATE DATABASE databaseName; statement.

   ```
   postgres=# CREATE DATABASE db01;
   CREATE DATABASE
   ```

3. Confirm that the database is created.
   Execute \l+, and confirm that the name of the database created in step 2 is displayed.

   ```
   postgres=# \l+
   ```

4. Disconnect from the postgres database.
   Execute \q to terminate the psql command.

   ```
   postgres=# \q
   ```

You can create a database using the createdb command.

See

Refer to "Creating a Database" in "Tutorial" in the PostgreSQL Documentation for information on creating a database using the createdb command.
Chapter 3 Backing Up the Database

This chapter describes how to back up the database.

Backup methods

The following backup methods enable you to recover data to a backup point or to the state immediately preceding disk physical breakdown or data logical failure.

- Backup using WebAdmin
  This method enables you to back up data through intuitive window operations using the GUI.
  WebAdmin is used for recovery.
- Backup using the pgx_dmpall command
  Execute the pgx_dmpall command with a script to perform automatic backup.
  To back up data automatically, you must register the process in the automation software of the operating system. Follow the procedure given in the documentation for your operating system.
  The pgx_rcvall command is used for recovery.

Information

By using a copy command created by the user, the pgx_dmpall command and the pgx_rcvall command can back up database clusters and tablespaces to any destination and recover them from any destination using any copy method. Refer to "Chapter 14 Backup/Recovery Using the Copy Command" for details.

Approximate backup time

The formula for deriving the approximate backup time when you use WebAdmin or the pgx_dmpall command is as follows:

\[ \text{backupTime} = \frac{\text{dataStorageDestinationUsage}}{\text{diskWritePerformance}} \times 1.5 \]

- \( \text{dataStorageDestinationUsage} \): Disk usage at the data storage destination
- \( \text{diskWritePerformance} \): Maximum data volume (bytes/second) that can be written per second in the system environment where operation is performed
- 1.5: Coefficient to factor in tasks other than disk write (which is the most time-consuming step)

If using the copy command with the pgx_dmpall command, the backup time will depend on the implementation of the copy command.

Note

- Backup operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.
- Use the selected backup method continuously.
  There are several differences, such as the data format, across the backup methods. For this reason, the following restrictions apply:
    - It is not possible to use one method for backup and another for recovery.
    - It is not possible to convert one type of backup data to a different type of backup data.
- Mirrored WALs can be used only for backup/recovery using the pgx_dmpall command or WebAdmin.
- There are several considerations for the backup of the keystore and backup of the database in case the data stored in the database is encrypted. Refer to the following for details:
  - 5.6.4 Backing Up and Recovering the Keystore
  - 5.7 Backing Up and Restoring/Recovering the Database
- If you have defined a tablespace, back it up. If you do not back it up, directories for the tablespace are not created during recovery, which may cause the recovery to fail. If the recovery fails, refer to the event log, create the tablespace, and then perform the recovery process again.

- If performing backups with WebAdmin, the following password file is temporarily created during backup for WebAdmin to connect to the database:

  - userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceName\pgpass.conf

Therefore, when you are backing up core files created in the core_directory parameter of postgresql.conf, or log files created in the log_directory parameter of postgresql.conf, ensure not to back up the password files located in the same directories at the same time.

---

### Information

The following methods can also be used to perform backup. Performing a backup using these methods allows you to restore to the point when the backup was performed.

- **Backup using an SQL-based dump**
  
  Dump the data by using SQL. This backup method also enables data migration.

- **File system level backup**
  
  This backup method requires you to stop the instance and use OS commands to backup database resources as files.

- **Backup by continuous archiving**
  
  This is the standard backup method for PostgreSQL.

Refer to "Backup and Restore" in "Server Administration" in the PostgreSQL Documentation for information on these backup methods.

---

### 3.1 Periodic Backup

It is recommended that you perform backup periodically.

Backing up data periodically using WebAdmin or the pgx_dmpall command has the following advantages:

- This method reduces disk usage, because obsolete archive logs (transaction logs copied to the backup data storage destination) are deleted. It also minimizes the recovery time when an error occurs.

**Backup cycle**

The time interval when backup is performed periodically is called the backup cycle. For example, if backup is performed every morning, the backup cycle is 1 day.

The backup cycle depends on the jobs being run, but on FUJITSU Enterprise Postgres it is recommended that operations are run with a backup cycle of at least once per day.

---

### 3.2 Backup Methods

This section describes the methods for backing up the database.

- **3.2.1 Using WebAdmin**

- **3.2.2 Using Server Commands**

---

### 3.2.1 Using WebAdmin

You can use WebAdmin to perform backup and check the backup status.
Note

- If backup is disabled for an instance, you will not be able to back up or restore the instance. Refer to "[Backup]" in "Creating an Instance" in the Installation and Setup Guide for Server for details.
- If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.
- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.

Backup operation

Follow the procedure below to back up the database.

1. Select the database to back up
   In the [Instances] tab, select the instance to be backed up and click .

2. Back up the database
   The [Backup] dialog box is displayed. To perform backup, click [Yes]. An instance is automatically started when backup is performed.

Backup status

If an error occurs and backup fails, [Error] is displayed adjacent to [Data storage status] or [Backup storage status] in the [Instances] tab. An error message is also displayed in the message list.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, [Solution] appears to the right of the error message. Clicking this button displays information explaining how to resolve the cause of the error. Remove the cause of failure, and perform backup again.

3.2.2 Using Server Commands

Use the pgx_dmpall command and pgx_rcvall command to perform backup and check the backup result.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Follow the procedure below.

See

Refer to "Preparing Directories to Deploy Resources" in the Installation and Setup Guide for Server for information on the location of directories required for backup and for points to take into account.

1. Prepare the backup data storage disk
   For backup, prepare a separate disk unit from the database storage disk and mount it using the operating system commands.

2. Create a directory where the backup data will be stored
   Create an empty directory.
   In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the directory.
3. Specify the settings required for backup

Stop the instance, and set the following parameters in the postgresql.conf file.

Start the instance after editing the postgresql.conf file.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backup_destination</td>
<td>Name of the directory where the backup data will be stored</td>
<td>Specify the name of the directory where the backup data will be stored. Appropriate privileges that allow only the instance administrator to access the directory must already be set. Place the backup data storage destination directory outside the data storage destination directory, the tablespace directory, and the transaction log storage destination directory.</td>
</tr>
<tr>
<td>archive_mode</td>
<td>on</td>
<td>Specify the archive log mode. Specify [on] (execute).</td>
</tr>
<tr>
<td>archive_command</td>
<td><code>cmd /c &quot;&quot;installationDirectory\bin\pgx_walcopy.cmd&quot; &quot;%p&quot;&quot; backupDataStorageDestinationDirectory\archived_wal\%f&quot;&quot;</code></td>
<td>Specify the path name of the command that will save the transaction log and the storage destination. Note the following when specifying the path: - Specify \ as the path delimiter. - Enclose the path in double quotes (&quot;&quot;') if it contains spaces.</td>
</tr>
</tbody>
</table>

Refer to "Appendix A Parameters" and "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

**Backup operation (file backup)**

Use the pgx_dmpall command to perform file backup. You can even embed the pgx_dmpall command in OS automation software to perform backup.

The backup data is stored in the directory specified in the backup_destination parameter of postgresql.conf.

Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

```bash
> pgx_dmpall -D D:\database\inst1
```

**Note**

Backup stores the data obtained during the backup and the backup data of the data obtained during previous backup.
If the data to be stored in the database is encrypted, refer to the following and back up the keystore:

- 5.6.4 Backing Up and Recovering the Keystore

Backup status

Use the `pgx_rcvall` command to check the backup status.

Specify the following values in the `pgx_rcvall` command:

- The `-l` option indicates backup data information.
- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

```
> pgx_rcvall -l -D D:\database\inst1
```

<table>
<thead>
<tr>
<th>Date</th>
<th>Status</th>
<th>Dir</th>
</tr>
</thead>
</table>

If an error occurs and backup fails, a message is output to the event log.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, remove the cause of failure and perform backup again.

See

Refer to "pgx_dmpall" and "pgx_rcvall" in the Reference for information on the `pgx_dmpall` command and `pgx_rcvall` command.

Setting a restore point

In case you want to recover your database to a certain point in time, you can name this particular point in time, which is referred to as the restore point, by using the `psql` command.

By setting a restore point before executing an application, it becomes easy to identify up to which point in time the data will be reverted.

A restore point can be set to any point in time after a backup is executed. However, if a restore point is set before a backup is executed, the database cannot be recovered to that point in time. This is because restore points are recorded in the archive logs, and the archive logs are discarded when backups are executed.

Example

The following example uses the `psql` command to connect to the database and execute the SQL statement to set a restore point.

However, when considering continued compatibility of applications, do not use functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

```
postgres=# SELECT pg_create_restore_point('batch_20200503_1');
LOG: restore point "batch_20200503_1" created at 0/200000E8
```

Refer to "15.3.2 Using the pgx_rcvall Command" for information on using a restore point to recover the database.
Note

- Name restore points so that they are unique within the database. Add the date and time of setting a restore point to distinguish it from other restore points, as shown below:

  - YYMMDD_HHMMSS
    - YYMMDD: Indicates the date
    - HHMMSS: Indicates the time

- There is no way to check restore points you have set. Keep a record in, for example, a file.

See

Refer to "System Administration Functions" under "Functions and Operators" in the PostgreSQL Documentation for information on pg_create_restore_point.
Chapter 4 Configuring Secure Communication Using Secure Sockets Layer

If communication data transferred between a client and a server contains confidential information, encrypting the communication data can protect it against threats, such as eavesdropping on the network.

4.1 Configuring Communication Data Encryption

To encrypt communication data transferred between a client and a server, configure communication data encryption as described below. Communication data encryption not only protects the communication content, but it also guards against man-in-the-middle (MITM) attacks (for example, data and password theft through server impersonation).

Table 4.1 Configuration procedure

<table>
<thead>
<tr>
<th>Configuration procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Issue a certificate</td>
</tr>
<tr>
<td>2) Deploy a server certificate file and a server private key file</td>
</tr>
<tr>
<td>3) Distribute a CA certificate file to the client</td>
</tr>
<tr>
<td>4) Configure the operating environment for the database server</td>
</tr>
<tr>
<td>5) Configure the operating environment for the client</td>
</tr>
</tbody>
</table>

The following figure illustrates the environment for communication data encryption.

Figure 4.1 Environment for communication data encryption
4.1.1 Issuing a Certificate

For authenticating servers, you must acquire a certificate issued by the certificate authority (CA). FUJITSU Enterprise Postgres supports X.509 standard PEM format files. If the certificate authority issues a file in DER format, use a tool such as the openssl command to convert the DER format file to PEM format.

The following provides an overview of the procedure. Refer to the procedure published by the public or independent certificate authority (CA) that provides the certificate file for details.

a. Create a server private key file
b. Disable the passphrase for the server private key file
c. Create a CSR (signing request for obtaining a server certificate) from the server private key file
d. Apply to the certificate authority (CA) for a server certificate
e. Obtain a server certificate file and a CA certificate file from the certificate authority (CA)
f. Store the server certificate file and the CA certificate file
   Note: If you lose or destroy the certificates, you will need to have them re-issued.

The above procedure enables you to prepare the following files:
- Server private key file
- Server certificate file
- CA certificate file

4.1.2 Deploying a Server Certificate File and a Server Private Key File

Create a directory on the local disk of the database server and store the server certificate file and the server private key file in it. Use the operating system features to set access privileges for the server certificate file and the server private key file so that only the database administrator has load privileges.

Back up the server certificate file and the server private key file in the event that data corruption occurs and store them securely.

4.1.3 Distributing a CA Certificate File to the Client

Create a directory on the local disk of the client and place the distributed CA certificate file there. Use the operating system features to set load privileges to protect the CA certificate file against accidental deletion.

4.1.4 Configuring the Operating Environment for the Database Server

Refer to "Secure TCP/IP Connections with SSL" under "Server Administration" in the PostgreSQL Documentation for details.

4.1.5 Configuring the Operating Environment for the Client

Refer to the following sections in the Application Development Guide for details, depending on your application development environment:
- "Settings for Encrypting Communication Data" under "Setup" in "JDBC Driver"
- "Settings for Encrypting Communication Data" under "Setup" in "C Library (libpq)"
- "Settings for Encrypting Communication Data" under "Setup" in "Embedded SQL in C"
4.1.6 Performing Database Multiplexing

When you perform communication that uses database multiplexing and a Secure Socket Layer server certificate, certificates with the same "Common Name" must be used. To ensure this, take one of the following actions:

- Create one server certificate, replicate it, and place a copy on each server used for database multiplexing.
- Create a server certificate with the same "Common Name" for each server used for database multiplexing.

Refer to "Using the Application Connection Switch Feature" in the Application Development Guide for information on how to specify applications on the client.
This chapter describes how to encrypt data to be stored in the database.

5.1 Protecting Data Using Encryption

With PostgreSQL, data in a database is protected from access by unauthorized database users through the use of authentication and access controls. However, the OS file is not protected from attackers who bypass the database server's authentication and access controls.

With FUJITSU Enterprise Postgres, data inside the OS file is encrypted, so valuable information is protected even if the file or disk is stolen. Data to be stored in a database is encrypted when it is written to the data file, and decrypted when it is read.

This is performed automatically by the instance, so the user and the application need not be aware of key management and encryption or decryption. This process is called TDE (Transparent Data Encryption).

The characteristics of TDE are described below.

Encryption mechanisms

Two-layer encryption key and the keystore

In each tablespace, there is a tablespace encryption key that encrypts and decrypts all the data within. The tablespace encryption key is encrypted by the master encryption key and saved. Only one master encryption key exists in a database cluster. It is encrypted based on a passphrase specified by the user and stored in a keystore. FUJITSU Enterprise Postgres provides a file-based keystore. Attackers who do not know the passphrase cannot read the master encryption key from the keystore.

Strong encryption algorithms

TDE uses the Advanced Encryption Standard (AES) as its encryption algorithm. AES was adopted as a standard in 2002 by the United States Federal Government, and is used throughout the world.

Faster encryption and decryption based on hardware

TDE minimizes the overhead of encryption and decryption by using the AES-NI (Advanced Encryption Standard New Instructions) built into Intel(R) Xeon(R) processors since the 5600 series. This means that even in situations where previously the minimum encryption target was selected as a tradeoff between performance and security, it is now possible to encrypt all the data of an application.

Refer to the Intel Corporation's website for information on the list of processors equipped with AES-NI.

Zero overhead storage areas

Encryption does not change the size of data stored in tables, indexes, or WAL. There is, therefore, no need for additional estimates or disks.

Scope of encryption

All user data within the specified tablespace

The tablespace is the unit for specifying encryption. All tables, indexes, temporary tables, and temporary indexes created in the encrypted tablespace are encrypted. There is no need for the user to consider which tables and strings to encrypt.

Refer to "5.4 Encrypting a Tablespace" for details.

Backup data

The pgx_dmpall command and pg_basebackup command create backup data by copying the OS file. Backups of the encrypted data are, therefore, also encrypted. Information is protected from leakage even if the backup medium is stolen.

WAL and temporary files

WAL, which is created by updating encrypted tables and indexes, is encrypted with the same security strength as the update target. When large merges and sorts are performed, the encrypted data is written to a temporary file in encrypted format.
Streaming replication support

You can combine streaming replication and transparent data encryption. The data and WAL encrypted on the primary server is transferred to the standby server in its encrypted format and stored.

Note

The following are not encrypted:

- `pg_dump` and `pg_dumpall` output files
- Files output by the `COPY` command
- Notification event payloads that communicate using the `LISTEN` or `NOTIFY` command
- Checksum validation is not performed on encrypted tablespaces during backup and when using the `pg_checksum` utility.

5.2 Setting the Master Encryption Key

To use transparent data encryption, you must create a keystore and set the master encryption key.

1. In the `keystore_location` parameter of `postgresql.conf`, specify the directory to store the keystore.
   
   Specify a different location for each database cluster.
   
   ```
   keystore_location = 'C:\key\store\location'
   ```

   Refer to "Appendix A Parameters" for information on `postgresql.conf`.

   After editing the `postgresql.conf` file, either start or restart the instance.
   
   - Using WebAdmin
     
     Refer to "2.1.1 Using WebAdmin", and restart the instance.
   
   - Using commands
     
     Refer to "2.1.2 Using Commands", and restart the instance.

2. Execute an SQL function, such as the one below, to set the master encryption key. This must be performed by the superuser. Execute it as the database superuser.

   ```
   SELECT pgx_set_master_key('passphrase');
   ```

   The value "passphrase" is the passphrase that will be used to open the keystore. The master encryption key is protected by this passphrase, so avoid specifying a short simple string that is easy to guess.

   Refer to "B.2 Transparent Data Encryption Control Functions" for information on the `pgx_set_master_key` function.

Note

Note that if you forget the passphrase, you will not be able to access the encrypted data. There is no method to retrieve a forgotten passphrase and decrypt data. Do not, under any circumstances, forget the passphrase.

The `pgx_set_master_key` function creates a file with the name `keystore.ks` in the keystore storage destination. It also creates a master encryption key from random bit strings, encrypts it with the specified passphrase, and stores it in `keystore.ks`. At this point, the keystore is open.

5.3 Opening the Keystore

To create encrypted tablespaces and access the encrypted data, you must first open the keystore. When you open the keystore, the master encryption key is loaded into the database server memory and becomes usable for encryption and decryption.
You need to open the keystore each time you start the instance. To open the keystore, the database superuser must execute the following SQL function.

```sql
SELECT pgx_open_keystore('passphrase');
```

The value "passphrase" is the passphrase specified during creation of the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the `pgx_open_keystore` function.

Note that, in the following cases, the passphrase must be entered when starting the instance, because the encrypted WAL must be decrypted for recovery. In this case, the above-mentioned `pgx_open_keystore` function cannot be executed.

- If performing crash recovery at the time of starting the instance
- If performing recovery using continuous archiving

For the above cases, select one of the following methods:

- Use an automatically opening keystore
  Select this method if ease of operation has priority over enhanced security. When using an automatically opening keystore, the content of the keystore file is decrypted and a copy of the keystore file is generated. Although the content of this file is obfuscated, the level of security becomes slightly weaker.

- Enter a passphrase when starting an instance
  Select this method if performing operations using WebAdmin.

- Enter a passphrase when starting an instance
  Specify the `--keystore-passphrase` in the `pg_ctl` command and start the instance. This displays the prompt that asks for the passphrase to be entered.

```console
> pg_ctl --keystore-passphrase start
Enter the passphrase:
The server is currently initiating
```

After performing the above operation, use the `pg_ctl` command to stop the instance.

Then start the instance in Windows services. Refer to “2.1.2 Using Commands” for information on how to start an instance in Windows services.

**Point**

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the database server starts. Refer to “5.6.3 Enabling Automatic Opening of the Keystore” for details.

### 5.4 Encrypting a Tablespace

The keystore must be open before you can create an encrypted tablespace.

When creating a tablespace that will be encrypted, configure the encryption algorithm in the runtime parameters. For example, to create a tablespace with the name `secure_tablespace` using AES with a key length of 256 bits as the encryption algorithm, configure as shown below.

```sql
-- Specify the encryption algorithm for the tablespace to be created below
SET tablespace_encryption_algorithm = 'AES256';
CREATE TABLESPACE secure_tablespace LOCATION 'C:\My\Data\Dir';
-- Specify that the tablespace to be created below is not to be encrypted
SET tablespace_encryption_algorithm = 'none';
```

Or

```sql
CREATE TABLESPACE secure_tablespace LOCATION '\My\Data\Dir' WITH (tablespace_encryption_algorithm = 'AES256');
```
When the tablespace is empty, the encryption algorithm can be modified with the command below.

```
ALTER TABLESPACE secure_tablespace SET (tablespace_encryption_algorithm=AES256);
```

Trying to set the encryption algorithm for a non-empty tablespace causes an error.

You can use AES with a key length of 128 bits or 256 bits as the encryption algorithm. It is recommended that you use 256-bit AES. Refer to "Appendix A Parameters" for information on how to specify the runtime parameters.

If user provides both GUC and command line options while creating the tablespace, the preference is given to the command line option.

The pg_default and pg_global tablespaces cannot be encrypted.

Create tables and indexes in the encrypted tablespace that you created. Relations created in the encrypted tablespace are automatically encrypted.

**Example**

**Example 1: Specifying an encrypted tablespace when creating it**

```
CREATE TABLE my_table (...)
    TABLESPACE secure_tablespace;
```

**Example 2: Not explicitly specifying a tablespace when creating it and instead using the default tablespace**

```
SET default_tablespace = 'secure_tablespace';
CREATE TABLE my_table (...);
```

The process is the same for encrypting temporary tables and temporary indexes. In other words, either explicitly specify the TABLESPACE clause or list encrypted tablespaces in the temp_tablespaces parameter, and then execute CREATE TEMPORARY TABLE or CREATE INDEX.

**Point**

If an encrypted tablespace is specified in the TABLESPACE clause of the CREATE DATABASE statement, relations created in the database without explicitly specifying a tablespace will be encrypted. Furthermore, the system catalog will also be encrypted, so the source code of user-defined functions is also protected.

**Example: Specifying a tablespace in a database definition statement**

```
CREATE DATABASE DB01 TABLESPACE=SP01 ... ;
```

Part of the data is also stored in the system catalog - to encrypt this data as well, specify an encrypted tablespace as above and create a database.

**Note**

An encrypted tablespace cannot be created from the window used for creating the pgAdmin tablespace, or from the query tool. To create an encrypted tablespace, click [PSQL Console] from the [Plugins] menu and create an encrypted tablespace in the psql console window.

### 5.5 Checking an Encrypted Tablespace

The pgx_tablespaces system view displays information about whether each tablespace has been encrypted, and about the encryption algorithm. Refer to "C.1 pgx_tablespaces" for information on strings.

You can discover which tablespaces have been encrypted by executing the following SQL statements.

However, when considering continued compatibility of applications, do not reference system catalogs (pg_tablespace) directly in SQL statements.
5.6 Managing the Keystore

This section describes how to manage the keystore and the master encryption key to guard against the threat of theft.

5.6.1 Changing the Master Encryption Key

Using the same encryption key for an extended period gives attackers an opportunity to decipher the encrypted data. It is recommended that you change the key at regular intervals, or whenever the key is exposed to risk.

Adhere to the industry's best practices for encryption algorithms and key management when considering how often the key should be changed. For example, the NIST in the United States has published "NIST Special Publication 800-57". The PCI DSS also refers to this publication. This publication recommends changing the master encryption key once a year.

To change the master encryption key, execute the pgx_set_master_key function, which is the same function used for configuring the key. Refer to "5.2 Setting the Master Encryption Key" for details.

After changing the master encryption key, you must immediately back up the keystore.

5.6.2 Changing the Keystore Passphrase

In security policies for organizations, it is usually a requirement that the passphrase be changed whenever a security administrator who knows the passphrase is removed from duties due to transfer or retirement. It is also recommended that the passphrase be changed if it is ever exposed to risks due to deception such as social engineering.

To change the keystore passphrase, execute the following SQL function as a superuser.

```
SELECT pgx_set_keystore_passphrase('oldPassphrase', 'newPassphrase');
```

After changing the passphrase, you must immediately back up the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_keystore_passphrase function.

5.6.3 Enabling Automatic Opening of the Keystore

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the instance starts. Execute the pgx_keystore command to enable automatic opening of the keystore.
> pgx_keystore --enable-auto-open C:\key\store\location\keystore.ks
Enter the passphrase:
Automatic opening of the keystore is now enabled
>

See

Refer to "pgx_keystore" in the Reference for information on pgx_keystore command.

When automatic opening is enabled, an automatically opening keystore is created in the same directory as the original keystore. The file name of the automatically opening keystore is keystore.aks. The file keystore.aks is an obfuscated copy of the decrypted content of the keystore.ks file. As long as this file exists, there is no need to enter the passphrase to open the keystore when starting the instance.

Do not delete the original keystore file, keystore.ks. It is required for changing the master encryption key and the passphrase. When you change the master encryption key and the passphrase, keystore.aks is recreated from the original keystore file, keystore.ks.

Protect keystore.ks, keystore.aks, and the directory that stores the keystore so that only the user who starts the instance can access them.

Configure the permission of the files so that only the user who starts the instance can access the SQL functions and commands that create these files. Accordingly, manually configure the same permission mode if the files are restored.

Set the permission mode in [Properties] in Windows(R) Explorer.

Note

- To use WebAdmin for recovery, you must enable automatic opening of the keystore.
- Refer to “5.7 Backing Up and Restoring/Recovering the Database” after enabling or reconfiguring encryption to back up the database.
- Specify a different directory from those below as the keystore storage destination:
  - Data storage destination
  - Tablespace storage destination
  - Transaction log storage destination
  - Backup data storage destination

5.6.4 Backing Up and Recovering the Keystore

Back up the keystore at the following times in case it is corrupted or lost. Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen. A passphrase is not required to open an automatically opening keystore, so store this type of keystore in a safe location.

- When the master encryption key is first configured
- When the master encryption key is changed
- When the database is backed up
- When the keystore passphrase is changed
Point
Do not overwrite an old keystore when backing up a keystore. This is because during database recovery, you must restore the keystore to its state at the time of database backup. When the backup data of the database is no longer required, delete the corresponding keystore.

Example
- Back up the database and the keystore on May 1, 2020.

```bash
> pgx_dmpall -D D:\database\inst1
> copy C:\key\store\location\keystore.ks C:\keybackup\keystore_20200501.ks
```

Specify the following in the `pgx_dmpall` command:
- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
- Change the master encryption key, and back up the keystore on May 5, 2020.

```bash
> psql -c "SELECT pgx_set_master_key('passphrase')" postgres
> copy C:\key\store\location\keystore.ks C:\keybackup\keystore_20200505.ks
```

Specify the following in the `psql` command:
- Specify the SQL function that sets the master encryption key in the `-c` option.
- Specify the name of the database to be connected to as the argument.

If the keystore is corrupted or lost, restore the keystore containing the latest master encryption key. If there is no keystore containing the latest master encryption key, restore the keystore to its state at the time of database backup, and recover the database from the database backup. This action recovers the keystore to its latest state.

Example
- Restore the keystore containing the latest master encryption key as of May 5, 2020.

```bash
> copy C:\keybackup\keystore_20200505.ks C:\key\store\location\keystore.ks
```

- If there is no backup of the keystore containing the latest master encryption key, recover the keystore by restoring the keystore that was backed up along with the database on 1 May 2020.

```bash
> copy C:\keybackup\keystore_20200501.ks C:\key\store\location\keystore.ks
> pgx_rcvall -B E:\backup\inst1 -D D:\database\inst1 --keystore-passphrase
```

Specify the following in the `pgx_rcvall` command:
- Specify the data storage directory in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
- Specify the backup data storage directory in the `-B` option.
- The `--keystore-passphrase` option prompts you to enter the passphrase to open the keystore.

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

It is recommended that you do not back up the automatically opening keystore file, keystore.aks. If the database backup medium and the backup medium storing the automatically opening keystore are both stolen, the attacker will be able to read the data even without knowing the passphrase.
If the automatically opening keystore is corrupted or lost, you must again enable automatic opening. The keystore.aks file will be recreated from keystore.ks at this time.

See

Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall and pgx_dmpall commands.
Refer to "psql" under "Reference" in the PostgreSQL Documentation for information on the psql command.
Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.
Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

5.7 Backing Up and Restoring/Recovering the Database

FUJITSU Enterprise Postgres enables you to use the five backup and recovery methods described below. Regardless of the method you use, you must back up the keystore at the same time.

Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen.

Backup and recovery using WebAdmin

- Backup
  WebAdmin backs up encrypted data.
  Back up the key store after backing up the database.
- Recovery
  Restore the keystore to its state at the time of database backup. Refer to "5.6.4 Backing Up and Recovering the Keystore" for details.
  Enable automatic opening of the keystore in accordance with the procedure described in "5.6.3 Enabling Automatic Opening of the Keystore". Then, use WebAdmin to recover the database.

Backup and recovery using the pgx_dmpall and pgx_rcvall commands

- Backup
  The pgx_dmpall command backs up the encrypted data.
  Back up the key store after backing up the database.
- Recovery
  Restore the keystore to its state at the time of the database backup.
  Configure automatic opening of the key store as necessary.
  If automatic opening of the keystore is not enabled, execute the pgx_rcvall command with the --keystore-passphrase option specified.
  This will display the prompt for the passphrase to be entered.

Example

- Back up the database and the keystore on May 1, 2020.

  > pgx_dmpall -D D:\database\inst1
  > copy C:\key\store\location\keystore.ks C:\keybackup\keystore_20200501.ks

Specify the following in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Recover the database and the keystore from the backup taken on May 1, 2020.

```
> copy C:\keybackup\keystore_20200501.ks C:\key\store\location\keystore.ks
> pgx_keystore --enable-auto-open C:\key\store\location\keystore.ks (Execute only when enabling automatic opening)
> pgx_rcvall -B E:\backup\inst1 -D D:\database\inst1 --keystore-passphrase
```

Specify the following in the pgx_rcvall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage directory in the -B option.
- The --keystore-passphrase option prompts you to enter the passphrase to open the keystore.

---

**Dump and restore using SQL**

- **Backup**
  The files output by the pg_dump and pg_dumpall commands are not encrypted. You should, therefore, encrypt the files using OpenSSL commands or other means before saving them, as described in "5.8 Importing and Exporting the Database" below.

  Back up the key store after backing up the database.

- **Restore**
  If the backup data has been encrypted using, for example Open SSL commands, decrypt that data.

  The data generated by the pg_dumpall command includes a specification to encrypt tablespaces by default. For this reason, the psql command encrypts tablespaces during restoration.

**File system level backup and restore**

- **Backup**
  Stop the instance and backup the data directory and the tablespace directory using the file copy command of the operating system. The files of encrypted tablespaces are backed up in the encrypted state.

  Back up the key store after performing the backup.

- **Restore**
  Restore the keystore to its state at the time of the database backup.

  Stop the instance and restore the data directory and the tablespace directory using the file copy command of the operating system.

**Continuous archiving and point-in-time recovery**

- **Backup**
  The pg_basebackup command backs up the encrypted data as is.

  Back up the key store after performing the backup.

- **Recovery**
  Restore the keystore to its state at the time of the database backup.

  Configure automatic opening of the key store as necessary.

  If automatic opening of the keystore is not enabled, refer to "5.3 Opening the Keystore" for information on starting an instance by specifying pg_ctl --keystore-passphrase start.
- Refer to "Reference" in the PostgreSQL Documentation for information on the following commands:
  - psql
  - pg_dump
  - pg_basebackup

- Refer to the Reference for information on the following commands:
  - pgx_rcvall
  - pgx_dmpall
  - pg_dmpall

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

Refer to “5.6.3 Enabling Automatic Opening of the Keystore” for information on how to enable automatic opening of the keystore.

### 5.8 Importing and Exporting the Database

The files output by the COPY TO command are not encrypted. Therefore, when transferring files to other systems, you should encrypt files using OpenSSL commands, or use file transfer software that performs encrypted communication for Windows, to encrypt the data being transferred.

Use a safe method to delete obsolete plain text files.

You can use the following methods to safely delete files:
- `fsutil` command

**Example**

```bash
# Export the contents of the table my_table to a CSV file.
> psql -c "COPY my_table TO 'C:\WINDOWS\Temp\my_table.csv' (FORMAT CSV)" postgres

# Encrypt the exported file.
> C:\OpenSSL-Win32\bin\openssl enc -e -aes256 -in C:\WINDOWS\Temp\my_table.csv -out my_table.csv.enc
(The user is prompted to enter the passphrase to be used for encryption)

# Check the size of plain text files, and delete them after zero padding
> dir C:\WINDOWS\Temp\my_table.csv
> fsutil file setzerodata offset=0 length=7 C:\WINDOWS\Temp\my_table.csv
> del C:\WINDOWS\Temp\my_table.csv

# Decrypt the encrypted files on other systems.
> C:\OpenSSL-Win32\bin\openssl enc -d -aes256 -in my_table.csv.enc -out my_table.csv
(The user is prompted to enter the passphrase to be used for decryption)
```

If you use COPY FROM to import data to tables and indexes in an encrypted tablespace, the imported data is automatically encrypted before being stored.

### 5.9 Encrypting Existing Data

You cannot encrypt existing unencrypted tablespaces. In addition, you cannot change encrypted tablespaces so that they do not encrypt.

As an alternative, transfer the tables and indexes to other tablespaces. You can use the following SQL commands for this.
ALTER TABLE table_name SET TABLESPACE new_tablespace;
ALTER INDEX index_name SET TABLESPACE new_tablespace;
ALTER DATABASE database_name SET TABLESPACE new_tablespace;

See

Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on SQL commands.

5.10 Operations in Cluster Systems

This section describes how to use transparent data encryption on cluster systems such as high-availability systems, streaming replication, and database multiplexing.

5.10.1 HA Clusters that do not Use Database Multiplexing

Take the following points into account when using transparent data encryption in an HA cluster environment that does not use database multiplexing.

Placement and automatic opening of the keystore file

There are two alternatives for placing the keystore file:

- Sharing the keystore file
- Placing a copy of the keystore file

Sharing the keystore file

This involves using the same keystore file on the primary server and the standby server.

As the standby server is not active while the primary server is running, this file would not be accessed simultaneously, and therefore, it can be shared.

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location.

Enable the automatic opening of the keystore on both the primary and standby servers.

Placing a copy of the keystore file

This involves placing a copy of the primary server keystore file on the standby server.

You can do this if you cannot prepare a shared server or disk device that can be accessed from both the primary and standby servers.

However, if you change the master encryption key and the passphrase on the primary server, you must copy the keystore file to the standby server again.

To manage the keystore file in a more secure manner, prepare the key management server or the key management storage isolated in a secure location for both the primary and standby servers, and place the keystore files there.

