Preface

Purpose of this manual
This document is intended for users of "FUJITSU Software Enterprise Postgres" (hereafter referred to as "FUJITSU Enterprise Postgres"), and explains how to read the manuals.

Structure of this document
The structure and content of this manual is shown below.

Chapter 1 How to Read the Manuals
This section explains the notational conventions in FUJITSU Enterprise Postgres manuals.

Chapter 2 Trademarks
This section explains the trademarks.

Export control restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 How to Read the Manuals

The FUJITSU Enterprise Postgres manuals use certain notational conventions and rules. Pay attention to these conventions and rules when reading the FUJITSU Enterprise Postgres manuals.

1.1 Intended Products

The manuals apply to the following products:
- FUJITSU Enterprise Postgres Advanced Edition
- FUJITSU Enterprise Postgres Standard Edition

1.2 Abbreviations of manual titles

The following tables list abbreviations of the titles of manuals for FUJITSU Enterprise Postgres as they appear in the manuals.

<table>
<thead>
<tr>
<th>Formal manual title</th>
<th>Abbreviation in FUJITSU Enterprise Postgres manuals</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Release Notes</td>
<td>Release Notes</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres General Description</td>
<td>General Description</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Installation and Setup Guide for Client</td>
<td>Installation and Setup Guide for Client</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Operation Guide</td>
<td>Operation Guide</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Cluster Operation Guide</td>
<td>Cluster Operation Guide</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Application Development Guide</td>
<td>Application Development Guide</td>

</tr>
</tbody>
</table>

1.3 System of manuals and how to use the manuals

This section describes the system of manuals for FUJITSU Enterprise Postgres.

1.3.1 System of Manuals

FUJITSU Enterprise Postgres manuals

The table below shows the manuals on FUJITSU Enterprise Postgres.
<table>
<thead>
<tr>
<th>Use/Purpose</th>
<th>Manual title</th>
<th>Content</th>
<th>When to read</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>W</strong></td>
<td><strong>L</strong> Deciding whether to upgrade the product.</td>
<td>Release Notes</td>
<td>Overview of upgraded features and incompatibility information.</td>
</tr>
<tr>
<td>Acquiring an overview of the product and the basic information required for work and operation.</td>
<td>General Description</td>
<td>Description of all available functions associated with each intended purpose or use, and screenshots of operations.</td>
<td>Learn basic information and restrictions that system engineers and operators must know to actually operate the product.</td>
</tr>
<tr>
<td>Installing and setting up FUJITSU Enterprise Postgres correctly to enable its use.</td>
<td>Installation and Setup Guide for Server</td>
<td>Procedure for installing and setting up FUJITSU Enterprise Postgres.</td>
<td>Install and Setup FUJITSU Enterprise Postgres.</td>

</tr>
</tbody>
</table>

1.3.2 Documentation Roadmap

This section provides a documentation roadmap, broken down by user role.

Database administrator

The database administrator is a user who performs FUJITSU Enterprise Postgres installation and setup, and who operates and monitors the database.

Refer to the manuals in the table below, according to purpose:

<table>
<thead>
<tr>
<th>Required reading</th>
<th>Purpose</th>
<th>Manual name</th>
</tr>
</thead>
<tbody>
<tr>
<td>W</td>
<td>L</td>
<td>Required reading</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td></td>
<td>Glossary</td>
</tr>
<tr>
<td>Refer to as required</td>
<td>To learn about PostgreSQL features</td>
<td>PostgreSQL Documentation</td>
</tr>
</tbody>
</table>

Application developer

The application developer is a user who defines the database and develops applications.

Refer to the manuals in the table below, according to purpose:

1.4.3 FUJITSU Enterprise Postgres conventions

The naming conventions for the FUJITSU Enterprise Postgres product names and functions used in the FUJITSU Enterprise Postgres manuals are shown below.

1.4.3.1 Server

The names used in the manuals in explanations regarding FUJITSU Enterprise Postgres functions are shown below.

<table>
<thead>
<tr>
<th>Product name</th>
<th>Name used in manuals</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Advanced Edition (64bit) and FUJITSU Enterprise Postgres Standard Edition (64bit)</td>
<td>64-bit product</td>
</tr>
</tbody>
</table>

1.4.3.2 Client

The names used in the manuals in explanations regarding FUJITSU Enterprise Postgres client functions are shown below.

<table>
<thead>
<tr>
<th>Product name</th>
<th>Name used in manuals</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Client (64bit)</td>
<td>64-bit product</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Client (32bit)</td>
<td>32-bit product</td>
</tr>
</tbody>
</table>

1.4.4 Abbreviations for specific terms

The following abbreviations are used in descriptions concerning Linux and Solaris:
- "UNIX system" is an abbreviation for FUJITSU Enterprise Postgres running under Linux or Solaris.
- "UNIX system files" is an abbreviation for files handled under Linux or Solaris.
- "UNIX system" is an abbreviation for a system configured for Linux or Solaris.

1.4.5 Symbol convention

The symbols shown below are used in the manuals.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>These symbols indicate characters displayed in a window or dialog box or keyboard keys. Examples: [Setting] dialogue box, [File] menu, [Item name], [OK] button, [Enter] key.</td>
</tr>
</tbody>
</table>

1.5 Notes about Manuals

This section contains notes about the FUJITSU Enterprise Postgres operating environments and manuals.
- Images in figures

The FUJITSU Enterprise Postgres manuals contain figures showing printouts for FUJITSU Enterprise Postgres to provide the reader an idea of what the printouts look like, but since the figures are only examples, they are incomplete.
- Explanatory examples

  - Most of the examples of databases in the FUJITSU Enterprise Postgres manuals are modeled after inventory control databases of retail stores. The design and contents of the databases in the examples are fictitious and do not represent any real database.

  - The examples given in the FUJITSU Enterprise Postgres manuals are assumed to be for RHEL6 unless expressly stated otherwise.(For Linux)

- UNIX release version number

  This system conforms to UNIX System V Rel4.2MP.
Chapter 2 Trademarks

- Internet Information Services, Microsoft, MS, MS-DOS, Windows, Windows Server, Visual Basic, Visual Studio and Microsoft .NET Framework are registered trademarks or trademarks of Microsoft Corporation in the U.S. and/or other countries.

- Oracle and Java are registered trademarks of Oracle Corporation and its subsidiaries and affiliated companies in the U.S. and other countries. Product and company names mentioned in this manual are the trademarks or registered trademarks of their respective owners.

- Linux is a registered trademark or trademark of Mr. Linus Torvalds in the U.S. and other countries.

- Red Hat, RPM, and all Red Hat-based trademarks and logos are registered trademarks or trademarks of Red Hat, Inc. in the U.S. and other countries.

- UNIX is a registered trademark of Open Group in the U.S. and other countries.

- Interstage, Systemwalker, and FUJITSU Software Enterprise Postgres are trademarks or registered trademarks of Fujitsu Limited.

Other product and company names mentioned in this manual are the trademarks or registered trademarks of their respective owners.
Preface

Purpose of This Document
This document explains FUJITSU Enterprise Postgres terminology.

Intended Readers
This document is aimed at all users of FUJITSU Enterprise Postgres.

Export Restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

</tbody>
</table>
**Server command**

A command used on the database server. Also known as a server application.

**Standby server**

A server that generates a replicated database synchronized with the primary server, and that can run as an alternative server in case the primary server fails during multiplexed database operation.

**Transaction log**

Contains the history of updates made to the database by transactions. Also known as the WAL (Write-Ahead Log).

**Transaction log storage destination**

The directory that stores the transaction log.

**VCI (Vertical Clustered Index)**

An index with columnar data structure suitable for aggregation.

**WAL (Write-Ahead Log)**

Has the same meaning as 'transaction log'.

FUJITSU Enterprise Postgres 9.6

General Description
Preface

Purpose of This Document
This document explains the FUJITSU Enterprise Postgres concepts to those who are to operate databases using it.
This document explains the features of FUJITSU Enterprise Postgres.

Intended Readers
This document is intended for people who are:
- Considering installing FUJITSU Enterprise Postgres
- Using FUJITSU Enterprise Postgres for the first time
- Wanting to learn about the concept of FUJITSU Enterprise Postgres
- Wanting to see a functional overview of FUJITSU Enterprise Postgres

Readers of this document are also assumed to have general knowledge of:
- Computers
- Jobs
- Oracle Solaris
- Linux
- Windows(R)

Structure of This Document
This document is structured as follows:
Chapter 1 FUJITSU Enterprise Postgres Basics
Explains the features of FUJITSU Enterprise Postgres.
Appendix A List of Features
Explains the lists of the main features provided by FUJITSU Enterprise Postgres.

Export Control Restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

**Index** ..................................................................................................... 11
Chapter 1 FUJITSU Enterprise Postgres Basics

FUJITSU Enterprise Postgres maintains the operating methods, interfaces for application development and SQL compatibility of PostgreSQL, while providing expanded features for enhanced reliability and operability.

This chapter explains the functionality extended by FUJITSU Enterprise Postgres.

Refer to "Appendix A List of Features" for feature differences between editions.

FUJITSU Enterprise Postgres has the following features:

- Flexible database recovery
  Not only does FUJITSU Enterprise Postgres recover data to its most recent form when a failure occurs, which is essential for databases, but it can also recover to any point in time.

- Simple GUI-based installation and operation management
  FUJITSU Enterprise Postgres uses GUI to simplify cumbersome database operations, and allows databases to be used intuitively.

- High reliability by using database multiplexing
  Database multiplexing protects important data and enables highly reliable database operation.

- Seamless migration from Oracle databases
  FUJITSU Enterprise Postgres provides a compatibility feature with Oracle databases that localizes the correction of existing applications and allows easy migration to FUJITSU Enterprise Postgres.

- Linkage with integrated development environment
  FUJITSU Enterprise Postgres links with Visual Studio, thereby allowing a standard framework to be used to create applications.

- Storage Data Protection using Transparent Data Encryption
  Information can be protected from data theft by encrypting data to be stored in the database.

- Data masking for improved security
  The data masking feature changes the returned data for queries from applications, to prevent exposing actual data. This improves security for handling confidential data such as personal information.

- Enhanced query plan stability
  The following features can control SQL statement query plans:

  - Optimizer hints
  - Locked statistics

  These features are used for curbing performance deterioration caused by changes in SQL statement query plans, such as with mission-critical jobs that emphasize performance stability over improved SQL statement processing performance.

- Increased aggregation performance using the in-memory feature
  The following features help speed up scans even when aggregating many rows.

  - Vertical Clustered Index (VCI)
  - In-memory data
1.1 Flexible Database Recovery

Threats such as data corruption due to disk failure and incorrect operations are unavoidable in systems that use databases. The ability to reliably recover corrupted databases without extensive damage to users when such problems occur is an essential requirement in database systems.

FUJITSU Enterprise Postgres provides the following recovery features that flexibly respond to this requirement:

- Media recovery, which recovers up to the most recent point in time
- Point-in-time recovery, which can recover up to a specific point in time

**Media recovery, which recovers up to the most recent point in time**

When a disk failure occurs, media recovery can recover data to how it was immediately before the failure.