Enable the automatic opening of the keystore on both the primary and standby servers. Note that copying the automatically opening keystore file (keystore.aks) to the standby server does not enable the automatic opening of the keystore.

5.10.2 Database Multiplexing Mode

Note the following when using transparent data encryption in environments that use streaming replication, or database multiplexing with streaming replication.

Placing the keystore file

Place a copy of the primary server keystore file on the standby server.

This is required as the keystore file cannot be shared, and both servers may need to access it simultaneously.
To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location. A keystore used by both the primary and standby servers can be managed on the same key management server or key management storage.

However, create different directories for the keystores to be used by the primary server and the standby server. Then copy the keystore for the primary server to the directory used on the standby server.

Automatically opening the keystore

You must enable automatic opening of the keystore.

To do this, enable automatic opening of the keystore in all servers that make up database multiplexing. The settings for automatic opening of the keystore include information unique to each server, so simply copying the file does not enable it.

Changing the passphrase

Changes to the passphrase are reflected in all servers that make up database multiplexing, so no special operation is required.

Building and starting a standby server

Before using the pg_basebackup command or pgx_rcvall command to build a standby server, copy the keystore file from the primary server to the standby server. When using an automatically opening keystore, use the copied keystore file to enable automatic opening on the standby server.

Open the keystore each time you start the standby server. This step is necessary for decrypting and restoring encrypted WAL received from the primary server. To open the keystore, specify the --keystore-passphrase option in the pg_ctl command or pgx_rcvall command and enter the passphrase, or use an automatically opening keystore.

If specifying --keystore-passphrase in the pg_ctl command, refer to "5.3 Opening the Keystore" for details.

Changing the master encryption key and the passphrase

Change the master encryption key and the passphrase on the primary server. You need not copy the keystore from the primary server to the standby server. You need not even restart the standby server or reopen the keystore. Changes to the master encryption key and the passphrase are reflected in the keystore on the standby server.

Refer to "pgx_rcvall " in the Reference for information on pgx_rcvall command.

Refer to "pg_basebackup" under "Reference" in the PostgreSQL Documentation for information on pg_basebackup command.

Refer to "High Availability, Load Balancing, and Replication" under "Server Administration" in the PostgreSQL Documentation for information on how to set up streaming replication.

5.11 Security-Related Notes

- Decrypted data is cached in the database server memory (shared buffer). As a result, unencrypted data is stored in a minidump, which is the process memory dump. You should, therefore, safely delete the memory dump. You can safely delete files by using the following command:
  - fsutil command

- Unencrypted data may be written from the database server memory to the operating system's swap area. To prevent leakage of information from the swap area, consider either disabling the use of swap area or encrypting the swap area using a full-disk encryption product.

- The content of the server log file is not encrypted. Therefore, in some cases the value of a constant specified in a SQL statement is output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement.
- When executing an SQL function that opens the keystore and modifies the master encryption key, ensure that the SQL statement containing the passphrase is not output to the server log file. To prevent this, consider setting a parameter such as `log_min_error_statement`. If you are executing this type of SQL function on a different computer from the database server, encrypt the communication between the client and the database server with SSL.

- Starting with FEP 10, logical replication is available, which allows non-backed up clusters to subscribe to databases where transparent data encryption is enabled. Logical replication does not need to have the same encryption strategy between publisher and subscriber. In this scenario, if the user wants to encrypt the subscribed copy of data as well, then it is the user’s responsibility to create encryption policies to the subscribed databases. By default, published encrypted tablespace data will not be encrypted in the subscriber side.

### 5.12 Tips for Installing Built Applications

With transparent data encryption, you can easily encrypt all the data in an application without modifying the application. Database administrators install built applications in the following manner. However, this procedure stores data to the default tablespace, so take necessary action if processing differs from the original design.

1. **(Normal procedure) Create an owner and a database for the built application.**
   ```sql
   CREATE USER crm_admin ...
   CREATE DATABASE crm_db ...
   ```

2. **(Procedure for encryption) Create an encrypted tablespace to store the data for the built application.**
   ```sql
   SET tablespace_encryption_algorithm = 'AES256';
   CREATE TABLESPACE crm_tablespace LOCATION 'C:\crm\data';
   ```

3. **(Procedure for encryption) Configure an encrypted tablespace as the default tablespace for the owner of the built application.**
   ```sql
   ALTER USER crm_admin SET default_tablespace = 'crm_tablespace';
   ALTER USER crm_admin SET temp_tablespaces = 'crm_tablespace';
   ```

4. **(Normal procedure) Install the built application.** The application installer prompts you to enter the host name and the port number of the database server, the user name, and the database name. The installer uses the entered information to connect to the database server and execute the SQL script. For applications that do not have an installer, the database administrator must manually execute the SQL script.

   Normally, the application's SQL script includes logic definition SQL statements, such as CREATE TABLE, CREATE INDEX, and GRANT or REVOKE, converted from the entity-relationship diagram. It does not include SQL statements that create databases, users, and tablespaces. Configuring the default tablespace of the users who will execute the SQL script deploys the objects generated by the SQL script to the tablespace.
Data masking is a feature that can change the returned data for queries generated by applications, so that it can be referenced by users. For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

When using this feature, it is recommended that the changed data be transferred to another medium for users to reference. This is because, if users directly access the database to extract the masked data, there is a possibility that they can deduce the original data by analyzing the masking policy or query result to the masking target column.

6.1 Masking Policy

Masking policy is a method of changing data under specific conditions when it is returned for a query from an application. One masking policy can be created per table. You can configure masking target, masking type, masking condition and masking format in a masking policy.

When a masking policy is defined, the search performance for the corresponding table may deteriorate.
6.1.1 Masking Target

Masking target refers to a column to which a masking policy will be applied. When referring to a masking target or a function that includes a masking target, the execution result will be changed and obtained.

The following commands can change the execution result:
- SELECT
- COPY
- pg_dump
- pg_dumpall

Note
- If a masking target is specified to INSERT...SELECT target columns, processing will be performed using data before change.
- If a masking target other than SELECT target columns is specified, processing will be performed using data before change.
- If a masking target is specified in a function where the data type will be converted, an error will occur.

6.1.2 Masking Type

Masking type is a method to change column data that is returned from queries. Specify the masking type in the function_type parameter. The following masking types can be specified and selected depending on the masking target data type.

Full masking
All the data in the specified column is changed. The changed value returned to the application that made the query varies depending on the column data type.
For example, 0 is used for a numeric type column and a space is used for a character type column.

Partial masking
The data in the specified column is partially changed.
For example, digits except the last four digits of an employee number can be changed to "*".

Regular expression masking
The data in the specified column is changed via a search that uses a regular expression.
For example, for strings such as email address that can have variable length, "*" can be used to change characters preceding "@" by using a regular expression. Regular expression masking can only be used for character type data.

Note
- If multiple valid masking targets are specified for a function, the masking type for the left-most masking target will be applied. For example, if "SELECT GREATEST(c1, c2) FROM t1" is executed for numeric type masking target c1 and c2, the masking type for c1 will be applied.
- When masking the data that includes multibyte characters, do not specify partial masking for masking type. The result may not be as expected.

6.1.3 Masking Condition

Masking condition refers to the conditions configured to perform masking. Specify the masking condition in the expression parameter. Changed or actual data can be displayed for different users by defining masking condition. An expression that returns a boolean type result needs to be specified in masking condition and masking is performed only when TRUE is returned. Refer to "Value Expressions" in the PostgreSQL Documentation for information on the expressions that can be specified. Note that expressions that include a column cannot...
be specified. For example, when masking data only for "postgres" users, specify `current_user = "postgres"` in the masking condition.

---

**Information**

Specify `1=1` so the masking condition is always evaluated to be TRUE and masking is performed all the time.

---

### 6.1.4 Masking Format

Masking format is a combination of change method and displayed characters when the masking condition is met. Masking format varies depending on the masking type. The following describes the masking format.

#### Full masking

With full masking, all characters are changed to values as determined by the database. Changed characters can be referenced in the `pgx_confidential_values` table. Also, replacement characters can be changed using the `pgx_update_confidential_values` system management function.

#### Partial masking

With partial masking, data is changed according to the content in the `function_parameters` parameter. The method of specifying `function_parameters` varies depending on the data type.

<table>
<thead>
<tr>
<th>Category</th>
<th>Method of specifying <code>function_parameters</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td><code>'replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify the number to display. Specify a value from 0 to 9.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the start position of masking. Specify a positive integer.</td>
</tr>
<tr>
<td></td>
<td>- <code>endPosition</code>: Specify the end position of masking. Specify a positive integer that is greater than <code>startPosition</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong></td>
</tr>
<tr>
<td></td>
<td>Specify as below to change the values from the 1st to 5th digits to 9.</td>
</tr>
<tr>
<td></td>
<td><code>function_parameters := '9, 1, 5'</code></td>
</tr>
<tr>
<td></td>
<td>In this example, if the original data is &quot;123456789&quot;, it will be changed to &quot;999996789&quot;.</td>
</tr>
<tr>
<td>Character type</td>
<td><code>'inputFormat, outputFormat, replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>inputFormat</code>: Specify the current format of the data. Specify &quot;V&quot; for characters that will potentially be masked, and specify &quot;F&quot; for values such as spaces or hyphens that will not be masked.</td>
</tr>
<tr>
<td></td>
<td>- <code>outputFormat</code>: Define the method to format the displayed data. Specify &quot;V&quot; for characters that will potentially be masked. Any character to be output can be specified for each character &quot;F&quot; in <code>inputFormat</code>. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify any single character. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the position of &quot;V&quot; as the start position of masking. For example, to specify the position of the 4th &quot;V&quot; from the left, specify 4. Specify a positive integer.</td>
</tr>
</tbody>
</table>
**Category Method of specifying function_parameters**

- **endPosition**: Specify the position of "V" as an end position of masking. When working out the end position, do not include positions of "F". For example, to specify the position of the 11th "V" from the left, specify 11. Specify a positive integer that is greater than startPosition.

**Example**

Specify as below to mask a telephone number other than the first three digits using *.

function_parameters := 'VVVFVVVVFVVV, VVV-VVVV-VVVV, *, 4, 11'

In this example, if the original data is "012-3156-7890", it will be changed to "012-****-****".

**Date/timestamp type** 'MDYHMS'

- **M**: Masks month. To mask month, enter the month from 1 to 12 after a lowercase letter m. Specify an uppercase letter M to not mask month.
- **D**: Masks date. To mask date, enter the date from 1 to 31 after a lowercase letter d. If a value bigger than the last day of the month is entered, the last day of the month will be displayed. Specify an uppercase letter D to not mask date.
- **Y**: Masks year. To mask year, enter the year from 1 to 9999 after a lowercase letter y. Specify an uppercase letter Y to not mask year.
- **H**: Masks hour. To mask hour, enter the hour from 0 to 23 after a lowercase letter h. Specify an uppercase letter H to not mask hour.
- **M**: Masks minute. To mask minute, enter the minute from 0 to 59 after a lowercase letter m. Specify an uppercase letter M to not mask minute.
- **S**: Masks second. To mask second, enter the second from 0 to 59 after a lowercase letter s. Specify an uppercase letter S to not mask second.

**Example**

Specify as below to mask hour, minute, and second and display 00:00:00.

function_parameters := 'MDYh0m0s0'

In this example, if the original data is "2010-10-10 10:10:10", it will be changed to "2010-10-10 00:00:00".

**See**

- Refer to "B.3.2 pgx_create_confidential_policy" for information on function_parameters.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

**Regular expression masking**

With regular expression masking, data is changed according to the content of the regexp_pattern, regexp_replacement and regexp_flags parameters. For regexp_pattern, specify the search pattern using a regular expression. For regexp_replacement, specify the replacement character to use when data matches the search pattern. For regexp_flags, specify the regular expression flags.

**Example**

Specify as below to change all three characters starting from b to X.

regexp_pattern := 'b..'
regexp_replacement := 'X'
regexp_flags := 'g'

In this example, if the original data is "foobarbaz", it will be changed to "fooXX".

See
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

Note
- When column data type is character\((n)\) or char\((n)\) and if the string length after change exceeds n, the extra characters will be truncated and only characters up to the nth character will be displayed.
- When column data type is character varying\((n)\) or varchar\((n)\) and if the string length after change exceeds the length before the change, the extra characters will be truncated and only characters up to the length before change will be displayed.

### 6.2 Usage Method

#### Preparation
The following preparation is required to use this feature.

1. Set the postgresql.conf file parameters.
   Prepend "pgx_datamasking" to the shared_preload_libraries parameter.
2. Restart the instance.
3. Execute CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

```
postgres=# CREATE EXTENSION pgx_datamasking;
CREATE EXTENSION
```

#### Note
You must always prepend "pgx_datamasking" to the "shared_preload_libraries" parameter.

#### Information
- Specify "false" for pgx_datamasking.enable to not use this feature. Data will not be masked even if a masking policy is configured. This feature becomes available again once "true" is specified for pgx_datamasking.enable. This setting can be made
by specifying a SET statement or specifying a parameter in the postgresql.conf file.

Example

```
postgres=# SET pgx_datamasking.enable=false;
```

- Hereafter, also perform this preparatory task for the "template1" database, so that this feature can be used by default when creating a new database.

---

**Usage**

To perform masking, a masking policy needs to be configured. The masking policy can be created, changed, confirmed, enabled, disabled, or deleted during operation.

The procedures to perform these tasks are explained below with examples.

1. Creating a masking policy
2. Changing a masking policy
3. Confirming a masking policy
4. Enabling and disabling a masking policy
5. Deleting a masking policy

---

**Note**

Only database superusers can configure masking policies.

---

### 6.2.1 Creating a Masking Policy

An example of the operation on the server is shown below.

1. Create a masking policy
   
   Execute the `pgx_create_confidential_policy` system management function to create a masking policy.
   
   The following values are configured in this example.
   - Masking target: Numeric type c1
   - Masking type: FULL
   - Masking condition: ‘1=1’

   ```
   postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
   expression := '1=1', column_name := 'c1', function_type := 'FULL');
   ```

2. Confirm the displayed data
   
   Confirm that the masking target data (column c1) has been correctly changed.

   ```
   postgres=# select * from t1;
   c1 | c2
   =-+=-=-=-=-+-----
   0 | 012-3456-7890
   0 | 012-3456-7891
   0 | 012-3456-7892
   ```

---

**See**

- Refer to "B.3.2 pgx_create_confidential_policy" for information on the `pgx_create_confidential_policy` system management function.
- Only one masking policy can be created per table.
- All users can view the masking policy created, so do not grant the login privilege of the database where this feature is set to the users who refer to the changed data. Masking policies are defined in the "pgx_confidential_columns", "pgx_confidential_policies" and "pgx_confidential_values" tables.

6.2.2 Changing a Masking Policy

1. An example of the operation on the server is shown below.

2. Change a masking policy
   Execute the pgx_alter_confidential_policy system management function to change a masking policy.
   The following values are changed in this example.
   - Content of change: Add a masking target
   - Masking target: Character type c2
   - Masking type: PARTIAL
   - Masking condition: 'VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11'

   postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1',
   action := 'ADD_COLUMN', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
   'VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11');

   pgx_alter_confidential_policy
   ---------------------------
   t
   (1 row)

3. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
   0 | 012-****-****
   0 | 012-****-****
   0 | 012-****-****
   (3 row)

See
- Refer to "B.3.1 pgx_alter_confidential_policy" for information on the pgx_alter_confidential_policy system management function.

6.2.3 Confirming a Masking Policy

An example of the operation on the server is shown below.

1. Confirm information about a masking target where a masking policy is set
   Refer to the pgx_confidential_columns table to confirm the masking target where the masking policy is set.

   postgres=# select * from pgx_confidential_columns;
   schema_name | table_name | policy_name | column_name | function_type | function_parameters | regexp_pattern | regexp_replacement | regexp_flags | column_description
   public | t1 | pl | c1 | FULL
   | | | | | | | | | |
2. Confirm information about the masking policy content
   Refer to `pgx_confidential_policies` to confirm the masking policy content.
   
   ```sql
   postgres=# select * from pgx_confidential_policies;
   ```

<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>expression</th>
<th>enable</th>
<th>policy_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>1=1</td>
<td>t</td>
<td></td>
</tr>
<tr>
<td>(1 row)</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

   - Refer to "D.1 pgx_confidential_columns" for information on the `pgx_confidential_columns` table.
   - Refer to "D.2 pgx_confidential_policies" for information on the `pgx_confidential_policies` table.

### 6.2.4 Enabling and Disabling a Masking Policy

An example of the operation on the server is shown below.

1. **Disable a masking policy**
   Execute the `pgx_enable_confidential_policy` system management function to disable a masking policy.

   ```sql
   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 'f');
   ```

   ```
   pgx_enable_confidential_policy  
   t  
   (1 row)
   ```

2. **Confirm the displayed data**
   Confirm that the original data is displayed by disabling the masking policy.

   ```sql
   postgres=# select * from t1;
   ```

<table>
<thead>
<tr>
<th>c1</th>
<th>c2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>012-3456-7890</td>
</tr>
<tr>
<td>2</td>
<td>012-3456-7891</td>
</tr>
<tr>
<td>3</td>
<td>012-3456-7892</td>
</tr>
<tr>
<td>(3 row)</td>
<td></td>
</tr>
</tbody>
</table>

3. **Enable a masking policy**
   Execute the `pgx_enable_confidential_policy` system management function to enable a masking policy.

   ```sql
   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');
   ```

   ```
   pgx_enable_confidential_policy  
   t  
   (1 row)
   ```

4. **Confirm the displayed data**
   Confirm that the masking target data has been correctly changed.

   ```sql
   postgres=# select * from t1;
   ```

<table>
<thead>
<tr>
<th>c1</th>
<th>c2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>012-<strong><strong>-</strong></strong></td>
</tr>
<tr>
<td>0</td>
<td>012-<strong><strong>-</strong></strong></td>
</tr>
<tr>
<td>(2 row)</td>
<td></td>
</tr>
</tbody>
</table>
See

- Refer to "B.3.4 pgx_enable_confidential_policy" for information on the pgx_enable_confidential_policy system management function.

6.2.5 Deleting a Masking Policy

An example of the operation on the server is shown below.

1. Delete a masking policy
   Execute the pgx_drop_confidential_policy system management function to delete a masking policy.

   ```
   postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
   pgx_drop_confidential_policy
   --------------------------
   t
   (1 row)
   ```

2. Confirm the displayed data
   Confirm that the original data is displayed by deleting the masking policy.

   ```
   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
   1 | 012-3456-7890
   2 | 012-3456-7891
   3 | 012-3456-7892
   (3 row)
   ```

See

- Refer to "B.3.3 pgx_drop_confidential_policy" for information on the gx_drop_confidential_policy function.

6.3 Data Types for Masking

The data types for which data masking can be performed are shown below.

<table>
<thead>
<tr>
<th>Category</th>
<th>Data type</th>
<th>Masking type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Full masking</td>
</tr>
<tr>
<td>Numeric type</td>
<td>smallint</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>integer</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>bigint</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>decimal</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>numeric</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>float</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>real</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>double precision</td>
<td>Y</td>
</tr>
<tr>
<td>Category</td>
<td>Data type</td>
<td>Full masking</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Character type</td>
<td>character varying(n)</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>varchar(n)</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>character(n)</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>char(n)</td>
<td>Y</td>
</tr>
<tr>
<td>Date/timestamp type</td>
<td>date</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>timestamp</td>
<td>Y</td>
</tr>
</tbody>
</table>

### 6.4 Security Notes

- Starting with FEP 10, logical replication is available, which allows non-backed up clusters to subscribe to databases where data masking policies are enabled. Logical replication allows publisher and subscriber databases to have their own or the same data masking policies. In this scenario, the user must disable data masking on the publisher database whenever a subscription is created. This ensures that subscribers are able to obtain the original data (initial copy) instead of the masked version. Then, it is the user's responsibility to set masking policies to each subscribed database.

- Take strong caution in publishing data masking's confidential tables (pgx_confidential_policies, pgx_confidential_columns, etc.) unless the user is publishing all tables of the database and wants to apply the same data masking’s policies on the subscribed database for all of them.

Otherwise, as these confidential tables contain the masking policies for all tables of the database, confidential policies of unpublished tables may be unintentionally published. Additionally, it is not possible to apply different data masking policies on the subscriber database.
Chapter 7 Periodic Operations

This chapter describes the operations that must be performed periodically when running daily database jobs.

7.1 Configuring and Monitoring the Log

FUJITSU Enterprise Postgres enables you to output database errors and warnings to a log file. This information is useful for identifying if errors have occurred and the causes of those errors.

By default, this information is output to the event log. It is recommended that you configure FUJITSU Enterprise Postgres to collect logs from its log files (for example, log_destination) before operating FUJITSU Enterprise Postgres.

Periodically monitor the log files to check if any errors have occurred.

See

- Refer to "Error Reporting and Logging" under "Server Administration" in the PostgreSQL Documentation for information on logs.
- Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on log settings when operating with WebAdmin.

7.2 Monitoring Disk Usage and Securing Free Space

When a database is used for an extended period, free space on the disk is continuously consumed and in some cases the disk space runs out. When this happens, database jobs may stop and no longer run.

You should, therefore, periodically monitor the usage of disk space, and delete obsolete files located in the disk.

Monitor the disk usage of the disk where the following directories are located:

- Data storage destination directory
- Transaction log storage destination (if the transaction log is stored in a different directory from the data storage destination directory)
- Backup data storage destination directory
- Tablespace storage destination directory

7.2.1 Monitoring Disk Usage

To check the disk usage, use the following operating system commands:

- fsutil volume diskfree command

You can even use SQL statements to check tables and indexes individually.

Refer to "Determining Disk Usage" under "Server Administration" in the PostgreSQL Documentation for information on this method.

Information

If you are using WebAdmin for operations, a warning is displayed when disk usage reaches 80%.

7.2.2 Securing Free Disk Space

Secure free disk space by using the following operating system commands to delete unnecessary files, other than the database, from the same disk unit.

- del command

You can also secure disk space by performing the following tasks periodically:
To secure space on the data storage destination disk:
Execute the REINDEX statement. Refer to "7.5 Reorganizing Indexes" for details.

To secure space on the backup data storage destination disk:
Execute backup using WebAdmin or the pgx_dmpall command.

### 7.3 Automatically Closing Connections

If an application stops responding and abnormally terminates for any reason, the connection from the application may remain active on the database server. If this situation continues for an extended period, other applications attempting to connect to the database server may encounter an error, or an error indicating that the tables are unavailable may occur.

It is, therefore, recommended that idle connections be closed automatically at regular intervals.

Set the following parameters in the postgresql.conf file to indicate the time permitted to elapse before a connection is closed.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp_keepalives_idle</td>
<td>Time until keepalive is sent (seconds)  If 0, the default value of the system is used.</td>
<td>Sends keepalive to an idle connection at the specified interval in seconds It is recommended to specify 30 seconds.</td>
</tr>
<tr>
<td>tcp_keepalives_interval</td>
<td>keepalive send interval (seconds)  If 0, the default value of the system is used.</td>
<td>Sends keepalive at the specified interval It is recommended to specify 6 seconds.</td>
</tr>
</tbody>
</table>

**Note**
The maximum number of connections allowed is 125, unless the desktop heap setting is changed.

**See**
Refer to "Connection Settings" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

### 7.4 Monitoring the Connection State of an Application

FUJITSU Enterprise Postgres does not immediately delete the updated or deleted data. If the VACUUM determines there are no transactions that reference the database, FUJITSU Enterprise Postgres collects obsolete data. However, obsolete data is not collected if there are connections that have remained active for an extended period or connections occupying resources. In this case the database may expand, causing performance degradation.

**See**
Refer to "Routine Vacuuming" under "Server Administration" in the PostgreSQL Documentation for information on the VACUUM command.

In such cases, you can minimize performance degradation of the database by monitoring problematic connections.

The following methods are supported for monitoring connections that have been in the waiting status for an extended period:

- 7.4.1 Using the View (pg_stat_activity)
- 7.4.2 Using pgAdmin
7.4.1 Using the View (pg_stat_activity)

Use the view (pg_stat_activity) to identify and monitor connections where the client has been in the waiting status for an extended period.

**Example**

The example below shows connections where the client has been in the waiting status for at least 60 minutes.

However, when considering continued compatibility of applications, do not reference system catalogs directly in the following SQL statements.

```sql
postgres=# select * from pg_stat_activity where state='idle in transaction' and current_timestamp >
cast(query_start + interval '60 minutes' as timestamp);
```

<table>
<thead>
<tr>
<th>datid</th>
<th>13003</th>
</tr>
</thead>
<tbody>
<tr>
<td>datname</td>
<td>db01</td>
</tr>
<tr>
<td>pid</td>
<td>4638</td>
</tr>
<tr>
<td>leader_pid</td>
<td></td>
</tr>
<tr>
<td>usesysid</td>
<td>10</td>
</tr>
<tr>
<td>usename</td>
<td>fsep</td>
</tr>
<tr>
<td>application_name</td>
<td>apl01</td>
</tr>
<tr>
<td>client_addr</td>
<td>192.33.44.15</td>
</tr>
<tr>
<td>client_start</td>
<td>2020-02-24 09:09:21.730641+09</td>
</tr>
<tr>
<td>xact_start</td>
<td>2020-02-24 09:09:23.858727+09</td>
</tr>
<tr>
<td>query_start</td>
<td>2020-02-24 09:09:23.858727+09</td>
</tr>
<tr>
<td>state_change</td>
<td>2020-02-24 09:09:23.858834+09</td>
</tr>
<tr>

</tr>
</tbody>
</table>
```

**See**

- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

- Refer to "The Statistics Collector" under "Server Administration" in the PostgreSQL Documentation for information on pg_stat_activity.

7.4.2 Using pgAdmin

This section describes the procedure for monitoring connections using [Server Status] in pgAdmin.

1. In the [Browser] pane, click the database server for monitoring.
2. In the [Dashboard] tab, identify client connections that have been in the waiting state for an extended period.

7.5 Reorganizing Indexes

Normally, a database defines indexes in tables, but if data is frequently updated, indexes can no longer use free space in the disk efficiently. This situation can also cause a gradual decline in database access performance. To rearrange used space on the disk and prevent the database access performance from declining, it is recommended that you periodically execute the REINDEX command to reorganize indexes.

Check the disk usage of the data storage destination using the method described in "7.2 Monitoring Disk Usage and Securing Free Space".

**Note**

Because the REINDEX command retrieves the exclusive lock for an index being processed and locks writing of tables that are the source of the index, other processes that access these may stop while waiting to be locked.

Therefore, it is necessary to consider measures such as executing the command after the task is completed.

**See**

Refer to "Routine Reindexing" under "Server Administration" in the PostgreSQL Documentation for information on reorganizing indexes by periodically executing the REINDEX command.

**Point**

Typically, reorganize indexes once a month at a suitable time such as when conducting database maintenance. Use SQL statements to check index usage. If this usage is increasing on a daily basis, adjust the frequency of recreating the index as compared to the free disk space.

The following example shows the SQL statements and the output.

However, when considering continued compatibility of applications, do not reference system catalogs and functions directly in the following SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.
[SQL statements]

```sql
SELECT
    nspname AS schema_name,
    relname AS index_name,
    round(100 * pg_relation_size(indexrelid) / pg_relation_size(indrelid)) / 100 AS index_ratio,
    pg_size_pretty(pg_relation_size(indexrelid)) AS index_size,
    pg_size_pretty(pg_relation_size(indrelid)) AS table_size
FROM pg_index I
    LEFT JOIN pg_class C ON (C.oid = I.indexrelid)
    LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE
    C.relkind = 'i' AND
    pg_relation_size(indrelid) > 0
ORDER BY pg_relation_size(indexrelid) DESC, index_ratio DESC;
```

<table>
<thead>
<tr>
<th>schema_name</th>
<th>index_name</th>
<th>index_ratio</th>
<th>index_size</th>

<td></td>
</tr>
</tbody>
</table>

---

See Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

### 7.6 Monitoring Database Activity

FUJITSU Enterprise Postgres enables you to collect information related to database activity. By monitoring this information, you can check changes in the database status.

This information includes wait information for resources such as internal locks, and is useful for detecting performance bottlenecks. Furthermore, you should collect this information in case you need to request Fujitsu technical support for an investigation.

**Figure 7.1 Overview of information collection**

- **Work hours**
  - 0:00
  - 9:00
  - 18:00

- **After hours**
  - 21:00
  - 23:59

1. Collect statistics at a fixed intervals
   (for example, every 10 minutes)
2. Reset statistics
3. Save the file with collected information

Collect the information using a single transaction
For example: transaction information, replication information, WAIT information, connection information, table information, conflict information, DB I/O information, WAL I/O information, checkpoint information, vacuum information
1. Collect statistics at fixed intervals during work hours.
   Accumulate the collected information into a file.
   Wherever possible, collect data from the various statistics views using a single transaction, because it enables you to take a snapshot of system performance at a given moment.
   Refer to "7.6.1 Information that can be Collected" for information on the system views that can be collected.

2. Reset statistics after work hours, that is, after jobs have finished.
   Refer to "7.6.3 Information Reset" for information on how to reset statistics.

3. Save the file with collected information.
   Keep the file with collected information for at least two days, in order to check daily changes in performance and to ensure that the information is not deleted until you have sent a query to Fujitsu technical support.
   Where jobs run 24 hours a day, reset statistics and save the file with collected information when the workload is low, for example, at night.

Note
Statistics cumulatively add the daily database value, so if you do not reset them, the values will exceed the upper limit, and therefore will not provide accurate information.

The subsections below explain the following:
- Information that can be collected
- Collection configuration
- Information reset

7.6.1 Information that can be Collected
Information that can be collected is categorized into the following types:
- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

Information common to PostgreSQL
See
Refer to "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on information common to PostgreSQL.

Information added by FUJITSU Enterprise Postgres
You can collect the following information added by FUJITSU Enterprise Postgres.

Table 7.1 Information added by FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>View name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>Displays statistic related to lightweight lock, with each type of content displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.2 pgx_stat_lwlock&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>Displays statistics related latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.3 pgx_stat_latch&quot; for details.</td>
</tr>
</tbody>
</table>
### View name | Description
---|---
pgx_stat_walwriter | Displays statistics related to WAL writing, in a single line. Refer to "C.4 pgx_stat_walwriter" for details.
pgx_stat_sql | Displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line. Refer to "C.5 pgx_stat_sql" for details.
pgx_stat_gmc | Displays statistics related to Global Meta Cache hit ration and used memory size. Refer to “C.6 pgx_stat_gmc” for detail. Also refer to Chapter 12 Global Meta Cache for information on the Global Meta Cache.

### 7.6.2 Collection Configuration
The procedure for configuring collection depends on the information content.

- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

#### Information common to PostgreSQL

See

Refer to "The Statistics Collector" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on information common to PostgreSQL.

#### Information added by FUJITSU Enterprise Postgres

Information added by FUJITSU Enterprise Postgres is collected by default.

To enable or disable information collection, change the configuration parameters in postgresql.conf. The following table lists the views for which you can enable or disable information collection, and the configuration parameters.

<table>
<thead>
<tr>
<th>View name</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>track_waits (*1)</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td></td>
</tr>
<tr>
<td>pgx_stat_sql</td>
<td>track_sql</td>
</tr>
<tr>
<td>pgx_stat_gmc</td>
<td>track_gmc</td>
</tr>
</tbody>
</table>

Remarks: You cannot change the collection status for pgx_stat_walwriter.

*1: When executing the SQL statement with EXPLAIN ANALYZE, processing time may increase because of this information collection. It is recommended to set this parameter to "off" when executing EXPLAIN ANALYZE to check the processing time.

Refer to "Appendix A Parameters" for information on the parameters.

### 7.6.3 Information Reset
This section describes how to reset information.

#### Information added by FUJITSU Enterprise Postgres

You can reset information added by FUJITSU Enterprise Postgres by using the pg_stat_reset_shared function in the same way as for information common to PostgreSQL.

Configure the following parameters in the pg_stat_reset_shared function:
<table>
<thead>
<tr>
<th>Function</th>
<th>Type of return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pg_stat_reset_shared(text)</td>
<td>void</td>
<td>Reset some cluster-wide statistics counters to zero, depending on the argument (requires superuser privileges). Calling <code>pg_stat_reset_shared('lwlock')</code> will zero all counters shown in <code>pgx_stat_lwlock</code>. Similarly, in the following cases, all values of the pertinent statistics counter are reset:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('latch')</code> is called: All values displayed in <code>pgx_stat_latch</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('walwriter')</code> is called: All values displayed in <code>pgx_stat_walwriter</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('sql')</code> is called: All values displayed in <code>pgx_stat_sql</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If <code>pg_stat_reset_shared('gmc')</code> is called: All values except size column in <code>pgx_stat_gmc</code></td>
</tr>
</tbody>
</table>

See

Refer to "Statistics Functions" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on other parameters of the `pg_stat_reset_shared` function.
Chapter 8 Streaming Replication Using WebAdmin

This chapter describes how to create a streaming replication cluster using WebAdmin.

Streaming replication allows the creation of one or more standby instances, which connect to the master instances and replicate the data using WAL records. The standby instance can be used for read-only operations.

WebAdmin can be used to create a streaming replication cluster. WebAdmin allows the creation of a cluster in the following configurations:

- Master-Standby Configuration: This configuration creates a master and standby instance together.
- Standby Only Configuration: This configuration creates a standby instance from an already existing instance.

**Point**

- A standby instance can be created from a standalone instance, a master instance, or even from another standby instance.
- If a streaming replication cluster is created using WebAdmin, the network with the host name (or IP address) specified in [Host name] will be used across sessions of WebAdmin, and also used as the log transfer network.
- To use a network other than the job network as the log transfer network, specify the host name other than the job network one in [Host name].

8.1 Creating a Standby Instance

Follow the procedure below to create a standby instance.

1. In the [Instances] tab, select the instance from which a standby instance is to be created.
2. Click 
3. Enter the information for the standby instance to be created. In the example below, a standby instance is created from instance “inst1”.

   The instance name, host address and port of the selected instance are already displayed for easy reference.

   ![Create Instance](image)

   Enter the following items:

   - [Location]: Whether to create the instance in the server that the current user is logged in to, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.
- [Replication credential]: The user name and password required for the standby instance to connect to the master instance. The user name and password can be entered or selected from the Wallet. Refer to “Appendix G WebAdmin Wallet” for information on creating wallet entries.

- [Instance name]: Name of the standby database instance to create. The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- [Instance port]: Port number of the standby database instance.

- [Host IP address]: The IP address of the server machine where the standby instance is to be created. This information is needed to configure the standby instance to be connected to the master.

- [Data storage path]: Directory where the database data will be stored

- [Backup storage path]: Directory where the database backup will be stored

- [Transaction log path]: Directory where the transaction log will be stored

- [Encoding]: Database encoding system

- [Replication mode]: Replication mode of the standby instance to be created ("Asynchronous“ or “Synchronous“)

- [Application name]: The reference name of the standby instance used to identify it to the master instance. The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

4. Click to create the standby instance.

5. Once the standby instance is created successfully, select standby instance in the [Instances] tab. The following page will be displayed:
- Backups are not possible for standby instances in WebAdmin. As a result, and are disabled and no value is shown for [Backup storage status] and [Backup time].

- If using WebAdmin to manage Mirroring Controller, the message below may be output to the server log or system log in the standby instance. No action is required, as the instance is running normally.