In order to recover the database, FUJITSU Enterprise Postgres accumulates a history of database update operations, such as data additions and deletions, as an update log.

FUJITSU Enterprise Postgres retains a duplicate (mirror image) of the update log after backup execution on the data storage destination and on the backup data storage destination. Therefore, the data on one disk can be used to recover to the most recent state of the database even if a disk failure has occurred on the other.

Media recovery is executed using either a GUI tool provided with FUJITSU Enterprise Postgres (WebAdmin) or server commands.

**Information**

Recovery using WebAdmin requires less time and effort, since WebAdmin automatically determines the scope of the operation.

**Point-in-time recovery, which can recover up to a specific point in time**

Point-in-time recovery can be used to recover a database that has been updated by an incorrect operation, for example, by specifying any date and time before the incorrect operation.

Point-in-time recovery is executed using FUJITSU Enterprise Postgres server commands.
1.2 Simple GUI-Based Installation and Operation Management

FUJITSU Enterprise Postgres provides WebAdmin, which is a GUI tool for a range of tasks, from database installation to operation management. This allows the databases to be used simply and intuitively.

WebAdmin can be used for FUJITSU Enterprise Postgres setup, creating and monitoring a streaming replication cluster, database backups, and for recovery. Depending on the configuration, WebAdmin can be used to manage FUJITSU Enterprise Postgres instances in a single server, or instances spread across multiple servers.

- Setup

   To perform setup using WebAdmin, you must create an instance. An instance is a set of server processes that manage a database cluster (database storage area on the data storage destination disk). Instances can be created easily and with only minimal required input, because the tool automatically determines the optimal settings for operation.

- Database backup/recovery

   Database backup and recovery can be performed using simple GUI operations.

   In particular, FUJITSU Enterprise Postgres can automatically identify and isolate the location of errors. This simplifies the recovery process and enables faster recovery.

In addition, FUJITSU Enterprise Postgres provides the following expanded features in pgAdmin:

- NCHAR type
- Expanded trigger definition
  - REPLACE feature
  - Function call feature

1.3 High Reliability with Database Multiplexing

It is vital for systems that use databases to protect data from damage or loss caused by a range of factors such as hardware and software errors. Database multiplexing protects important data and enables highly reliable database operation.
FUJITSU Enterprise Postgres not only mirrors a database using the PostgreSQL streaming replication feature, but also provides simplified switchover and standby disconnection features as well as a feature to detect faults in elements that are essential for the continuity of process, disk, network, and other database operations.

Even if a switchover is performed, the client automatically distinguishes between the primary and standby servers, so applications can be connected transparently regardless of the physical server.

The Mirroring Controller option enables the primary server (the database server used for the main jobs) to be switched automatically to the standby server if an error occurs in the former.

In addition, by using the data on the standby server, reference jobs such as data analysis and form output can be performed in parallel to the jobs on the primary server.

---

See

Refer to "Database Multiplexing Mode" in the Cluster Operation Guide for information on the database multiplexing.

### 1.4 Seamless Migration from Oracle Databases

FUJITSU Enterprise Postgres supports Oraforce, to provide compatibility with Oracle databases.

Using the compatibility feature reduces the cost of correcting existing applications and results in easy database migration.

---

See

Refer to "Compatibility with Oracle Databases" in the Application Development Guide for information on compatible features.
1.5 Linkage with Integrated Development Environment

You can link with Microsoft Visual Studio to create application. And, you can automatically generate applications to access database resources by linking to Visual Studio.

Relationship between .NET Framework and FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres provides .NET Data Provider, which is an interface for ADO.NET of .NET Framework. This enables you to select FUJITSU Enterprise Postgres as the connection destination database of ADO.NET and use the intuitive and efficient application development features of Visual Studio.

1.6 Storage Data Protection using Transparent Data Encryption

The encryption of data to be stored in a database is essential under the following encryption requirements of PCI DSS (Payment Card Industry Data Security Standard), the data security standard of the credit industry:

- Confidential information (such as credit card numbers) can be encrypted.
- The encryption key and data are managed as separate entities.
- The encryption key is replaced at regular intervals.

To satisfy these requirements, FUJITSU Enterprise Postgres provides a transparent data encryption feature. Note that PostgreSQL uses an encryption feature called pgcrypto, which can also be used in FUJITSU Enterprise Postgres, but requires applications to be modified. Therefore, we recommend using FUJITSU Enterprise Postgres's transparent data encryption feature.
See

Refer to "Protecting Storage Data Using Transparent Data Encryption" in the Operation Guide for information on stored data encryption.

1.7 Data Masking for Improved Security

FUJITSU Enterprise Postgres provides a data masking feature that protects data to maintain security of data handled in systems.

The data masking feature changes the returned data for queries from applications and makes it available for reference without exposing the actual data.

For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

Also, the data changed by the data masking feature can be transferred to a test database so that users who perform testing or development can reference the data. As production data should not be used in a test or development environment because of the risk of data leakage, this feature enables data that is similar to actual production data to be safely used in those environments.
1.8 Enhanced Query Plan Stability

FUJITSU Enterprise Postgres estimates the cost of query plans based on SQL statements and database statistical information, and selects the least expensive query plan. However, like other databases, FUJITSU Enterprise Postgres does not necessarily select the most suitable query plan. For example, it may suddenly select unsuitable query plan due to changes in the data conditions.

In mission-critical systems, stable performance is more important than improved performance, and changes in query plans case to be avoided. In this situation, the following features can stabilize query plans:

- **Optimizer hints**
  
  You can use `pg_hint_plan` to specify a query plan in each individual SQL statement.

- **Locked statistics**
  
  You can use `pg_dmbs_stats` to lock statistical information per object, such as a database, schema, or table.

Refer to "Optimizer Hints" in the Application Development Guide for information on optimizer hints.

Refer to "Locked Statistics" in the Application Development Guide or information on locked statistics.

Use the features provided when FUJITSU Enterprise Postgres is installed for optimizer hints and locked statistical information. FUJITSU Enterprise Postgres does not support other similar open-source features.
1.9 Increased Aggregation Performance Using the In-memory Feature

FUJITSU Enterprise Postgres provides the in-memory feature, which uses columnar index and memory-resident data. This reduces disk I/Os and enhances aggregation performance.

**Note**

This feature can only be used in Advanced Edition.

**Columnar index**

Many aggregation processes may require a large portion of data in a particular column. However, traditional row data structure reads unnecessary columns, resulting in inefficient use of memory and CPU cache, and slower processing. FUJITSU Enterprise Postgres provides a type of columnar index, VCI (Vertical Clustered Index). This addresses the above issues, and enhances aggregation performance.

VCI provides the following benefits:

- Minimizes impact on existing jobs, and can perform aggregation using job data in real time.
- Provided as an index, so no application modification is required.
- Stores data also on the disk, so aggregation jobs can be quickly resumed using a VCI even if a failure occurs (when an instance is restarted).
- If the amount of memory used by VCI exceeds the set value, aggregation can still continue by using VCI data on the disk.

It also provides the features below:

- Disk compression
  Compresses VCI data on the disk, minimizing required disk space. Even if disk access is required, read overhead is low.
- Parallel scan
  Enhances aggregation performance by distributing aggregation processes to multiple CPU cores and then processing them in parallel.

**In-memory data**

The following features keep VCI data in memory and minimize disk I/Os on each aggregation process.

- Preload feature
  Ensures stable response times by loading VCI data to memory before an application scans it after the instance is restarted.
- Stable buffer feature
  Reduces disk I/Os by suppressing VCI data eviction from memory by other job data.

**Purposes of this feature**

This feature has a data structure that can efficiently use the newly added resources, and aims to enhance the existing aggregation processing in normal operations to be faster than parallel scan. It shares the same purpose of enhancing aggregation performance with the parallel scan feature that is provided separately, but differs in that it speeds up nightly batch processes by utilizing available resources.

**VCI architecture**

This section briefly explains VCI architecture as it contains basic terminology required, for example, when setting parameters.

Update and aggregation operations to enable real time use of job data are described.

VCI has write buffer row-based WOS (Write Optimized Store) in addition to the columnar data structure ROS (Read Optimized Store). Converting each update into a columnar index has a significant impact on the update process response times. Therefore, data is synchronously reflected to the row-based WOS when updating. After a certain amount of data is stored in WOS, the ROS control daemon asynchronously converts it to ROS. As above, the entire VCI is synchronized with the target table column, minimizing update overhead.
The same scan results can be obtained without a VCI by using WOS in conjunction with ROS. More specifically, WOS is converted to Local ROS in local memory for each aggregation process, and aggregated with ROS.

Refer to "Installing and Operating the In-memory Feature" in the Operation Guide for information on installation and operation of VCI. Refer to "Scan Using a Vertical Clustered Index (VCI)" in the Application Development Guide for information on scan using a VCI.
## Appendix A List of Features

The following table lists the main features provided by FUJITSU Enterprise Postgres.

Preface

Purpose of This Document
This document provides release information for FUJITSU Enterprise Postgres.

Structure of This Document
This document is structured as follows:

Chapter 1 New Features and Improvements
Explains the new features and improvements in this version.

Chapter 2 Compatibility Information
Provides information regarding compatibility.

Chapter 3 Program Updates
Explains updates incorporated in this version.

Export Restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue Date and Version
Edition 1.0: September 2017

*1: Already provided in FUJITSU Enterprise Postgres 9.5 AE.

1.1 Features Added in 9.6

This section explains new features and improvements in FUJITSU Enterprise Postgres 9.6.

1.1.1 Operations

This section explains the new features related to operation.

- Improvements to the GUI

1.1.1.1 Improvements to the GUI

The WebAdmin GUI incorporates the following new features and improvements:

- Import instance
  Instances created via the command line using the initdb command can be imported into and subsequently managed by WebAdmin.
  Refer to "Importing Instances" in the Installation and Setup Guide for Server for details.

- Edit instance
  The following items for an instance can now be modified: Instance name, Port number, and Backup storage path.
  Refer to "Editing instance information" in the Installation and Setup Guide for Server for details.

- Anomaly processing
  WebAdmin now detects external changes to the port and backup_destination parameters in postgresql.conf, and provides the ability to synchronize these parameters with the corresponding items in WebAdmin.
  WebAdmin also detects external changes to Mirroring Controller configuration of cluster replication added via WebAdmin, and disables Mirroring Controller functionality for the instance for which the anomaly is detected.
  Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.
- Interoperability support

WebAdmin can now be used to manage instances of earlier versions. WebAdmin 9.6 supports FUJITSU Enterprise Postgres 9.6 and FUJITSU Enterprise Postgres 9.5 to create and manage instances.

- Optional backup

Backup and restore functionality can now be disabled for an instance.

Refer to "Creating an Instance" > "[Backup]" in the Installation and Setup Guide for Server for details.

- Auto-refresh

The auto-refresh feature automatically refreshes the status of all instances at set intervals.

- Performance improvements

Performance has been significantly improved for various operations.

---

See

Refer to "Operating Methods" in the Operation Guide for details.

---

1.1.2 Performance

This section explains the new features added to improve performance:

- Parallel scan

1.1.2.1 Parallel Scan

PostgreSQL 9.6 parallel scan is now available in FUJITSU Enterprise Postgres Standard Edition.

In addition to PostgreSQL 9.6 parallel scan, it features the CPU resource availability check, which is already provided in FUJITSU Enterprise Postgres 9.5 Advanced Edition. This prevents slowdown when excessive parallel scans are performed under high load on the server.

Information

CPU resource availability check

Check if sufficient system resources are available when the SQL statement is executed. (CPU usage)

Consider using parallel scan only if two or more cores of the CPU in the server are available when the SQL statement is executed.

For example, if the CPU has four cores and the total of 200% or more is available from cores 1 to 4, parallel scan is planned, otherwise it is not.

1.1.3 Application Development

This section explains the new features related to application development:

- Support for variable format source code in COBOL programs

- Support for Visual Studio 2015

- Support for Oracle's compatibility features (orafce)
1.1.3.1 Support for Variable Format Source Code in COBOL Programs

For embedded SQL in COBOL, variable format source code is now supported in COBOL programs. This makes it possible to precompile existing COBOL programs that use variable format source code as is.

Refer to “Embedded SQL in COBOL” in the Application Development Guide for details.

1.1.3.2 Support for Visual Studio 2015

Visual Studio 2015 is supported as a development environment of the FUJITSU Enterprise Postgres client feature for Windows(R).

Refer to “Related Software” in the Installation and Setup Guide for Client for details.

1.1.3.3 Support for Oracle’s Compatibility Features (orafce)

The existing compatibility features have been kept and more compatibility features are now available.

Refer to “Compatibility with Oracle Databases” in the Application Development Guide for details.

1.1.4 Platform Enhancement

This section explains the new features related to platform enhancement:

- Additional operating system support for client

1.1.4.1 Additional Operating System Support for Client Feature

The following additional operating systems are supported:

- Solaris 10
- Solaris 11

Refer to “Required Operating System” in the Installation and Setup Guide for Client for details.

1.1.5 OSS

This section explains the new feature related to OSS:

- PostgreSQL rebase

1.1.5.1 PostgreSQL Rebase

The PostgreSQL version that FUJITSU Enterprise Postgres is based on is 9.6.2.
Chapter 2 Compatibility Information

This chapter explains incompatible items and actions required when migrating from FUJITSU Enterprise Postgres 9.5 to FUJITSU Enterprise Postgres 9.6. Check compatibility before migrating and take the appropriate action.

2.1 Installation/Setup Incompatibility

2.1.1 Changing the WebAdmin Installation Method

Incompatibility

WebAdmin is not installed automatically during server installation. Therefore, install WebAdmin separately.

Action method

None.

2.2 Application Migration Incompatibility

2.2.1 Changing how to Use the Features Compatible with Oracle Databases

Incompatibility

To use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

CREATE EXTENSION oracle_compatible

Action method

None.

2.3 Operation Migration Incompatibility

2.3.1 Changing masking policy definition for unsupported data types

Incompatibility

The data masking feature of FUJITSU Enterprise Postgres is updated so that an error occurs when a masking policy is defined for a column of an unsupported data type (array type or timestamp with timezone type).

FUJITSU Enterprise Postgres 9.5

The definition of a masking policy for a column of array type or timestamp with timezone type ends normally, but an error occurs when accessing a column of a table for which the policy is defined.

FUJITSU Enterprise Postgres 9.6

An error occurs when defining a masking policy for a column of array type or timestamp with timezone type.

Action method

If a policy that was defined in FUJITSU Enterprise Postgres 9.5 includes masking of a column of an unsupported data type (array type or timestamp with timezone type), perform one of the following in FUJITSU Enterprise Postgres 9.6:

- Ignore the error if the masking policy contains columns of only these data types, or delete the policy with the pgx_drop_confidential_policy system administration function.
- If the masking policy target contains columns of these data types and a supported data type, delete the problematic columns with the `pgx_alter_confidential_policy` system function.
Chapter 3 Program Updates

This version incorporates the updates implemented in PostgreSQL 9.6.0, 9.6.1, and 9.6.2.

See

Refer to the PostgreSQL Global Development Group website for information on the updates implemented in the following releases:

[PostgreSQL 9.6.0]

[PostgreSQL 9.6.1]
https://www.postgresql.org/docs/9.6/static/release-9-6-1.html

[PostgreSQL 9.6.2]
https://www.postgresql.org/docs/9.6/static/release-9-6-2.html

Issues that occurred in previous versions and levels are also fixed.

Refer to the following table for details of the program fixes included in this version and level.

Table 3.1 Program fixes in FUJITSU Enterprise Postgres 9.6

</tr>
</tbody>
</table>

When a multi-version installation is performed on a Windows client, execution of the pgx_NpgsqlRegister command is completed successfully, however, the .NET Data Provider feature is not registered correctly.
As a result, .NET applications of the version that was running previously will not operate.

**[Environment]**
The following operating system is used:
- Windows

**[Conditions]**
1. A multi-version installation is performed on a Windows client, and
2. The pgx_NpgsqlRegister command is executed to register the .NET Data Provider feature, and
3. A .NET application using the DbProviderFactories class that was running on the installed version is executed.

If the pg_upgrade command is executed for an instance that includes a tablespace with transparent data encryption specified, the following error is output, and the upgrade fails.
ERROR: tablespace encryption algorithm option cannot be changed

**[Issue 2]**
If the pg_dumpall command is executed to back up an instance that includes a tablespace with transparent data encryption specified, and the psql command or pg_restore command is executed to perform a restore, the following error is output, and the restore fails.
ERROR: tablespace encryption algorithm option cannot be changed

**[Environment]**
One of the following operating systems is used:
- Linux
- Windows

**[Conditions for issue 1]**
1. A tablespace with transparent data encryption specified has been defined in an old version targeted for an upgrade, and
2. The pg_upgrade command is executed to perform an upgrade for 1.

**[Conditions for issue 2]**
1. A tablespace with transparent data encryption specified has been defined in an old version targeted for an upgrade, and
2. The `pg_dumpall` command is executed to perform a backup for the tablespace with transparent data encryption specified in 1, and
3. After the upgrade, the `psql` command or `pg_restore` command is executed to perform a restore, using the backup data obtained in 2.

Release Notes
(Windows)
Preface

Purpose of This Document
This document provides release information for FUJITSU Enterprise Postgres.

Structure of This Document
This document is structured as follows:

Chapter 1 New Features and Improvements
Explains the new features and improvements in this version.

Chapter 2 Compatibility Information
Provides information regarding compatibility.

Chapter 3 Program Updates
Explains updates incorporated in this version.

Export Restrictions

Chapter 1 New Features and Improvements

1.1 Features Added in 9.6
   1.1.1 Operations
   1.1.1.1 Improvements to the GUI
   1.1.2 Performance
   1.1.2.1 Parallel Scan
   1.1.3 Application Development
   1.1.3.1 Support for Variable Format Source Code in COBOL Programs
   1.1.3.2 Support for Visual Studio 2015
   1.1.3.3 Support for Oracle's Compatibility Features (orafce)
   1.1.4 Platform Enhancement
   1.1.4.1 Additional Operating System Support for Server Feature
   1.1.4.2 Additional Operating System Support for Client Feature
   1.1.5 OSS
   1.1.5.1 PostgreSQL Rebase

Chapter 2 Compatibility Information

2.1 Installation/Setup Incompatibility
   2.1.1 Changing the WebAdmin Installation Method

2.2 Application Migration Incompatibility
   2.2.1 Changing how to Use the Features Compatible with Oracle Databases

2.3 Operation Migration Incompatibility
   2.3.1 Changing masking policy definition for unsupported data types

Chapter 3 Program Updates

Index
Chapter 1 New Features and Improvements

This chapter explains FUJITSU Enterprise Postgres new features and improvements added in this version.

*1: Already provided in FUJITSU Enterprise Postgres 9.5 AE.

1.1 Features Added in 9.6

This section explains new features and improvements in FUJITSU Enterprise Postgres 9.6.

1.1.1 Operations

This section explains the new features related to operation.

- Improvements to the GUI

1.1.1.1 Improvements to the GUI

The WebAdmin GUI incorporates the following new features and improvements:

- Import instance
  Instances created via the command line using the initdb command can be imported into and subsequently managed by WebAdmin.
  Refer to "Importing Instances" in the Installation and Setup Guide for Server for details.

- Edit instance
  The following items for an instance can now be modified: Instance name, Port number, and Backup storage path.
  Refer to "Editing instance information" in the Installation and Setup Guide for Server for details.

- Anomaly processing
  WebAdmin now detects external changes to the port and backup_destination parameters in postgresql.conf, and provides the ability to synchronize these parameters with the corresponding items in WebAdmin.
  WebAdmin also detects external changes to Mirroring Controller configuration of cluster replication added via WebAdmin, and disables Mirroring Controller functionality for the instance for which the anomaly is detected.
  Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.
- Interoperability support

WebAdmin can now be used to manage instances of earlier versions. WebAdmin 9.6 supports FUJITSU Enterprise Postgres 9.6 and FUJITSU Enterprise Postgres 9.5 to create and manage instances.

- Optional backup

Backup and restore functionality can now be disabled for an instance.

Refer to "Creating an Instance" > "[Backup]" in the Installation and Setup Guide for Server for details.

- Auto-refresh

The auto-refresh feature automatically refreshes the status of all instances at set intervals.

- Performance improvements

Performance has been significantly improved for various operations.

See

Refer to "Operating Methods" in the Operation Guide for details.

1.1.2 Performance

This section explains the new features added to improve performance:

- Parallel scan

1.1.2.1 Parallel Scan

PostgreSQL 9.6 parallel scan is now available in FUJITSU Enterprise Postgres Standard Edition.

In addition to PostgreSQL 9.6 parallel scan, it features the CPU resource availability check, which is already provided in FUJITSU Enterprise Postgres 9.5 Advanced Edition. This prevents slowdown when excessive parallel scans are performed under high load on the server.

Information

CPU resource availability check

Check if sufficient system resources are available when the SQL statement is executed. (CPU usage)

Consider using parallel scan only if two or more cores of the CPU in the server are available when the SQL statement is executed.

For example, if the CPU has four cores and the total of 200% or more is available from cores 1 to 4, parallel scan is planned, otherwise it is not.

1.1.3 Application Development

This section explains the new features related to application development:

- Support for variable format source code in COBOL programs
- Support for Visual Studio 2015
- Support for Oracle's compatibility features (orafce)
1.1.3.1 Support for Variable Format Source Code in COBOL Programs

For embedded SQL in COBOL, variable format source code is now supported in COBOL programs. This makes it possible to precompile existing COBOL programs that use variable format source code as is.

See

Refer to "Embedded SQL in COBOL" in the Application Development Guide for details.

1.1.3.2 Support for Visual Studio 2015

Visual Studio 2015 is supported as a development environment of the FUJITSU Enterprise Postgres client feature for Windows(R).

See

Refer to "Related Software" in the Installation and Setup Guide for Client for details.