```
ERROR:  pgx_rcvall failed (16491)
ERROR:  pgx_rcvall: backup of the database has not yet been performed, or an incorrect backup storage directory was specified
```

- Replication credential (user name and password) should not contain hazardous characters. Refer to “Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters”.

---

**8.2 Promoting a Standby Instance**

Streaming replication between a master and standby instance can be discontinued using WebAdmin.

Follow the procedure below to promote a standby instance to a standalone instance, thereby discontinuing the streaming replication.

1. In the [Instances] tab, select the standby instance that needs to be promoted.
2. Click .
3. Click [Yes] from the confirmation dialog box.

The standby instance will be promoted and will become a standalone instance, which is not part of a streaming replication cluster.

Once the standby instance is promoted to become a standalone instance, the backup storage status will be "Error". This is because no backups are available when the instance is newly promoted to a standalone instance. The status will be reset if a new backup is performed by clicking [Solution] or .

---

**8.3 Converting an Asynchronous Replication to Synchronous**

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert an Asynchronous standby instance to Synchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.
2. Click .
3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Add the "Application name" of the standby instance you want to be in Synchronous mode.
4. Click .
5. Select the master instance and click .
6. Select the standby instance. [Instance type] will now show the updated status.

---

**Note**

- Converting an Asynchronous standby instance to Synchronous can cause the master instance to queue the incoming transactions until the standby instance is ready. For this reason, it is recommended that this operation be performed during a scheduled maintenance period.
- When adding a synchronous standby instance, FUJITSU Enterprise Postgres will only keep the first entry in [Synchronous standby names] in synchronous state.
To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.

8.4 Converting a Synchronous Replication to Asynchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous Mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert a Synchronous standby instance to Asynchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.

2. Click ✓.

3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Remove the “Application name” of the standby instance you want to be in Asynchronous mode.

4. Click ✓.

5. Select the master instance and click ✓.

6. Select the standby instance. [Instance type] will now show the updated status.

Note

To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.

8.5 Joining a Replication Cluster

WebAdmin facilitates the joining of an old master of the cluster as a standby node.

1. In the [Instances] tab, select the remote instance (from where the new cluster node will stream WAL entries), and then click ✓.

2. Configure the node to accept streaming requests from the new node.

3. In the [Instances] tab, select the new standby instance (which needs to be connected to the cluster), and then click ✓.

4. Set [Replication host name] to the remote instance.

5. Enter [Replication credential].
   - Specify the user name and password required for the standby instance to connect to the remote instance. The user name and password can be entered or selected from the Wallet. Refer to “Appendix G WebAdmin Wallet” for information on creating wallet entries. Replication credential (user name and password) should not contain hazardous characters. Refer to “Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters”.

6. Enter [Host IP address].
   - Specify the IP address of the node where the standby instance was created.

7. Click ✓ to open the [Join replication cluster] dialog box.
   - For FUJITSU Enterprise Postgres 12 and earlier instances, select [Restart later] or [Restart now], and then click [Yes] to set up the standby instance.
   - For FUJITSU Enterprise Postgres 13, click [Yes] or [Restart now], and then click [Yes] to set up the standby instance.

8. Upon successful completion, the confirmation dialog box will be displayed.

9. Click [Close] to return to the instance details window.
The instance will become a standby instance, and will be part of the streaming replication cluster. The replication diagram will display the relationship between the standby instance and the remote instance. The user can change the replication relationship of the remote instance from asynchronous to synchronous (and vice versa) using the [Configuration] window.
Chapter 9 Installing and Operating the In-memory Feature

The in-memory feature enables fast aggregation using Vertical Clustered Index (VCI) and memory-resident feature.

VCI has a data structure suitable for aggregation, and features parallel scan and disk compression, which enable faster aggregation through reduced disk I/O.

The memory-resident feature reduces disk I/O that occurs during aggregation. It consists of the preload feature that reads VCI data to memory in advance, and the stable buffer feature that suppresses VCI data eviction from memory. The stable buffer feature secures the proportion specified by parameter in the shared memory for VCI.

This chapter describes how to install and operate the in-memory feature.

Note

This feature can only be used in Advanced Edition.

9.1 Installing Vertical Clustered Index (VCI)

This section describes the installation of VCI.

1. Evaluating whether to Install VCI
2. Estimating Resources
3. Setting up

9.1.1 Evaluating whether to Install VCI

VCI uses available resources within the server to increase scan performance.

It speeds up processing in many situations, and can be more effective in the following situations:

- Single table processing
- Processing that handles many rows in the table
- Processing that handles some columns in the table
- Processing that performs very heavy aggregation such as simultaneous sum and average aggregation

VCI will not be used in the following cases, so it is necessary to determine its effectiveness in advance:

- The data type of the target table or column contains VCI restrictions.
- The SQL statement does not meet the VCI operating conditions
- VCI is determined to be slower based on cost estimation

Note

If performing operations that use VCI, the full_page_writes parameter setting in postgresql.conf must be enabled (on). For this reason, if this parameter is disabled (off), operations that use VCI return an error. In addition, to perform operations for tables that do not create a VCI when the full_page_writes parameter setting is temporarily disabled (off), do not create a VCI or perform operations to tables that created a VCI during that time.

See

- Refer to "9.1.4 Data that can Use VCI" for information on VCI restrictions.
9.1.2 Estimating Resources

Estimate resources before setting up VCI.

Select the aggregation that you want to speed up and identify the required column data. The additional resources below are required according to the number of columns.

- **Memory**
  Secure additional capacity required for the disk space for the column for which VCI is to be created.

- **Disk**
  Secure additional disks based on the disk space required for the column for which VCI is to be created, as VCI stores column data as well as existing table data on the disk. It is recommended to provide a separate disk in addition to the existing one, and specify it as the tablespace to avoid impact on any other jobs caused by I/O.

**Information**

The operations on VCI can continue even if the memory configured for VCI is insufficient by using VCI data on the disk.

**See**

9.1.3 Setting up

This section describes how to set up VCI.

**Setup flow**

1. **Setting Parameters**
2. **Installing the Extensions**
3. **Creating VCI**
4. **Confirming that VCI has been Created**

9.1.3.1 Setting Parameters

Edit postgresql.conf to set the required parameters for VCI. After that, start or restart the instance.

The following table lists the parameters that need or are recommended to be configured in advance:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at server start.</td>
<td>Y</td>
</tr>
<tr>
<td>session_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at connection start.</td>
<td>Y</td>
</tr>
<tr>
<td>reserve_buffer_ratio</td>
<td>Percentage of shared memory to be used for stable buffer table</td>
<td>Proportion of shared memory to be used for a stable buffer table.</td>
<td>N</td>
</tr>
</tbody>
</table>
### Parameter List

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>vci.control_max_workers</td>
<td>Number of background workers that manage VCI.</td>
<td>Number of background workers that manage VCI. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of background workers used for parallel scan.</td>
<td>Maximum number of background workers used for parallel scan. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.smc_directory</td>
<td>Directory name in which a temporary file is created as the dynamic shared memory</td>
<td>Directory name in which a temporary file is created as the dynamic shared memory during a scan using a VCI.</td>
<td>N</td>
</tr>
</tbody>
</table>

#### Example

```
shared_preload_libraries = 'vci, pg_prewarm'
session_preload_libraries = 'vci, pg_prewarm'
reserve_buffer_ratio = 20
vci.control_max_workers = 8
vci.max_parallel_degree = 4
max_worker_processes = 18 # Example: If the initial value was 6, 6 + 8 + 4 = 18
vci.smc_directory = 'E:\vci\work'
```

#### Note

- If performing operations that use VCI, do not delete the shared library names specified to "shared_preload_libraries" and "session_preload_libraries". If operations that access VCI are performed after the VCI was defined, unexpected behavior may occur.

#### See

- Refer to "Appendix A Parameters" for information on all parameters for VCI. Refer also to default value for each parameter and details such as specification range in the same chapter. Refer to "Server Configuration" under "Server Administration" in the PostgreSQL documentation for information on shared_preload_libraries, session_preload_libraries, and max_worker_processes.

### 9.1.3.2 Installing the Extensions

Execute CREATE EXTENSION to install the VCI and pg_prewarm extensions. Both extensions need to be installed for each database.

- Installing VCI

  ```sql
db01=# CREATE EXTENSION vci;
  ```

- Installing pg_prewarm

  ```sql
db01=# CREATE EXTENSION pg_prewarm;
  ```

#### Note

- Only superusers can install VCI extensions.
- VCI extensions can only be installed in public schema.
- Some operations cannot be performed for VCI extensions. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
9.1.3.3 Creating a VCI

Execute the CREATE INDEX statement with the "USING vci" clause to create a VCI for the desired columns and the "WITH (stable_buffer=true)" clause to enable the stable buffer feature.

To use a separate disk for the VCI, specify the TABLESPACE clause.

```
db01=# CREATE INDEX idx_vci ON table01 USING vci (col01, col02) WITH (stable_buffer=true);
```

**Note**

- Some table types cannot be specified on the ON clause of CREATE INDEX. Refer to "9.1.4.1 Relation Types" for details.
- Some data types cannot be specified on the column specification of CREATE INDEX. Refer to "9.1.4.2 Data Types" for details.
- Some operations cannot be performed for VCI. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
- The same column cannot be specified more than once on the column specification of CREATE INDEX.
- VCI cannot be created for table columns that belong to the template database.
- CREATE INDEX creates multiple views named vci_10digitRelOid_5digitRelAttr_1charRelType alongside VCI itself. These are called VCI internal relations. Do not update or delete them as they are used for VCI aggregation.
- All data for the specified column will be replaced in columnar format when VCI is created, so executing CREATE INDEX on an existing table with data inserted takes more time compared with a general index (B-tree). Jobs can continue while CREATE INDEX is running.
- When CREATE INDEX USING VCI is invoked on a partitioned table, the default behavior is to recurse to all partitions to ensure they all have matching indexes. Each partition is first checked to determine whether an equivalent index already exists, and if so, that index will become attached as a partition index to the index being created, which will become its parent index. If no matching index exists, a new index will be created and automatically attached; the name of the new index in each partition will be determined as if no index name had been specified in the command. If the ONLY option is specified, no recursion is done, and the index is marked invalid. (ALTER INDEX ... ATTACH PARTITION marks the index valid, once all partitions acquire matching indexes.) Note, however, that any partition that is created in the future using CREATE TABLE ... PARTITION OF will automatically have a matching index, regardless of whether ONLY is specified.
- Parallel index build is not supported on VCI indexes.

9.1.3.4 Confirming that the VCI has been Created

Execute the SELECT statement to reference the pg_indexes catalog, and confirm that the VCI was created for the target columns.

```
db01=# SELECT indexdef FROM pg_indexes WHERE indexdef LIKE '%vci%';
indexdef
----------------------------------------------------------
CREATE INDEX idx_vci ON table01 USING vci (col01, col02)
(1 row)
```

9.1.4 Data that can Use VCI

This section describes on which relation types and for which data types VCIs can be created.

9.1.4.1 Relation Types

VCIs cannot be created on some relation types.

The ON clause of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify relations on which VCIs cannot be created.
- Relations on which VCIs can be created
  - Normal tables
  - UNLOGGED TABLEs
- Relations on which VCIs cannot be created
  - Materialized views
  - Temporary tables
  - Views
  - Temporary views
  - Foreign tables

### 9.1.4.2 Data Types

VCIs cannot be created for some data types.

The column specification of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify a column with data type on which VCIs cannot be created.

9.2 Operating VCI

This section describes how to operate VCI.

9.2.1 Commands that cannot be Used for VCI

Some operations cannot be performed for VCI extensions and VCI itself.

This section describes SQL commands that cannot be executed for the VCI extensions and VCI itself, and client application commands.

**SQL commands**

- Operations that cannot be performed for the VCI extension

<table>
<thead>
<tr>
<th>Command</th>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER EXTENSION</td>
<td>UPDATE</td>
<td>The VCI extension cannot be specified.</td>
</tr>
<tr>

</table>

**Client application command**
- Operations that cannot be performed on relations containing a VCI

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterdb</td>
<td>Clustering cannot be performed for tables that contain a VCI.</td>
</tr>
<tr>
<td>reindexdb</td>
<td>VCIs cannot be specified on the --index option.</td>
</tr>
</tbody>
</table>

**9.2.2 Data Preload Feature**

The first aggregation using VCI immediately after an instance is started may take time, because the VCI data has not been loaded to buffer. Therefore, use the preload feature to load the VCI data to buffer in advance when performing VCI aggregation after an instance is started. When using the preload feature, execute the function pgx_prewarm_vci to each VCI created with CREATE INDEX.

db01=# SELECT pgx_prewarm_vci('idx_vci');
See Refer to "B.4 VCI Data Load Control Function" for information on pgx_prewarm_vci.
Chapter 10 Parallel Query

FUJITSU Enterprise Postgres enhances parallel queries, by taking into consideration the aspects below:

- CPU load calculation
- Increase of workers during runtime

10.1 CPU Load Calculation

There may be a case when the user tries to execute a parallel query but there is not enough CPU available. Adding dynamic workers at this stage will provide no benefits - instead, it may add overhead due to context switching. FUJITSU Enterprise Postgres takes into consideration the current CPU load when deciding on the number of workers for parallel query.

10.2 Increase of Workers during Runtime

This FUJITSU Enterprise Postgres enhancement allows systems to allocate additional workers during query execution (if there are workers available at the time). This improves query performance, which could otherwise starve of CPU if there were fewer or no workers when the query started.

Note

The ability to increase workers during runtime is available only with parallel sequence scan.
Chapter 11 High-Speed Data Load

High-speed data load uses the pgx_loader command to load data from files at high speed into FUJITSU Enterprise Postgres.

Note
- This feature is available only in the Advanced Edition.
- This feature is not available in single-user mode. This is because in single-user mode instances run in a single process, and it cannot start parallel workers.

11.1 Installing High-Speed Data Load

This section describes how to install high-speed data load.

Installation flow
1. Deciding whether to Install
2. Estimating Resources
3. Setup

11.1.1 Deciding whether to Install

The feature achieves high speed data load by executing the COPY FROM command in parallel. If the database system is unable to use sufficient resources due to the feature using more resources than the COPY FROM command of PostgreSQL, load performance may be inferior to that of the COPY FROM command of PostgreSQL. Therefore, determine if the feature will be effective by considering the factors below before deciding to install.

Database server memory
If the value of shared_buffers in postgresql.conf is small, fewer data pages are cached to the shared memory of the database server. This will result in multiple parallel workers more often having to wait for write exclusive locks to the same data page. Moreover, the smaller the number of data pages, the more often the table expands. During table expansion, access to the table is exclusive (standby event name: extend), so write time increases. To cater for that, increase the value of shared_buffers.

See
The standby event name is stored in the wait_event column of the pg_stat_activity view. Refer to "wait_event Description" in "The Statistics Collector" in the PostgreSQL Documentation for details.

Frequency of checkpoints
If checkpoints are issued at short intervals, write performance is reduced. If the messages below are output to the server log during data writes, increase the values of max_wal_size and checkpoint_timeout in postgresql.conf to reduce the frequency of checkpoints.

Example
LOG: checkpoints are occurring too frequently (19 seconds apart)
HINT: Consider increasing the configuration parameter "max_wal_size".

11.1.2 Estimating Resources

Estimate the memory requirements for high-speed data load.
Up to 128 parallel workers to perform data load can be specified for this feature. The additional resources below are required depending on the number of parallel workers.

- Dynamic shared memory created during data load

The feature creates shared memory and shared memory message queues during data load. These are used to send external data from the back end to the parallel workers, and for error notifications.

**Note**

If the value of sharedBuffers in postgresql.conf is small, the system will often have to wait for write exclusive locks to the same data page (as described in "Database server memory" in "11.1.1 Deciding whether to Install"). Since input data cannot be loaded from the shared memory message queues during such waits, they will often be full. In these cases, it will not be possible to write to the shared memory message queues, resulting in degraded data load performance.

---

**11.1.3 Setup**

This section describes how to set up high-speed data load.

**Setup flow**

1. Setting Parameters
2. Installing the Extension

**11.1.3.1 Setting Parameters**

Set the parameters required for high-speed data load in postgresql.conf. After that, start or restart the instance.

The table below lists the postgresql.conf parameters that must be changed, and the values that must be added to their current values. After editing postgresql.conf, start or restart the instance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_prepared_transactions</td>
<td>Add the number of transactions that can be prepared by parallel workers during data load to the parameter's current value. The resulting value must be equal to or greater than the maximum number of parallel workers used with this feature.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>max_worker_processes</td>
<td>Number of parallel workers to perform data load.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>max_parallel_workers</td>
<td>Add the maximum number of parallel workers to be used in a parallel query by this feature to the parameter's current value. The resulting value must be equal to or greater than the number of parallel workers used with this feature.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

**Example**

The example below shows how to configure 2 instances of high-speed data load being executed simultaneously using a degree of parallelism of 4.
max_prepared_transactions = 13  #Example if the initial value was 5: 5 + 2 x 4 = 13
max_worker_processes = 16         #Example if the initial value was 8: 8 + 2 x 4 = 16
max_parallel_workers = 12         #Example if the initial value was 4: 4 + 2 x 4 = 12

Note
As shown in the example above, set the value of max_prepared_transactions, max_worker_processes and max_parallel_workers multiplied by the number of instances of this feature executed simultaneously.

The table below lists the postgresql.conf parameters that must also be checked.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_shared_memory_type</td>
<td>Implementation of dynamic shared memory to be used by the instance.</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>The default value is recommended.</td>
<td></td>
</tr>
</tbody>
</table>

See
Refer to “Resource Consumption” in the PostgreSQL Documentation for information on the parameters.

11.1.3.2 Installing the Extension
Execute CREATE EXTENSION to install the high-speed data load extension. The extension needs to be installed on each database.

Example
The example below installs the extension on the "postgres" database.

```sql
postgres=# CREATE EXTENSION pgx_loader;
CREATE EXTENSION
```

Note
- Only superusers can install the high-speed data load extension.
- The high-speed data load extension can only be installed on the public schema.

11.2 Using High-Speed Data Load
This section describes how to use high-speed data load.

11.2.1 Loading Data
To load data from a file into a FUJITSU Enterprise Postgres table, execute the pgx_loader command in load mode.

Example
The example below loads the file E:/path/to/data.csv (2000 records) into table tbl using a degree of parallelism of 3.
If an external file contains data that violates the format or constraints, the data load may fail partway through, resulting in delays for routine tasks such as nightly batch processing. Therefore, it is recommended to remove the invalid data before executing the data load.

The data inserted using this feature is dumped as a COPY command by the `pg_dump` command and the `pg_dumpall` command.

See

- Refer to "pgx_loader" in the Reference for information on the command.
- Refer to "COPY" in the PostgreSQL Documentation for information on the deployment destination and access privileges for external files.

11.2.2 Recovering from a Data Load that Ended Abnormally

If a system interruption such as a server failure occurs while high-speed data load is being performed, transactions prepared using this feature may be changed to the in-doubt state. At that point, resources occupied by the transaction will be locked, and access to the relevant resources from other transactions will be blocked, rendering them unusable.

In such cases, check transactions that are in an in-doubt state, and resolve them.

Checking for in-doubt transactions

This section describes how to check for in-doubt transactions.

1. Refer to the `pgx_loader_state` table in the `pgx_loader` schema.

   Retrieve the global transaction identifier (gid column) of in-doubt transactions. In-doubt transactions will contain "rollback" in the column "state".

   **Example**

   The example below retrieves the global transaction identifier (gid) of in-doubt transactions performed by the database role myrole and that used table tbl. The retrieved global transaction identifiers `pgx_loader:9589` and `pgx_loader:9590` identify in-doubt transactions.

   ```
   postgres=# SELECT gid, state FROM pgx_loader.pgx_loader_state WHERE
   postgres-# role_oid IN (SELECT oid FROM pg_roles WHERE rolname = 'myrole') AND
   postgres-# relation_oid IN (SELECT relid FROM pg_stat_all_tables WHERE
   postgres-# relname = 'tbl');
   gid       | state
  -----------------+-------------
   pgx_loader:9590 | rollback
   pgx_loader:9591 | commit
   pgx_loader:9589 | rollback
   (3 rows)
   ```

2. Refer to the `pg_prepared_xacts` system view.

   Check if the in-doubt transactions retrieved above exist.
Example
The example below checks if in-doubt transactions with the global transaction identifiers pgx_loader:9589 and pgx_loader:9590 exist.

```
postgres=# SELECT gid FROM pg_prepared_xacts WHERE gid IN ('pgx_loader:9589','pgx_loader:9590');
gid
------------------
pgx_loader:9590
pgx_loader:9589
(2 rows)
```

See
Refer to "E.1 pgx_loader_state" for information on the pgx_loader_state table.

Resolving in-doubt transactions
Execute the pgx_loader command in recovery mode to resolve in-doubt transactions.
After executing the pgx_loader command in recovery mode, perform the procedure described in "Checking for in-doubt transactions" to check if the in-doubt transactions have been resolved.

Example
The example below completes the in-doubt transactions prepared for table tbl.

```
$ pgx_loader recovery -t tbl
```

Point
The recovery mode of the pgx_loader command only resolves transactions prepared by high-speed data load. For transactions prepared by an application using distributed transactions other than this feature, follow the procedure described in "15.13 Actions in Response to Error in a Distributed Transaction".

11.3 Removing High-Speed Data Load
This section describes how to remove high-speed data load.

11.3.1 Removing the Extension
Execute DROP EXTENSION to remove the high-speed data load extension. The extension needs to be removed on each database.

Example
The example below removes the extension on the "postgres" database.

```
postgres=# DROP EXTENSION pgx_loader;
DROP EXTENSION
```

- 76 -
- The information required for operation of high-speed data load is stored in the pgx_loader_state table of the pgx_loader schema. Do not remove the high-speed data load extension if the pgx_loader_state table is not empty.

- Only superusers can remove the high-speed data load extension.

- The high-speed data load extension can only be removed on the public schema.
Chapter 12 Global Meta Cache

The Global Meta Cache (GMC) feature loads a meta cache into shared memory using the pgx_global_metacache parameter. This reduces the amount of memory required throughout the system.

Note

This feature can only be used in Advanced Edition.

12.1 Usage

Describes how to use the Global Meta Cache feature.

12.1.1 Deciding Whether to Enable the Global Meta Cache Feature

Global Meta Cache is a mechanism for sharing meta caches between processes, so it works well on systems with a high number of resources accessed and SQL connections. The number of resources is primarily the number of tables accessed by a process, the number of indexes, or the total number of all columns in all tables accessed.

In particular, consider using Global Meta Cache if the total size of the meta cache for each process exceeds the amount of installed memory, or takes up a large portion of that memory, thereby squeezing memory allocations to the database cache or the Operating system file cache. Using Global Meta Cache may slightly increase the time it takes to execute a single SQL to reference a meta cache on shared memory (For example, it will not exceed 5% of the execution time in a situation where all the data is located in the database cache), but you can expect a greater benefit from being able to allocate more memory, such as for the database cache.

If performance degradation using Global Meta Cache is not acceptable, you may want to limit the number of tables accessed by a process.

12.1.2 Estimating Memory for Global Meta Cache

To enable the Global Meta Cache feature, the pgx_global_metacache parameter must specify an upper limit on the size of the shared memory (Hereinafter, the GMC area) dedicated to Global Meta Cahche. Ideally, this upper limit should be the size estimated in “Appendix A Parameters”. Values lower than this can still work, but refer to “12.1.3 How the GMC Memory Area Is Used” on using the GMC area to understand the disadvantages.

12.1.3 How the GMC Memory Area Is Used

At startup, the memory for the GMC area is not used much, but the GMC area grows as new meta caches are placed in the GMC area. If it does, it discards any meta caches that the system determines are not heavily used and places a new one in the GMC area.

Therefore, the GMC area will work even if it is smaller than the estimate, but the meta cache will be regenerated if the discarded meta cache needs to be reused. Note that if this happens frequently, it will degrade overall performance.

With this in mind, it may not be a problem if, for example, the tables to be accessed are different depending on the time zone, and the degradation of the time zone immediately after the change is acceptable.

In any case, be sure to test and tune the system thoroughly before running it.

12.1.4 Enabling the Global Meta Cache Feature

To Enable the Global Meta Cache feature edit the postgresql.conf file and set the pgx_global_metacache parameter. Restarting the instance after editing the postgresql.conf file is required. Refer to "Appendix A Parameters" for information on the parameters.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_global_metacache</td>
<td>Specify the maximum amount of memory for the GMC area on shared memory. When it’s set to 0 (default value), the Global Meta Cache feature is disabled. When enabled, the minimum value allowed is 10MB.</td>
</tr>
</tbody>
</table>
When the cache is created, if the total amount of meta caches on shared memory exceeds the value specified by `pgx_global_metacache`, the inactive, unreferenced meta caches are removed from the GMC area. Note that if all GMC are in use and the cache cannot be created in the GMC area, the cache is temporarily created in the local memory of the backend process.

**Example**

Here is an example `postgresql.conf` configuration:

```
pgx_global_metacache = 800 MB
```

**Wait Events**

The Global Meta Cache feature may cause wait events. Wait events are identified in the `wait_event` column of the `pg_stat_activity` view. GMC specific wait events are described below.

<table>
<thead>
<tr>
<th>Wait Event Type</th>
<th>Wait Event Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LWLock</td>
<td>GlobalCatcache</td>
<td>Waiting to find, add, and remove meta caches in the GMC area.</td>
</tr>
<tr>
<td>IPC</td>
<td>GMCSweep</td>
<td>Waiting to select a meta cache that can be deleted when GMC space is low. If the GMC is fully referencing and there is no deletable meta cache, it is waiting for the reference to be removed and a deletable meta cache to be selected.</td>
</tr>
</tbody>
</table>

**Note**

If GMCSweep is happened frequently, increase the `pgx_global_metacache` setting.

**See**

Refer to “Viewing Statistics” in the PostgreSQL Documentation for information on the `pg_stat_activity` view.

**12.1.5 Estimating Resources**

Refer to “Global Meta Cache Memory Requirements” in the Installation and Setup Guide for Server for formulas to estimate the amount of memory used by the Global Meta Cache feature.

**12.2 Statistics**

Describes the statistics for the Global Meta Cache feature.

**12.2.1 System View**

You can check the cache hit ratio and size of the GMC area in the system view `pgx_stat_gmc`. Refer to “C.6 `pgx_stat_gmc`” for information on the columns.

If the cache hit ratio is low and the current memory usage is close to `pgx_global_metacache`, increase the `pgx_global_metacache` setting because performance may be degraded.

Refer to “7.6 Monitoring Database Activity” in the Operations Guide for information on the statistics.
Chapter 13 Local Meta Cache Limit

Local Meta Cache Limit feature limits the size of a Local Meta Cache by removing it if it has not been accessed for a long time.

Note

This feature is available only in the Advanced Edition.

13.1 Usage

Describes how to use the Local Meta Cache Limit feature.

13.1.1 Deciding Whether to Enable the Local Meta Cache Limit Feature

Refer to “Appendix A Parameters”, after estimating the total amount of memory to be used as the catalog cache and relation cache, when the total amount of memory exceeds the amount of installed memory or occupies a large amount of installed memory, consider using this feature.

This feature adds the action of discarding the meta cache that has been held permanently. If you attempt to refer to a destroyed meta cache again, the meta cache is recreated, so using this feature will result in poor performance compared to not using it.

Therefore, read the following to understand how to discard a meta cache.

- 13.1.3 Cache Removal when Local Meta Cache Limit is Enabled
- 13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature
- Parameters for the Local Meta Cache Limit feature

How to set the upper limit with these considerations is described in detail in the estimation formula in “Appendix A Parameters”.

13.1.2 How to Set Parameters for the Local Meta Cache Limit Feature

To enable the Local Meta Cache Limit feature, set the `pgx_catalog_cache_max_size` and `pgx_relation_cache_max_size` parameters.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pgx_catalog_cache_max_size</code></td>
<td>Specify the maximum amount of memory that the backend process should use as the catalog cache. You can enable catalog cache removal by setting it to 8 KB or more. When it is set to 0 (default value), the catalog cache removal is disabled.</td>
</tr>
<tr>
<td><code>pgx_relation_cache_max_size</code></td>
<td>Specify the maximum amount of memory that the backend process should use as the relation cache. You can enable relation cache removal by setting it to 8 KB or more. When it is set to 0 (default value), the relation cache removal is disabled.</td>
</tr>
</tbody>
</table>

Example

Here is an example `postgresql.conf` configuration:

```plaintext
pgx_catalog_cache_max_size = 1MB
pgx_relation_cache_max_size = 1MB
```

13.1.3 Cache Removal when Local Meta Cache Limit is Enabled

When this feature is enabled, the caching strategy is to keep the cache as long as possible within the specified upper limit. If holding a new cache exceeds the limit, consider locality of reference and remove the cache from the one with the longest unreferenced time.

However, because the cache used by active transactions cannot be removed, if a transaction uses a large number of caches, the cache may be held above the limit. In this case, remove the all caches at the end of the transaction. This is necessary to free up memory.
In PostgreSQL, in order to acquire memory at high speed, a memory block of a certain size is acquired from the OS, and a small memory is cut out from the block and used. The memory for the metacache is cut out in the same way. Therefore, it is possible to return the memory block to the OS by destroying all the meta caches scattered throughout the memory block. When this happens, the next SQL execution will be slowed down due to the re-creation of the meta cache. Therefore, upper limit of feature should be set to a value larger than the size of the meta cache used by at least one transaction.

When the size of the meta cache exceeds the upper limit, the following message is output:

```
WARNING: could not reduce Cat/RelCacheMemoryContext size to AA kilobytes, reduced to BB kilobytes
HINT: consider increasing the configuration parameter pgx_catalog/relation_cache_max_size
```

(AA: Upper limit, BB: Amount of memory actually used)

CatCacheMemoryContext and RelCacheMemoryContext are memory areas for storing the catalog cache and relation cache, respectively. If this message is output, consider increasing the upper limit.

If the memory consumption by the backend process exceeds the allowable value by increasing the upper limit, reconsider the SQL to be executed, such as reducing the number of tables accessed in one transaction, or add memory adjust to the amount of memory used.

### 13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature

By observing how much meta cache regeneration is taking place, you can determine if the low upper limit is the cause of the failure to achieve the desired performance.

From the message below, calculate the cache hit ratio as follows:

\[
\text{Cache hit ratio} = \frac{\text{Number of cache hits}}{\text{Number of times the cache was searched}}
\]

If the cache hit ratio is 80% or higher, this feature will not be the main factor that impedes performance. If not, raise the upper limit and see if performance can reach the goal. In doing so, first try to shift the focus of allocation to the relations cache. This is because when executing SQL, the relation cache generated based on the catalog cache is mainly referenced, so it is advantageous to leave a large amount of relation cache.