1.1.3.3 Support for Oracle’s Compatibility Features (orafce)

The existing compatibility features have been kept and more compatibility features are now available.

See

Refer to "Compatibility with Oracle Databases" in the Application Development Guide for details.

1.1.4 Platform Enhancement

This section explains the new features related to platform enhancement:

- Additional operating system support for server
- Additional operating system support for client

1.1.4.1 Additional Operating System Support for Server Feature

The following additional operating system is supported:

- Windows Server(R) 2016

Note

The following features of Windows Server(R) 2016 are not supported:

- Server Core
- Nano Server
- Windows Server Container

See

Refer to "Required Operating System" in the Installation and Setup Guide for Server for details.

1.1.4.2 Additional Operating System Support for Client Feature

The following additional operating systems are supported:
- Solaris 10
- Solaris 11

Refer to "Required Operating System" in the Installation and Setup Guide for Client for details.

1.1.5 OSS

This section explains the new feature related to OSS:

- PostgreSQL rebase

1.1.5.1 PostgreSQL Rebase

The PostgreSQL version that FUJITSU Enterprise Postgres is based on is 9.6.2.

Chapter 2 Compatibility Information

This chapter explains incompatible items and actions required when migrating from FUJITSU Enterprise Postgres 9.5 to FUJITSU Enterprise Postgres 9.6. Check compatibility before migrating and take the appropriate action.

2.1 Installation/Setup Incompatibility

2.1.1 Changing the WebAdmin Installation Method

Incompatibility

WebAdmin is not installed automatically during server installation. Therefore, install WebAdmin separately.

Action method

None.

2.2 Application Migration Incompatibility

2.2.1 Changing how to Use the Features Compatible with Oracle Databases

Incompatibility

To use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

CREATE EXTENSION oracle_compatible

Action method

None.

2.3 Operation Migration Incompatibility

2.3.1 Changing masking policy definition for unsupported data types

Incompatibility

The data masking feature of FUJITSU Enterprise Postgres is updated so that an error occurs when a masking policy is defined for a column of an unsupported data type (array type or timestamp with timezone type).

FUJITSU Enterprise Postgres 9.5

The definition of a masking policy for a column of array type or timestamp with timezone type ends normally, but an error occurs when accessing a column of a table for which the policy is defined.

FUJITSU Enterprise Postgres 9.6

An error occurs when defining a masking policy for a column of array type or timestamp with timezone type.

Action method

If a policy that was defined in FUJITSU Enterprise Postgres 9.5 includes masking of a column of an unsupported data type (array type or timestamp with timezone type), perform one of the following in FUJITSU Enterprise Postgres 9.6:

- Ignore the error if the masking policy contains columns of only these data types, or delete the policy with the pgx_drop_confidential_policy system administration function.
- If the masking policy target contains columns of these data types and a supported data type, delete the problematic columns with the `pgx_alter_confidential_policy` system function.
Chapter 3 Program Updates

This version incorporates the updates implemented in PostgreSQL 9.6.0, 9.6.1, and 9.6.2.

See

Refer to the PostgreSQL Global Development Group website for information on the updates implemented in the following releases:

[PostgreSQL 9.6.0]

[PostgreSQL 9.6.1]
https://www.postgresql.org/docs/9.6/static/release-9-6-1.html

[PostgreSQL 9.6.2]
https://www.postgresql.org/docs/9.6/static/release-9-6-2.html

This software incorporates the following security updates that were modified from PostgreSQL 9.6.3 to 9.6.4:

- CVE-2017-7484: selectivity estimators bypass SELECT privilege checks
- CVE-2017-7485: libpq ignores PGREQUIRESSL environment variable
- CVE-2017-7486: pg_user_mappings view discloses foreign server passwords
- CVE-2017-7546: Empty password accepted in some authentication methods
- CVE-2017-7547: The "pg_user_mappings" catalog view discloses passwords to users lacking server privileges
- CVE-2017-7548: lo_put() function ignores ACLs

See

Refer to the PostgreSQL Global Development Group website for information on the security updates:

https://www.postgresql.org/about/news/1746/

https://www.postgresql.org/about/news/1772/

Issues that occurred in previous versions and levels are also fixed.

Refer to the following table for details of the program fixes included in this version and level.

Table 3.1 Program fixes in FUJITSU Enterprise Postgres 9.6

<table>
<thead>

</tbody>
</table>

If you try to recover the database to a past point in a streaming replication configuration, pgx_rcvall may fail and output the following message:

FATAL: Demanded time series %u is not an affiliate of time series %u of the data base system.

[Environment]

One of the following operating systems is used:

- Linux
- Windows

[Conditions]
1. A streaming replication environment is built, and
2. The database is recovered in the following order:
   2.1 The primary server is recovered to a past point using one of the following commands, and
      - `pgx_rcvall -e "recoveryPointInTime"`
      - `pgx_rcvall -n "namedRestorePoint"`
      - `pgx_rcvall -p`
   2.2 One of the following occurs, and
      - Failover or switchover occurs one or more times, or
      - A command other than `pgx_rcvall` is used to recover to a past point.
   2.3 The new primary server is backed up using `pgx_dmpall`, and
   2.4 Both nodes are stopped, and
   2.5 In the following command, the backup obtained in 2.3 is specified for the old or new primary
      server to recover to a past point:
      - `pgx_rcvall -e "recoveryPointInTime"`

2 PH12548 [Issue]
If the TransactionScope feature of the .NET data provider is used, the application ends with an
exception.
Error message: prepared transaction with identifier "@1@" does not exist
@1@: Transaction identifier

[Environment]
The following operating system is used:
- Windows

[Conditions]
An application is run that satisfies the following conditions:
1. TransactionScope is used, and
2. Multiple connections are generated in a scope in 1, and
3. The connections in 2 are used to access the database, and
4. The Complete method is called for the scope in 1.

3 PH12605 [Issue]
In applications targeting the following versions of .NET Framework, database connections using
the DbProviderFactory class output the error message below and fail.
- Target .NET Framework versions:
  - .NET Framework 2.0
  - .NET Framework 3.0
  - .NET Framework 3.5
  - .NET Framework 3.5 Client Profile
Error message
Unable to find the requested .Net Framework Data Provider. It may not be installed.

[Environment]
The following operating system is used:
- Windows
| 4 | PH12818 | [Issue]  
If PreloadReader=True is specified for a connection string in a product based on Npgsql 2.1.x or later, the value of the HasRows property is always false even if data exists.  
[Environment]  
The following operating system is used:  
- Windows  
[Conditions]  
1. PreloadReader=True is specified for a connection string in .NET Data Provider, and a Connection instance is created, and  
2. The Connection instance created in 1 and a SELECT statement, for which the result set is not empty, are specified and a Command instance is created, and  
3. A DataReader instance is created from the Command instance created in 2, and  
4. The value of the HasRows property of the DataReader instance created in 3 is obtained. |
| 5 | PH13223 | [Issue]  
When a multi-version installation is performed on a Windows client, execution of the pgx_NpgsqlRegister command is completed successfully, however, the .NET Data Provider feature is not registered correctly.  
As a result, .NET applications of the version that was running previously will not operate.  
[Environment]  
The following operating system is used:  
- Windows  
[Conditions]  
1. A multi-version installation is performed on a Windows client, and  
2. The pgx_NpgsqlRegister command is executed to register the .NET Data Provider feature, and  
3. A .NET application using the DbProviderFactories class that was running on the installed version is executed. |
| 6 | PH13243 | [Issue 1]  
If the pg_upgrade command is executed for an instance that includes a tablespace with transparent data encryption specified, the following error is output, and the upgrade fails.  
ERROR: tablespace encryption algorithm option cannot be changed  
[Issue 2]  
If the pg_dumpall command is executed to back up an instance that includes a tablespace with transparent data encryption specified, and the psql command or pg_restore command is executed to perform a restore, the following error is output, and the restore fails. |
ERROR: tablespace encryption algorithm option cannot be changed

[Environment]
One of the following operating systems is used:
- Linux
- Windows

[Conditions for issue 1]
1. A tablespace with transparent data encryption specified has been defined in an old version targeted for an upgrade, and
2. The `pg_upgrade` command is executed to perform an upgrade for 1.

[Conditions for issue 2]
1. A tablespace with transparent data encryption specified has been defined in an old version targeted for an upgrade, and
2. The `pg_dumpall` command is executed to perform a backup for the tablespace with transparent data encryption specified in 1, and
3. After the upgrade, the `psql` command or `pg_restore` command is executed to perform a restore, using the backup data obtained in 2.

7 PH13328

A masking policy definition for an array type or timestamp with timezone type, is mistakenly completed successfully when it is supposed to end abnormally. As a result, an error is output when accessing a column of a table where a policy is defined.

[Environment]
One of the following operating systems is used:
- Linux
- Windows

[Conditions]
1. A masking policy is created for an array type or timestamp with timezone type column using the pgx_create_confidential_policy system administration function.

8 PH13361

[Issue 1]
When PL/Python is installed for a database, the error message below is output, and installation fails.

ERROR: could not load library "fujitsuEnterprisePostgresInstallDir/lib/plpython2.so":
libpython2.6.so.1.0: cannot open shared object file: No such file or directory

[Issue 2]
When PL/Perl is installed for a database, the error message below is output, and installation fails.

ERROR: could not load library "fujitsuEnterprisePostgresInstallDir/lib/plperl.so":
fujitsuEnterprisePostgresInstallDir/lib/plperl.so: undefined symbol: Perl_lincgv_ptr

[Environment]
The following operating system is used:
- Linux

[Conditions for issue 2]
1. FUJITSU Enterprise Postgres is used in an RHEL7.0 or later environment, and
2. One of the following commands is executed to install PL/Python:
- CREATE EXTENSION plpythonu
- CREATE LANGUAGE plpythonu

[Conditions for issue 2]

1. FUJITSU Enterprise Postgres is used in an RHEL 7.0 or later environment, and
2. One of the following commands is executed to install PL/Perl:
   - CREATE EXTENSION plperl
   - CREATE LANGUAGE plperl

Installation and Setup Guide for Server
Installation and Setup Guide for Client
Installation and Setup Guide for Server

Linux >
Solaris >
Windows >
Installation and Setup Guide for Server (Linux)
Preface

Purpose of This Document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Linux platform. This document describes how to install and set up "FUJITSU Enterprise Postgres".

Intended Readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres. Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Linux

Structure of This Document
This document is structured as follows:

Chapter 1 Overview of Installation
Describes the installation types and procedures

Chapter 2 Operating Environment
Describes the operating environment required to use FUJITSU Enterprise Postgres

Chapter 3 Installation
Describes how to perform a new installation of FUJITSU Enterprise Postgres

Chapter 4 Setup
Describes the setup to be performed after installation

Chapter 5 Uninstallation
Describes how to uninstall FUJITSU Enterprise Postgres

Appendix A Installation in Silent Mode
Provides specifications for installation in silent mode

Appendix B Recommended WebAdmin Environments
Describes the recommended WebAdmin environment.

Appendix C Setting Up and Removing WebAdmin
Describes how to set up and remove WebAdmin

Appendix D Configuring Parameters
Describes FUJITSU Enterprise Postgres parameters.