```
Catalog cache: catalog cache hit stats: search XX, hits YY
Relation cache: relation cache hit stats: search XX, hits YY
```

(XX: Number of times the cache was searched, YY: Number of cache hits)

This message is printed when the transaction ends. However, if you output the message frequently, the performance will be degraded by itself, so you can adjust the output interval with the following parameters.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_cache_hit_log_interval</td>
<td>When the transaction ends, if the time set in this parameter has elapsed since the previous message was output, the message is output. If set to 0, a message will be output each time the transaction ends. Setting -1 disables the output. The default value is 10min. Even if pgx_catalog_cache_max_size and pgx_relation_cache_max_size are disabled, the message output of the corresponding cache will be invalid. Immediately after connecting to the server, a small transaction occurs before the request from the user application, such as for user authentication. Since it is meaningless to know the hit ratio for these, a message is output at the end of the transaction that started after the time set in this parameter has elapsed after connecting to the server. For the same reason, setting a small value such as 0 may result in a message being printed at the end of such a small transaction. You can check which transaction the message corresponds to from the information output at the beginning. This information depends on the setting of the parameter log_line_prefix.</td>
</tr>
</tbody>
</table>
Example

Here is an example postgresql.conf configuration:

```
pgx_cache_hit_log_interval= 30min
```
Chapter 14 Backup/Recovery Using the Copy Command

By using a copy command created by the user, the pgx_dmpall command and the pgx_rcvall command can perform backup to any destination and can perform recovery from any destination using any copy method.

Copy commands must be created in advance as executable scripts for the user to implement the copy process on database clusters and tablespaces, and are called when executing the pgx_dmpall and pgx_rcvall commands.

This appendix describes backup/recovery using the copy command.

**Point**

It is also possible to back up only some tablespaces using the copy command. However, database resources not backed up using the copy command are still backed up to the backup data storage destination.

**Note**

Both the backup data storage destination and the optional backup destination are necessary for recovery - if they are located in secondary media, combined management of these is necessary.

14.1 Configuration of the Copy Command

This section describes the configuration of the copy command for backup and recovery.

**Cyclic usage of the backup area**

Prepare two backup areas for the copy command in case an issue affects the data storage destination during backup. The copy command performs backup while cyclically using these backup areas.
Note

The backup data storage destination cannot be used as these backup areas used by the copy command.

Backup using the backup information file

The copy command must determine the backup destination on each backup, as it is necessary to cycle through the backup areas. Backup can be automated by using the backup information file, which contains information about the backup destination.
Information

The backup information file is prepared in the backup data storage destination by the pgx_dmpall command, and contains information that can be read or updated by the copy command. This file is managed by associating it with the latest backup successfully completed by the pgx_dmpall command, so the latest backup information relating to the copy command registered by the user can be retrieved. Additionally, the content of the backup information file can be displayed using the pgx_rcvall command.

Configuration of the copy command for backup

The pgx_dmpall command calls the copy command for backup after execution for the three modes below. It is therefore necessary for the copy command for backup to implement the required processing for each of the modes.

- **prepare mode**
  
  Determines which of the two backup areas will be used for the current backup.
  
  The backup area to be used for the current backup is determined by reading the information relating to the latest backup destination where the backup information file was written to during the previous backup.

- **backup mode**

  Performs backup on the backup area determined by prepare mode, using any copy method.

- **finalize mode**

  Writes information relating to the destination of the current backup to the backup information file.
  
  This enables the prepare mode to check the destination of the previous backup during the next backup.

Note

The user can use any method to hand over backup information between modes within the copy command, such as creating temporary files.

Configuration of the copy command for recovery

The pgx_rcvall command calls the copy command for recovery for the mode below. It is therefore necessary for the copy command for recovery to implement the required processing for the mode.

- **restore mode**

  Any copy method can be used to implement restore from the backup destination retrieved using the copy command for backup.

Point

By referring to the mode assigned to the copy command as an argument, backup and recovery can be implemented using a single copy command.

Example

Using a batch file

```bash
if "%1" == "prepare" goto prepare
if "%1" == "backup"   goto backup
if "%1" == "finalize" goto finalize
if "%1" == "restore" goto restore
:prepare
    processingRequiredForPrepareMode
    exit /b
:backup
    processingRequiredForBackupMode
```
Point

A sample batch file that backs up the database cluster and tablespace directory to a specific directory is supplied to demonstrate how to write a copy command.

The sample is stored in the directory below:

installDir\share\copy_command.bat.sample

14.2 Backup Using the Copy Command

To perform backup using the copy command, in addition to performing the standard backup procedure, it is also necessary to create a copy command, and then execute the pgx_dmpall command specifying it. This section describes the procedure specific to using the copy command.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Perform the following procedure:

1. Determine the database resources to be backed up

   Determine the database resources to be backed up using the copy command. The copy command can back up the following resources:
   - Database cluster
   - Tablespace

   To back up only some tablespaces, create a file listing them. This file is not necessary to back up all tablespaces.

   Example
   
   To back up only tablespaces tblspc1 and tblspc2

   
   tblspc1
   tblspc2

2. Prepare a backup area

   Prepare a backup area to save the database resources to be backed up, as determined in step 1.

3. Create the copy command

   Create the copy commands for backup and recovery. Refer to "14.4 Copy Command Interface" for details.

Performing backup

Execute the pgx_dmpall command with the -Y option specifying the full path of the copy command for backup created in step 3 of preparation for backup.

The example below backs up only some tablespaces, but not the database cluster, using the copy command.
Example

> pgx_dmpall -D \database\inst1 -Y \database\command\backup.bat
   --exclude-copy-cluster -P \database\command\tablespace_list.txt

Point

- To exclude the database cluster from backup using the copy command, specify the --exclude-copy-cluster option.
- To back up only some tablespaces using the copy command, use the -P option specifying the full path of the file created in step 1 of preparation for backup.

See

- Refer to "pgx_dmpall" in the Reference for information on the command.

Checking backup status

Use the pgx_rcvall command to check the backup status.

Execute the pgx_rcvall command with the -l option specified to output backup data information. If backup was performed using the copy command, the resources backed up using the copy command will also be output.

Example

> pgx_rcvall -l -D \database\inst1
Date                Status   Dir                                 Resources backed up by the copy command

14.3 Recovery Using the Copy Command

To perform recovery using the copy command, in addition to performing the standard recovery procedure, it is also necessary to create a copy command, and then execute the pgx_rcvall command specifying it. This section describes the procedure specific to using the copy command.

Determining the backup area of the latest backup

Check the backup information file to determine the backup area used for the latest backup, and confirm that it is in a recoverable state.

Execute the pgx_rcvall command with the --view-results-of-copying option to output the content of the backup information file.

Example

> pgx_rcvall -D \database\inst1 --view-results-of-copying

Perform recovery

Execute the pgx_rcvall command with the -Y option specifying the full path of the copy command for recovery created in step 3 of the preparation for backup described in "14.2 Backup Using the Copy Command".

The example below recover only some tablespaces, but not the database cluster, using the copy command.
Example

> pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1 -Y D:\database\command\recovery.bat

Point

If the latest backup was performed using the copy command, the pgx_rcvall command automatically recognizes which database resources were backed up using the copy command, or whether resources were backed up to the backup data storage destination. Therefore, recovery can be performed by simply executing the pgx_rcvall command specifying the copy command for recovery.

See

Refer to "pgx_rcvall" in the Reference for information on the command.

14.4 Copy Command Interface

The following types of copy command are available:

- Copy command for backup
- Copy command for recovery

This appendix describes the interface of each copy command.

14.4.1 Copy Command for Backup

Feature

User exit (for the copy command) called from the pgx_dmpall command.

Format

The syntax for calling the copy command from the pgx_dmpall command is described below.

If the operation mode is "prepare"

```
copyCommandName prepare "pathOfBackupInfoFile" "pathOfBackupTargetListFile"
```

If the operation mode is "backup"

```
copyCommandName backup
```

If the operation mode is "finalize"

```
copyCommandName finalize "pathOfBackupInfoFile"
```

Argument

- Operation mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prepare</td>
<td>Implements the preparation process for backing up using the copy command.</td>
</tr>
<tr>
<td></td>
<td>Called before the PostgreSQL online backup mode is started.</td>
</tr>
<tr>
<td>backup</td>
<td>Implements the backup process.</td>
</tr>
<tr>
<td></td>
<td>Called during the PostgreSQL online backup mode.</td>
</tr>
<tr>
<td>Mode</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>finalize</td>
<td>Implements the backup completion process. Called after the PostgreSQL online backup mode is completed.</td>
</tr>
</tbody>
</table>

- **Full path of the backup information file**

  Full path of the backup information file of the latest backup, enclosed in double quotation marks. If a backup has not been performed, specify `""`.

- **Full path of the backup target list file**

  Full path of the file containing the resources to be backed up using the copy command, enclosed in double quotation marks. One of the following is described in each resource name.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>pg_data</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Tablespace name</td>
</tr>
</tbody>
</table>

**Example**

To back up the database cluster and the tablespaces dbspace and indexspace using the copy command, the file should contain the following:

```
pg_data
dbspace
indexspace
```

**Information**

The encoding of resource names output to the backup target list file by the pgx_dmpall command is the encoding used when this command connects to the database with auto specified for the client_encoding parameter, and is dependent on the locale at the time of command execution.

The number of arguments vary depending on operation mode. The argument of each operation mode is as follows:

<table>
<thead>
<tr>
<th>Operation mode</th>
<th>First argument</th>
<th>Second argument</th>
<th>Third argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>prepare</td>
<td>Operation mode</td>
<td>Backup information file path name</td>
<td>Backup target list file path name</td>
</tr>
<tr>
<td>backup</td>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>finalize</td>
<td></td>
<td>Backup information file path name</td>
<td></td>
</tr>
</tbody>
</table>

Additionally, the access permissions for the backup information file and backup target list file are different depending on the operation mode. The access permissions of each operation mode are as follows:

<table>
<thead>
<tr>
<th>Operation mode</th>
<th>Backup information file</th>
<th>Backup target list file</th>
</tr>
</thead>
<tbody>
<tr>
<td>prepare</td>
<td>Can be viewed</td>
<td>Can be viewed</td>
</tr>
<tr>
<td>backup</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>finalize</td>
<td>Can be viewed and updated</td>
<td>-</td>
</tr>
</tbody>
</table>

**Return value**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Normal end</td>
</tr>
</tbody>
</table>
### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other than 0</td>
<td>Abnormal end</td>
</tr>
<tr>
<td></td>
<td>The pgx_dmpall command terminates in error.</td>
</tr>
</tbody>
</table>

### Description

- The copy command operates with the privileges of the operating system user who executed the pgx_dmpall command. Therefore, grant copy command execution privileges to users who will execute the pgx_dmpall command. Additionally, have the copy command change users as necessary.
- To write to the backup information file, use a method such as redirection from the copy command.
- Because the copy command is called for each mode, implement all processing for each one.
- To copy multiple resources simultaneously, have the copy command copy them in parallel.

#### Note

- The backup information file and backup target list file cannot be deleted. Additionally, the privileges cannot be changed.
- Standard output and standard error output of the copy command are output to the terminal where the pgx_dmpall command was executed.
- If the copy command becomes unresponsive, the pgx_dmpall command will also become unresponsive. If the copy command is deemed to be unresponsive by the operating system, use an operating system command to forcibly stop it.
- Output the copy command execution trace and the result to a temporary file, so that if it terminates in error, the cause can be investigated at a later time.
- For prepare mode only, it is possible to use the PostgreSQL client application to access the database using the copy command. For all other modes, do not execute FUJITSU Enterprise Postgres commands or PostgreSQL applications.
- Enable the fsync parameter in postgresql.conf, because data on the shared memory buffer needs to have been already written to disk when backup starts.

### 14.4.2 Copy Command for Recovery

#### Feature

User exit (for the copy command) called from the pgx_rcvall command.

#### Format

The syntax for calling the copy command from the pgx_rcvall command is described below.

```plaintext
copyCommandName restore "pathOfBackupInfoFile" "pathOfBackupTargetListFile"
```

#### Argument

- **Operation mode**

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>restore</td>
<td>Performs restore.</td>
</tr>
</tbody>
</table>

- **Full path of the backup information file**

  Full path of the backup information file, enclosed in double quotation marks.
- Full path of the backup target list file

Full path of the file containing the resources to be restored using the copy command, enclosed in double quotation marks.

The access permissions for the backup information file and backup target list file are as below.

<table>
<thead>
<tr>
<th>Backup information file</th>
<th>Backup target list file</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be viewed</td>
<td>Can be viewed</td>
</tr>
</tbody>
</table>

**Return value**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Normal end</td>
</tr>
<tr>
<td></td>
<td>The pgx_rcvall command continues processing.</td>
</tr>
<tr>
<td>Other than 0</td>
<td>Abnormal end</td>
</tr>
<tr>
<td></td>
<td>The pgx_rcvall command terminates in error.</td>
</tr>
</tbody>
</table>

**Description**

- The copy command operates with the privileges of the operating system user who executed the pgx_rcvall command. Therefore, grant copy command execution privileges to users who will execute the pgx_rcvall command. Additionally, have the copy command change users as necessary.

- The copy command is called once only in restore mode.

- To copy multiple resources simultaneously, have the copy command copy them in parallel.

**Note**

- The backup information file and backup target list file cannot be deleted. Additionally, the privileges cannot be changed.

- Standard output and standard error output of the copy command are output to the terminal where the pgx_rcvall command was executed.

- If the copy command becomes unresponsive, the pgx_rcvall command will also become unresponsive. If the status of the copy command is deemed to be unresponsive by the operating system, use an operating system command to forcibly stop it.

- Output the copy command execution trace and the result to a temporary file, so that if it terminates in error, the cause can be investigated at a later time.

- Do not execute FUJITSU Enterprise Postgres commands or PostgreSQL applications in the copy command.

- There may be files and directories not required for recovery using the archive log included in the backup, such as postmaster.pid, pg_wal/subdirectory and pg_replslot in the database cluster. If such unnecessary files and directories exist, have the copy command delete them after the restore.
Chapter 15 Actions when an Error Occurs

This chapter describes the actions to take when an error occurs in the database or an application, while FUJITSU Enterprise Postgres is operating.

Depending on the type of error, it may be necessary to recover the database cluster. The recovery process recovers the following resources:

- Data storage destination
- Transaction log storage destination (if the transaction log is stored in a separate disk from the data storage destination)
- Backup data storage destination

Note

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output. The recovery actions differ for these error messages.

Check the status of the disk, and select one of the following actions:

- If the disk is defective
  Refer to "15.1 Recovering from Disk Failure (Hardware)", and take actions accordingly.
- If the disk is not defective
  Refer to "15.14 I/O Errors Other than Disk Failure", and take actions accordingly.

A few examples of errors generated even if the disk is not defective include:

- Network error with an external disk
- Errors caused by power failure or mounting issues

Determining the cause of an error

If an error occurs, refer to the WebAdmin message and the event log, and determine the cause of the error.

See

Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on server logs.

Approximate recovery time

The formulas for deriving the approximate recovery time of resources in each directory are given below.

If using the copy command with the pgx_recvall command, the recovery time will depend on the implementation of the copy command.

- Data storage destination or transaction log storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheDataStorageDestination} + \text{usageByTheTransactionLogStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]

- usageByTheDataStorageDestination: Disk space used by the database cluster
- usageByTheTransactionLogStorageDestination: Disk space used by the transaction log stored outside the database cluster
- diskWritePerformance: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed

- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

- Backup data storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheBackupDataStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]
- **usageByTheBackupDataStorageDestination**: Disk space used by the backup data
- **diskWritePerformance**: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

## 15.1 Recovering from Disk Failure (Hardware)

This section describes how to recover database clusters to a point immediately before failure, if a hardware failure occurs in the data storage disk or the backup data storage disk.

There are two methods of recovery:

- 15.1.1 Using WebAdmin
- 15.1.2 Using Server Command

### Point

Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

### 15.1.1 Using WebAdmin

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

#### Note

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

### If failure occurred in the data storage disk or the transaction log storage disk

Follow the procedure below to recover the data storage disk or the transaction log storage disk.

1. Stop applications
   - Stop applications that are using the database.
2. Stop the instance
   - Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.
3. Recover the failed disk
   - Replace the disk, and then recover the volume configuration information.
4. Create a tablesapce directory
   - If a tablespace was defined after backup, create a directory for it.
5. Recover the keystore, and enable automatic opening of the keystore
   - Do the following if the data in the database has been encrypted:
     - Restore the keystore to its state at the time of the database backup.
     - Enable automatic opening of the keystore.
6. Recover the database cluster
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message in the lower-right corner.

7. Run recovery
   In the [Restore Instance] dialog box, click [Yes].
   Instance restore is performed. An instance is automatically started when recovery is successful.

   **Note**
   WebAdmin does not support recovery of hash index. If you are using a hash index, then after recovery, execute the REINDEX command to rebuild it. Use of hash indexes is not recommended.

8. Resume applications
   Resume applications that are using the database.

   **Point**
   WebAdmin may be unable to detect disk errors, depending on how the error occurred.
   If this happens, refer to "15.10.3 Other Errors" to perform recovery.

---

**If failure occurred on the backup data storage disk**

Follow the procedure below to recover the backup data storage disk.

1. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

2. Recover the backup data
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

3. Run backup
   Perform backup to enable recovery of the backup data. In the [Backup] dialog box, click [Yes]. The backup is performed. An instance is automatically started when backup is performed.

   **Point**
   If you click [Recheck the status], the resources in the data storage destination and the backup data storage destination are reconfirmed. As a result, the following occurs:
   - If an error is not detected
     The status of the data storage destination and the backup data storage destination returns to normal, and it is possible to perform operations as usual.
   - If an error is detected
     An error message is displayed in the message list again. Click [Solution], and resolve the problem by following the resolution for the cause of the error displayed in the dialog box.

---

**15.1.2 Using Server Command**

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

**If failure occurred on the data storage disk or the transaction log storage directory**

Follow the procedure below to recover the data storage disk or the transaction log storage directory.
1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance, refer to “2.1.2 Using Commands” for details.
   If the instance fails to stop, refer to “15.11 Actions in Response to Failure to Stop an Instance”.

3. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

4. Create a storage destination directory
   - If failure occurred on the data storage disk
     Create a data storage destination directory. If a tablespace was defined, also create a directory for it.
   - If failure occurred on the translation log storage disk
     Create a transaction log storage destination directory.

   In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

   ![See](Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on how to create a storage directory.)

5. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

6. Recover the database cluster
   Recover the database cluster using the backup data.
   Specify the following in the pgx_rcvall command:
   - Specify the data storage location in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup data storage location in the -B option.

   **Example**
   ```
   > pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1
   ```

   **Note**
   If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.
   If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.
   The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).
   ```
   FATAL: the database system is starting up
   ```

7. Start the instance
   Refer to “2.1.2 Using Commands” for information on how to start an instance.
8. Resume applications

Resume applications that are using the database.

**If failure occurred on the backup data storage disk**

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td>N</td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>5</td>
<td>Recover the failed disk</td>
<td>Y</td>
</tr>
<tr>
<td>6</td>
<td>Create a backup data storage destination directory</td>
<td>Y</td>
</tr>
<tr>
<td>7</td>
<td>Resume output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>8</td>
<td>Resume transaction log mirroring</td>
<td>Y</td>
</tr>
<tr>
<td>9</td>
<td>Start the instance</td>
<td>N</td>
</tr>
<tr>
<td>10</td>
<td>Run backup</td>
<td>Y</td>
</tr>
<tr>
<td>11</td>
<td>Resume applications</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Required
N: Not required

The procedure is as follows:

**If an instance has not been stopped**

1. Confirm that transaction log mirroring has stopped

Use the following SQL function to confirm that transaction log mirroring has stopped.

```
pqrs=# SELECT pgx_is_wal_multiplexing_paused();
pgx_is_wal_multiplexing_paused
-------------------
t
(1 row)
```

If transaction log mirroring has not stopped, then stop it using the following SQL function.

```
pqrs=# SELECT pgx_pause_wal_multiplexing();
LOG: multiplexing of transaction log files has been stopped
pgx_pause_wal_multiplexing
--------------------------

(1 row)
```
2. Stop output of archive logs

Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

To prevent this, use the following methods to stop output of archive logs.

- Changing archive_command
  Specify a command that will surely complete normally, so that archive logs will be regarded as having been output.
  If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

- Reload the configuration file
  Execute the pg_ctl reload command or the pg_reload_conf SQL function to reload the configuration file.

If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

Create a backup data storage destination.

In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the backup data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

Refer to "3.2.2 Using Server Commands" for information on how to create a backup data storage destination.

5. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.

6. Resume transaction log mirroring

Execute the pgx_resume_wal_multiplexing SQL function.

Example

```
SELECT pgx_resume_wal_multiplexing()
```

7. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pgx_dmpall -D D:\database\inst1
```

If an instance has been stopped

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Commands" for details.

If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.
4. Create a backup data storage destination

Create a backup data storage destination.

In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the backup data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

Refer to “3.2.2 Using Server Commands” for details.

5. Start the instance

Start the instance. Refer to “2.1.2 Using Commands” for information on how to start an instance.

6. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```bash
> pgx_dmpall -D D:\database\inst1
```

7. Resume applications

Resume applications that are using the database.

---

**See**

- Refer to ”pgx_rcvall“ and ”pgx_dmpall“ in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to ”Write Ahead Log“ under ”Server Administration“ in the PostgreSQL Documentation for information on archive_command.
- Refer to ”B.1 WAL Mirroring Control Functions“ for information on pgx_resume_wal_multiplexing.

---

**15.2 Recovering from Data Corruption**

If data in a disk is logically corrupted and the database does not operate properly, you can recover the database cluster to its state at the time of backup.

There are two methods of recovery:

- 15.2.1 Using WebAdmin
- 15.2.2 Using the pgx_rcvall Command

---

**Note**

- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.
- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.

---

**15.2.1 Using WebAdmin**

If using WebAdmin, recover the data to the point immediately prior to data corruption by using the backup data.

Refer to ”15.1.1 Using WebAdmin“ for details.
15.2.2 Using the pgx_rcvall Command

Recover the database cluster by specifying in the pgx_rcvall command the date and time of the backup you want to read from. Then re-execute the transaction as required to recover the data.

Follow the procedure below to recover the data storage disk.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the backup date and time
   Pinpoint a date and time prior to the data corruption based on the content of the job log or event log.

4. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster
   Use the pgx_rcvall command to recover the database cluster.
   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup storage directory in the -B option.
   - Specify the recovery date and time in the -e option.

   Example
   In the following examples, "May 20, 2020 10:00:00" is specified as the recovery time.

   > pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1 -e "2020-05-20 10:00:00"

Note
   If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.
   If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.
   The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

   FATAL: the database system is starting up

6. Start the instance
   Start the instance. Refer to "2.1.2 Using Commands" for information on how to start an instance.
   If necessary, re-execute transaction processing from the specified recovery time, and then resume database operations.
7. Resume applications

Resume applications that are using the database.

See

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

15.3 Recovering from an Incorrect User Operation

This section describes how to recover database clusters when data has been corrupted due to erroneous user operations.

There are two methods of recovery:

- 15.3.1 Using WebAdmin
- 15.3.2 Using the pgx_rcvall Command

Note

- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.
- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.
- An effective restore point is one created on a time series for which you have made a backup. That is, if you recover data to a point in the past, you cannot use any restore points set after that recovery point. Therefore, once you manage to recover your target past data, make a backup.

15.3.1 Using WebAdmin

You can use WebAdmin to recover data to a backup point.

Note

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

Follow the procedure below to recover the data in the data storage disk.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.
3. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.

4. Recover the database cluster
   Log in to WebAdmin, and in the [Instances] tab, select the instance to be recovered and click .

5. Recover to the backup point
   In the [Restore Instance] dialog box, click [Yes].
   Recovery is performed. An instance is automatically started when recovery is successful.

   **Note**
   WebAdmin cannot accurately recover a hash index. If you are using a hash index, then after recovery, execute the REINDEX command for the appropriate index.

6. Resume database operations
   If necessary, re-execute transaction processing from the backup point to when an erroneous operation was performed, and then resume database operations.

### 15.3.2 Using the pgx_rcvall Command

The pgx_rcvall command recovers database clusters to the restore point created with the server command. Refer to "Setting a restore point" in "3.2.2 Using Server Commands" for information on how to create a restore point.

Follow the procedure below to recover the data in the data storage disk.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the restore point
   Use a restore point recorded in an arbitrary file, as explained in "3.2.2 Using Server Commands", to determine a restore point prior to the erroneous operation.

4. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster
   Use the pgx_rcvall command to recover the database cluster.
   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup data storage destination in the -B option.
   - The -n option recovers the data to the specified restore point.

   **Example**
The following example executes the `pgx_rcvall` command with the restore point "batch_20200503_1".

```
> pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1 -n batch_20200503_1
```

**Note**

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the `pgx_rcvall` command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the `pgx_rcvall` command.

The following message displayed during recovery is output as part of normal operation of `pgx_rcvall` (therefore the user does not need to be concerned).

```
FATAL: the database system is starting up
```

6. Start the instance

Start the instance.

Refer to “2.1.2 Using Commands” for information on how to start an instance.

**Note**

The `pgx_rcvall` command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the `REINDEX` command for the appropriate index.

7. Restart operation of the database

If necessary, re-execute transaction processing from the specified recovery time to the point when an erroneous operation was performed, and then resume database operations.

See

Refer to "pgx_rcvall" in the Reference for information on the `pgx_rcvall` command.

---

### 15.4 Actions in Response to an Application Error

If there is a connection from a client that has been in the waiting state for an extended period, you can minimize performance degradation of the database by closing the problematic connection.

The following methods are available for identifying a connection to be closed:

- view(`pg_stat_activity`) (refer to "15.4.1 When using the view (pg_stat_activity)")
- pgAdmin (refer to "15.4.2 Using pgAdmin")

Use the system management function (`pg_terminate_backend`) to disconnect connections.

**15.4.1 When using the view (pg_stat_activity)**

When using the view (`pg_stat_activity`), follow the procedure below to close a connection.

1. Use `psql` command to connect to the postgres database.

```
> psql postgres
psql (13.1)
Type "help" for help.
```
2. Close connections from clients that have been in the waiting state for an extended period.

    Use `pg_terminate_backend()` to close connections that have been trying to connect for an extended period.

    However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements. Refer to “Notes on Application Compatibility” in the Application Development Guide for details.

Example

The following example closes connections where the client has been in the waiting state for at least 60 minutes.

```
select pid, usename, application_name, client_hostname, pg_terminate_backend(pid) from
    pg_stat_activity where state='idle in transaction' and current_timestamp > cast(query_start +
    interval '60 minutes' as timestamp);
```

- [ RECORD 1 ]-----------------------
  pid | 4684
  username | fsepuser
  application_name | apl1
  client_addr | 192.11.11.1
  pg_terminate_backend | t

See

- Refer to “System Administration Functions” under “The SQL Language” in the PostgreSQL Documentation for information on `pg_terminate_backend`.
- Refer to “Notes on Application Compatibility” in the Application Development Guide for information on how to maintain application compatibility.

15.4.2 Using pgAdmin

If using pgAdmin, follow the procedure below to close connections.

1. In the [Browser] pane, click the relevant database server.
2. Close the client connections that have been in a wait state for an extended period.

   Click the [Dashboard] tab. In the [Server activity] section, select the connections that have been in an "idle" or "idle in transaction" state for an extended period. For each of these connections, click ✗ to close the session.

15.5 Actions in Response to an Access Error

If access is denied, grant privileges allowing the instance administrator to operate the following directories, and then re-execute the operation. Also, refer to the event log and the server log, and confirm that the file system has not been mounted as read-only due to a disk error. If the file system has been mounted as read-only, mount it properly and then re-execute the operation.

- Data storage destination
- Tablespace storage destination
- Transaction log storage destination
- Backup data storage destination

See Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on the privileges required for the directory.

15.6 Actions in Response to Insufficient Space on the Data Storage Destination

If the data storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.

If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

There are two methods of migrating data:

- 15.6.1 Using a Tablespace
15.6.1 Using a Tablespace

FUJITSU Enterprise Postgres enables you to use a tablespace to change the storage destination of database objects, such as tables and indexes, to a different disk.

The procedure is as follows:

1. Create a tablespace
   Use the `CREATE TABLESPACE` command to create a new tablespace in the prepared disk.

2. Modify the tablespace
   Use the `ALTER TABLE` command to modify tables for the newly defined tablespace.

See

Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on the `CREATE TABLESPACE` command and `ALTER TABLE` command.

15.6.2 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the data storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:

- 15.6.2.1 Using WebAdmin
- 15.6.2.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the data storage destination.

Note

- Before replacing the disk, stop applications and instances that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

15.6.2.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using WebAdmin.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.

2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.
5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablespace directory ") to 7 ("Run recovery") under "If failure occurred in the data storage disk or the transaction log storage disk" in "15.1.1 Using WebAdmin" for information on the procedure. An instance is automatically started when recovery is successful.

7. Resume applications
   Resume applications that are using the database.

8. Restore the files
   Restore the files backed up in step 1.

15.6.2.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using server commands.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.

2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.2 Using Server Commands" for details.

4. Stop the instance
   After backup is complete, stop the instance. Refer to "2.1.2 Using Commands" for information on how to stop an instance.

   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a data storage destination
   Create a data storage destination. If a tablespace was defined, also create a directory for it.

   In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

7. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

8. Recover the database cluster
   Use the pgx_rcvall command to recover the database cluster.

   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

   - Specify the backup storage directory in the -B option.

Example

> pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1
Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_recvall command.

If the message "pgx_recvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_recvall command.

The following message displayed during recovery is output as part of normal operation of pgx_recvall (therefore the user does not need not be concerned).

FATAL: the database system is starting up

See

Refer to "pgx_recvall" in the Reference for information on the pgx_recvall command.

9. Start the instance

Start the instance.

Refer to "2.1.2 Using Commands" for information on how to start an instance.

Note

The pgx_recvall command cannot accurately recover a hash index. If you are using a hash index, wait for the pgx_recvall command to end and then execute the REINDEX command for the appropriate index.

10. Resume applications

Resume applications that are using the database.

11. Restore files

Restore the files backed up in step 1.

15.7 Actions in Response to Insufficient Space on the Backup Data Storage Destination

If space runs out on the backup data storage destination, check if the disk contains any unnecessary files and delete them, and then make a backup as required.

If deleting unnecessary files does not solve the problem, take the following action:

- 15.7.1 Temporarily Saving Backup Data
- 15.7.2 Replacing the Disk with a Larger Capacity Disk

15.7.1 Temporarily Saving Backup Data

This method involves temporarily moving backup data to a different directory, saving it there, and securing disk space on the backup data storage destination so that a backup can be made normally.

Use this method if you need time to prepare a larger capacity disk.

If space runs out on the backup data storage destination, archive logs can no longer be stored in the backup data storage destination. As a result, transaction logs continue to accumulate in the data storage destination or the transaction log storage destination.

If action is not taken soon, the transaction log storage destination will become full, and operations may not be able to continue.

To prevent this, secure space in the backup data storage destination, so that archive logs can be stored.
There are two methods of taking action:

- 15.7.1.1 Using WebAdmin
- 15.7.1.2 Using Server Commands

15.7.1.1 Using WebAdmin

Follow the procedure below to recover the backup data storage disk.

1. Temporarily save backup data

   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (E:\backup\inst1) under F:\mnt\usb \backup.

   Example

   > mkdir F:\mnt\usb\backup
   > move E:\backup\inst1\* F:\mnt\usb\backup

   Note: Place the temporary backup destination directory in a location where it will not impact on operating system resources or FUJITSU Enterprise Postgres resources.

2. Back up the database cluster

   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

3. Delete temporarily saved backup data

   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

   The following example deletes backup data that was temporarily saved in F:\mnt\usb.

   Example

   > rmdir /S /Q F:\mnt\usb\backup

15.7.1.2 Using Server Commands

The following describes the procedure for recovering the backup storage disk.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Stop transaction log mirroring</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td>N</td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>5</td>
<td>Temporarily save backup data</td>
<td>Y</td>
</tr>
<tr>
<td>6</td>
<td>Resume output of archive logs</td>
<td>Y</td>
</tr>
</tbody>
</table>
The procedure is as follows:

**Performing recovery while the instance is active**

1. **Stop transaction log mirroring**

   Stop transaction log mirroring.

   ```sql
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   ----------------------------
   (1 row)
   ``

2. **Stop output of archive logs**

   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

   To prevent this, use the following methods to stop output of archive logs.
   - Changing the archive_command parameter
     
     Specify a command that will surely complete normally, so that archive logs will be regarded as having been output.
     
     If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.
   - Reloading the configuration file
     
     Run the pg_ctl reload command or the pg_reload_conf SQL function.

   If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

3. **Temporarily save backup data**

   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (E:\backup\inst1) under F:\mnt\usb\backup.

   **Example**

   ```bash
   > mkdir F:\mnt\usb\backup
   > move E:\backup\inst1* F:\mnt\usb\backup
   ```
Note: Place the temporary backup destination directory in a location where it will not impact on operating system resources or FUJITSU Enterprise Postgres resources.

4. Resume output of archive logs
   Return the archive_command setting to its original value, and reload the configuration file.

5. Resume transaction log mirroring
   Execute the `pgx_resume_wal_multiplexing` SQL function.
   **Example**
   ```sql
   SELECT pgx_resume_wal_multiplexing()
   ```

6. Run backup
   Use the `pgx_dmpall` command to back up the database cluster.
   Specify the following option in the `pgx_dmpall` command:
   ```
   - Specify the directory of the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   ```
   **Example**
   ```
   > pgx_dmpall -D "D:\database\inst1"
   ```

7. Delete temporarily saved backup data
   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
   The following example deletes backup data that was temporarily saved in `F:\mnt\usb`.
   **Example**
   ```
   > rmdir /S /Q F:\mnt\usb\backup
   ```

---

If an instance has been stopped

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Commands" for details.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

3. Temporarily save backup data
   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   The following example saves backup data from the backup data storage destination directory (`E:\backup\inst1`) under `F:\mnt\usb\backup`.
   **Example**
   ```
   > mkdir F:\mnt\usb\backup
   > move E:\backup\inst1* F:\mnt\usb\backup
   ```

   Note: Place the temporary backup destination directory in a location where it will not impact on operating system resources or FUJITSU Enterprise Postgres resources.
4. Start the instance

Start the instance. Refer to "2.1.2 Using Commands" for information on how to start an instance.

5. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

```
> pgx_dmpall -D D:\database\inst1
```

6. Resume applications

Resume applications that are using the database.

7. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in F:\mnt\usb.

**Example**

```
> rmdir /S /Q F:\mnt\usb\backup
```

---

**See**

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexing_paused and pgx_resume_wal_multiplexing.

---

**15.7.2 Replacing the Disk with a Larger Capacity Disk**

This method involves replacing the disk at the backup data storage destination with a larger capacity disk, so that it does not run out of free space again. After replacing the disk, back up data to obtain a proper backup.

There are two methods of performing backup:

- **15.7.2.1 Using WebAdmin**
- **15.7.2.2 Using Server Commands**

**Note**

Before replacing the disk, stop applications that are using the database.

---

**15.7.2.1 Using WebAdmin**

Follow the procedure below to recover the backup storage disk.

1. Back up files

If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.
2. Temporarily save backup data

   Save the backup data to a different directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (E:\backup\inst1) under F:\mnt\usb\backup.

   Example

   ```shell
   > mkdir F:\mnt\usb\backup
   > move E:\backup\inst1\* F:\mnt\usb\backup
   ```

   Note: Place the temporary backup destination directory in a location where it will not impact on operating system resources or FUJITSU Enterprise Postgres resources.

3. Replace with a larger capacity disk

   Replace the disk. Then, recover the volume configuration information.

4. Run backup

   Log in to WebAdmin, and perform recovery operations. Refer to steps 2 ("Recover the backup data") and 3 ("Run backup") under "If failure occurred on the backup storage disk" in "15.1.1 Using WebAdmin".

5. Restore files

   Restore the files backed up in step 1.

6. Delete temporarily saved backup data

   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

   The following example deletes backup data that was temporarily saved in F:\mnt\usb.

   Example

   ```shell
   > rmdir /S /Q F:\mnt\usb\backup
   ```

15.7.2.2 Using Server Commands

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Back up files</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Temporarily save backup data</td>
<td>Y</td>
</tr>
<tr>
<td>3</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td>Y / N</td>
</tr>
<tr>
<td>4</td>
<td>Stop output of archive logs</td>
<td>Y / N</td>
</tr>
<tr>
<td>5</td>
<td>Stop applications</td>
<td>N</td>
</tr>
<tr>
<td>6</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>7</td>
<td>Replace with a larger capacity disk</td>
<td>Y</td>
</tr>
</tbody>
</table>
The procedure is as follows:

**If an instance has not been stopped**

1. **Back up files**
   - If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. **Temporarily save backup data**
   - Save the backup data to a different directory.
   
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (E:\backup\inst1) under F:\mnt\usb\backup.

   **Example**

   ```
   > mkdir F:\mnt\usb\backup
   > move E:\backup\inst1\* F:\mnt\usb\backup
   ```

3. **Confirm that transaction log mirroring has stopped**
   - Use the following SQL function to confirm that transaction log mirroring has stopped.

   ```
   postgres=# SELECT pgx_is_wal_multiplexing_paused();
   pgx_is_wal_multiplexing_paused
   ---------------
   t
   (1 row)
   ```

   If transaction log mirroring has not stopped, then stop it using the following SQL function.

   ```
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   ------------------------------
   (1 row)
   ```
4. Stop output of archive logs

Transaction logs may accumulate during replacement of backup storage disk, and if the data storage destination disk or the transaction log storage destination disk becomes full, there is a risk that operations may not be able to continue.

To prevent this, use the following methods to stop output of archive logs.

- Changing the archive_command parameter
  Specify a command that will surely complete normally, so that archive logs will be regarded as having been output.
  If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

- Reloading the configuration file
  Run the pg_ctl reload command or the pg_reload_conf SQL function.
  If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

5. Replace with a larger capacity disk

Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination

Create a backup data storage destination.

In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the backup data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

Refer to "3.2.2 Using Server Commands" for details.

7. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.

8. Resume transaction log mirroring

Execute the pgx_resume_wal_multiplexing SQL function.

**Example**

```
SELECT pgx_resume_wal_multiplexing()
```

9. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

```
> pgx_dmpall -D D:\database\inst1
```

10. Restore files

Restore the files backed up in step 1.

11. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in F:\mnt\usb.

**Example**

```
> rmdir /S /Q F:\mnt\usb\backup
```
If an instance has been stopped

1. Back up files
   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data
   Save the backup data to a different directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (E:\backup\inst1) under F:\mnt\usb\backup.

   **Example**
   ```shell
   > mkdir F:\mnt\usb\backup
   > move E:\backup\inst1\* F:\mnt\usb\backup
   ```
   Note: Place the temporary backup destination directory in a location where it will not impact on operating system resources or FUJITSU Enterprise Postgres resources.

3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination
   Create a backup data storage destination.
   In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the backup data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)
   Refer to "3.2.2 Using Server Commands" for details.

7. Start the instance
   Start the instance. Refer to "2.1.2 Using Commands" for information on how to start an instance.

8. Run backup
   Use the pgx_dmpall command to back up the database cluster.
   Specify the following value in the pgx_dmpall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

   **Example**
   ```shell
   > pgx_dmpall -D D:\database\inst1
   ```

9. Resume applications
   Resume applications that are using the database.

10. Restore files
    Restore the files backed up in step 1.
11. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in F:\mnt\usb.

Example

```
> rmdir /S /Q F:\mnt\usb\backup
```

See

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexingPaused and pgx_resume_wal_multiplexing.

15.8 Actions in Response to Insufficient Space on the Transaction Log Storage Destination

If the transaction log storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.

If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

15.8.1 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the transaction log storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:

- 15.8.1.1 Using WebAdmin
- 15.8.1.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the transaction log storage destination.

Note

- Before replacing the disk, stop applications that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

15.8.1.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using WebAdmin.

1. Back up files

   If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the transaction log storage destination.
2. Back up the database cluster
   Back up the latest data storage destination resources and transaction log storage destination resources (refer to "3.2.1 Using WebAdmin" for details).

3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a tablespace directory
   If a tablespace was defined after backing up, create a directory for it.

7. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.

8. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablespace directory") to 7 ("Run Recovery") under "If failure occurred in the data storage disk or the transaction log storage disk" in "15.1.1 Using WebAdmin" for information on the procedure. An instance is automatically started when recovery is successful.

9. Resume applications
   Resume applications that are using the database.

10. Restore files
    Restore the files backed up in step 1.

15.8.1.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using server commands.

1. Back up files
   If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the transaction log storage destination.

2. Back up the database cluster
   Use server commands to back up the latest data storage destination resources and transaction log storage destination resources. Refer to "3.2.2 Using Server Commands" for information on how to perform backup.

3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   After backup is complete, stop the instance. Refer to "2.1.2 Using Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "15.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.
6. Create a transaction log storage destination

Create a transaction log storage destination. If a tablespace was defined, also create a directory for it.

In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the transaction log destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

7. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

8. Recover the database cluster

Use the pgx_rcvall command to recover the database cluster.

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup storage directory in the -B option.

Example

```
> pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1
```

**Note**

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

```
FATAL: the database system is starting up
```

**See**

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

9. Start the instance

Start the instance.

Refer to "2.1.2 Using Commands" for information on how to start an instance.

**Note**

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

10. Resume applications

Resume applications that are using the database.

11. Restore files

Restore the files backed up in step 1.
15.9 Errors in More Than One Storage Disk

If an error occurs in the storage destination disks or resources are corrupted, determine the cause of the error from event logs and server logs and remove the cause.

If errors occur in either of the following combinations, you cannot recover the database.

Recreate the instance, and rebuild the runtime environment.

<table>
<thead>
<tr>
<th>Data storage disk</th>
<th>Transaction log storage disk</th>
<th>Backup data storage disk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>-</td>
<td>Error</td>
</tr>
<tr>
<td>-</td>
<td>Error</td>
<td>Error</td>
</tr>
</tbody>
</table>

See

Refer to "Setup" in the Installation and Setup Guide for Server for information on how to create an instance and build the runtime environment.

15.10 Actions in Response to Instance Startup Failure

If an instance fails to start, refer to the event log and the server log, and determine the cause of the failure.

If using WebAdmin, remove the cause of the error. Then, click [Solution] and [Recheck the status] and confirm that the instance is in the normal state.

The following sections describe common causes of errors and the actions to take.

15.10.1 Errors in the Configuration File

If you have directly edited the configuration file using a text editor or changed the settings using WebAdmin, refer to the event log and the server log, confirm that no messages relating to the files below have been output.

- postgresql.conf
- pg_hba.conf

See

Refer to the following for information on the parameters in the configuration file:

- "Configuring Parameters" in the Installation and Setup Guide for Server
- "Appendix A Parameters"
- "Server Configuration" and "Client Authentication" under "Server Administration" in the PostgreSQL Documentation

15.10.2 Errors Caused by Power Failure or Mounting Issues

If mounting is cancelled after restarting the server, for example, because the disk device for each storage destination disk was not turned on, or because automatic mounting has not been set, then starting an instance will fail.

Refer to "15.14.2 Errors Caused by Power Failure or Mounting Issues", and take actions accordingly.

15.10.3 Other Errors

This section describes the recovery procedure to be used if you cannot take any action or the instance cannot start even after you have referred to the event log and the server log.
There are two methods of recovery:

- 15.10.3.1 Using WebAdmin
- 15.10.3.2 Using Server Commands

Note that recovery will not be possible if there is an error at the backup data storage destination. If the problem cannot be resolved, contact Fujitsu technical support.

15.10.3.1 Using WebAdmin

Follow the procedure below to perform recovery.

1. Delete the data storage destination directory and the transaction log storage destination directory
   Back up the data storage destination directory and the transaction log storage destination directory before deleting them.

2. Reconfirm the status
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.
   Click [Recheck the status] to reconfirm the storage destination resources.

3. Run recovery
   Restore the database cluster after WebAdmin detects an error.
   Refer to "15.2.1 Using WebAdmin" for details.

15.10.3.2 Using Server Commands

Follow the procedure below to recover the database.

1. Delete the data storage destination directory and the transaction log storage destination directory
   Save the data storage destination directory and the transaction log storage destination directory, and then delete them.

2. Execute recovery
   Use the pgx_rcvall command to recover the database cluster.
   Refer to "15.2.2 Using the pgx_rcvall Command" for details.

15.11 Actions in Response to Failure to Stop an Instance

If an instance fails to stop, refer to the event log and the server log, and determine the cause of the failure.

If the instance cannot stop despite taking action, perform the following operation to stop the instance.

There are two methods of recovery:

- 15.11.1 Using WebAdmin
- 15.11.2 Using Server Commands

15.11.1 Using WebAdmin

In the [Instances] tab, click  and select the Fast stop mode or the Immediate stop mode to stop the instance. Forcibly terminate the server process from WebAdmin if the instance cannot be stopped.

Refer to "2.1.1 Using WebAdmin" for information on the stop modes.

15.11.2 Using Server Commands

There are three methods:
- Stopping the Instance Using the Fast Mode

If backup is in progress, then terminate it, roll back all executing transactions, forcibly close client connections, and then stop the instance.

- Stopping the Instance Using the Immediate Mode

Forcibly terminate the instance immediately. A crash recovery is run when the instance is restarted.

- Forcibly Stopping the Server Process

Reliably stops the server process when the other methods are unsuccessful.

15.11.2.1 Stopping the Instance Using the Fast Mode

Specify "-m fast" in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "15.11.2.2 Stopping the Instance Using the Immediate Mode" or "15.11.2.3 Forcibly Stopping the Server Process".

Example

> pg_ctl stop -D D:\database\inst1 -m fast

15.11.2.2 Stopping the Instance Using the Immediate Mode

Specify "-m immediate " in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "15.11.2.3 Forcibly Stopping the Server Process".

Example

> pg_ctl stop -D D:\database\inst1 -m immediate

15.11.2.3 Forcibly Stopping the Server Process

If both the Fast mode and the Immediate mode fail to stop the instance, use the kill parameter of the pg_ctl command to forcibly stop the server process.

The procedure is as follows:

1. Execute the wmic command to identify the process ID of the server process.

```
c:>wmic
wmic:root\cli>process where "name = \"postgres.exe\"" get CommandLine,Name,ProcessId
CommandLine Name ProcessId
:C:\Program Files\Fujitsu\fabservx64\bin\postgres.exe -D "D:\database\inst1"
postgres.exe 896
```

The postgres.exe process ID(896) that indicates the data storage destination directory of the applicable instance in the -D option becomes the server process.

2. Forcibly stop the server process

As instance manager, forcibly stop the server process using the pg_ctl command.

```
c:>pg_ctl kill QUIT 896
```
15.12 Actions in Response to Failure to Create a Streaming Replication Standby Instance

When creating a streaming replication standby instance using WebAdmin, if the instance creation fails, refer to the event log and the server log, and determine the cause of the failure.

When an error occurs in the creation of the standby instance using WebAdmin, it is unlikely that the partially created standby instance can be resumed to complete the operation.

In such a scenario, fix the cause of the error, delete the partially created standby instance, and then create a new standby instance. This recommendation is based on the following assumptions:

- As the instance is yet to be created completely, there are no applications connecting to the database.
- The standby instance is in error state and is not running.
- There are no backups for the standby instance and as a result, it cannot be recovered.

Refer to "Deleting Instances" in the Installation and Setup Guide for details on how to delete an instance.

15.13 Actions in Response to Error in a Distributed Transaction

If a system failure (such as server failure) occurs in an application that uses distributed transactions (such as .NET TransactionScope), then transactions may be changed to the in-doubt state.

At that point, resources accessed by the transaction will be locked, and rendered unusable by other transactions.

The following describes how to check for in-doubt transactions, and how to resolve them.

How to check for in-doubt transactions

The following shows how to check for them:

If the server fails

1. An in-doubt transaction will have occurred if a message similar to the one below is output to the log when the server is restarted.

   Example

   LOG: Restoring prepared transaction 2103.

2. Refer to system view pg_prepared_xacts to obtain information about the prepared transaction.

   If the transaction identifier of the prepared transaction in the list (in the transaction column of pg_prepared_xacts) is the same as the identifier of the in-doubt transaction obtained from the log output when the server was restarted, then that row is the information about the in-doubt transaction.

   Example

   postgres=# select * from pg_prepared_xacts;
   transaction |   gid     |   prepared |  owner   | database
   --------------------------|-----------|------------|----------|----------
   2103 | 374ec221-f6dc-4b73-9d62-d4fee9b430cd | 2020-05-06 16:28:48.471+08 | postgres |
   postgres (1 row)

   Information about the in-doubt transaction is output to the row with the transaction ID 2103 in the transaction column.

If the client fails

If there are no clients connected and there is a prepared transaction in pg_prepared_xacts, then you can determine that the transaction is in the in-doubt state.
If at least one client is connected and there is a prepared transaction in pg_prepared_xacts, you cannot determine whether there is a transaction in the in-doubt state. In this case, use the following query to determine the in-doubt transaction from the acquired database name, user name, the time PREPARE TRANSACTION was executed, and the information about the table name accessed.

```
select gid,x.database,owner,prepared,l.relation::regclass as relation from pg_prepared_xacts x
left join pg_locks l on l.virtualtransaction = '-1/'||x.transaction and l.locktype='relation';
```

If it still cannot be determined from this information, wait a few moments and then check pg_prepared_xacts again.

If there is a transaction that has continued since the last time you checked, then it is likely that it is the one in the in-doubt state.

**Point**

As you can see from the explanations in this section, there is no one way to definitively determine in-doubt transactions. Consider collecting other supplementary information (for example, logging on the client) or performing other operations (for example, allocating database users per job).

---

**How to resolve in-doubt transactions**

From the system view pg_prepared_xacts mentioned above, obtain the global transaction identifier (in the gid column of pg_prepared_xacts) for the in-doubt transaction, and issue either a ROLLBACK PREPARED statement or COMMIT PREPARED statement to resolve the in-doubt transaction.

**Example**

- Rolling back in-doubt transactions

  ```
  postgres=# rollback prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';
  ROLLBACK PREPARED
  ```

- Committing in-doubt transactions

  ```
  postgres=# commit prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';
  COMMIT PREPARED
  ```

---

**15.14 I/O Errors Other than Disk Failure**

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output.

A few examples of such errors are given below. The appropriate action for each error is explained respectively.

- **15.14.1 Network Error with an External Disk**
- **15.14.2 Errors Caused by Power Failure or Mounting Issues**

**15.14.1 Network Error with an External Disk**

This is an error that occurs in the network path to/from an external disk.

Determine the cause of the error by checking the information in the event log and the server log, the disk access LED, network wiring, and network card status. Take appropriate action to remove the cause of the error, for example, replace problematic devices.

**15.14.2 Errors Caused by Power Failure or Mounting Issues**

These are errors that occur when the disk device is not turned on, automatic mounting of the disk was not set, or mounting was accidentally cancelled.
In this case, check the information in the event log and the server log, the disk access LED, and whether the disk is mounted correctly. If problems are detected, take appropriate action.

If mounting has been cancelled, it is possible that mounting was accidentally cancelled, or the existing setting (automatic mounting at the time of starting the operating system) has been changed so that mounting is not performed automatically. In this case, set the mounting to be performed automatically.

15.15 Anomaly Detection and Resolution

The following operations performed via the command line interface will result in an anomaly in WebAdmin:
- Changes to the port and backup_destination parameters in postgresql.conf
- Changes to Mirroring Controller configuration of cluster replication added via WebAdmin

This section describes when WebAdmin checks for such anomalies, and what takes place when an anomaly is detected.

15.15.1 Port Number and Backup Storage Path Anomalies

An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of its corresponding parameter in postgresql.conf - port and backup_destination, respectively.

WebAdmin checks for anomalies when an instance is selected for viewing or any instance operation is performed. Anomalies will be identified for the selected instance only.

The following occurs when an anomaly is detected in port number and/or backup storage path:
- All instance operation buttons are disabled, except for "Edit instance", "Refresh instance", and "Delete Mirroring Controller"
- A red error status indicator is displayed on the instance icon
- For an anomaly specific to backup storage path, a red error status indicator is displayed on the [Backup storage] disk icon, and [Backup storage status] is set to "Error"
- The message, "WebAdmin has detected an anomaly with...", is displayed in the [Message] section along with an associated [Solution] button

Click [Solution]. The [Anomaly Error] dialog box is displayed.
Select the required option, click [OK], and then resolve the anomaly error.

Note

Critical errors encountered during anomaly resolution will be displayed, however, rollback of the instance to its previous state is not supported.

15.15.2 Mirroring Controller Anomalies

The following conditions will cause a Mirroring Controller anomaly:

- The Mirroring Controller management folder or configuration files have been deleted
- The permissions to the Mirroring Controller management folder or configuration files have been changed such that:
  - The instance administrator's access to Mirroring Controller configuration is denied
  - Users other than an instance administrator have access privileges to Mirroring Controller configuration files

WebAdmin checks for anomalies when Mirroring Controller status check is performed.

The following occurs when a Mirroring Controller anomaly is detected:

- All Mirroring Controller functionality is disabled for the replication cluster, except for "Delete Mirroring Controller"
- [Mirroring Controller status] is set to "Error"
- Either of the following messages is displayed in the [Message] section
  "Failed to access the Mirroring Controller management folder or configuration files 'path'. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again."
  "Failed to find the Mirroring Controller management folder or configuration files 'path'. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again."
Appendix A Parameters

This appendix describes the parameters to be set in the postgresql.conf file of FUJITSU Enterprise Postgres.

The postgresql.conf file is located in the data storage destination.

--- Information ---

The maximum value that can be expressed as a 4-byte signed integer changes according to the operating system. Follow the definition of the operating system in use.

--- Note ---

Note the following when specifying the path:

- Specify \ as the path delimiter.
- Enclose the path in double quotes (") if it contains spaces.

- core_directory (string)
  This parameter specifies the directory where the corefile is to be output. If this parameter is omitted, the data storage destination is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- core_contents (string)
  This parameter specifies the contents to be included in the corefile.
  - full: Outputs all contents of the server process memory to the corefile.
  - none: Does not output a corefile.
  - minimum: Outputs only non-shared memory server processes to the corefile. This reduces the size of the corefile. However, in some cases, this file may not contain sufficient information for examining the factor that caused the corefile to be output.

  If this parameter is omitted, "minimum" is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- keystore_location (string)
  This parameter specifies the directory that stores the keystore file. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- tablespace_encryption_algorithm (string)
  This parameter specifies the encryption algorithm for tablespaces that will be created. Valid values are "AES128", "AES256", and "none". If you specify "none", encryption is not performed. The default value is "none". To perform encryption, it is recommended that you specify "AES256". Only superusers can change this setting.

- backup_destination (string)
  This parameter specifies the absolute path of the directory where pgx_dmpall will store the backup data. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

  Place this directory on a different disk from the data directory to be backed up and the tablespace directory. Ensure that users do not store arbitrary files in this directory, because the contents of this directory are managed by the database system.

- search_path (string)
  When using the SUBSTR function compatible with Oracle databases, set "oracle" and "pg_catalog" in the search_path parameter. You must specify "oracle" before "pg_catalog".
**Example**

```bash
search_path = "'$user', public, oracle, pg_catalog'
```

**Information**

- The `search_path` feature specifies the priority of the schema search path. The `SUBSTR` function in Oracle database is defined in the `oracle` schema.

- Refer to "Statement Behavior" under "Server Administration" in the PostgreSQL Documentation for information on `search_path`.

- **track_waits (string)**

  This parameter enables collection of statistics for `pgx_stat_rwlock` and `pgx_stat_latch`.

  - on: Enables collection of statistics.
  - off: Disables collection of statistics.

  If this parameter is omitted, "on" is assumed. Only superusers can change this setting.

- **track_sql (string)**

  This parameter enables collection of statistics for `pgx_stat_sql`.

  - on: Enables collection of statistics.
  - off: Disables collection of statistics.

  If this parameter is omitted, "on" is assumed. Only superusers can change this setting.

**Parameters for the in-memory feature**

- **reserve_buffer_ratio (numerical value)**

  This parameter specifies the proportion of shared memory to be used for a stable buffer table.

  - Minimum value: 0
  - Maximum value: 80

  If this parameter is omitted, 0 will be used.

- **vci.cost_threshold (numerical value)**

  This parameter specifies the lowest cost that selects an execution plan that uses a VCI. If the cost of the best execution plan that does not use a VCI is lower than this value, that execution plan will be selected.

  - Minimum value: 0
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 18000 will be used.

- **vci.control_max_workers (numerical value)**

  This parameter specifies the number of background workers that manage VCI. The number of workers for the entire instance is limited by `max_worker_processes`, so add the value specified here to `max_worker_processes`.

  - Minimum value: 1
  - Maximum value: 8388607

  If this parameter is omitted or a value outside this range is specified, 8 will be used.
- vci.enable (string)
  This parameter enables or disables VCI.
  - on: Enables VCI.
  - off: Disables VCI.
  If this parameter is omitted, "on" will be used.

- vci.log_query (string)
  This parameter enables or disables log output when VCI is not used due to insufficient memory specified by vci.max_local_ros.
  - on: Enables log output.
  - off: Disables log output.
  If this parameter is omitted, "off" will be used.

- vci.maintenance_work_mem (numerical value)
  This parameter specifies the maximum memory size used for maintenance of VCI (when executing CREATE INDEX, for example).
  - Minimum value: 1 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer / 1024
  If this parameter is omitted or a value outside this range is specified, 256 MB will be used.

- vci.max_local_ros (numerical value)
  This parameter specifies the maximum memory size used for VCI scan.
  - Minimum value: 64 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  If this parameter is omitted or a value outside this range is specified, 64 MB will be used.

- vci.max_parallel_degree (numerical value)
  This parameter specifies the maximum number of background workers used for parallel scan. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.
  A value from -8388607 to 8388607 can be specified.
  - Integer (1 or greater): Parallel scan is performed using the specified degree of parallelism.
  - 0: Stops the parallel scan process.
  - Negative number: The specified value minus the maximum number of CPUs obtained from the environment is used as the degree of parallelism and parallel scan is performed.
  If this parameter is omitted or a value outside this range is specified, 0 will be used.

- vci.shared_work_mem (numerical value)
  This parameter specifies the maximum memory size used for VCI parallel scan.
  - Minimum value: 32 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer
  If this parameter is omitted or a value outside this range is specified, 1 GB will be used.

- vci.smc_directory (string)
  This parameter specifies a directory name in which a temporary file is created as the dynamic shared memory during a scan using a VCI.
  If this parameter is omitted, a directory (dataStorageDir\base\pgsql_tmp) under the data storage directory will be used.

Parameters for the Global Meta Cache feature
**pgx_global_metacache (numerical value)**

Specifies the memory size of the GMC area.

Specify a value calculated by the formula below.

A value lower than the calculated value will still work, but the meta cache may not be able to fit into the GMC area.

In this case, the system will discard the meta cache it thinks it is no longer needed, but if it is needed again, the meta cache will need to be expanded and will not perform well.

If the value is less than 10 MB and is set to a nonzero value that disables the feature, the database startup fails because the Global Meta Cache feature cannot operate.

A setting of 0 disables the Global Meta Cache feature. The default is 0.

Changing this setting requires restarting the database.

\[
\text{Size of GMC area} = \max(10\text{MB}, (\text{All user table} \times 0.4\ \text{KB} + \text{All user indexes} \times 0.3\ \text{KB} + \text{All user columns} \times 0.8\ \text{KB}) \times 1.5 \times (1))
\]

\(\times 1\) Safety Factor (1.5)

This value takes into account the case where both GMC before and after the change temporarily exist at the same time in shared memory when the table definition is changed or the row of the system catalog is changed.

**track_gmc (string)**

This parameter enables collection of statistics for pgx_stat_gmc.

- on: Enables collection of statistics.
- off: Disables collection of statistics.

If this parameter is omitted, "on" is used.

Only superusers can change this setting.

---

### Parameters for the Local Meta Cache Limit feature

**pgx_catalog_cache_max_size (numerical value)**

Specifies the maximum amount of memory that the backend process should use as the catalog cache.

You can enable catalog cache deletion by setting it to 8 KB or more.

A setting of 0 disables the catalog cache removal. The default is 0.

If no units are specified, they are treated as KB.

- Minimum value: 8 KB
- Maximum value: Maximum value that can be expressed as a 4-byte signed integer

When calculating the parameter settings, the factors that determine the cache size are calculated as the number of tables, the number of indexes, and the number of columns. What is kept as a catalog cache or relation cache also includes objects such as databases, roles, or procedures, but these are small compared to the above factors and do not need to be factored into them. It also includes a calculation method for pgx_relacion_cache_max_size because the given memory is distributed between the catalog cache and the relation cache.

---

**Note**

The calculation method here assumes that all backends have similar access and that the transaction also has access to a similar number of resources. If you have a small number of singular backends or transactions, consider excluding them as errors.
1. Determine how much memory a backend process can use. Decide by subtracting the memory size required by the entire system such as the database cache from the installed memory and dividing the rest by the number of connections.

2. For best performance, use the following formula to calculate the total memory size of the catalog cache when the backend holds the catalog cache for all resources accessed during its lifetime. The amount of memory varies depending on whether Global Meta Cache is enabled or disabled. Enabling Global Meta Cache reduces the amount of memory required because most of the cache is located on shared memory.

   When Global Meta Cache is enabled:
   
   \[(\text{Number of tables to access} + \text{Number of indexes to access} + \text{Number of columns to access}) \times 0.1\text{KB} \times 1.5 \times (\text{1})\]

   When Global Meta Cache is disabled:
   
   \[
   \{(\text{Number of tables to access} \times 0.5\text{KB}(\text{pg_class tuple size})
   
   + \text{Number of indexes to access} \times 0.5\text{KB}(\text{pg_index tuple size})
   
   + \text{Number of columns to access} \times 1.0\text{KB}(\text{pg_statistic tuple size})) \times 1.5 \times (\text{1})\}
   
   *(1) Safety Factor (1.5)

   The system catalog contains columns with variable-length types. For example, the tuple size in pg_class is a constant value multiplied by the number of tables, while relname in pg_class is variable length data. It is not practical to calculate every definition in detail, so we added 50% to the above formula.

3. In the same way as in 2., calculate the relation cache using the following formula.

   \[(1.4\text{KB} \times \text{Number of tables to access} + 2.4\text{KB} \times \text{Number of indexes to access}) \times 1.5 \times (\text{1})\]

   *(1) Safety Factor (1.5)

   The relation cache is structured to facilitate the use of table and index definitions, holds pointers to various objects, and is sized to include them. It is variable length because the type of object allocated by the table definition and its size change. Since it is not realistic to calculate for all definitions, 50% is added.

4. If the value of 1. ≥ the value of 2. + the value of 3., the backend process can keep all caches to the extent allowed, so there is no need to limit the caches. If you want to cap for safety, set the value of 2. to pgx_catalog_cache_max_size and the value of 3. to pgx_relation_cache_max_size.

5. If the value of 1. < the value of 2. + the value of 3., then you need to limit the cache. However, this parameter does not limit the size of the cache used by a transaction. Therefore, take the following steps.

6. Calculate the catalog cache used by a transaction using the formula in 2.

7. Calculate the relation cache used by a transaction using the formula in 3.

8. If the value of 1. < the value of 6. + the value of 7., then the value of 1. needs to be increased. In other words, in some cases, it may be necessary to increase the installed memory or reduce the number of connections.

9. If the value of 1. ≥ the value of 6. + the value of 7., the condition of 1. can be satisfied by limiting the cache with this parameter. Divide the value of 1. by the ratio of 2. and 3. and set it as a parameter. Set the value distributed to 2. to pgx_catalog_cache_max_size and the value distributed to 3. to pgx_relation_cache_max_size.

10. The value calculated in 9. is a provisional value. If you cannot meet your target performance, first try to shift the focus of allocation to the relation cache. This is because when executing SQL, the relation cache generated based on the catalog cache is mainly referenced, so it is advantageous to leave a large amount of relation cache. If the performance is still not satisfied, adjust the parameters by referring to "13.1.4 Performance Impact and Parameter Tuning of the Local Meta Cache Limit Feature".

---

**Note**

Be careful when partitioning the table.

The cached definition changes depending on whether the parent table is specified in the SQL statement or the child table is specified. In particular, note that if you specify a parent table, the definitions of all child tables are cached. This is because when you specify a parent table in an SQL statement, you need to know the definitions of all the child tables in order to determine which child table will contain the desired data. Note that the column information of the parent table is not cached.
When specifying the parent table:

\[
\text{Number of tables to access} = \text{Number of parent tables to access} + \text{Number of defined child tables} \\
\text{Number of columns} = \text{Number of defined columns} \times \text{number of defined child tables}
\]

When specifying the child table directly:

\[
\text{Number of tables to access} = \text{Number of child tables actually accessed} \\
\text{Number of columns} = \text{Number of defined columns} \times \text{number of child tables actually accessed}
\]

Example)

Suppose the parent table T (1 index, 3 columns) is split from child tables T1 to T5 (1 index, 3 columns, respectively). If the parent table T is specified in SQL, when the child tables that contain the data to be queried are limited to T1 and T2, and when accessing the data using the indexes defined by T1 and T2, calculate as follows.

\[
\begin{align*}
\text{Number of tables} & = 1 \text{(parent table)} + 5 \text{(child table)} = 6 \\
\text{Number of indexes} & = 2 \text{ (index to access)} \\
\text{Number of columns} & = 3 \text{ (number of columns)} \times 5 \text{ (child table)} = 15
\end{align*}
\]

If you specify child tables T1 and T2 in SQL and use the indexes defined on T1 and T2 when accessing data, the calculation is as follows.

\[
\begin{align*}
\text{Number of tables} & = 2 \text{ (child table)} \\
\text{Number of indexes} & = 2 \text{ (index to access)} \\
\text{Number of columns} & = 3 \text{ (number of columns)} \times 2 \text{ (child table)} = 6
\end{align*}
\]

- `pgx_relation_cache_max_size`(numerical value)

  Specifies the maximum amount of memory that the backend process should use as the relation cache.

  You can enable catalog cache deletion by setting it to 8 KB or more.

  A setting of 0 disables the relation cache removal. The default is 0.

  If no units are specified, they are treated as KB.

  - Minimum value: 8KB
    - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  For the calculation method for parameter setting, refer to the calculation method of `pgx_catalog_cache_max_size`.

- `pgx_cache_hit_log_interval`(numerical value)

  Specifies the time interval to output a message indicating the cache reference status for each backend process.

  When the transaction ends, if the time set in this parameter has elapsed since the previous message was output, the message is output.

  If set to 0, a message will be output each time the transaction ends.

  Setting -1 disables the output. The default value is 10min.

  If no units are specified, they are treated as ms.

  Even if `pgx_catalog_cache_max_size` and `pgx_relation_cache_max_size` are disabled, the message output of the corresponding cache will be invalid.

  Immediately after connecting to the server, a small transaction occurs before the request from the user application, such as for user authentication. Since it is meaningless to know the hit rate for these, a message will be output at the end of the transaction that started after the time set in this parameter has elapsed after connecting to the server.

  For the same reason, setting a small value such as 0 may result in a message being printed at the end of such a small transaction.

  You can check which transaction the message corresponds to from the information output at the beginning.

  This information depends on the setting of the parameter `log_line_prefix`.

  - Minimum value: 0
    - Maximum value: 2147483647ms
See

Refer to “Server Configuration” under “Server Administration” in the PostgreSQL Documentation for information on other postgresql.conf parameters.
Appendix B System Administration Functions

This appendix describes the system administration functions of FUJITSU Enterprise Postgres.

See

Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on other system administration functions.

B.1 WAL Mirroring Control Functions

The following table lists the functions that can be used for backup and recovery based on WAL mirroring.

Table B.1 WAL mirroring control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_pause_wal_multiplexing()</td>
<td>void</td>
<td>Stops WAL multiplexing</td>
</tr>
<tr>
<td>pgx_resume_wal_multiplexing()</td>
<td>void</td>
<td>Resumes WAL multiplexing</td>
</tr>
<tr>
<td>pgx_is_wal_multiplexing_paused()</td>
<td>boolean</td>
<td>Returns true if WAL multiplexing has stopped</td>
</tr>
</tbody>
</table>

If WAL mirroring has not been configured, these functions return an error. Setting the backup_destination parameter in postgresql.conf configures WAL multiplexing.

Only superusers can execute these functions.

B.2 Transparent Data Encryption Control Functions

The following table lists the functions that can be used for transparent data encryption.

Table B.2 Transparent data encryption control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_open_keystore(passphrase)</td>
<td>void</td>
<td>Opens the keystore</td>
</tr>
<tr>
<td>pgx_set_master_key(passphrase)</td>
<td>void</td>
<td>Sets the master encryption key</td>
</tr>
<tr>
<td>pgx_set_keystore_passphrase(olapassphrase, newPassphrase)</td>
<td>void</td>
<td>Changes the keystore passphrase</td>
</tr>
</tbody>
</table>

The pgx_open_keystore function uses the specified passphrase to open the keystore. When the keystore is opened, the master encryption key is loaded into the database server memory. In this way, you can access the encrypted data and create encrypted tablespaces. If the keystore is already open, this function returns an error.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block.

The pgx_set_master_key function generates a master encryption key and stores it in the keystore. If the keystore does not exist, this function creates a keystore. If the keystore already exists, this function modifies the master encryption key. If the keystore has not been opened, this function opens it.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.
The `pgx_set_keystore_passphrase` function changes the keystore passphrase. Specify the current passphrase in `oldPassphrase`, and a new passphrase in `newPassphrase`.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.

### B.3 Data Masking Control Functions

The table below lists the functions that can be used for data masking.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pgx_alter_confidential_policy</code></td>
<td>boolean</td>
<td>Changes masking policies</td>
</tr>
<tr>
<td><code>pgx_create_confidential_policy</code></td>
<td>boolean</td>
<td>Creates masking policies</td>
</tr>
<tr>
<td><code>pgx_drop_confidential_policy</code></td>
<td>boolean</td>
<td>Deletes masking policies</td>
</tr>
<tr>
<td><code>pgx_enable_confidential_policy</code></td>
<td>boolean</td>
<td>Enables or disables masking policies</td>
</tr>
<tr>
<td><code>pgx_update_confidential_values</code></td>
<td>boolean</td>
<td>Changes replacement characters when full masking is specified for masking type</td>
</tr>
</tbody>
</table>

#### B.3.1 `pgx_alter_confidential_policy`

**Description**

Changes masking policies

**Format**

The format varies depending on the content to be changed. The format is shown below.

- **Common format**