Appendix E Uninstall (middleware)
Describes the Uninstall (middleware)

Appendix F Uninstall (middleware) Messages
Describes the messages output by the Uninstall (middleware) tool.

Appendix G Estimating Database Disk Space Requirements
Describes how to estimate database disk space requirements

Appendix H Estimating Memory Requirements
Describes the formulas for estimating memory requirements
Appendix I Quantitative Limits
   Describes the quantity range

Appendix J Configuring Kernel Parameters
   Describes the settings for kernel parameters

Appendix K Determining the Preferred WebAdmin Configuration
   Describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration

Appendix L Supported contrib Modules and Extensions Provided by External Projects
   Lists the PostgreSQL contrib modules and the extensions provided by external projects supported by FUJITSU Enterprise Postgres.

Export Restrictions
   Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that can be Installed

Each FUJITSU Enterprise Postgres feature is installed on the machine that was used to build the database environment.

The following table shows the relationship between the product to be installed and the features that can be installed.

<table>
<thead>
<tr>
<th>Feature that can be installed</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>AE</td>
</tr>
<tr>
<td>Basic feature (server feature, client feature)</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be installed

1.2 Installation Types

The following three installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, FUJITSU Enterprise Postgres is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

FUJITSU Enterprise Postgres products can be installed on the same server if the product version (indicated by x.y in "x.y.SPz") is different from that of any version of the product that is already installed.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.

1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In the interactive mode installation, the installation state of FUJITSU Enterprise Postgres is determined automatically. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
- Multi-version installation

1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres.
Chapter 2 Operating Environment

This chapter describes the operating environment required to use FUJITSU Enterprise Postgres.

See

Refer to "Operating Environment" in the installation and Setup Guide for Client when installing the FUJITSU Enterprise Postgres client feature at the same time.

2.1 Required Operating System

One of the operating systems shown below is required in order to use FUJITSU Enterprise Postgres.

- RHEL6.5 (Intel 64) or later
- RHEL7.2 or later

Note

- The SELinux (Security-Enhanced Linux) feature is not supported for RHEL6.
- The sepgsql module, which is a PostgreSQL extension, can be used in RHEL7 or later.
- PL/Python supports PostgreSQL languages based on Python 2 only. PostgreSQL languages based on Python 3 are not supported.

Information

Select the x86_64 architecture package when installing the 64-bit product.

- The following packages are required for operations on RHEL6 (Intel64).

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>alsa-lib</td>
<td></td>
</tr>
<tr>
<td>audit-libs</td>
<td></td>
</tr>
<tr>
<td>dstat</td>
<td>Required when using parallel scan.</td>
</tr>
<tr>
<td>glibc</td>
<td></td>
</tr>
<tr>
<td>libgcc</td>
<td></td>
</tr>
<tr>
<td>libstdc++</td>
<td></td>
</tr>
<tr>
<td>libtool-lidl</td>
<td>Required when using ODBC drivers.</td>
</tr>
<tr>
<td>ncurses-libs</td>
<td></td>
</tr>
<tr>
<td>nss-softokn-freebl</td>
<td></td>
</tr>
<tr>
<td>pam</td>
<td>Required when using PAM authentication.</td>
</tr>
<tr>
<td>perl-libs</td>
<td>Required when using PL/Perl. Install 5.10.</td>
</tr>
<tr>
<td>python-libs</td>
<td>Required when using PL/Python Install 2.6.</td>
</tr>
<tr>
<td>redhat-lsb</td>
<td></td>
</tr>
<tr>
<td>tcl</td>
<td>Required when using PL/Tcl Install 8.5.</td>
</tr>
</tbody>
</table>
The following packages are required for operations on RHEL7.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>unzip</td>
<td></td>
</tr>
<tr>
<td>xz-libs</td>
<td></td>
</tr>
<tr>
<td>zlib</td>
<td></td>
</tr>
</tbody>
</table>

2.2 Related Software

No other software is required in order to use FUJITSU Enterprise Postgres.

The following table lists servers that can be connected to the FUJITSU Enterprise Postgres client feature.

Table 2.1 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>

<tr>
<td>Linux</td>
<td></td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>
2.3 Excluded Software

This section describes excluded software.

FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres cannot be installed if all the following conditions are met:
- The product version (indicated by x.y in "x.y SPz") of the product to be installed is the same as that of the installed product
- The editions are different

Example

In the following cases, FUJITSU Enterprise Postgres cannot be installed as an exclusive product:
- The installed product is FUJITSU Software Enterprise Postgres Standard Edition (64bit) 9.5
- The product to be installed is FUJITSU Software Enterprise Postgres Advanced Edition (64bit) 9.5

Other products

There are no exclusive products.

2.4 Required Patches

There are no required patches.

2.5 Hardware Environment

The following hardware is required to use FUJITSU Enterprise Postgres.

Memory

At least 512 MB of memory is required.

2.6 Disk Space Required for Installation

The following table shows the disk space requirements for new installation of FUJITSU Enterprise Postgres. If necessary, increase the size of the file system.

Table 2.2 Disk space required for installation

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space (Unit: MB)</th>

<tr>
<td>Installation destination of the client (32-bit)</td>
<td>80</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>83</td>
</tr>
</tbody>
</table>

*1: Required for the installation of the Uninstall (middleware) tool.
*2: Required for the installation of FIQSS.
2.7 Supported System Environment

This section describes the supported system environment.

2.7.1 TCP/IP Protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

⚠️ Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

2.7.2 File System

All file systems with a POSIX-compliant interface are supported. However, for stable system operation, the disk where the database is deployed must use a highly reliable file system. Consider this aspect when selecting the file system to be used.

The recommended file system is "ext4".

2.8 PostgreSQL Version Used for FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres is based on PostgreSQL 9.6.2.

2.9 Notes on Using Streaming Replication

To use streaming replication, build the primary server and all standby servers using the same FUJITSU Enterprise Postgres version (*1).

*1: The product version is indicated by "x" in the notation "x.y SPz".

⚠️ Note

Streaming replication cannot be used in combination with Open Source PostgreSQL.
Chapter 3 Installation

This chapter explains each of the installation procedures of FUJITSU Enterprise Postgres.
Note that "x.y Spz" in window examples and "<xy>" in paths indicate the version and level of the installed product.

3.1 Pre-installation Tasks

Check the system environment below before installing FUJITSU Enterprise Postgres.

Check the disk space
Ensure that there is sufficient disk space to install FUJITSU Enterprise Postgres.
Refer to "2.6 Disk Space Required for Installation" for information on the required disk space.
Reconfigure the disk partition if disk space is insufficient.

Check the installed product and determine the installation method
Using the operation shown below, start Uninstall (middleware), and check the installed products.

Example

```bash
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. FUJITSU Enterprise Postgres Client(64bit) x.y Spz
2. FUJITSU Enterprise Postgres Client(32bit) x.y Spz
3. FUJITSU Enterprise Postgres Standard Edition(64bit) x.y Spz
4. FUJITSU Enterprise Postgres WebAdmin x.y Spz

Type [number] to select the software you want to uninstall.
[number, q] => q

Exiting Uninstaller.
```

If FUJITSU Enterprise Postgres is already installed, determine which installation method to use:
- Reinstallation
- Multi-version installation

Remove applied updates
If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

Note
If a product is installed without removing applied updates, the following problems will occur:
- Performing reinstallation
  if an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.
  Perform reinstallation after removing the update.
1. Display the applied updates

Execute the following command to display the applied updates:

Example

```
# /opt/FJSVFupde/bin/uam showup
[product-name FUJITSU Enterprise Postgres Standard Edition(64bit) x.y SPz]
2015/11/04 13:32 update-number R A L O - - - - FUJITSU Enterprise Postgres SE(FSEPDB)
[product-name FUJITSU Enterprise Postgres Client x.y SPz]
2015/11/04 13:33 update-number R A L O - - - - FUJITSU Enterprise Postgres Client
```

2. Remove the updates

Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.

Example

```
# /opt/FJSVFupde/bin/uam remove -i update-number
2015/11/04 13:32 update-number R A L O - - - - FUJITSU Enterprise Postgres SE(FSEPDB)
Are you sure you want to restore the updated product to its pre-update state? (Y/N)y
Restoration to the pre-update state is completed.
The update application management ledger has been updated.
```

Determine the preferred WebAdmin configuration

Starting with FUJITSU Enterprise Postgres 9.5, WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

Refer to "Appendix K Determining the Preferred WebAdmin Configuration" for details.

3.2 Installation in Interactive Mode

Install according to the following procedure:

**Note**

The following characters can be used as input values:

Alphanumeric characters, hyphens and forward slashes

1. Stop applications and the client program

If the installation method is one of the following, the applications and the program must be stopped:

- Reinstallation

Before starting the installation, stop the following:

- Applications that use the product
- Instance
- Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

Example

If WebAdmin is installed in /opt/fsepv<x>y>webadmin:
- Mirroring Controller

Execute the `mc_ctl` command with the stop mode option specified and stop the Mirroring Controller.

Example

```
$ mc_ctl stop -M /mcdir/inst1
```

2. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

3. Mount the DVD drive

Insert the server program DVD in the DVD drive, and run the command given below.

Example

```
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```

/`dev/dvd` is the DVD drive device, and `/media/dvd` is the mount point (which must already exist before calling the command).

**Note**

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

4. Run the installation

Execute the following command:

Example

```
# cd /media/dvd
# ./install.sh
```

In the example above, `/media/dvd` is the DVD mount point.

5. Select the product for installation

The list of installation target products is displayed as shown below.

Type the number for the product to be installed, or "all", and press Enter.

Note that "x.y SPz" in sample windows indicates the version level of products to install.