  ```
  common_arg:
  [schema_name := 'schemaName',]
  table_name := 'tableName',
  policy_name := 'policyName'
  ```

- **Add a masking target to a masking policy**

  ```
  pgx_alter_confidential_policy(
    commonArg,
    [action := 'ADD_COLUMN', ]
    column_name := 'colName'
    [, function_type := 'FULL' ]
    [, function_type := 'PARTIAL', partialOpt] |
    [, function_type := 'REGEXP', regexpOpt]
  )
  ```

  **partialOpt**:

  ```
  function_parameters := 'maskingFmt'
  ```

  **regexpOpt**:

  ```
  regexp_pattern := 'regexpPattern',
  regexp_replacement := 'regexpReplacementChar',
  [, regexp_flags := 'regexpFlags']
  ```
- Delete a masking target from a masking policy

```
pgx_alter_confidential_policy(
    commonArg,
    action        := 'DROP_COLUMN',
    column_name    := 'colName'
)
```

- Change the masking condition

```
pgx_alter_confidential_policy(
    commonArg,
    action        := 'MODIFY_EXPRESSION',
    expression    := 'expr'
)
```

- Change the content of a masking policy set for a masking target

```
pgx_alter_confidential_policy(
    commonArg,
    action        := 'MODIFY_COLUMN',
    column_name    := 'colName'
    [, function_type    := 'FULL'] |
    [, function_type    := 'PARTIAL', partialOpt] |
    [, function_type    := 'REGEXP', regexpOpt]
)
```

```
partialOpt:
    function_parameters    := 'maskingFmt'
```

```
regexpOpt:
    regexp_pattern        := 'regexpPattern',
    regexp_replacement        := 'regexpReplacementChar',
    [, regexp_flags        := 'regexpFlags']
```

- Change the masking policy description

```
pgx_alter_confidential_policy(
    commonArg,
    action        := 'SET_POLICY_DESCRIPTION',
    policy_description    := 'policyDesc'
)
```

- Change the masking target description

```
pgx_alter_confidential_policy(
    commonArg,
    action        := 'SET_COLUMN_DESCRIPTION',
    column_name    := 'colName',
    column_description    := 'colDesc'
)
```

**Argument**

The argument varies depending on the content to be changed. Details are as follows.

- Common arguments
<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td></td>
<td>Name of table for which a masking policy is applied</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td></td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Add a masking target to a masking policy

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'ADD_COLUMN'</td>
<td>'ADD_COLUMN'</td>
</tr>
<tr>
<td></td>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- 'FULL': Full masking</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- 'PARTIAL': Partial masking</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- 'REGEXP': Regular expression masking</td>
<td></td>
</tr>
<tr>
<td>Partial masking</td>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Regular expression masking</td>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>

<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

### Execution example 1

Adding masking policy p1 to masking target c2

```sql
pgx_alter_confidential_policy
-----------------------------
t
(1 row)
```

### Execution example 2

Deleting masking target c1 from masking policy p1

```sql
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'DROP_COLUMN', column_name := 'c1');
pgx_alter_confidential_policy
-----------------------------
t
(1 row)
```
Execution example 3
Changing the masking condition for masking policy p1

postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'MODIFY_EXPRESSION', expression := 'false');
pgx_alter_confidential_policy
--------------------------------
t (1 row)

Execution example 4
Changing the content of masking policy p1 set for masking target c2

postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'MODIFY_COLUMN', column_name := 'c2', function_type := 'FULL');
pgx_alter_confidential_policy
--------------------------------
t (1 row)

Execution example 5
Changing the description of masking policy p1

postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'SET_POLICY_DESCRIPTION', policy_description := 'this policy is an example.');
pgx_alter_confidential_policy
--------------------------------
t (1 row)

Execution example 6
Changing the description of masking target c2

postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'SET_COLUMN_DESCRIPTION', column_name := 'c2', column_description := 'c2 column is FULL.');
pgx_alter_confidential_policy
--------------------------------
t (1 row)

Description
- The arguments for the pgx_alter_confidential_policy system management function can be specified in any order.
- The action parameters below can be specified. When action parameters are omitted, ADD_COLUMN is applied.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COLUMN</td>
<td>Adds a masking target to a masking policy.</td>
</tr>
<tr>
<td>DROP_COLUMN</td>
<td>Deletes a masking target from a masking policy.</td>
</tr>
<tr>
<td>MODIFY_EXPRESSION</td>
<td>Changes expression.</td>
</tr>
<tr>
<td>MODIFY_COLUMN</td>
<td>Changes the content of a masking policy set for a masking target.</td>
</tr>
<tr>
<td>SET_POLICY_DESCRIPTION</td>
<td>Changes policy_description.</td>
</tr>
<tr>
<td>SET_COLUMN_DESCRIPTION</td>
<td>Changes column_description.</td>
</tr>
</tbody>
</table>

- The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.
The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.
- regexp_pattern
- regexp_replacement
- regexp_flags

See
- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

B.3.2 pgx_create_confidential_policy

Description
Creates masking policies

Format
The format varies depending on the masking type. The format is shown below.

```sql
pgx_create_confidential_policy(
    [schema_name := 'schemaName',]
    table_name := 'tableName',
    policy_name := 'policyName',
    expression := 'expr'
    [, enable := 'policyStatus']
    [, policy_description := 'policyDesc']
    [, column_name := 'colName'
        [, function_type := 'FULL']
        [, function_type := 'PARTIAL', partialOpt]
        [, function_type := 'REGEXP', regexpOpt]
        [, column_description := 'colDesc']
    ]
)
```

partialOpt:
```
function_parameters := 'maskingFmt'
```

regexpOpt:
```
regexp_pattern := 'regexpPattern',
regexp_replacement := 'regexpReplacementChar',
[, regexp_flags := 'regexpFlags']
```

Argument
Details are as follows.

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>

<tr>
<td>regexp_replacement</td>
<td>-</td>
<td>-</td>
<td>N</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>-</td>
<td>-</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified
## Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

## Execution example 1
Creating masking policy `p1` that does not contain a masking target

```sql
postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
expression := '1=1');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

## Execution example 2
Creating masking policy `p1` that contains masking target `c1` of which the masking type is full masking

```sql
postgres=# select pgx_create_confidential_policy(schema_name := 'public', table_name := 't1',
policy_name := 'p1', expression := '1=1', enable := 't', policy_description := 'this policy is an example.', column_name := 'c1', function_type := 'FULL', column_description := 'c1 column is FULL.');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

## Execution example 3
Creating masking policy `p1` that contains masking target `c2` of which the masking type is partial masking

```sql
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
'VVVFVVVFVVV, VVV-VVVV-VVVV, *, 4, 11');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

## Execution example 4
Creating masking policy `p1` that contains masking target `c3` of which the masking type is regular expression masking

```sql
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c3', function_type := 'REGEXP', regexp_pattern := '(.*)(@.*)',
regexp_replacement := 'xxx\2', regexp_flags := 'g');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

## Description
- The arguments for the `pgx_create_confidential_policy` system management function can be specified in any order.
- If `column_name` is omitted, only masking policies that do not contain masking target will be created.
- One masking policy can be created for each table. Use the `pgx_alter_confidential_policy` system management function to add a masking target to a masking policy.
- The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.

- The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.
  - regexp_pattern
  - regexp_replacement
  - regexp_flags

Note

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

See

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

### B.3.3 pgx_drop_confidential_policy

**Description**

Deletes masking policies

**Format**

```sql
pgx_drop_confidential_policy(
    [schema_name := 'schemaName', ]
    table_name := 'tableName',
    policy_name := 'policyName'
)
```

**Argument**

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is deleted</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is deleted</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted
Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Deleting masking policy p1

```sql
postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
pgx_drop_confidential_policy
-------------------------------
t
(1 row)
```

Description

The arguments for the pgx_drop_confidential_policy system management function can be specified in any order.

**Note**

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

**See**

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.3.4 pgx_enable_confidential_policy

Description

Enables or disables masking policies

Format

```sql
pgx_enable_confidential_policy(
[ schema_name := 'schemaName', ]
 table_name := 'tableName',
 policy_name := 'policyName',
 enable := 'policyStatus'
)
```

Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is enabled or disabled</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is enabled or disabled</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- 144 -
### Argument Data type Description Default value

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>- 'T': Disabled</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
<tr>
<td>enable</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted

### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

### Execution example

Enabling masking policy p1

```sql
postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');
pgx_enable_confidential_policy
-------------
t
(1 row)
```

### Description

The arguments for the pgx_enable_confidential_policy system management function can be specified in any order.

See

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

### B.3.5 pgx_update_confidential_values

#### Description

Changes replacement characters when full masking is specified for masking type

#### Format

```sql
pgx_update_confidential_values{
  [number_value := 'numberValue']
  [, char_value := 'charValue']
  [, varchar_value := 'varcharValue']
  [, date_value := 'dateValue']
  [, ts_value := 'tsValue']
}
```
### Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Replacement character in numeric type</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>Replacement character in char type</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>Replacement character in varchar type</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>Replacement character in date type</td>
</tr>
<tr>
<td>ts_value</td>
<td>timestamp</td>
<td>Replacement character in timestamp type</td>
</tr>
</tbody>
</table>

### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

### Execution example

Using '*' as a replacement character in char type and varchar type

```sql
postgres=# select pgx_update_confidential_values(char_value := '*', varchar_value := '*');
pgx_update_confidential_values
---------------------------------
t
(1 row)
```

### Description

- The arguments for the `pgx_update_confidential_values` system management function can be specified in any order.
- Specify one or more arguments for the `pgx_update_confidential_values` system management function. A replacement character is not changed for an omitted argument.

### B.4 VCI Data Load Control Function

The table below lists the function that loads VCI data to buffer cache.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pgx_prewarm_vci(vci_index regclass)</code></td>
<td>int8</td>
<td>Loads the VCI data to buffer cache.</td>
</tr>
</tbody>
</table>

`pgx_prewarm_vci` loads the specified VCI data to buffer cache and returns the number of blocks of the loaded VCI data.

The aggregation process using VCI may take time immediately after an instance is started, because the VCI data has not been loaded to buffer cache. Therefore, the first aggregation process can be sped up by executing `pgx_prewarm_vci` after an instance is started.

The amount of memory required for preloading is the number of blocks returned by `pgx_prewarm_vci` multiplied by the size of one block.

This function can only be executed if the user has reference privilege to the VCI index and execution privilege to the `pg_prewarm` function.
B.5 High-Speed Data Load Control Functions

The table below lists the functions that can be used for high-speed data load.

Table B.5 High-speed data load control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_loader</td>
<td>bigint</td>
<td>Creates dynamic shared memory, starts parallel workers and loads data</td>
</tr>
<tr>
<td>pgx_loader_recovery</td>
<td>smallint</td>
<td>Resolves in-doubt transactions</td>
</tr>
</tbody>
</table>

The `pgx_loader` command executes the above functions internally.
Appendix C System Views

This appendix describes how to use the system views in FUJITSU Enterprise Postgres.

See Refer to “System Views” under “Internals” in the PostgreSQL Documentation for information on other system views.

C.1 pgx_tablespaces

The pgx_tablespaces catalog provides information related to the encryption of tablespaces.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>References</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spctablespace</td>
<td>oid</td>
<td>pg_tablespace.oid</td>
<td>Tablespace OID</td>
</tr>
<tr>
<td>spcencalgo</td>
<td>text</td>
<td></td>
<td>Tablespace encryption algorithm</td>
</tr>
</tbody>
</table>

The spcencalgo string displays one of the following values:
- none: Tablespace is not encrypted
- AES128: AES with key length of 128 bits
- AES256: AES with key length of 256 bits

C.2 pgx_stat_lwlock

The pgx_stat_lwlock view displays statistics related to lightweight locks, with each type of content displayed on a separate line.

Table C.1 pgx_stat_lwlock view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lwlock_name</td>
<td>name</td>
<td>Name of the lightweight lock</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused by the lightweight lock</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the lightweight lock</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistics was reset</td>
</tr>
</tbody>
</table>

C.3 pgx_stat_latch

The pgx_stat_latch view displays statistics related to latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line.

Table C.2 pgx_stat_latch view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>latch_name</td>
<td>name</td>
<td>Name of the latch</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused a wait</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the latch</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.4 pgx_stat_walwriter

The pgx_stat_walwriter view displays statistics related to WAL writing, in a single line.
### Table C.3 pgx_stat_walwriter view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirty_writes</td>
<td>bigint</td>
<td>Number of times old WAL buffers were written to the disk because the WAL buffer was full when WAL records were added</td>
</tr>
<tr>
<td>writes</td>
<td>bigint</td>
<td>Number of WAL writes</td>
</tr>
<tr>
<td>write_blocks</td>
<td>bigint</td>
<td>Number of WAL write blocks</td>
</tr>
<tr>
<td>total_write_time</td>
<td>double precision</td>
<td>Number of milliseconds spent on WAL writing</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

### C.5 pgx_stat_sql

The pgx_stat_sql view displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line.

### Table C.4 pgx_stat_sql view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>selects</td>
<td>bigint</td>
<td>Number of SELECT statements executed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In database multiplexing mode, this number includes the SELECT statements executed in Mirroring Controller. Mirroring Controller executes the SELECT statement using the interval specified for the heartbeat_interval of the server definition file (milliseconds).</td>
</tr>
<tr>
<td>inserts</td>
<td>bigint</td>
<td>Number of INSERT statements executed</td>
</tr>
<tr>
<td>deletes</td>
<td>bigint</td>
<td>Number of DELETE statements executed</td>
</tr>
<tr>
<td>updates</td>
<td>bigint</td>
<td>Number of UPDATE statements executed</td>
</tr>
<tr>
<td>selects_with_parallelism</td>
<td>bigint</td>
<td>Number of times parallel scan was used in SELECT statements</td>
</tr>
<tr>
<td>inserts_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>deletes_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>updates_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>copies_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>declares</td>
<td>bigint</td>
<td>Number of DECLARE statements executed (number of cursor OPENs)</td>
</tr>
<tr>
<td>fetches</td>
<td>bigint</td>
<td>Number of FETCH statements executed</td>
</tr>
<tr>
<td>checkpoints</td>
<td>bigint</td>
<td>Number of CHECKPOINT statements executed</td>
</tr>
<tr>
<td>clusters</td>
<td>bigint</td>
<td>Number of CLUSTER statements executed</td>
</tr>
<tr>
<td>copies</td>
<td>bigint</td>
<td>Number of COPY statements executed</td>
</tr>
<tr>
<td>reindexes</td>
<td>bigint</td>
<td>Number of REINDEX statements executed</td>
</tr>
<tr>
<td>truncates</td>
<td>bigint</td>
<td>Number of TRUNCATE statements executed</td>
</tr>
<tr>
<td>locks</td>
<td>bigint</td>
<td>Number of times a lock occurred</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

### C.6 pgx_stat_gmc

The pgx_stat_gmc view provides information about the GMC areas.
<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>searches</td>
<td>bigint</td>
<td>Number of times the cache table is searched.</td>
</tr>
<tr>
<td>hits</td>
<td>bigint</td>
<td>Number of times the cache table is hit.</td>
</tr>
<tr>
<td>size</td>
<td>bigint</td>
<td>The current amount of memory (bytes) used in the GMC area.</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time these statistics were reset.</td>
</tr>
</tbody>
</table>
Appendix D Tables Used by Data Masking

This appendix explains tables used by the data masking feature.

**Note**

These tables are updated by the data masking control function, so do not use SQL statements to directly update these tables.

### D.1 pgx_confidential_columns

This table provides information on masking target for which masking policies are set.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
</tr>
<tr>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
</tr>
<tr>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
</tr>
<tr>
<td>column_description</td>
<td>varchar(1024)</td>
<td>Masking target description</td>
</tr>
</tbody>
</table>

**Execution example**

```
postgres=# select * from pgx_confidential_columns;
```

<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>column_name</th>
<th>function_type</th>
<th>function_parameters</th>
<th>regexp_pattern</th>
<th>regexp_replacement</th>
<th>regexp_flags</th>
<th>column_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>c1</td>
<td>FULL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>c2</td>
<td>PARTIAL</td>
<td>VVFFVVFVFVVVVV, VVVV--VVVV--VVVV,</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>* , 4, 11</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(2 row)

### D.2 pgx_confidential_policies

This table provides information on masking policies.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>Column</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
</tr>
<tr>
<td>policy_description</td>
<td>varchar(1024)</td>
<td>Masking policy description</td>
</tr>
</tbody>
</table>

**Execution example**
```
postgres=# select * from pgx_confidential_policies;
schema_name | table_name | policy_name | expression | enable | policy_description
-------------+------------+-------------+------------+--------+---------------------
public      | t1         | p1          | 1=1        | t      |                     
(1 row)
```

**D.3 pgx_confidential_values**
This table provides information on replacement characters when full masking is specified for masking type.

<table>
<thead>
<tr>
<th>Column</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Numeric</td>
<td>0</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>char type</td>
<td>Spaces</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>varchar type</td>
<td>Spaces</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>date type</td>
<td>'1970-01-01'</td>
</tr>
<tr>
<td>timestamp_value</td>
<td>timestamp</td>
<td>timestamp type</td>
<td>'1970-01-01 00:00:00'</td>
</tr>
</tbody>
</table>

**Execution example**
```
postgres=# select * from pgx_confidential_values;
number_value | char_value | varchar_value | date_value | ts_value
--------------+------------+---------------+------------+---------------------
0             |           |               | 1970-01-01 | 1970-01-01 00:00:00 |
(1 row)
```
This appendix describes the tables used by high-speed data load.

### E.1 **pgx_loader_state**

The `pgx_loader_state` table provides information about transactions prepared by high-speed data load.

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>serial</td>
<td>Unique identifier. This value is assigned from the <code>pgx_loader_state_id_seq</code> sequence.</td>
</tr>
<tr>
<td>gid</td>
<td>text</td>
<td>Global transaction identifier assigned to a transaction.</td>
</tr>
<tr>
<td>state</td>
<td>text</td>
<td>State of the transaction. The value can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- commit: The prepared transaction has been committed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- rollback: The prepared transaction is in in-doubt state.</td>
</tr>
<tr>
<td>master_pid</td>
<td>integer</td>
<td>Process ID of the backend process (master process) that executed the <code>pgx_loader</code> control function.</td>
</tr>
<tr>
<td>role_oid</td>
<td>integer</td>
<td>Role identifier (OID). A prepared transaction can only be completed by the same user who executed the original transaction or by a superuser.</td>
</tr>
<tr>
<td>relation_oid</td>
<td>integer</td>
<td>Object identifier (OID).</td>
</tr>
</tbody>
</table>

**Note**

The `pgx_loader_state` table and `pgx_loader_state_id_seq` sequence are updated by high-speed data load. Do not update these database objects directly using SQL.
To use WebAdmin for creating and managing a FUJITSU Enterprise Postgres instance on a server where FUJITSU Enterprise Postgres is installed, you must first start the Web server feature of WebAdmin.

- Using WebAdmin in a single-server configuration
  You must start the Web server on the server on which FUJITSU Enterprise Postgres and WebAdmin are installed.

- Using WebAdmin in a multiserver configuration
  You must start the Web server on all servers on which WebAdmin has been installed.

This appendix describes how to start and stop the Web server feature of WebAdmin.

---

See

Refer to "Installing WebAdmin in a Multiserver Configuration" in the Installation and Setup Guide for Server for information on multiserver installation.

---

### F.1 Starting the Web Server Feature of WebAdmin

Follow the procedure below to start the Web server feature of WebAdmin:

1. Display the [Services] window
   In the [Administrative Tools], click [Services].

2. Start a service
   Select the displayed name "FUJITSU Enterprise Postgres WebAdmin version", and then click [Start Service].

You can also start a service by specifying the service name of the Web server feature of WebAdmin in the net start command or sc start command.

### F.2 Stopping the Web Server Feature of WebAdmin

This section describes how to stop the Web server feature of WebAdmin.

Follow the procedure below to stop the Web server feature of WebAdmin:

1. Display the [Services] window
   In the [Administrative Tools], click [Services].

2. Stop a service
   Select the displayed name "FUJITSU Enterprise Postgres WebAdmin version", and then click [Stop Service].

You can also stop a service by specifying the service name of the Web server feature of WebAdmin in the net stop command or sc stop command.
Appendix G WebAdmin Wallet

This appendix describes how to use the Wallet feature of WebAdmin.

When a remote instance or a standby instance is created, it is necessary to provide user name and password for authentication with the remote machine or the database instance.

The Wallet feature in WebAdmin is a convenient way to create and store these credentials.

Once created, these credentials can be repeatedly used in one or more instances.

Note

It is not mandatory to create a credential in the Wallet. It is possible to create a remote instance or a standby instance without creating any credential in the Wallet.

If no credential is created beforehand, a user name and password can be entered in the instance creation page. When creating a “Remote” instance, if operating system credentials are entered without using a credential stored in the Wallet, WebAdmin automatically creates a credential with the given user name and password, and stores it in the user’s wallet for future use.

G.1 Creating a Credential

1. In the [My Wallet] tab, click . The [New credential] page will be displayed.

2. Enter the information for the credentials.

Enter the following items. Credential name, User name and Password should not contain hazardous characters. Refer to “Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters”.

- [Credential name]: Name of the credential
  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters
- [User name]: The operating system user name or database instance user name that will be used later
- [Password]: Password for the user
- [Confirm password]: Reenter the password.

3. Click✓ to store the credential.

G.2 Using a Credential

Once a credential is created in the Wallet, it can be used during remote instance creation or standby instance creation.

The following page uses the credential that was created in the previous section.

When “Cred1” is selected in [Operating system credential], the user name and password are automatically populated from the credential.
Appendix H WebAdmin Disallow User Inputs Containing Hazardous Characters

WebAdmin considers the following as hazardous characters, which are not allowed in user inputs:

| (pipe sign)
& (ampersand sign)
; (semicolon sign)
$ (dollar sign)
% (percent sign)
@ (at sign)
' (single apostrophe)
" (quotation mark)
\' (backslash-escaped apostrophe)
\" (backslash-escaped quotation mark)
<> (triangular parenthesis)
() (parenthesis)
+ (plus sign)
CR (Carriage return, ASCII 0x0d)
LF (Line feed, ASCII 0x0a)
, (comma sign)
\ (backslash)
Appendix I  Collecting Failure Investigation Data

If the cause of an error that occurs while building the environment or during operations is unclear, data must be collected for initial investigation.

This appendix describes how to collect data for initial investigation.

Use FJQSS (Information Collection Tool) to collect data for initial investigation.

See

Refer to the following manual for information on how to use FJQSS.

- In the [Apps] menu, select [FJQSS (Information Collection Tool)], and then click [FJQSS User's Guide].

Note

- When using FJQSS to collect data for initial investigation, a window will be displayed for you to set the following environment variables:
  - PGDATA
    Set the data storage destination.
  - PGDATABASE
    Set the database name from which you want to collect data for initial investigation.
  - PGPORT
    Set the instance port number. This does not need to be set if the default port number (27500) has not been changed.
  - PGUSER
    Set the database superuser. Set the database superuser so that client authentication is possible.
    FJQSS establishes a TCP/IP connection with the template1 database and collects data from the database.
  - Refer to “Collecting Failure Investigation Data” in the Cluster Operation Guide (Database Multiplexing) for information on how to collect failure investigation data when performing database multiplexing.

Information

FJQSS corresponds the required operating system of FUJITSU Enterprise Postgres described below.

Preface

Purpose of this document

This document describes security when building and operating a FUJITSU Software Enterprise Postgres (hereinafter referred to as “FUJITSU Enterprise Postgres”) database system.

Intended readers

This document is intended for those who are:
- Considering installing FUJITSU Enterprise Postgres
- Designing, building, and operating the security operating environment in FUJITSU Enterprise Postgres
- Accessing FUJITSU Enterprise Postgres database systems

Readers of this document are assumed to have general knowledge of:
- Business operations
- FUJITSU Enterprise Postgres
- Linux

Structure of this document

This document is structured as follows:

Chapter 1 Overview of Security
Provides an overview of the security system, and explains the security features provided by FUJITSU Enterprise Postgres.

Chapter 2 Overview of Security Operation
Provides an overview of security operation.

Chapter 3 Tasks of the Manager
Explains the tasks for security measures to be implemented by the manager.

Chapter 4 Tasks of Administrators
Explains the tasks for security measures to be implemented by administrators.

Chapter 5 Tasks of Users
Explains the tasks for security measures to be implemented by users.

Chapter 6 Audit Log Feature
Explains the audit log feature provided by FUJITSU Enterprise Postgres.

References

This document contains abstracts from the following document:
- Database Security Guideline Version 2.0
  (Database Security Consortium (DBSC))

Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Security

1.1 What is Security?

Computer security is the protection of information systems and data from risks such as leakage or tampering of information, attacks, intrusions, eavesdropping from external sources, and interference with information services. Security measures are essential for the advance prevention of security threats in order for information systems to gain trust as social infrastructure.

The security measures in information systems can be classified as follows:
- Network
- Web
- Application
- Database
- PC

This document focuses on database security measures when using FUJITSU Enterprise Postgres.

1.2 Security Requirements

Below are the necessary security requirements for information systems.

Maintenance of security policies

A security policy clarifies the approach the company should take in relation to information assets, and the actions employees should take.

It is necessary to undertake security of information systems while maintaining security policies.

Integrated security management

Security has the aspects below. It is necessary to manage information in an integrated manner based on these aspects.
Confidentiality
Access to the information is restricted to prevent leakage of information outside of the company
Example measures: Prevention of information leakage or setup of access privileges

Integrity
Integrity is guaranteed, ensuring information does not become corrupted or tampered with
Example measures: Prevention or detection of tampering

Availability
Failure is prevented and normal operation is maintained so that information can be used when needed
Example measures: Power supply measures, system mirroring

1.3 Security Threats

A security threat is defined as something that threatens the confidentiality, integrity, and availability indicated in "1.2 Security Requirements" in respect to information assets. This includes technical threats such as accessing a database, but does not include physical destruction.

Threats are considered to be a combination of type of user who is the source of the threat, information assets that need to be protected, techniques, and unauthorized actions. For example, a threat might be a general user exploiting a database vulnerability to obtain database management information, and then tampering with that information.

When considering security measures, it is firstly necessary to clarify what kind of threats there are. A list of possible threats is shown in the table below. Refer to "Types of user" and "Information assets" for details on the definition of each type of user and information assets that should be protected.

### Possible threats

<table>
<thead>
<tr>
<th>Type of user</th>
<th>Information asset</th>
<th>Technique</th>
<th>Unauthorized action</th>
</tr>
</thead>
<tbody>
<tr>
<td>General user</td>
<td>Database management information</td>
<td>Eavesdropping of packets</td>
<td>Unauthorized acquisition (viewing) of information</td>
</tr>

</tbody>
</table>

**Types of user**

In database security, the persons involved with databases and their roles are defined below.
<table>
<thead>
<tr>
<th>Type of user</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>System manager</td>
<td>Manages developers, administrators, and operators</td>
</tr>
<tr>
<td>System developer</td>
<td>Builds the network around the database server</td>
</tr>
<tr>
<td></td>
<td>Builds the database server</td>
</tr>
<tr>
<td>System administrator</td>
<td>Operates devices of the surrounding database network</td>
</tr>
<tr>
<td></td>
<td>Operates the database server</td>
</tr>
<tr>
<td>System operator</td>
<td>Operates the surrounding database network</td>
</tr>
<tr>
<td>Database administrator</td>
<td>Builds the database system</td>
</tr>
<tr>
<td></td>
<td>Operates the database system</td>
</tr>
<tr>
<td>Database operator</td>
<td>Performs business operations</td>
</tr>
<tr>
<td>Internal user</td>
<td>End user inside the company</td>
</tr>
<tr>
<td>General user</td>
<td>End user outside the company</td>
</tr>
</tbody>
</table>

**Information assets**

In database security, it is necessary to protect the information assets to be stored on the database server. Such assets are defined below.

**Database management information**
- Database configuration information (system catalog, user ID/password, and so on)
- Database logs (such as access logs)

**General database information**
- Job data
- Applications

**1.4 Security Scope**

In database systems, both the database server and the surrounding database network are part of the security scope. It is necessary to clarify the extent of the security scope that each type of user is involved with, and consider security measures for the same.

The relationship of the security scope and the types of user is shown below.
1.5 Security Provided by FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres provides security features that satisfy the security requirements indicated in "1.2 Security Requirements".

This section describes security provided by FUJITSU Enterprise Postgres.

1.5.1 Roles Targeted For Security

In FUJITSU Enterprise Postgres database systems, the roles targeted in relation to security are "Manager", "Administrator", and "User". In order to build a robust security system, it is necessary to put security measures in place for each role.

The roles targeted for security and the mapping of Types of user indicated in "1.3 Security Threats" are shown in the table below.

<table>
<thead>
<tr>
<th>Role targeted for security</th>
<th>Type of user</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manager</td>
<td>System manager</td>
</tr>
<tr>
<td>Administrator</td>
<td>System developer</td>
</tr>
<tr>
<td></td>
<td>System administrator</td>
</tr>
<tr>
<td></td>
<td>System operator</td>
</tr>
<tr>
<td></td>
<td>Database administrator</td>
</tr>
<tr>
<td></td>
<td>Database operator</td>
</tr>
<tr>
<td>User</td>
<td>General user</td>
</tr>
<tr>
<td></td>
<td>Internal user</td>
</tr>
</tbody>
</table>

Manager

The manager establishes a security policy and decides on an operations policy for the organization as a whole.
Refer to “Chapter 3 Tasks of the Manager” for details.

**Administrator**

Administrators design, build and operate a system. While doing this, the administrators must implement the security measures in accordance with the security policy established by the manager.

Refer to “Chapter 4 Tasks of Administrators” for details.

**User**

A user is a person other than the manager or an administrator who accesses a database. There may be any number of users. It is necessary for users to be registered in the database system, and that access to the database is restricted according to the access privileges.

Refer to “Chapter 5 Tasks of Users” for details.

### 1.5.2 Security Features

FUJITSU Enterprise Postgres provides the following security features:

- Authentication
- Access control
- Encryption
- Audit log
- Data masking

This section describes each of these features.

**Authentication**

The databases that can be accessed can be restricted by authenticating the database users who access the database. Additionally, authentication of the server can be performed to prevent spoofing of the database server.

Refer to "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for details on authentication.

Refer to "Secure TCP/IP Connections with SSL" in "Server Setup and Operation" in the PostgreSQL Documentation for details on server authentication.

**Access control**

Database objects can only be used by the object creator or database user who was specified as the owner when the object was created (both persons are hereinafter referred to as “owner”), or instance administrator, when objects are in their initial state. By having the object owner or instance administrator control access privileges for database users, it is possible to control what kind of tables the database users who connect to the database can access, and what kind of operations they can perform.

Refer to "Privileges" in "The SQL Language" in the PostgreSQL Documentation for details on object access control.

**Encryption**

FUJITSU Enterprise Postgres provides a transparent data encryption feature that satisfies the requirements below.

- Confidential information can be changed into an unidentifiable state.
- The encryption key and data are managed separately.
- The encryption key is replaced at regular intervals.

PostgreSQL provides an encryption feature called "pgcrypto" that can also be used in FUJITSU Enterprise Postgres, however, it is recommended to use the transparent data encryption features because it will otherwise be necessary to modify the applications that consider encryption. Refer to “Protecting Storage Data Using Transparent Data Encryption” in the Operation Guide for details.
Additionally, if communication data transferred between a client and a server contains confidential information, it is necessary to encrypt the communication data to protect it against threats, such as eavesdropping on the network.

Refer to “Configuring Secure Communication Using Secure Sockets Layer” in the Operation Guide for details on encryption of communication data.

Audit log

A feature that addresses threats such as misuse of administrator privileges, unauthorized access to a database by a user, and other such threats. Information for tracing the processing of administrators and users is retrieved and stored as an audit log.

By periodically viewing and monitoring audit logs, the administrators can detect events that are impacting on the system in some way, or are depleting system resources as a result of incorrect operations by users, and can take appropriate measures to prevent information leakages or system failures in advance.

Refer to “Chapter 6 Audit Log Feature” for details.

Data masking

A feature that changes part of the data to make it available for reference in response to queries issued by an application.

For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to “*” so that it can be used for reference without exposing the actual data.

Specifically, the data changed by the data masking feature can be transferred to a test database so that users who perform testing or development can reference the data. During testing, it is desirable to use the data that will be used on a production environment database. However, actual production data should not be used as is for testing because of the risk of leakage of confidential data. This feature enables data that is similar to actual production data to be safely used in test and development environments.

Refer to “Data Masking” in the Operation Guide for details on data masking.
Chapter 2 Overview of Security Operation

2.1 Security Operation Flow

This section shows the flow of work when building a security environment and performing security operation in FUJITSU Enterprise Postgres.

When performing security operation, there are technical measures to be implemented to address security threats by equipping the system with security features, and manual work, such as the implementation of security guidelines, a training system, and the establishment of usage rules.
Figure 2.1 Security operation flow

Manager:
- Define important information / perform risk analysis
- Formulate account management policies
- Formulate log retrieval policies
- Formulate rules
- Implement training
- Check database management operations

Administrator:
- Receive training

User:
- Receive training

Design and build security system:
- Perform initial setup
- Authenticate
- Control access
- Encrypt
- Control use of external media
- Restrict access
- Restrict resources
- Manage logs
- Detect unauthorized access
- Analyze logs

Operation:
- Periodically diagnose the status of security measures

Manage account/password
Chapter 3 Tasks of the Manager

The manager formulates security policies, which become guidelines for security measures.

3.1 Defining Important Information and Risk Analysis

Before formulating security policies, define important information and perform risk analysis. Based on the importance of the information and the result of risk analysis, decide what kind of security measures to put in place.

In defining the important information, identify what should be protected and classify it by importance in order to effectively implement the security measures. Information that should be protected includes "database management information" and "general database information", as indicated in "Information assets". Examples of information classifications are "personal information" and "confidential information".

In the risk analysis, refer to "Possible threats" to identify threats that may arise, and analyze the risks in respect to such threats. Additionally, by performing a risk analysis once annually as a guide, it is possible to identify threats that may adversely impact the business and related vulnerabilities.

3.2 Formulating Account Management Policies

In formulating an account management policy, implement the following and document the formulated policy.

Organize system users and roles

- Identify the necessary roles of the relevant system based on "Types of user". Additionally, organize personnel for each role.

Organize accounts

- Organize accounts with the appropriate privileges for each role, and decide on account policies.
  - Database administrator account
    - Organize separate accounts for database administrators and database operators
    - Ensure that the database administrator account can only be used by specific persons
    - Perform tasks that do not require database administrator privileges using a separate account without database administrator privileges
  - General account
    - Create an account for general users by application usage.

Review account management policy

- Review the accounts in order to effectively implement security measures.
  - Regularly check the accounts mentioned above and their privileges, and determine if they are still appropriate
  - If there have been system or operational changes, review the accounts and privileges
  - If unsuitable accounts and privileges are discovered, modify them as required

3.3 Formulating Log Retrieval Policies

In formulating a log retrieval policy, implement the following and document the formulated policy.

Organize the purpose of log retrieval

- To clarify what logs will be retrieved for, define their reason for retrieval.
  - Examples of the purpose might include, "To use for investigation in the event of unauthorized access", and "To submit to investigating authorities as evidence if any issues arise".
Decide on the types of logs to be retrieved

In order to retrieve appropriate logs, organize the types of logs that can be retrieved in the target system, and decide on the logs to be retrieved.

Examples of log types are "operating system logs", "application run logs", and "database audit logs".

Organize log retrieval target access

In order to decide on access for log retrieval targets, organize what kind of access will take place.

For example, the following access is possible:
- Access related to important information
  - Access to personal information, confidential information, and database management information
  - Access outside of business hours
  - Login
  - Specific SQL
- Access suspected to be unauthorized
  - Large amount of search access
  - Access from different locations
  - Access outside of business hours

Decide on the log retrieval content

In order to effectively use retrieved logs, organize the required content as a log, and decide on the retrieval content.

For example, the following output content is possible:
- When (time)
- Who (database account, application user)
- What (object ID, table name)
- Where from (machine name, IP address)
- How (SQL type, SQL statement)
- Execution result (success/fail)

Formulate log maintenance policy

In order to use the logs as purposed, formulate the log maintenance policy.

For each log, define its location, storage medium, retention period, access control, and so on.

3.4 Formulating Rules

Formulate the rules that will become the standard for security measures of the target system. Additionally, prescribe penalties for security violations. For example, formulate rules and penalties as below:
- Rules
  - Applying security patches and update programs
  - Prohibiting unauthorized acquisition of information from the database
  - Prohibiting the saving of acquired information to media that is not permitted for use
- Penalties
  - Prescribe penalties in the company's employment policies and procedures
3.5 Implementing Training

In order to have administrators and users recognize the importance and necessity of information security, and to prevent unauthorized access due to operational omissions and mistakes, implement and promote security-related training for administrators and users.

For example, implement promotion of security policies, formulation of training schedules, and formulation of training materials.

3.6 Checking the Database Management Operations

In order to prevent operational errors and unauthorized actions by administrators, implement the measures below:

- Always collect the latest information on security incidents and vulnerabilities related to databases
- Implement management operations only after providing advance notice
- Retain records of management operations

3.7 Periodic Diagnosis of the Status of Security Measures

In order to check if the security measures are effective, periodically diagnose if the security measures have been put in place appropriately based on the security threats.

Additionally, evaluate if the current security measures and policies are effective for the threats and vulnerabilities, and if there are any issues, review the security policies and security measures.
Chapter 4 Tasks of Administrators

Administrators perform the actions below as security measures when designing, building, and operating the system in accordance with the security policies formulated by the manager.

Preparation
- Implement training

Measures to protect against unauthorized behavior
- Perform initial setup
- Authenticate
- Control access
- Encrypt
- Control use of external media
- Restrict access
- Restrict resources

Measures to detect and trace unauthorized behavior
- Manage logs
- Detect unauthorized access
- Analyze logs

4.1 Receiving Training
Administrators receive security-related training in accordance with the training schedule formulated by the manager. Additionally, administrators instruct users to receive training.

4.2 Initial Setup
To minimize database vulnerabilities and the possibility of unauthorized access, implement the security measures below in the initial stage of system building. Additionally, configure the database server so that it primarily operates the database system only.

Making the server more robust
Configure the operating system and network to prevent intrusion into or destruction of a database server, so that the system operates on a secure server.
- Remove unnecessary features or services on the operating system
- Enable only the necessary protocols
- Implement the security features for services, protocols, and daemons considered to have a relatively low security level, such as file sharing and FTP

Installing the latest version
Always download and apply the latest patches in order to reflect the latest security measures.

Installing the minimum necessary features
Install only the necessary features in order to prevent unauthorized use of the system.
Additionally, delete or disable features and services that will not be used.

Changing the port
To prevent unauthorized use of the system, change the default port that is set during installation.
Access restrictions for communication features

To prevent unauthorized use of the system using the communication features, implement access restrictions for communication features.

Settings for prohibiting the access path to database configuration files

To prevent database destruction, implement the measures below:

- Restrict users who are permitted to access database configuration files, and periodically review the permissions
- Allow only administrators to access table or definition scripts

Restrictions on the access path to the database

To prevent unauthorized use or operating errors for the database, restrict the distribution range of applications used to access the database only to devices used by users who are permitted access.

Dealing with unauthorized programs

To prevent unauthorized intrusions into a system through a backdoor, such as by tampering with the program source code of an application, document the author of the program to be run and perform checking and testing so that the program will not be tampered with. Additionally, employ safe coding techniques so that issues with general coding vulnerabilities can be addressed.

System security settings

In cases where it is clear that the system security settings will impact security, set reliable security settings in the initial setup stage, such as setting appropriate security parameters.

4.3 Authentication

When accessing a database, authentication must always be performed in order to prevent tampering or information leakage from spoofing by a malicious user.

Password authentication is used when logging on to a database, and the account and password used for authentication are to be strictly managed by administrators.

Additionally, authentication must also be implemented reliably for connections to a database from clients, so that only permitted users can access the database.

4.3.1 Managing Accounts

For account management, perform the actions below.

Create the required accounts

To prevent unauthorized use of accounts, such as spoofing, implement the measures below when creating an account:

- Select the required account
- Specify the user privileges
- Create database administrator accounts and general user accounts separately according to the privileges

Point

Accounts are created using the CREATE ROLE statement. Refer to "CREATE ROLE" in the PostgreSQL Documentation for details.
Delete unnecessary accounts

Remove accounts not used on a daily basis, such as unused accounts and accounts not needed for operations that are created by default during product installation.

Point

Accounts are deleted using the DROP ROLE statement. Refer to "DROP ROLE" in the PostgreSQL Documentation for details.

Set up account lockout

The usage frequency of accounts is to be checked periodically, and if there are any accounts that have not been used for a long period, lock those accounts. Set a limit for failed login attempts, and if this limit is exceeded, lock the account. Additionally, set the period until a locked account is reenabled.

Point

Account locking can be performed by using LDAP authentication. Refer to "LDAP Authentication" in the PostgreSQL Documentation for details.

Manage database administrator accounts

Manage database administrator accounts in accordance with the account management policy formulated by the manager.

Manage development environment and production environment accounts

To prevent unauthorized use of accounts used in a development environment, delete accounts used in the development environment before operation starts in the production environment. In cases where it is unavoidable to use an account used in the development environment in the production environment, use different passwords in each environment.

Set up a temporary use account

If a temporary user will use the system, either provide a shared account with a temporary password for each use, or create a temporary account.

### 4.3.2 Managing Passwords

Manage passwords as below.

Make strong passwords

The use of account passwords that can easily be guessed by others, such as a password that matches the ID, or the default password provided during installation, is prohibited. Set a complex and strong password.

Change passwords regularly

Change passwords regularly to prevent others from accessing the account in case the password is obtained by unauthorized means. Additionally, configure the settings to force a password change when prompted after the first use.

Set the password expiry period

To encourage regular changing of passwords, set a password expiry period.

Point

Password setting and changing is specified using the CERATE ROLE statement or ALTER ROLE statement. Refer to "CREATE ROLE" and "ALTER ROLE" in the PostgreSQL Documentation for details.

Additionally, by using passwordcheck and LDAP authentication, the actions below can be performed:

- The default password set during installation can be changed
- The password expiry period can be set
- The number and types of characters used for the password can be checked
Refer to "passwordcheck" and "LDAP Authentication" in the PostgreSQL Documentation for details.

### 4.3.3 Configuring Connections and Authentication

Configure connections and authentication so that the database can only be accessed by permitted users.

**Point**

Client authentication is configured in pg_hba.conf. Refer to "Client Authentication" in the PostgreSQL Documentation for details.

### 4.4 Access Control

If appropriate access privileges are not set for administrators and users, security incidents may occur, such as information leakage resulting from access to information by an unauthorized person. To minimize such incidents, it is necessary to implement the security measures below for the access privileges and perform rule-based access control.

**Point**

**Notes when setting access privileges**

- The creation of a special account that allows granting of privileges to all users is prohibited
- The creation of a general account that allows access to general information such as operations data is prohibited

**Identifying the database access requirements**

To set the appropriate access privileges for each usage purpose for the database, follow the procedure below to identify the access requirements:

1. Classify the usage purpose of the account, such as "For database management", "For object management", and "For data access".
2. Classify the required privileges for each usage purpose, such as "By feature" and "By object".
3. Categorize the accounts based on each privilege.
4. Identify the minimum necessary range of data and minimum necessary access content (view, update, create, delete) to be accessed for each categorized account, and decide on the database access requirements.

**Setting the access privileges**

Assign the minimum necessary privileges based on the database access requirements for each categorized account. Additionally, restrict accounts when assigning administrator privileges.

**Reviewing access privileges**

To reflect changes in access requirements in the system, periodically review the access privileges and check if there are any access privileges that are no longer needed. If any unnecessary access privileges have been set, promptly modify the access privileges.

**Point**

Access privileges are set using the GRANT statement or REVOKE statement. Refer to "GRANT" and "REVOKE" in the PostgreSQL Documentation for details.
4.5 Encryption

To prevent unauthorized usage of data in the event information leakage occurs due to data theft, eavesdropping of communication, and other such activities, implement the encryption measures below.

Encrypt communication

To protect data from eavesdropping over the network between a database server and clients, use the encryption feature to encrypt communications.

Encrypt data

To protect data from theft, use the encryption feature to encrypt the data. The data below is targeted for encryption:
- Data to be stored on the database
- Backup data
- Data files

Refer to “Protecting Storage Data Using Transparent Data Encryption” in the Operation Guide for details.

Manage encryption keys

Restrict the persons who can access the encryption key to a minimum number of database administrators.

Additionally, to ensure the encrypted information will not be easily decrypted, create a mechanism for appropriately managing the encryption key for the entire life cycle (generation, distribution, saving, and disposal), and strictly manage the encryption key.

Refer to “Configuring Secure Communication Using Secure Sockets Layer” and “Protecting Storage Data Using Transparent Data Encryption” in the Operation Guide for details.

4.6 Controlling Use of External Media

Information leakage can be prevented by controlling use of external media (such as CD/DVD, USB drive, and external hard disk) and PCs that are connected to the database, and restricting the removal of data from the database.

Restricting connection of external media

Remove external media and printers that will not be used in operations, and restrict connection of external media to which information may be written.

Restricting use of external media

Restrict connections for external media and printers to control the writing of information to these devices.

Controlling use of connected PCs

Prevent leakage of information from PCs connected to the database:
- Limit connections of external media to PCs
- Implement security measures to make the PC robust
- Implement individual authentication for access from the PC
- Manage the installed software and monitor the software usage status
- Limit connections to printers

4.7 Security Measures for Servers/Applications

An even more robust security system can be achieved by strengthening security for servers and applications in addition to the security measures for databases. Implement the security measures below for servers and applications:
Restrict access

Implement the measures below and restrict access to the database server:

- Install the database server inside the firewall to prevent direct access to the database server from many unspecified PCs.
- In the local network, implement measures such as using the router to restrict IP addresses, and restrict PCs and segments that can directly access the database server.

Restrict resources

Restrict excessive use of CPU resources by general users to prevent the disruption of service and extraction of large amounts of data.

4.8 Log Management

Logs are a feature that addresses threats such as misuse of administrator privileges, and unauthorized access to a database by a user. Information for investigating/tracing processes and operations performed for the database is retrieved and managed as logs for identifying the cause in the event information leakage or unauthorized access occurs.

FUJITSU Enterprise Postgres provides the audit log feature for retrieving and managing logs. Refer to "Chapter 6 Audit Log Feature" for details.

This section describes the information that should be obtained as logs and how to maintain logs, as a measure for managing information leakage and unauthorized access.

4.8.1 Retrieving Logs

The audit logs below are retrieved in accordance with the log retrieval policy formulated by the manager.

Login information

Retrieves logs during login and logout.

Database access information (view/update)

Retrieves all access relating to the information below:

- General database information (such as personal information and confidential information used in the business)
- Database management information (system catalog, user ID/password, and so on)

Changed information of database objects

Retrieves logs related to creating, changing, and deleting database objects such as database accounts and tables.

Operation logs for audit logs

To prevent suppression of retrieved audit logs, operations such as initialization of audit logs, and stoppage of the audit log feature are retrieved as logs.

4.8.2 Maintaining Logs

Logs are maintained in accordance with the log retrieval policy formulated by the manager.

Storing logs

Perform the actions below and store logs securely so that the retrieved logs will not be updated by others:

- Save logs to external media, and store the external media in a secure location, such as lockable storage
- Restrict the viewing of logs to administrators only, and set access restrictions for logs, such as not assigning update rights
- Decide on the log retention period, with consideration to cases where investigation tracing back to the time of discovery of an issue is required
Preventing tampering of logs

Implement measures to prevent tampering of logs, such as retaining multiple copies of logs and using storage that cannot be rewritten.

Encrypting logs

Encrypt logs so that logs are not easily viewed.

4.9 Detecting Unauthorized Access

To address unauthorized access, it is necessary to establish a mechanism for detecting unauthorized access to databases and monitor access.

Communicating unauthorized access

Create a mechanism that notifies of detected unauthorized access, such as notifying the manager and the administrator, if an account lock occurs due to the limit for failed login attempts being exceeded.

Checking access times

Create a mechanism that can check for suspicious access to the information below outside of normal access hours, together with implementing measures to address such access.

Detecting access to database management information

- Monitor logs and detect access during timeframes that have not been applied for
- In the event a request for access permission outside of normal access hours is made, the log is checked for any discrepancies in the requested content and work result

Detecting access to general database information

- Decide on the timeframes during which access to the database is permitted for each general account
- Detect access outside of normal access hours from session information logs

Checking the connection source where access is not permitted

To detect access from connection sources that are not permitted, define the sources from where access is permitted, and detect access from connection sources that are not permitted.

Define the access patterns (connection source, operating system user and account) of database administrator accounts and general accounts, and check for access outside of these patterns.

4.10 Analyzing Logs

Create a mechanism that analyzes logs to detect unauthorized behavior in cases where information leakage, unauthorized access, or other such activity, is suspected. Analyses should include those shown below.

Periodic analysis of session information

Analyze session information of logs from the perspectives below to detect unauthorized logins:

- Trend of sessions with a large number of failed login attempts
- Trend of sessions with accounts that are logged in for long periods of time
- Trend of sessions in which a large amount of resources are used

Periodic analysis of database access information

Analyze SQL statements from the perspectives below to detect unauthorized access to the database:

- Trend of SQL being executed over a long period of time
- Trend of SQL using a large amount of resources
Chapter 5 Tasks of Users

The user performs the actions below as security measures when using the system.

5.1 Receiving Training

The user must receive security-related training as instructed by the manager or the administrator to learn about security. By having users with a common awareness relating to security, an even more stable security system can be established.

5.2 Managing Accounts/Passwords

Users can use the database system by using the account and password provided by the administrator. At such times, the user is to implement the measures below so that the account and password are not misused by others:

- Be responsible for managing the ID and password in a manner that ensures the account does not become locked during login
- Change the password regularly
- Comply with the expiry period set for the password by promptly changing the password when it is about to expire
Chapter 6 Audit Log Feature

In PostgreSQL, logs output as server logs can be used as audit logs by using the log output feature. There are, however, logs that cannot be analyzed properly, such as SQL runtime logs, which do not output the schema name. Additionally, because the output conditions cannot be specified in detail, log volumes can be large, which may lead to deterioration in performance.

The audit log feature of FUJITSU Enterprise Postgres enables retrieval of details relating to database access as an audit log by extending the feature to pgaudit. Additionally, audit logs can be output to a dedicated log file or server log. This enables efficient and accurate log monitoring.

Note

The audit log feature cannot be used if PostgreSQL is running in single-user mode.

6.1 Audit Log Output Modes

In pgaudit, the two types of audit log below can be output.

Session Audit Logging

Session Audit Logging outputs information related to SQL executed in backend processes (processes generated when connection requests are received from clients), information related to starting and connecting databases, and information related to errors, as a log. In Session Audit Logging, by specifying the log output conditions and filtering the logs to be output, performance degradation due to outputting large volumes of logs can be prevented.

Refer to "6.4 Session Audit Logging" for details.

Object Audit Logging

When SELECT, INSERT, UPDATE, and DELETE are executed for specific objects (tables, columns), Object Audit Logging outputs these as a log. TRUNCATE is not supported. Object Audit Logging outputs object operations for which privileges have been assigned to specified roles, as a log. Object Audit Logging can control log output at an even finer level of granularity than Session Audit Logging.

Refer to "6.5 Object Audit Logging" for details.

Information

Depending on the application or command, FUJITSU Enterprise Postgres may execute SQL internally and the audit logs may be retrieved.

Also, the audit logs of multiple SQLs with the same statement ID may be retrieved. This is because before the user executes the SQL, another SQL is executed internally by FUJITSU Enterprise Postgres.

6.2 Setup

This section describes the setup method of pgaudit.

1. Copy the pgaudit files

As superuser, run the following command. Note that "<x>" in paths indicates the product version.

```
$ su -
Password:******
# cp -r /opt/fsepv<x>server64/OSS/pgaudit/* /opt/fsepv<x>server64
```

Open a command prompt as administrator privileges, run the following command. Note that "<x>" in paths indicates the product version.

```bash
```

- 22 -
> xcopy /E "c:\Program Files\Fujitsu\fsepv<server64\OSS\pgaudit\"  "c:\Program Files\Fujitsu\fsepv<server64"

2. Create the pgaudit configuration file

Create the pgaudit configuration file, which describes the information required for pgaudit actions. Create the file using the same encoding as used for the database.

In addition, set write permissions for the database administrator only in the pgaudit configuration file so that policies related to the audit log are not viewed by unintended users.

Refer to "6.3 pgaudit Configuration File" for details.

--- Note ---

Do not define the rule section in the pgaudit configuration file at this point.

--- Example of a pgaudit configuration file ---

[output]
logger = 'auditlog'

3. Configure postgresql.conf

Configure the parameters below in postgresql.conf to use audit logs:

shared_preload_libraries

Specify "pgaudit".

pgaudit.config_file

Specify the deployment destination path of the pgaudit configuration file.

If a relative path is specified, the path will be relative to the data storage directory.

log_replication_commands

Specify "on".

log_min_messages

Check if "ERROR" or higher has been specified.

If outputting an audit log to a server log ("serverlog" is specified in the logger parameter of the pgaudit configuration file), check the parameters below relating to server logs.

logging_collector

Check if "on" has been specified.

log_destination

Check if "stderr" has been specified.

log_file_mode

Check if the server log permissions are appropriate, so that only the permitted persons can access it.

--- Information ---

The default for the log_file_mode parameter is 0600, which only allows the database administrator to have access.

For example, to permit other members of the group to which the database administrator belongs to view the audit logs, specify 0640 for log_file_mode.
Example

```
log_file_mode = 0640
```

The database administrator can also be prevented from viewing audit logs by specifying 0000. However, write privileges are assigned for outputting logs.

If outputting an audit log to a dedicated log file ("auditlog" is specified in the logger parameter of the pgaudit configuration file), check the parameter below.

```
max_worker_processes
```

If the `max_worker_processes` parameter has been set, add 1 to the specified value.

See

Refer to "Error Reporting and Logging" in the PostgreSQL Documentation for details on server logs.

If using database multiplexing, refer to "6.6 Database Multiplexing" for details.

Example of `postgresql.conf`

In the example below, only the parameters that need to be configured when using the audit log feature are described.

```
shared_preload_libraries = 'pgaudit'
paudit.config_file = 'pgaudit.conf'
log_replication_commands = on
log_min_messages = WARNING
```

4. Start the instance

Start the instance and check if the message below is output.

```
LOG: pgaudit extension initialized
```

5. Create the pgaudit extension

Execute `CREATE EXTENSION` to create the pgaudit extension.

```
$ psql
=# CREATE EXTENSION pgaudit;
=# \dx
List of installed extensions
Name | Version | Schema | Description
-----|---------|--------|-------------------
pgaudit | 1.0     | public | provides auditing functionality
plpgsql | 1.0     | pg_catalog | PL/pgSQL procedural language
(2 rows)
```

6. Configure the parameters in the pgaudit configuration file

Add or change the parameters in the pgaudit configuration file as required.

Refer to "6.3 pgaudit Configuration File" for details.

7. Restart the instance

Restart the instance to apply the changes to the pgaudit configuration file. After restarting, check if the changes have been reflected correctly.

Linux
6.3 pgaudit Configuration File

In the pgaudit configuration file, specify the information required for pgaudit actions. The pgaudit configuration file comprises three sections: “output section”, “option section”, and “rule section”.

**output section**

The output section is specified using the format below:

```
- paramName = 'value'
```

The valid parameters in the output section are shown in the table below.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>logger</td>
<td>Dedicated log file (auditlog)/serverLog (serverlog) that will be the output destination of the audit log</td>
<td>The dedicated log file is output using the same encoding as used for the database.</td>
</tr>
<tr>
<td></td>
<td>The default is &quot;auditlog&quot; (dedicated log file).</td>
<td></td>
</tr>
<tr>
<td>log_directory</td>
<td>Directory where the audit log is to be created</td>
<td>Enabled only if &quot;auditlog&quot; is</td>
</tr>
<tr>
<td></td>
<td>Specify the full path or the relative path from the data storage directory.</td>
<td></td>
</tr>
<tr>
<td>Parameter name</td>
<td>Description</td>
<td>Remarks</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| log_filename   | File name of the audit log  
Specify a file name that varies according to the time, in the same manner as for log_filename in the postgresql.conf file.  
The default is "pgaudit-%Y-%m-%d_%H%M%S.log". | Enabled only if "auditlog" is specified for the logger parameter |
| log_file_mode  | Specify the permissions of the audit log so that only permitted persons can access it.  
The parameter value is the numeric mode specified in the format permitted in chmod and umask system calls. The default is "0600".  
Refer to "log_file_mode" in "6.2 Setup" for information on audit log file permissions. | Enabled only if "auditlog" is specified for the logger parameter |
| log_rotation_age | Maximum age of the audit log file  
A new audit log file is generated when the time (minute units) specified here elapses. To disable generation of new log files based on time, specify "0".  
The valid units are "min" (minutes), "h" (hours), and "d" (days). If the unit is omitted, "min" will be used.  
The default is "1d" (1 day). | Enabled only if "auditlog" is specified for the logger parameter |
| log_rotation_size | Maximum size of the audit log file  
A new log file will be generated after logs of the size specified here are output to a log file. To disable generation of new log files based on size, specify "0".  
The valid units are "kB" (kilobytes), "MB" (megabytes), and "GB" (gigabytes). If the unit is omitted, "kB" will be used.  
The default is "10MB". | Enabled only if "auditlog" is specified for the logger parameter |
| log_truncate_on_rotation | If rotating audit log files based on time, this parameter is used to specify whether to overwrite (on)/not overwrite (off) existing audit log files of the same name. For example, if "on" is specified, and "pgaudit-%H.log" is specified for log_filename, 24 separate log files will be generated based on time, and those files will be cyclically overwritten.  
The default is "off". If "off" is specified, the logs will be written to the existing audit log files. | Enabled only if "auditlog" is specified for the logger parameter |
| fifo_directory  | FIFO (named pipe) directory to be used between the daemon process that outputs audit log files and the backend process  
FIFO named p.PGAUDIT.<nnnn> (<nnnn> is the postmaster PID) are created in the fifo_directories directory. The files cannot be deleted manually.  
The default is "/tmp". | Enabled only if "auditlog" is specified for the logger parameter |
<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td>To disable generation of new log files based on size, specify &quot;0&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The valid units are &quot;kB&quot; (kilobytes), &quot;MB&quot; (megabytes), and &quot;GB&quot; (gigabytes). If the unit is omitted, &quot;kB&quot; will be</td>
<td></td>
</tr>
<tr>
<td></td>
<td>used.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default is &quot;10MB&quot;</td>
<td></td>
</tr>
<tr>
<td>log_truncate_on_rotation</td>
<td>If rotating audit log files based on time, this parameter is used to specify whether to overwrite (on)/not</td>
<td>Enabled only if &quot;auditlog&quot; is specified for the logger parameter</td>
</tr>
<tr>
<td></td>
<td>overwrite (off) existing audit log files of the same name. For example, if &quot;on&quot; is specified, and &quot;pgaudit-%H.log&quot; is</td>
<td></td>
</tr>
<tr>
<td></td>
<td>specified for log_filename, 24 separate log files will be generated based on time, and those files will be</td>
<td></td>
</tr>
<tr>
<td></td>
<td>cyclically overwritten.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default is &quot;off&quot;. If &quot;off&quot; is specified, the logs will be written to the existing audit log files.</td>
<td></td>
</tr>
</tbody>
</table>

**Information**

If the logger parameter is set to "serverlog", audit logs will be output to the server log as log messages, therefore the status information and message severity level according to the log_line_prefix parameter in postgresql.conf will be output to the beginning of the audit log.
If the logger parameter is omitted or set to "auditlog", audit logs will be output to a dedicated log file as dedicated logs, therefore the status information and message severity level according to the log_line_prefix parameter in the postgresql.conf file will not be output.

Refer to "Output format" in "6.4 Session Audit Logging" or "Output format" in "6.5 Object Audit Logging" for information on the output format of audit logs.

---

**Point**

The pgaudit log_file_mode configuration parameter setting is separate from, and unaffected by, the log_file_mode GUC parameter setting and the -g/-allow-group-access initdb option.

When using a dedicated pgaudit log file, since the pgaudit log_directory location defaults to inside the data storage directory, it is possible for the pgaudit log_file_mode permissions to conflict with the intended file permissions specified by the -g/-allow-group-access initdb option. In this case, the pgaudit log_directory should be specified to be a directory located outside of the data storage directory.

---

**Point**

If the file permissions for the server log do not satisfy the security requirements of the system, specify a dedicated log file for the output destination of the audit log, and set the access permissions for the output destination directory so that the security requirements are satisfied. At that time, assign read and write permissions to the database administrator.

---

### option section

The option section is specified using the format below:

- `paramName = 'value'`

The valid parameters in the option section are shown in the table below.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>role</td>
<td>Name of roles used in Object Audit Logging</td>
<td>Parameter used in Object Audit Logging only</td>
</tr>
<tr>
<td>log_catalog</td>
<td>Whether to enable (on)/disable (off) log output for pg_catalog</td>
<td></td>
</tr>
<tr>
<td>log_parameter</td>
<td>Whether to enable (on)/disable (off) output of values passed by parameters in SQL execution</td>
<td></td>
</tr>
<tr>
<td>log_statement_once</td>
<td>Whether to control (on)/not control (off) output for the second and subsequent SQL statements if the same SQL statement is the log output target</td>
<td></td>
</tr>
</tbody>
</table>

- 28 -
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_level</td>
<td>Log level of audit logs</td>
<td>Enabled only if &quot;serverlog&quot; is specified for the logger parameter</td>
</tr>
<tr>
<td></td>
<td>The valid values are &quot;DEBUG5&quot;, &quot;DEBUG4&quot;, &quot;DEBUG3&quot;, &quot;DEBUG2&quot;, &quot;DEBUG1&quot;, &quot;INFO&quot;, &quot;NOTICE&quot;, &quot;WARNING&quot;, and &quot;LOG&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default is &quot;LOG&quot;.</td>
<td></td>
</tr>
</tbody>
</table>

**rule section**

The rule section is used in Session Audit Logging. Refer to "6.4 Session Audit Logging" for details.

**Note**

Do not specify the rule section if the role parameter has been specified in the option section. If you specify the rule section, the audit logs of Object Audit Logging and Session Audit Logging will be output intermingled and you will be unable to view the logs in CSV format.

**6.4 Session Audit Logging**

In Session Audit Logging, specify the rules for filtering logs to be output in the rule section in the pgaudit configuration file. Rules are specified using the formats below. Multiple values can be specified, using a comma as the delimiter.

- `paramName = 'value'`
- `paramName != 'value'`

If [rule] is described on its own in the rule section with no parameters specified, all audit logs will be output.

**Example**

```
[output]
logger = 'auditlog'
[rule]
```

If the rule section is not described ([rule] is not described), the audit logs will not be output.

**Example**

```
[output]
logger = 'auditlog'
```

The valid parameters in the rule section are shown in the table below.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>Timestamp range</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Refer to &quot;timestamp&quot; for details on how to specify timestamps.</td>
<td><code>timestamp = '09:00:00 - 10:00:00, 18:00:00 - 18:30:00'</code></td>
</tr>
<tr>
<td>database</td>
<td>Database name</td>
<td></td>
</tr>
<tr>
<td></td>
<td>To specify a blank value, use a pair of double quotation marks (&quot;&quot;). When specifying a name containing uppercase characters, key words, multibyte</td>

</tr>
<tr>
<td></td>
<td>Select from the values below. Multiple values can be specified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- TABLE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- INDEX</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- SEQUENCE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- TOAST_VALUE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- VIEW</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- MATERIALIZED_VIEW</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- COMPOSITE_TYPE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- FOREIGN_TABLE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- FUNCTION</td>
<td></td>
</tr>
<tr>
<td>object_name</td>
<td>Object name</td>
<td><code>object_name = 'myschema.tbl1'</code></td>
</tr>
<tr>
<td></td>
<td>This parameter is enabled when the class parameter is &quot;READ&quot; and &quot;WRITE&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>object_name = 'myschema.tbl1, &quot;mySchema.TABLE&quot;'</code></td>
<td></td>
</tr>
</tbody>
</table>
### Parameter name

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Application name</td>
<td>application_name = 'myapp'</td>
</tr>
<tr>
<td>remote_host</td>
<td>Connection destination host name or IP address</td>
<td>remote_host = 'ap_server'</td>
</tr>
</tbody>
</table>

#### timestamp

Specify a timestamp range from "start_time" to "end_time" for the log output target. The timestamp format is 'hh:mm:dd-hh:mm:dd' (hh is expressed in 24-hour notation, and hh, mm, and dd are expressed in two-digit notation).

The start time must be earlier than the end time. If specifying multiple ranges, specify each start and end timestamp using a comma as the delimiter.

End timestamps consider milliseconds. For example, if '11:00:00 - 11:59:59' is specified for the timestamp, "11:00:00:000" to "11:59:59:999" will be the target range.

The timestamps used by evaluation in the rule section of pgaudit are different to the timestamps issued in the log entries. That is because log entries are output after evaluation by pgaudit, with the timestamp being generated at that time.

#### class

The meaning of each class specified in the class parameter is below:

- READ: SELECT, COPY FROM
- WRITE: INSERT, UPDATE, DELETE, TRUNCATE, COPY TO
- FUNCTION: Function call, DO
- ROLE: GRANT, REVOKE, CREATE ROLE, ALTER ROLE, DROP ROLE
- DDL: All DDLs (such as CREATE and ALTER) other than the DDLs of the ROLE class
- CONNECT: Events relating to connecting (request, authenticate, and disconnect)
- SYSTEM: Instance start, promotion to primary server
- BACKUP: pg_basebackup
- ERROR: Event completed by an error (PostgreSQL error codes other than 00). This class can be used if ERROR or lower level is specified for the log_min_messages parameter in postgresql.conf.

- MISC: Other commands (such as DISCARD, FETCH, CHECKPOINT, and VACUUM)

### Evaluation of the rule section

- When a log event occurs, all expressions in the rule section are evaluated at once. Log entries are only output if all parameters in the rule section are evaluated as being true.

For example, if the rule below has been set, of the operations performed by 'apserver' to 'myschema.tbl1', the operations applicable to classes other than 'WRITE' in the period from 10 a.m. to 11 a.m. will be output as audit logs.