```plaintext
The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): all
```

Selected product
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
FUJITSU Enterprise Postgres WebAdmin x.y SPz

Do you want to install the above product?
y: Proceed to the next step
n: Select the product again
q: Quit without installing
[y,n,q](The default value is y): y

- To develop or execute a 32-bit application in a 64-bit environment, FUJITSU Enterprise Postgres Client (32bit) is required.
- The FUJITSU Enterprise Postgres Server component and WebAdmin can be installed on the same machine by selecting options 1 and 4.
- The window below is displayed for each product that that was selected but has already been installed.

To perform a reinstallation, type the number for the product and press Enter.

Select the method to install FUJITSU Enterprise Postgres Client (32bit) x.y SPz.
If performing a reinstallation, select the number of the product to be reinstalled.

1: FUJITSU Enterprise Postgres Client (32bit) x.y SPz (*1)
q: Quit without installing
[number,q]:

*1: Output if the installed product can undergo installation or reinstallation.

To perform a multi-version installation, type "m" and press Enter.

Select the method to install FUJITSU Enterprise Postgres Client (32bit) x.y SPz.
Select m for multi-version installation.

m: Multi-version installation (*1)
q: Quit without installing
[m,q]:

*1: Output if the installed product can undergo multi-version installation.

6. Check the settings

The window for checking the installation information is displayed as shown below.
If there is no problem with the settings, type "y" and press Enter to start the installation (refer to "10. Display the installation status").
To change the settings, type "c" and press Enter.

Product to be installed
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
  New installation
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
  New installation
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
  New installation
FUJITSU Enterprise Postgres WebAdmin x.y SPz
  New installation

Installation directory information
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
  /opt/fsepv<xy>server64
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
  /opt/fsepv<xy>client32
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
/opt/fsepv<xy>client64
FUJITSU Enterprise Postgres WebAdmin x.y SPz
/opt/fsepv<xy>webadmin

Setup information
WebAdmin setup: Execute
Web server port number: 27515
WebAdmin internal port number: 27516

Start installation using the above information?
y: Start the installation
c: Change the information (*1)
q: Quit without installing
[y,c,q] (The default value is y): c (*1)

*1: This option is not displayed if there is no information that can be modified.
If the user types "c", then the window mentioned in the next step is displayed.

7. Enter the installation directory
If the installation method is one of the following, the window below is displayed for each product:
- New installation
- Multi-version installation

Enter the directory and press Enter.

FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz : Specify the installation directory.
[directory name,q] (The default value is /opt/fsepv<xy>server64): /opt/fsepsv64

8. Enter the WebAdmin setup information
If WebAdmin was selected, and the installation method is one of the following, the window below will be displayed:
- New installation
- Multi-version installation

Type the item name and press Enter.

Do you want to execute WebAdmin setup?
y: Execute
n: Do not execute
[y,n,q] (The default value is y):

Specify the Web server port number.
Web server port number [1024-32767,q] (The default value is 27515):

Specify the WebAdmin internal port number.
WebAdmin internal port number [1024-32767,q] (The default value is 27516):

If you have not set up WebAdmin, refer to "Appendix C Setting Up and Removing WebAdmin" for details.

9. Check the changed settings
The changed settings are displayed as shown below.
If there is no problem with the settings, type "y" and press Enter.
To change the settings again, type "c" and press Enter.

Product to be installed
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
New installation
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
New installation
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
Installation directory information
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
/opt/fsepsv64
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
/opt/fsepc32
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
/opt/fsepc64
Setup information
WebAdmin setup: Execute
Web server port number: 27515
WebAdmin internal port number: 27516
Start installation using the above information?
y: Start the installation
c: Change the information
q: Quit without installing
[y, c, q] (The default value is y): y

10. Display the installation status
The installation status is displayed as follows:

Starting installation.
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz Installation
Installation is complete.
FUJITSU Enterprise Postgres Client (32bit) x.y SPz Installation
Installation is complete.
FUJITSU Enterprise Postgres Client (64bit) x.y SPz Installation
Installation is complete.
Starting setup. (*1)
Sets up WebAdmin. (*1)
Setup is complete. (*1)

*1: Displayed only when "Execute" is selected for WebAdmin setup.
Even if WebAdmin setup fails, the process will still continue.
If the following message is displayed, manually execute WebAdmin setup after installation is completed.
Refer to "C.1 Setting Up WebAdmin" for information on the WebAdmin setup procedure.

Starting setup.
Setting up WebAdmin.
ERROR: WebAdmin setup failed.

11. Finish the installation
Upon completion, a message is displayed showing the status.
If installation was successful, a message like the one shown below is displayed:
Note
If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.

3.3 Installation in Silent Mode
Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

The installation procedure is described below.

1. Change to the superuser
Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

2. Mount the DVD drive
Insert the server program DVD in the DVD drive, and run the command given below.

Example

```
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```
/dev/dvd is the DVD drive device, and /media/dvd is the mount point (which must already exist before calling the command).

Note
If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

3. Create an installation parameters CSV file
Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
: 
```

Refer to "Appendix A Installation in Silent Mode" for information on installation parameters CSV files.

Information
The template for the installation parameters CSV file is "mountpoint/sample/sample.csv".

4. Run the installation
Execute the following command:
Example

```
# cd /media/dvd
# ./silent.sh /home/work/inspara.csv
```

In the example above, /media/dvd is the DVD mount point, and /home/work/inspara.csv is the installation parameter CSV.

If the installer ends in an error, a message is output to the log file and return values are returned. Refer to "Appendix A Installation in Silent Mode" for details.

### 3.4 Post-installation Tasks

To use the features compatible with Oracle databases, it is necessary to load the Oracle compatibility module. Refer to "Precautions when Using the Features Compatible with Oracle Databases" in the Application Development Guide for details.
Chapter 4 Setup

This chapter describes the setup procedures to be performed after installation completes.

4.1 Operating Method Types and Selection

This section describes how to operate FUJITSU Enterprise Postgres.

There are two methods of managing FUJITSU Enterprise Postgres operations - select one that suits your purposes:

The Operation Guide describes the operating method using WebAdmin, and the equivalent operating method using the server commands.

Simple operation management using a web-based GUI tool (WebAdmin)

Suitable when using frequently used basic settings and operations for operation management.

This method allows you to perform simple daily tasks such as starting the system before beginning business, and stopping the system when business is over, using an intuitive operation.

Usage method

Usage is started by using WebAdmin to create the instance.

By using an external scheduler and the pgx_dmpall command, periodic backups can be performed, which can then be used in recovery using WebAdmin.

Note

- Do not use a server command other than pgx_dmpall or a server application. Operation modes that use server commands and server applications cannot be used in conjunction with WebAdmin. If used, WebAdmin will not be able to manage the instances correctly. Refer to Reference and the PostgreSQL Documentation for information on server commands and server applications.

Advanced operation management using server commands

When operating in a system that is automated by operation management middleware (Systemwalker Centric Manager, for example), this method allows you to use more detailed settings and operations and perform higher level operation management.

An overview of the operating method using the GUI, and its relationship with the operating method using the server commands, are shown below.

Refer to the Operation Guide for details.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>
<td>Creating an instance</td>
<td>WebAdmin is used. The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically.</td>
</tr>
<tr>
<td></td>
<td>Creating a standby instance</td>
<td>WebAdmin is used. WebAdmin performs a base backup of the source instance and creates a standby instance.</td>
</tr>
<tr>
<td></td>
<td>Changing the configuration files</td>
<td>WebAdmin is used. The configuration file is edited directly using the initdb command.</td>
</tr>
<tr>
<td>Activating and stopping an instance</td>
<td>WebAdmin is used.</td>
<td>The pg_ctl command is used.</td>
</tr>
<tr>
<td>Creating a database</td>
<td>This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement.</td>
<td></td>
</tr>
</tbody>
</table>
### Operation

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backing up the database</td>
<td>WebAdmin, or the pgx_dmpall command, is used.</td>
<td>It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed.</td>
</tr>
<tr>
<td>Database recovery</td>
<td>WebAdmin is used.</td>
<td>To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used.</td>
</tr>
</tbody>
</table>

### Monitoring

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Database errors</td>
<td>The status in the WebAdmin window can be checked. (*1)</td>
<td>The messages that are output to the database server log are monitored (*1)</td>
</tr>
<tr>
<td>Disk space</td>
<td>The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. (*1)</td>
<td>This is monitored using the df command of the operating system, for example. (*1)</td>
</tr>
<tr>
<td>Connection status</td>
<td>This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application.</td>
<td></td>
</tr>
</tbody>
</table>

*1: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

See

Refer to "Periodic Operations" and "Actions when an Error Occurs" in the Operation Guide for information on monitoring and database recovery.

### 4.2 Preparations for Setup

This section describes the preparation required before setting up FUJITSU Enterprise Postgres.

#### 4.2.1 Creating an Instance Administrator

Decide which OS user account will be assigned the instance administrator role. You can assign it to a new user or to an existing one, but you cannot assign it to the OS superuser (root).

The following example shows an OS user account with the name "fsepuser" being assigned the instance administrator role.

**Example**

```
# useradd fsepuser
# passwd fsepuser
```

#### 4.2.2 Preparing Directories for Resource Deployment

Prepare the directories required when creating instances.

**Considerations when deploying resources**

The disk configuration on the resource deployment destination is important, because it affects not only recovery following disk corruption, but normal operation as well. The points for determining the disk configuration are as follows:

1. If the backup data storage destination and the data storage destination are both lost, it will not be possible to recover the data, so deploy them to separate disks.
2. To shorten the recovery time following a single disk fault, deploy the system disk and data storage destination to separate disks.
3. The backup data storage destination requires at least double the capacity of the data storage destination, so deploy it to the disk with the most space available.

4. When large amounts of data are updated, the write-to load for the data storage destination, transaction log storage destination, and backup data storage destination (mirrored transaction log) will also be great. For this reason, deploy them to separate disks, out of consideration for performance.

**Note**

When using the volume manager provided by the operating system, be aware of which physical disk the file system has been created on, for example, by deploying the data storage destination and the backup data storage destination to separate disks.

### Server resource of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Resource</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>The area where the database is stored. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Stores log information in preparation for a crash recovery or rollback.</td>
</tr>
<tr>
<td>Archive log</td>
<td>Stores log information for recovery</td>
</tr>
<tr>
<td>Corefile</td>
<td>FUJITSU Enterprise Postgres process corefile output when an error occurs with a FUJITSU Enterprise Postgres process.</td>
</tr>
</tbody>
</table>

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.

---

Examples of disk deployment

The following are examples of disk deployment:
<table>
<thead>
<tr>
<th>Number of disks</th>
<th>Disk</th>
<th>Deployment</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Corefile</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Backup data storage destination</td>
</tr>
<tr>
<td>2</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Corefile</td>
</tr>
<tr>
<td></td>
<td>Data storage destination, transaction log storage destination</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Backup data storage destination</td>
<td></td>
</tr>
</tbody>
</table>

Proposal for disk deployment using WebAdmin

To generate an instance using WebAdmin, we recommend an optimum deployment that takes into account the status of all disks at the time of instance generation, and items 1 to 3 in the "Considerations when deploying resources" subheading above, based on the limitations below (note that a different deployment can also be specified).

- The mount point does not include national characters
- The instance administrator has the proper permissions to read and write on the mount point

Preparing directories

The directories to be prepared depend on the way that you create the instances.

The following shows the directories that need to be prepared:

<table>
<thead>
<tr>
<th>Directory to be prepared</th>
<th>Using WebAdmin</th>
<th>Using the initdb command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data storage destination</td>
<td>Y (*1)</td>
<td>Y</td>
</tr>
<tr>
<td>Backup data storage destination</td>
<td>Y (*1)</td>
<td>O</td>
</tr>
<tr>
<td>Transaction log storage destination</td>
<td>O (*1) (*2)</td>
<td>O</td>
</tr>
<tr>
<td>Corefile output destination</td>
<td>N (*3)</td>
<td>O</td>
</tr>
</tbody>
</table>

Y: Required  
O: Optional  
N: Not required  

*1: WebAdmin automatically creates a directory  
*2: The default is to create a directory in the data storage destination. When it is necessary to distribute the I/O load for the database data and the transaction log, consider putting the transaction log storage destination on a different disk from the data storage destination  
*3: The corefile path is as follows:

```
/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core  
```

version: product version edition_architecture  
instanceAdminUser: operating system user name  
PortNumber: port number specified when creating the instance

Example:

```
/var/tmp/fsep_96_SE_64/naomi_myinst27599/core  
```

Note that resources placed in `/var/tmp` that have not been accessed for 30 days or more will be deleted by the default settings of the operating system. Consider excluding them from deletion targets or changing the output destination in the operating system settings.
To change the output destination, configure the `core_directory` and the `core_contents` parameters in `postgresql.conf`. Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

**Note**

- The directories must meet the following conditions:
  - The directory owner must be the OS user account that you want to be the instance administrator
  - The directory must have write permission
  - The directory must be empty
- It is not possible to use a directory mounted by NFS (Network File System) when using WebAdmin.

**Example**

The following example shows the OS superuser creating `/database/inst1` as the directory for storing the database data and changing the owner of the directory to the OS user account "fsepuser".

```bash
# mkdir /database/inst1
# chown fsepuser:fsep /database/inst1
# chmod 700 /database/inst1
```

### 4.2.3 Estimating Resources

Estimate the resources to be used on the FUJITSU Enterprise Postgres.

Refer to "Appendix G Estimating Database Disk Space Requirements" for information on estimating database disk space requirements.

Refer to "Parameters automatically set by WebAdmin according to the amount of memory" when creating multiple instances with WebAdmin.

Refer to "Appendix H Estimating Memory Requirements" when creating instances with the `initdb` command, to estimate memory usage.

### 4.2.4 Configuring Corefile Names

If a process crashes, a corefile for the process will be generated by the operating system. If a corefile is generated with the same name as an existing corefile generated for a different process, the newly-generated corefile will overwrite the previously dumped corefile. To prevent this, configure a unique corefile name for each crash by appending the process ID, program name, and datetime.

Corefile names can be configured using the "kernel.core_pattern" and "kernel.core_uses_pid" kernel parameters. Refer to the "man page" in "core(5)" for information on how to use these parameters.

Note that with regard to the location for storing corefiles, the operating system settings take precedence over the `core_directory` parameter of `postgresql.conf`.

### 4.3 Creating Instances

There are two methods that can be used to create an instance:

- **4.3.1 Using WebAdmin**
- **4.3.2 Using the `initdb` Command**

**Creating multiple instances**

Multiple instances can be created.

The memory allocated needs to be adjusted when multiple instances are created with WebAdmin (refer to "Parameters automatically set by WebAdmin according to the amount of memory" for details).
Features that cannot be set up using WebAdmin

The "Storage data protection using transparent data encryption" feature cannot be set up using WebAdmin.

To set up this feature in an instance created by WebAdmin, perform the additional setup tasks detailed in "Storage Data Protection using Transparent Data Encryption" in the Operation Guide.

Note

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.

- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.

- Databases with the names 'template0' and 'template1' are automatically created when an instance is created. These databases are used as the templates for databases created later. Furthermore, a default database with the name 'postgres' is automatically created, which will be used with FUJITSU Enterprise Postgres commands. It is important that you do not delete these databases created by default.

4.3.1 Using WebAdmin

This section describes how to create an instance using WebAdmin.

WebAdmin must be set up correctly before it can be used. Refer to "C.1 Setting Up WebAdmin" for details. Additionally, if WebAdmin needs to be configured to use an external repository database, refer to "C.3 Using an External Repository for WebAdmin" for details.

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build 38)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.

Configure your browser to allow cookies and pop-up requests from the server on which FUJITSU Enterprise Postgres is installed.

Refer to "Appendix B Recommended WebAdmin Environments" for information on how to change the pop-up request settings and other recommended settings.

Note

- WebAdmin does not run in Windows(R) safe mode.

- If the same instance is operated from multiple WebAdmin windows, it will not work correctly.

- If the same instance is operated from multiple WebAdmin versions, it will not work normally. It is always recommended to use the latest version of WebAdmin to operate the instance.

- For efficient use of WebAdmin, it is recommended not to use the browser [Back] and [Forward] navigation buttons, the [Refresh] button, and context-sensitive menus, including equivalent keyboard shortcuts.

- Copying and pasting the WebAdmin URLs are not supported. Additionally, bookmarking of WebAdmin URLs is not supported.

- It is recommended to match the language between the instance server locale and WebAdmin.

- WebAdmin supports only two languages: English and Japanese.

- It is recommended to change the WebAdmin language setting from the instance details page only.

- It is recommended to operate WebAdmin using the WebAdmin launcher.

- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.
- If the browser was not operated for a fixed period (about 30 minutes), the session will time out and the login page will be displayed again for the next operation.

- Port access permissions
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions.
  Consider the security risks carefully when opening ports.

- When creating or importing an instance in WebAdmin, set the log_directory parameter in postgresql.conf to '/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log'. Note that resources placed in /var/tmp that have not been accessed for 30 days or more will be deleted by the default settings of the operating system. Therefore, consider excluding instances created using WebAdmin from deletion targets in the operating system settings if you need to stop those instances for a long time.

### 4.3.1.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

**Activation URL for WebAdmin**

In the browser address bar, type the activation URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- `hostNameOrIpAddress`: Host name or IP address of the server where WebAdmin is installed.
- `portNumber`: Port number of WebAdmin. The default port number is 27515.

The activation URL window shown below is displayed. From this window you can launch WebAdmin or access the product documentation.

![FUJITSU Enterprise Postgres](image)

**Logging in to the database server**

Click [Launch WebAdmin] in the activation URL window to activate WebAdmin and display the login window. Enter the instance administrator user ID (operating system user account name) and password, and log in to WebAdmin.
4.3.1.2 Creating an Instance

This section describes how to create an instance.

--- Information ---

WebAdmin calculates values using the formula indicated in “Managing Kernel Resources” under “Server Administration” in the PostgreSQL Documentation, and configures these in the kernel parameters. Refer to “Appendix J Configuring Kernel Parameters” for information on configuring parameter names.

Refer to “Appendix D Configuring Parameters” for information on the postgresql.conf values required to derive the set values.

1. Activate WebAdmin, and log in to the database server.
2. In the [Instances] tab, click .
3. Enter the information for the instance to be created.

Enter the following items:

- **Configuration type**: Whether to create a standalone instance or an instance that is part of a cluster.
- **Server product type**: Whether to create a FUJITSU Enterprise Postgres 9.5 instance or a FUJITSU Enterprise Postgres 9.6 instance. The default is "FUJITSU Enterprise Postgres 9.6".

WebAdmin can create and manage instances that are compatible with FUJITSU Enterprise Postgres 9.5, however, the new features in FUJITSU Enterprise Postgres 9.6 may not be supported for such instances, and may be disabled.

- **Location**: Whether to create the instance in the server that the current user is logged into, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.

- **Instance name**: Name of the database instance to manage

  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- **Instance port**: Port number of the database server

- **Data storage path**: Directory where the database data will be stored

- **Backup**: Whether to enable or disable the WebAdmin backup feature. The default is "Enabled". Select "Disabled" to disable all backup and restore functionality for the instance.

  If "Enabled" is selected, enter the following item:

  - **Backup storage path**: Directory where the database backup will be stored

- **Transaction log path**: Directory where the transaction log will be stored

- **Encoding**: Database encoding system

If "Remote" is selected for **Location**, enter the following additional items:
- [Host name]: Name of the host where the instance is to be created
- [Operating system credential]: Operating system user name and password for the remote machine where the instance is to be created
- [Remote WebAdmin port for standalone]: Port in which WebAdmin is accessible in the remote machine

**Note**

- Refer to "4.2.2 Preparing Directories for Resource Deployment" - "Considerations when deploying resources" for information on points to consider when determining the data storage path, backup storage path, and transaction log path.
- The following items can be modified after the instance has been created. These items can be modified for FUJITSU Enterprise Postgres 9.6 instances only.
  - Instance name
  - Port number
  - Backup storage path

Refer to "Editing instance information" for details.
- Do not specify directories that include symbolic link or multibyte characters when specifying the data storage destination or backup data storage destination.
- In the instance that is created using WebAdmin, the locale of the character set to be used in the database, and the locale of the collating sequence, are fixed using C.

4. Click to create the instance.

   If the instance is created successfully, a message indicating the same will be displayed.

5. The instance will be started when it is created successfully.
6. Back up the basic information that was set

   Back up the WebAdmin management information periodically to ensure operational continuity when a fault occurs on the system disk. Follow the procedure below to perform the backup.

   a. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
   b. Back up the following directory:

      webAdminInstallDir/data/fepwa

4.3.1.3 Changing Instance Settings

You can change the information that is set when an instance is created.

Change the following settings to suit the operating and management environment for FUJITSU Enterprise Postgres.

- Instance configuration
  - Character encoding
  - Communication
  - SQL options
  - Used memory
  - Streaming replication

- Changing client authentication information
- Editing instance information

Information

These settings are the same as the parameters that can be set in the files shown below. Refer to "Appendix D Configuring Parameters" for information on the equivalence relationship between the item name and the parameter.

- postgresql.conf
- pg_hba.conf

Note

The files shown below can also be modified directly, however if a parameter not described in "Appendix D Configuring Parameters" was edited by mistake, WebAdmin may not run correctly.

- postgresql.conf
- pg_hba.conf

Instance configuration

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click .
3. Click to change the configuration.
4. Click to save your changes.
Select a client-side encoding system that can be converted to/from the database encoding system. Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the PostgreSQL Documentation for information on the encoding system combinations that can be converted.

Changing client authentication information

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click  

   Click  to register new authentication information.

   To change authentication information, select the information, and then click  .

   To delete authentication information, select the information, and then click  .

Note

When creating the instance, do not delete the entry below, because it is a connection required for WebAdmin to monitor the operational status of the database:
Type=local, Database=all, User=all, and Method=md5
Click - the window will change as shown below.

Editing instance information

Use the [Edit instance] page to modify the following items for an instance:

- Instance name
- Port number
- Backup storage path

1. In the [Instances] tab, click . The [Edit instance] page is displayed.
2. Modify the relevant items.

If [Backup storage path] is changed, [Backup management] is enabled. Select the required option:
- Retain existing backup: Create a backup in [Backup storage path] and retain the existing backup in its original location.
- Copy existing backup to new path: Copy the existing backup to [Backup storage path]. A new backup will not be created. The existing backup will be retained in its original location.
- Move existing backup to new path: Move the existing backup to [Backup storage path]. A new backup will not be created.
- Remove existing backup: Create a backup in [Backup storage path]. The existing backup will be removed.

3. Click to save your changes.

**Note**
- The [Edit instance] page is also displayed when the user selects 'Navigate to the "Edit instance" page' from the [Anomaly error] dialog box. Refer to "Anomaly Detection and Resolution" in the Operation Guide for information on what takes place when an anomaly is detected.
- When [Instance name] or [Instance port] is modified, the log_directory and core_directory parameters in postgresql.conf are updated. Also, the specified directories are created if they do not exist.

Refer to "4.3.1.4 Importing Instances" for information on the format of these directories.

### 4.3.1.4 Importing Instances

Instances can be created using WebAdmin, or via the command line using the initdb command. Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin.

This section explains how to import command line instances into WebAdmin.

1. In the [Instances] tab, click . The [Import instance] page is displayed.
2. Enter the information for the instance being imported. Refer to "4.3.1.2 Creating an Instance" for information on the items that need to be entered.
3. Click to import the instance.

**Note**
- Importing neither starts nor stops the instance.
- The following restrictions apply to instance import:
  - Any instance already managed by WebAdmin cannot be imported again.
  - The postgresql.conf file must be located in the same directory as [Data storage path].
  - Read/write permissions are required for [Data storage path].
  - The location specified in postgresql.conf for the following files must not have been changed:
    - hba_file
    - ident_file
  - If the instance is part of a cluster that is monitored by Mirroring Controller, WebAdmin will be unable to detect the Mirroring Controller settings.
  - Instances making use of Mirroring Controller functionality should not be imported, because subsequent operations on those instances may cause unexpected and undesirable side-effects.
  - It is not possible to import and operate an instance that uses a directory mounted by Network File System (NFS).
You must make the following changes to the parameters in postgresql.conf prior to importing the instance in WebAdmin.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>- port</td>
<td>- The port parameter should be uncommented.</td>
</tr>
</tbody>
</table>

The log_directory and core_directory parameters in postgresql.conf are updated during import. Also, the specified directories are created if they do not exist.

The format of these directories is as follows:

- **log_directory**: `/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log`
- **core_directory**: `/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core`
- **version**: product version_edition_architecture
- **instanceAdminUser**: operating system user name
- **PortNumber**: port number specified when creating the instance

Examples:
- **log_directory**: `/var/tmp/fsep_96_SE_64/naomi_myinst27599/log`
- **core_directory**: `/var/tmp/fsep_96_SE_64/naomi_myinst27599/core`

- When a standby instance is imported, a valid entry, using the IP address of the standby instance, must exist in the pg_hba.conf file of the master instance to allow the standby instance to connect to the master instance.
- When a standby instance is imported, the value for "host" in the primary_conninfo parameter of recovery.conf should match the host name of the master instance.
- Instances created by other operating systems cannot be imported.

### 4.3.2 Using the initdb Command

This section describes the procedure to create an instance using the initdb command.

**Note**

If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

#### 4.3.2.1 Editing Kernel Parameters

Refer to "Appendix J Configuring Kernel Parameters" prior to editing these settings.

After the settings are complete, check the command specifications of the relevant operating system and restart the system if required.

#### 4.3.2.2 Creating an Instance

Create an instance, with the database cluster storage destination specified in the PGDATA environment variable or in the -D option. Furthermore, the user that executed the initdb command becomes the instance administrator.

**Note**

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- If creating multiple instances, ensure that there is no duplication of port numbers or the directories that store database clusters.

See

Refer to "initdb" in "Reference" in the PostgreSQL Documentation for information on the initdb command.

The procedure to create an instance is described below.

1. Use the OS user account that you want as the instance administrator.
   Connect with the server using the OS user account that you want as the instance administrator.
   You cannot use the OS superuser (root).
   The following example shows the OS superuser connected to the server being changed to the OS user account "fsepuser".
   Example
   ```sh
   # su fsepuser
   ```

2. Configure the environment variables
   Configure the environment variables in the server with the newly created instance.
   Set the following environment variables:
   - PATH environment variables
     Add the installation directory "/bin".
   - MANPATH environment variables
     Add the installation directory "/share/man".
   - LD_LIBRARY_PATH environment variables
     Add the installation directory "/lib".
   Example
   The following example configures environment variables when the installation directory is "/opt/fsepv<xy>server64".
   Note that "<xy>" indicates the product version and level.
   **sh, bash**
   ```sh
   $ PATH=/opt/fsepv<xy>/server64/bin:$PATH ; export PATH
   $ MANPATH=/opt/fsepv<xy>/server64/share/man:$MANPATH ; export MANPATH
   $ LD_LIBRARY_PATH=/opt/fsepv<xy>/server64/lib:$LD_LIBRARY_PATH ; export LD_LIBRARY_PATH
   ```
   **csh, tcsh**
   ```csh
csh, tcsh