```plaintext
[rule]
timestamp = '10:00:00-11:00:00'
remote_host = 'apserver'
object_name = 'myschema.tbl1'
class != 'WRITE'
```

- Multiple rule sections can be defined in the pgaudit configuration file. Log events are evaluated using each rule section, and an audit log is output for each matching rule section.

For example, if the rules below are set, duplicated audit logs will be output.

```plaintext
[rule]
object_name = 'myschema.tbl1'
[rule]
object_name = 'myschema.tbl1'
```

- If the same parameter is specified multiple times in one rule section, the last specified parameter is effective.

For example, if the rule below has been set, "object_name = 'myschema.tbl3'" will take effect.

```plaintext
[rule]
object_name = 'myschema.tbl1'
object_name = 'myschema.tbl1'
object_name = 'myschema.tbl2'
object_name = 'myschema.tbl3'
```

### Output format

In Session Audit Logging, audit logs are output in the format below:

```
AUDIT: SESSION,READ,2020-03-12 19:00:58 PDT,
(1)         (2)     (3)
[local],19944,psql,appuser,postgres,2/8, 2, 1,SELECT,,TABLE,myschema.account,,
SELECT * FROM myschema.account;,<not logged>
(17)                      (18)
```

<table>
<thead>
<tr>

<tr>
<td></td>
<td>If the SQL contains a password, such as for CREATE ROLE, and so on, it will be replaced with &quot;&lt;REDACTED&gt;&quot;.</td>
</tr>
<tr>
<td></td>
<td>Additionally, if “on” is specified for the log_statement_once parameter of the option section in the pgaudit configuration file, &quot;&lt;previously logged&gt;&quot; is output for the second and subsequent statements.</td>
</tr>
<tr>
<td>(18)</td>
<td>Depending on the log_parameter parameter value of the option section in the pgaudit configuration file, the output content will be as below.</td>
</tr>
<tr>
<td></td>
<td>- log_parameter=on is specified</td>
</tr>
<tr>
<td></td>
<td>If parameters are specified in the SQL, the parameters are concatenated and output, using a space as the delimiter.</td>
</tr>
<tr>
<td></td>
<td>If parameters are not specified in the SQL, &quot;&lt;none&gt;&quot; is output.</td>
</tr>
<tr>
<td></td>
<td>- log_parameter=off (default) is specified</td>
</tr>
<tr>
<td></td>
<td>&quot;&lt;not logged&gt;&quot; is output.</td>
</tr>
<tr>
<td></td>
<td>Additionally, if “on” is specified for the log_statement_once parameter of the option section in the pgaudit configuration file, &quot;&lt;previously logged&gt;&quot; is output for the second and subsequent statements.</td>
</tr>
</tbody>
</table>

---

**Information**

If accessing resources that use the features below, the command tag (12) may be output as "???".

- INSTEAD OF trigger
- RULE
- VIEW
- Security policy per row
- Table inheritance

---

**Example**

Below is an example of retrieving audit logs in Session Audit Logging.
1. Settings
In the pgaudit configuration file, specify the rule section below.

```
[rule]
class = 'READ, WRITE'
object_name = 'myschema.account'
```

2. Retrieving logs
Execute the SQL below from the client.

```
CREATE TABLE myschema.account
(
  id int,
  name text,
  password text,
  description text
);
INSERT INTO myschema.account (id, name, password, description) VALUES (1, 'user1', 'HASH1', 'blah, blah');
SELECT * FROM myschema.account;
```

The audit log below can be retrieved.

'DDL' is not defined in the class parameter, so CREATE TABLE is not output as an audit log.

```
AUDIT: SESSION,WRITE,2020-03-12 19:00:49 PDT,[local],19944,psql,appuser,postgres,
2/7,1,1,INSERT,,TABLE,myschema.account,,"INSERT INTO myschema.account (id, name,
password, description) VALUES (1, 'user1', 'HASH1', 'blah, blah');";<not logged>
AUDIT: SESSION,READ,2020-03-12 19:00:58 PDT,[local],19944,psql,appuser,postgres,
2/8,2,1,SELECT,,TABLE,myschema.account,,SELECT * FROM myschema.account;;<not logged>
```

6.5 Object Audit Logging
In Object Audit Logging, retrieval of audit logs is achieved by using roles.

Roles are specified in the role parameter of the option section to retrieve audit logs. If there are privileges for commands executed by a role, or if privileges have been inherited from another role, those command operations are output as audit logs.

For example, after "auditor" is set for the role parameter of the option section, the SELECT and DELETE privileges for the account table are assigned to "auditor". In this case, when SELECT or DELETE is executed for the account table, audit logs are output.

Output format
In Object Audit Logging, audit logs are output in the format below:

```
AUDIT: OBJECT,1,1,READ,SELECT,TABLE,public.account,SELECT password FROM account;;<not logged>
```

<table>
<thead>
<tr>
<th>No</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Log header</td>
</tr>
<tr>
<td></td>
<td>Fixed as &quot;AUDIT: OBJECT&quot;.</td>
</tr>
<tr>
<td>2</td>
<td>Statement ID</td>
</tr>
<tr>
<td>3</td>
<td>Substatement ID</td>
</tr>
<tr>
<td>4</td>
<td>Class name</td>
</tr>
</tbody>
</table>
If "on" is specified for the log_statement_once parameter of the option section in the pgaudit configuration file, "<previously logged>" is output for the second and subsequent statements.

Depending on the log_parameter parameter value of the option section in the pgaudit configuration file, the output content will be as below.

- When log_parameter=on
  If parameters are specified in the SQL, the parameters are concatenated and output, using a comma as the delimiter.
  If parameters are not specified in the SQL, "<none>" is output.
- When log_parameter=off (default)
  "<not logged>" is output.

Additionally, if "on" is specified for the log_statement_once parameter of the option section in the pgaudit configuration file, "<previously logged>" is output for the second and subsequent statements.

---

**Information**

If accessing resources that use the features below, the command tag (5) may be output as "???".

- INSTEAD OF trigger
- RULE
- VIEW
- Security policy per row
- Table inheritance

---

**Example**

Below is an example of retrieving logs in Object Audit Logging.

By setting the target for assigning privileges to roles in detail, log output can be controlled.

In the example below, log retrieval of the account table is controlled by the privileges assigned to the columns, however, log retrieval of the account_role_map table is controlled by the privileges assigned to the table.

1. **Settings**

   The role parameter below is specified for the option section in the pgaudit configuration file.

   ```
   [option]
   role = 'auditor'
   ```

2. **Defining a role**

   A role is defined for Object Audit Logging.
3. Retrieving logs

Execute the SQL below from the client.

```
CREATE TABLE account
(
    id int,
    name text,
    password text,
    description text
);
GRANT SELECT (password) ON public.account TO auditor;
SELECT id, name FROM account;
SELECT password FROM account;
GRANT UPDATE (name, password) ON public.account TO auditor;
UPDATE account SET description = 'yada, yada';
UPDATE account SET password = 'HASH2';
CREATE TABLE account_role_map
(
    account_id int,
    role_id int
);
GRANT SELECT ON public.account_role_map TO auditor;
SELECT account.password, account_role_map.role_id
FROM account
    INNER JOIN account_role_map ON account.id = account_role_map.account_id;
```

The audit log below can be retrieved.

In the account table, only the operations for columns that privileges have been assigned to are output as logs.

In the account_role_map table, privileges are assigned to the table, so operations performed for the table are output as logs.

```
AUDIT: OBJECT,4,1,READ,SELECT,TABLE,public.account,SELECT password FROM account;,<not logged>
AUDIT: OBJECT,7,1,WRITE,UPDATE,TABLE,public.account,UPDATE account SET password = 'HASH2';,<not logged>
AUDIT: OBJECT,10,1,READ,SELECT,TABLE,public.account,"SELECT account.password, account_role_map.role_id
    FROM account
    INNER JOIN account_role_map ON account.id = account_role_map.account_id;",<not logged>
AUDIT: OBJECT,10,1,READ,SELECT,TABLE,public.account_role_map,"SELECT account.password, account_role_map.role_id
    FROM account
    INNER JOIN account_role_map ON account.id = account_role_map.account_id;",<not logged>
```

6.6 Database Multiplexing

This section describes audit log retrieval while in database multiplexing mode.

6.6.1 Setup

If setting up the audit log feature in a database multiplexing environment that has already been built, follow the procedure below.
1. Copy the pgaudit files
   Copy the pgaudit files on the primary server and standby server.
   Refer to step 1 in "6.2 Setup" for details on copying the pgaudit files.

2. Create the pgaudit configuration file
   Create the pgaudit configuration file on the primary server. Copy the pgaudit configuration file you created to the
   standby server.
   Refer to step 2 in "6.2 Setup" for details on creating the pgaudit configuration file.

3. Configure postgresql.conf
   In the postgresql.conf file on the primary server and standby server, configure the parameters for using audit logs. Set
   the same values for the parameters.
   Refer to step 3 in "6.2 Setup" and "6.6.2 Configuring Audit Log Retrieval" for details on the parameters to configure.

4. Configure the serverIdentifier.conf file of Mirroring Controller
   In the serverIdentifier.conf file on the primary server and standby server, configure the parameters for using audit logs.
   Refer to "6.6.2 Configuring Audit Log Retrieval" for details on the parameters to be set.

5. Start the instance
   Start the instance of the primary server and standby server.

6. Create the pgaudit extension
   Execute CREATE EXTENSION on the primary server to create a pgaudit extension.
   Refer to step 5 in "6.2 Setup" for details on creating pgaudit extensions.

7. Configure the parameters in the pgaudit configuration file
   Add/change the parameters of the pgaudit configuration file on the primary server. Copy the pgaudit configuration file
   with the added/changed parameters to the standby server.
   Refer to "6.3 pgaudit Configuration File" and "6.6.2 Configuring Audit Log Retrieval" for details on the parameters
   to set.

8. Restart the instance
   Restart the instance of the primary server and standby server.

6.6.2 Configuring Audit Log Retrieval
In database multiplexing mode, Mirroring Controller periodically accesses the database to check the multiplexing status and
detect failure. Due to this, audit logs are also periodically retrieved, so log files become used up. Therefore, set the parameters
below so that audit logs are not retrieved by Mirroring Controller.

postgresql.conf
   log_connections
       Omit, or specify "off".
   log_disconnections
       Omit, or specify "off".

serverIdentifier.conf file of Mirroring Controller
   target_db
       Specify "template1".
If creating a new database, create it after stopping Mirroring Controller, or specify a name other than "template1" for the template database.

pgaudit configuration file
rule section database
   Specify database != 'template1'.

6.7 Failover
This section explains audit log retrieval performed by the failover feature integrated with the cluster software.

6.7.1 Configuring Audit Log Retrieval
The failover feature accesses the database periodically to check the instance status. Due to this, audit logs are also periodically retrieved, so log files become depleted. Therefore, set the parameters below so that audit logs are not retrieved.

postgresql.conf
log_connections
   Omit, or specify "off".
log_disconnections
   Omit, or specify "off".

pgaudit configuration file
rule section database
   Specify database != 'template1'.

6.8 View Audit Logs Using SQL
By using file_fdw of an additional module, audit logs can be accessed using SQL. This section describes how to view audit logs, using Session Audit Logging output to a dedicated log file as an example.

1. Install file_fdw
   Execute CREATE EXTENSION to install file_fdw as an extension.

   $ psql
   "CREATE EXTENSION file_fdw;"
   "$ \dx"
   List of installed extensions
   Name       | Version | Schema    | Description
   ----------+---------+-----------+-------------------------------------------
   file_fdw  | 1.0     | public    | foreign-data wrapper for flat file access
   pgaudit   | 1.0     | public    | provides auditing functionality
   plpgsql   | 1.0     | pg_catalog| PL/pgSQL procedural language
   (3 rows)

2. Create an external server
   Use CREATE SERVER to create an external server managed by file_fdw.

   $ psql
   "$ CREATE SERVER auditlog FOREIGN DATA WRAPPER file_fdw;"
3. Create an audit log table.

Use CREATE FOREIGN TABLE to define the table columns of audit logs, CSV file name and format.

```sql
$ psql
=# CREATE FOREIGN TABLE auditlog (  
    header text,  
    class text,  
    sql_start_time timestamp with time zone,  
    remote_host_name text,  
    backend_process_id text,  
    application_name text,  
    session_user_name text,  
    database_name text,  
    virtual_transaction_id text,  
    statement_id text,  
    substatement_id text,  
    command_tag text,  
    sqlstate text,  
    object_type text,  
    object_name text,  
    error_message text,  
    sql text,  
    parameter text  
) SERVER auditlog  
OPTIONS ( filename '/database/inst1/pgaudit_log/pgaudit-2020-03-12.log', format 'csv' );
```

**Note**

If an audit log file is rotated and multiple audit log files exist, it is necessary to create a table for each audit log file.

4. View audit logs

Use SELECT and view the audit logs.

```sql
$ psql
=# SELECT * FROM auditlog;  
    header     |  class  |     sql_start_time     | remote_host_name |  
backend_process_id ...  
+------------------- ...  
AUDIT: SESSION | WRITE  | 2020-03-12 19:00:49+09 | [local]          |  
19944              ...  
AUDIT: SESSION | READ   | 2020-03-12 19:00:58+09 | [local]          |  
19944              ...
```

6.9 Removing Setup

This section describes how to remove the setup of pgaudit.

1. Start the instance

2. Remove the pgaudit extension

Execute DROP EXTENSION to remove the pgaudit extension from the database.

```sql
$ psql -d <database name>  
=# DROP EXTENSION pgaudit;  
=# \q
```
3. Change postgresql.conf
   Remove the parameters below relating to pgaudit.
   - shared_preload_libraries
   - pgaudit.config_file

4. Restart the instance

5. Remove the pgaudit files

As superuser, run the following command. Note that "<x>" in paths indicates the product version.

```
$ su -
Password:******
# rm -rf /opt/fsepv<x>server64/filesCopiedDuringSetup
```

**Information**

The files copied during setup can be checked below.

```
# find /opt/fsepv<x>server64/OSS/pgaudit
```

**Warning**

Open a command prompt as administrator privileges, run the following command. Note that "<x>" in paths indicates the product version.

```
> del "c:\Program Files\Fujitsu\fsepv<x>server64\filesCopiedDuringSetup"
```

**Information**

The files copied during setup can be checked below.

```
> dir /b /s "c:\Program Files\Fujitsu\fsepv<x>server64\OSS\pgaudit"
```
Cluster Operation Guide
Database Multiplexing
(Linux)
Preface

Purpose of this document
This document describes the tasks required for using the database multiplexing feature of FUJITSU Enterprise Postgres.

Intended readers
This document is intended for those who set up and use the database multiplexing feature.

Readers of this document are also assumed to have general knowledge of:
- PostgreSQL
- SQL
- Linux

Structure of this document
This document is structured as follows:

Chapter 1 Overview of Database Multiplexing Mode
Provides an overview of database multiplexing mode.

Chapter 2 Setting Up Database Multiplexing Mode
Describes how to set up database multiplexing mode.

Chapter 3 Operations in Database Multiplexing Mode
Explains periodic database multiplexing mode.

Chapter 4 Action Required when an Error Occurs in Database Multiplexing Mode
Explains the action required when an error occurs during a database multiplexing mode.

Chapter 5 Managing Mirroring Controller Using WebAdmin
Explains how to set up and manage Mirroring Controller in a streaming replication cluster using WebAdmin.

Appendix A Parameters
Explains the configuration files and parameters required for database multiplexing mode.

Appendix B Supplementary Information on Building the Primary Server and Standby Server on the Same Server
Explains supplementary information on building the primary server and standby server on the same server.

Appendix C User Commands
Explains the user commands.

Appendix D Notes on Performing Automatic Degradation Immediately after a Heartbeat Abnormality
Provides notes when performing automatic degradation unconditionally after a heartbeat abnormality is detected during heartbeat monitoring of an operating system or server.

Appendix E Supplementary Procedure on Configuring for Operation in Database Multiplexing Mode
Explains supplementary procedure on the configuration required for operation in database multiplexing mode.

Appendix F WebAdmin Disallow User Inputs Containing Hazardous Characters
Explains characters not allowed in WebAdmin.

Appendix G Collecting Failure Investigation Data
Explains how to collect data for initial investigation.
Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue date and version

Edition 1.0: April 2021

Copyright 2016-2021 FUJITSU LIMITED
This chapter provides an overview of database multiplexing mode.

**Point**

In this and subsequent chapters, the word “Mirroring Controller” may be used in the process or management directory name or explanation.

### 1.1 What is Database Multiplexing Mode

Database multiplexing mode is an operation mode (log shipping mode) based on PostgreSQL streaming replication. Other software such as cluster software is not required.

This mode replicates the database on all servers that comprise the cluster system. It achieves this by transferring the updated transaction logs of the database from the server that receives the updates (primary server) to another server (standby server), and then reflecting them on the standby server. The client driver automatically distinguishes between the primary and standby servers, so applications can be connected transparently regardless of the physical server.

It consists of a feature that detects faults in the elements that are essential for the continuity of the database operation (such as the database process, disk, and network), as well as simplified switchover and standby server disconnection features. Furthermore, referencing can be performed on the standby server. The database will be copied in synchronous mode.

**Note**

If using WebAdmin or Mirroring Controller, FUJITSU Enterprise Postgres supports cluster systems comprising one primary server and one standby server.

- Although it is possible to connect an asynchronous standby server to the cluster system as an additional server, the standby server is not targeted for monitoring by Mirroring Controller.

- A synchronous standby server cannot be connected to the cluster system as an additional server.

**See**

The streaming replication feature is not described in this manual.

Refer to “High Availability, Load Balancing, and Replication” in the PostgreSQL Documentation for information on the streaming replication feature.
FUJITSU Enterprise Postgres provides the Server Assistant that objectively determines the status of database servers as a third party, and if necessary, isolates affected databases if the database servers are unable to accurately ascertain their mutual statuses in database multiplexing mode, such as due to a network error between database servers, or server instability. Database degradation can be performed by using the server (arbitration server) on which the Server Assistant is installed.

For database degradation using the arbitration server, if the database servers are unable to check their mutual statuses (due to a network error between database servers or server instability), then the database server queries the arbitration server for the status of the other database server. If it is determined based on the heartbeat result that the status is unstable, the applicable database server will be isolated from the cluster system (fencing). The arbitration server periodically heartbeats the database server so that it can respond immediately to queries from the database server. The fencing process can be customized according to the environment where Mirroring Controller is used.

Additionally, the database servers are always performing their heartbeats for the arbitration server so that it can perform check requests any time.
Note

Install the arbitration server on a different physical server to that of the database server. Refer to "1.2 System Configuration for Database Multiplexing Mode" for information on the system configuration when using the arbitration server.

**Database degradation using the arbitration command**

The arbitration command is a user command that performs arbitration processing in lieu of the arbitration server. If an arbitration server cannot be deployed, arbitration of the database server can be performed using the arbitration command.
1.1.1 Monitoring Using Database Multiplexing Mode

In database multiplexing mode, perform the monitoring below.

- Operating system or server failures, and no-response state
  By generating a heartbeat between Mirroring Controller on each server, operating system or server errors are detected and acknowledged between the relevant servers.

The optimal operating method for environments where database multiplexing mode is performed can be selected from the following:

- Use the arbitration server to perform automatic degradation (switch/disconnect)
  This is the default method.
  The arbitration server objectively determines the status of database servers, then isolates and degrades from the cluster system the ones with an unstable status.
  Refer to "Database degradation using the arbitration server" for details.

- Call the user exit (user command) that will perform the degradation decision, and perform automatic degradation
  If the arbitration server cannot be installed, select if arbitration processing can be performed by the user instead.
  Mirroring Controller queries the user exit on whether to degrade. The user exit determines the status of the database server, and notifies Mirroring Controller whether to perform degradation.
  Refer to "Database degradation using the arbitration command" for details.

- Notification messages
  Use this method if using a two-database server configuration.
  Mirroring Controller outputs messages to the system log when an abnormality is detected. This ensures that a split brain will not occur due to a heartbeat abnormality - however, automatic switching will not be performed if the primary server operating system or server fails or becomes unresponsive.

See

Refer to "2.6 Creating a User Exit for a Database Server" or "Appendix C User Commands" for information on user commands.

Figure 1.4 Database degradation using the arbitration command
- Perform automatic degradation unconditionally after a heartbeat abnormality

   This method is handled as in FUJITSU Enterprise Postgres 9.6 or earlier versions.

   This method is not recommended, because Mirroring Controller unconditionally will perform automatic degradation after heartbeat abnormalities.

- Database process failures, and no-response state

   Mirroring Controller periodically accesses the database processes and checks the status. A process error is detected by monitoring whether an access timeout occurs.

- Disk failure

   Mirroring Controller periodically creates files on the data storage destination disk below. A disk error is detected when an I/O error occurs.
   - Data storage destination disk
   - Transaction log storage destination disk
   - Tablespace storage destination disk

   Failures that can be detected are those that physically affect the entire system, such as disk header or device power failures.

- Streaming replication issue

   Mirroring Controller detects streaming replication issues (log transfer network and WAL send/receive processes) by periodically accessing the PostgreSQL system views.

- Mirroring Controller process failure and no response

   In order to continue the monitoring process on Mirroring Controller, Mirroring Controller process failures and no responses are also monitored.

   The Mirroring Controller monitoring process detects Mirroring Controller process failures and no responses by periodically querying the Mirroring Controller process. If an issue is detected, Mirroring Controller is automatically restarted by the Mirroring Controller monitoring process.

**Point**

- If output of messages is selected as the operation to be performed when a heartbeat abnormality is detected during heartbeat monitoring of the operating system or server, automatic degradation will not be performed.

   However, if an issue in the WAL send process is detected on the primary server, then the standby server will be disconnected, and as a result an automatic disconnection may be performed even if the standby server operating system or server fails or becomes unresponsive.

- You can select in the parameters if the primary server will be switched if a database process is unresponsive or if tablespace storage destination disk failure is detected. Refer to "Appendix A Parameters" for details.

- If the standby server was disconnected, Mirroring Controller will automatically comment out the synchronous_standby_names parameter in the postgresql.conf file of the primary server. Accordingly, you can prevent the application processing for the primary server being stopped.

**Note**

If the role of primary server was switched to another server and then starts degrading, the original primary server will not become the standby server automatically. Remove the cause of the error, and then change the role of the original primary server to the server currently acting as standby server. Refer to "4.1 Action Required when Server Degradation Occurs" for details.
1.1.2 Referencing on the Standby Server

1.1.2.1 If Prioritizing the Main Job on the Primary Server

If a reference job is performed on the standby server and the primary server is switched, this may impact the main job from the point of view of load and conflict. This is because, on the new primary server (that is, the original standby server), both the main job that was being executed on the original primary server and the reference job that was being continued on the original standby server will be processed.

Therefore, to degrade the reference job (so that the impact on the main job is reduced), you can select the user exit below to disconnect the reference job that was performed on the original standby server.

- Post-switch command

Note

If continuing with the referencing job after switching the primary server, give careful consideration to the server resource estimates, and the likely impact on performance.

1.1.2.2 If Performing the Referencing Job on the Synchronous Standby Server

If an issue such as a log transfer network failure obstructs the continuation of a job on the primary server, the standby server may be automatically disconnected from the cluster system.

Therefore, if operating the reference job on the assumption that the connection destination is the synchronous standby server, you can select to temporarily stop the job by using the user exit or the feature below, so that unexpected referencing of past data does not occur as a result of the disconnection.

- Pre-detach command

- Forced stoppage of the standby server instance on disconnection (specify in the parameter of the server configuration file)

Additionally, if the standby server is incorporated into the cluster system, reference jobs can be started or resumed by using the user exit below.

- Post-attach command

See

- Refer to “2.6 Creating a User Exit for a Database Server” or “Appendix C User Commands” for information on each user exit.

- Refer to “A.4.1 Server Configuration File for the Database Servers” for information on the server configuration file of the database server.

Point

Mirroring Controller will continue processing regardless of the processing result of the above user exits and features.

1.2 System Configuration for Database Multiplexing Mode

This section explains the products, features, and networks that are part of a database multiplexing system.

The following table shows the network types uses by database multiplexing systems.

<table>
<thead>
<tr>
<th>Network type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job network</td>
<td>Network between the application that accesses the database, and the database server.</td>
</tr>
<tr>
<td>Network type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Arbitration network</td>
<td>Network used by the arbitration server to check the status of the primary server and standby server, and communicate with Mirroring Controller of the database servers. Additionally, if the job network is disconnected from outside, it can also be used as the arbitration network. Refer to &quot;1.4 Security in Database Multiplexing&quot; for details on network security.</td>
</tr>
<tr>
<td>Admin network</td>
<td>Network used by the primary server and the standby server to monitor each other using Mirroring Controller, and to control Mirroring Controller of other servers.</td>
</tr>
<tr>
<td>Log transfer network</td>
<td>Network used to transfer the transaction logs of the database, which is part of database multiplexing.</td>
</tr>
</tbody>
</table>

Figure 1.5 System configuration for database multiplexing mode

The arbitration server is installed to check the database server status as a third party, and to perform fencing. Therefore, to obtain the intended benefits, consider the following:

- Install the arbitration server on a different server to that of the database server.
- For the arbitration network, use a network that will not be impacted by line faults or the load on the admin network or log transfer network. This is necessary to correctly determine issues on the admin network or log transfer network.
- The arbitration server can also be used as an application server. However, consider the server load.
- It is recommended to link the arbitration server with other cluster systems, in order to provide redundancy.
- Use the arbitration server in combination with the same version of FUJITSU Enterprise Postgres as that of the primary server and standby server.
- The arbitration server can be built on a different platform to that of the database server.

Note

Because the ping command of the operating system is used for heartbeat monitoring of the database server, configure the network so that ICMP can be used on the admin network and the arbitration network.

1.2.1 Mirroring Controller Resources

This section describes the database server and arbitration server resources of Mirroring Controller.

1.2.1.1 Database Server Resources

The only Mirroring Controller resource is the Mirroring Controller management directory, which stores the files that define the Mirroring Controller behavior, and the temporary files that are created when Mirroring Controller is active.

Note

- Do not create the Mirroring Controller management directory in a directory managed by FUJITSU Enterprise Postgres, otherwise it may be deleted by mistake or may cause unexpected problems when FUJITSU Enterprise Postgres recovery is performed (such as old version of files being restored).
  

- The backup methods described in "Back Up the Database" in the Operation Guide cannot be used to back up the Mirroring Controller resources. Therefore, users must obtain their own backup of Mirroring Controller resources, in addition to FUJITSU Enterprise Postgres server resources. Retrieve backups after stopping Mirroring Controller.

- If the automatic switch/disconnection is enabled, do not edit synchronous_standby_names for the Mirroring Controller monitoring target instance. Otherwise, if Mirroring Controller is switched after editing, data may be lost or SQL access may stop.

- If you are building on a virtual machine or cloud, make sure the virtual machines are on different physical servers. Refer to your virtual machine software and cloud vendor documentation for instructions on how to deploy virtual machines.

The content on the primary server will be backed up. You cannot tell which server is the primary server to be backed up, because switching and failback may be performed between the servers. It is also impossible to tell which server is to be restored using the backed up data. Accordingly, ensure that you create a backup of each server when it is working as the primary server.
1.2.1.2 Arbitration Server Resources

The only arbitration server resource is the Mirroring Controller arbitration process management directory. This directory stores the files that define the Mirroring Controller arbitration process behavior and the temporary files created when Mirroring Controller is active.

1.2.2 Mirroring Controller Processes

This section describes the database server and arbitration server processes of Mirroring Controller.

1.2.2.1 Database Server Processes

The database server processes comprise the Mirroring Controller process and Mirroring Controller monitoring process.

<table>
<thead>
<tr>
<th>Process type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mirroring Controller process</td>
<td>Performs operating system/server and process heartbeat monitoring and disk abnormality monitoring between database servers. Additionally, it issues arbitration requests to the arbitration server.</td>
</tr>
<tr>
<td>Mirroring Controller monitoring process</td>
<td>Performs heartbeat monitoring of the Mirroring Controller process. If the Mirroring Controller process returns no response or is down, the monitoring process is restarted automatically.</td>
</tr>
</tbody>
</table>

1.2.2.2 Arbitration Server Process

The only arbitration process is the Mirroring Controller arbitration process.
<table>
<thead>
<tr>
<th>Process type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

### 1.2.3 Redundancy of the Admin and Log Transfer Networks

The admin network is an important one, because it is used by Mirroring Controller to check the status of each server. Additionally, the log transfer network is an important one, because it is necessary to ensure data freshness. Accordingly, configure a failure-resistant network by implementing network redundancy via channel bonding provided by the operating system or network driver vendor.

### 1.2.4 Notes on CPU Architecture and Products

Use the same CPU architecture (endian) for the primary server, standby server, and the arbitration server. A server using only PostgreSQL streaming replication cannot be specified as the database multiplexing system log transfer destination.

### 1.3 Deciding on Operation when a Heartbeat Abnormality is Detected

The operation to be performed when a heartbeat abnormality is detected using operating system/server heartbeat monitoring is decided on according to the environment where database multiplexing mode is performed or the operating method.

It is possible to select from the four operations below, and specify this in the parameters of Mirroring Controller:
- Use the arbitration server to perform automatic degradation (switch/disconnect)
- Call the user exit (user command) that will perform the degradation decision, and perform automatic degradation
- Notification messages
- Perform automatic degradation unconditionally (switch/disconnect)

The table below shows if jobs can be continued on the primary server when an issue is detected during heartbeat monitoring of the operating system/server.

#### Continuation of jobs on the primary server when an issue is detected during heartbeat monitoring of the operating system/server

<table>
<thead>
<tr>
<th>Operation</th>

1.4 Security in Database Multiplexing

The database server replicates the database on all servers that comprise the cluster system. It achieves this by transferring and reflecting the updated transaction logs of the database from the primary server to the standby server.

To safeguard the database against unauthorized access and preserve data confidentiality in transaction log transfers, carefully consider security and take note of the following when performing database multiplexing:

- Do not use trust authentication when using replication connection.
- Configure the admin network and the log transfer network so that they cannot be connected from the outside, as shown in Figure 1.7 Security.

Additionally, for the line on which Mirroring Controller connects from the database server to the arbitration server, take note of the following points and consider security carefully.

- Build a network with the arbitration server disconnected from outside, as shown in Figure 1.7 Security.

Figure 1.7 Security

However, it may not always be possible to adopt the configuration mentioned above. For example, you may want to place the servers in a nearby/neighborhood office to minimize network delays.

In this case, combine the following features to enhance security:

- Authentication of the Standby Server
- Encryption of Transaction Logs Transferred to the Standby Server

When these features are combined, security will be achieved as shown below.
**Point**

If the job network is disconnected from outside, it can be used as the arbitration network. However, if a network is to be used as both a job network and arbitration network, consider the load on the network.

**Note**

If a port is blocked (access permission has not been granted) by a firewall, etc., enable use of the target port by granting access. Refer to the vendor document for information on how to open (grant access permission to) a port. Consider the security risks carefully when opening ports.

Figure 1.8 Security achieved when standby server authentication is combined with transaction log encryption

---

**See**

Refer to “Performing Database Multiplexing” under “Configuring Secure Communication Using Secure Sockets Layer” in the Operation Guide for information on encrypting SSL communications.
1.4.1 Authentication of the Standby Server

You can prevent spoofing connections from an external server purporting to be the standby server by using authentication with a user name and password.

Configure the setting in the primary server pg_hba.conf file so that authentication is performed for connections from the standby server in the same way as for connections from the client.

See

Refer to "Client Authentication" in the PostgreSQL Documentation for information on content that can be configured in pg_hba.conf.

1.4.2 Encryption of Transaction Logs Transferred to the Standby Server

In case the authentication of the standby server is breached so that a malicious user purporting to be the standby server can spoof data, the transaction log data can be encrypted to prevent it from being deciphered. The transparent data encryption feature is used to encrypt the data.

See

Refer to "Protecting Storage Data Using Transparent Data Encryption" in the Operation Guide for details.
Chapter 2 Setting Up Database Multiplexing Mode

This chapter describes how to set up database multiplexing mode, and how to check it.

Users who perform setup and operations on the database server

Setup and operations of the database server must be performed by the instance administrator user.

Users who perform setup and operations on the arbitration server

The following users may perform setup and operations on the arbitration server when it is used for automatic degradation.

Linux

Any operating system user.

Windows

Any user with administrator privileges. This user must be assigned the "Log on as a service" user right.

- Mirroring Controller selects a database superuser as the user who will connect to the database instance. This enables instance administrator users and database superusers who operate the Mirroring Controller commands to run database multiplexing mode in different environments.

- The application name for connecting to the database instance is "mc_agent".

Matching the system times

Before starting the setup, ensure that the times in the primary server, standby server and arbitration server match, by using the operating system time synchronization feature, for example.

The tolerated difference is approximately one second.

If the system times are not synchronized (because the tolerated difference is exceeded, for example), problem investigation may be affected.

Configuring ICMP

Because the ping command of the operating system is used for heartbeat monitoring of the database server, configure the network so that ICMP can be used on the admin network and the arbitration network. Refer to the relevant operating system procedure for details.

Setup

The setup procedure is shown in the table below. However, the procedure on the arbitration server should be performed only when the arbitration server is used for automatic degradation. A distinction is made between the procedures on the primary server and standby server according to whether the arbitration server is used.

<table>

Explanations for each step are provided below.

**Information**

- The setup procedure is also the same when changing the mode on a single server to database multiplexing mode. In this case, omit the installation of FUJITSU Enterprise Postgres and the creation of the instance. Refer to "3.9.2 Changing from Single Server Mode to Database Multiplexing Mode" for details.