   $ setenv PATH /opt/fsepv<xy>/server64/bin:$PATH
   $ setenv MANPATH /opt/fsepv<xy>/server64/share/man:$MANPATH
   $ setenv LD_LIBRARY_PATH /opt/fsepv<xy>/server64/lib:$LD_LIBRARY_PATH
   ```

3. Create a database cluster
   Create the database cluster with the initdb command, specifying the storage destination directory.
   Specify the transaction log storage destination and the locale setting option as required.
   Example
   ```sh
   $ initdb -D /database/inst1 --xlogdir=/transaction/inst1 --lc-collate="C" --lc-type="C" --encoding=UTF8
   ```
In some features, instance names are requested, and those names are required to uniquely identify the instance within the system. These features allow names that conform to WebAdmin naming conventions, so refer to the following points when determining the names:

- Maximum of 16 characters
- The first character must be ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

Note

- To balance I/O load, consider deploying the transaction log storage destination to a disk device other than the database cluster storage destination and the backup data storage destination.
- Specify "C" or "POSIX" for collation and character category. Performance deteriorates if you specify a value other than "C" or "POSIX", although the behavior will follow the rules for particular languages, countries and regions. Furthermore, this may need to be revised when running applications on systems with different locales.
  
  For example, specify as follows:

  
  initdb --locale="C" --lc-messages="C"
  initdb --lc-collate="C" --lc-ctype="C"

- Specify the same string in the LANG environment variable of the terminal that starts FUJITSU Enterprise Postgres as was specified in lc-messages of initdb (lc_messages of postgresql.conf). If the same string is not specified, messages displayed on the terminal that was started, as well as messages output to the log file specified in the -l option of the pg_ctl command or the postgres command used for startup, may not be output correctly.

- Specify an encoding system other than SQL_ASCII for the database. If SQL_ASCII is used, there is no guarantee that the encryption system for data in the database will be consistent, depending on the application used to insert the data.

See

Refer to "Locale Support" in "Localization" in "Server Administration" in the PostgreSQL Documentation for information on locales.

4. Set port number.

Specify a port number in the port parameter of postgresql.conf. Ensure that the specified port number is not already used for other software. If a port number is not specified, "27500" is selected.

Register the specified port numbers in the /etc/services file if WebAdmin is used to create other instances. WebAdmin uses the /etc/services file to check if port numbers specified as available candidates have been duplicated.

Register any name as the service name.

5. Set the corefile output destination.

Specify the output destination of the corefile, which can later be used to collect information for investigation, by setting the core_directory and core_contents parameters of postgresql.conf.

See

Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

6. Set the backup storage destination.

Specify the backup data storage destination and other backup settings when backup is to be performed as a provision against database errors.
7. Start an instance.

Start with the start mode of the pg_ctl command.

It is recommended to specify the -w option, which causes the command to return after waiting for the instance to start. If the -w option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

If either of the following conditions are met, the message "FATAL: the database system is starting up(11189)" may be output.

- An application, command, or process connects to the database while the instance is starting
- An instance was started with the -w option specified

This message is output by the pg_ctl command to check if the instance has started successfully. Therefore, ignore this message if there are no other applications, commands, or processes that connect to the database.

Example

```
$ pg_ctl start -w -D /database/inst1
```

---

4.4 Configuring Remote Connections

This section describes the settings required when connecting remotely to FUJITSU Enterprise Postgres from a database application or a client command.

4.4.1 When an Instance was Created with WebAdmin

**Settings related to connection**

The default is to accept connections from remote computers to the database.

Change "listen_addresses" in postgresql.conf to change this.

Refer to "Appendix D Configuring Parameters" for more information on postgresql.conf.

**Client Authentication Information settings**

The following content is set by default when WebAdmin is used to create an instance.

- Authentication of remote connections from local machines is performed.
- Only the instance administrator can perform connections in a UNIX domain socket.

When changing Client Authentication Information, select [Client Authentication] from [Setting], and then change the settings.

4.4.2 When an Instance was Created with the initdb Command

**Connection settings**

The default setting only permits local connections from the client to the database. Remote connections are not accepted.

Change "listen_addresses" in postgresql.conf to perform remote connection.

All remote connections will be allowed when changed as shown below.
Example

```
listen_addresses = '***'
```

Also, configure the parameters shown below in accordance with the applications and number of client command connections.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
</tr>
</thead>
<tbody>
<tr>
<td>superuser_reserved_connections</td>
<td>Number of connections reserved for database maintenance, for example backup or index rebuilding. If you need to simultaneously perform a large number of processes that exceed the default value, change this value accordingly.</td>
</tr>
<tr>
<td>max_connections</td>
<td>Set the value as: <code>numberOfSimultaneousConnectionsToInstance + superuser_reserved_connections</code></td>
</tr>
</tbody>
</table>

**Client authentication information settings**

When trying to connect from a client to a database, settings are required to determine whether the instance permits connections from the client - if it does, then it is possible to make settings to determine if authentication is required.

See

Refer to "The pg_hba.conf File" in "Server Administration" in the PostgreSQL Documentation for details.

### 4.5 Other Settings

This section describes settings that are useful for operations.

#### 4.5.1 Error Log Settings

This section explains the settings necessary to monitor errors in applications and operations, and to make discovering the causes easier.

Make error log settings only when instances are created with the `initdb` command.

When creating instances with WebAdmin, these settings are already made and hence do not need to be set.

Furthermore, some parameters are used by WebAdmin, and if changed, may cause WebAdmin to no longer work properly. Refer to "Appendix D Configuring Parameters" for details.

**Note**

Set the output destination for the system log to the server log so that it cannot be viewed by administrators of other instances.

Application errors are output to the system log or server log. The output destination directory for the system log and server log should have access permissions set so that they cannot be viewed by people other than the instance administrator.

Edit the following parameters in `postgresql.conf`:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>How to enable the settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>syslog_ident</td>
<td>Used to specify labels to attach to messages, so that these can be identified when output to the system log if more than one FUJITSU Enterprise Postgres is used.</td>
<td>reload option of the <code>pg_ctl</code> mode</td>
</tr>
<tr>
<td>logging_collector</td>
<td>Specify &quot;on&quot; to ensure that messages are output by FUJITSU Enterprise Postgres to the server log file. The server log file is created in the <code>pg_log</code> directory in the database cluster.</td>
<td>restart option of the <code>pg_ctl</code> mode</td>
</tr>
</tbody>
</table>
### Parameter name | Parameter description | How to enable the settings
--- | --- | ---
log_destination | Specify "stderr,syslog" to output messages from FUJITSU Enterprise Postgres to the screen and either the system log or the event log. | reload option of the pg_ctl mode
log_line_prefix | Specify information to be added at the start of messages output by an instance. This information is useful for automatic monitoring of messages. You can output the SQLSTATE value, output time, executing host, application name, and user ID. Refer to "What To Log" in the PostgreSQL Documentation for details. Example: log_line_prefix = '%e: %t [%p]: [%l-%I] user = %u,db = %d,remote = %r app = %a' | reload option of the pg_ctl mode

---

**Point**

- If you want fewer application errors being output to the system log, refer to "When To Log" and "What To Log" in the PostgreSQL Documentation for information on how to reduce the output messages.
- If you want to separate errors output from other software, refer to "Where To Log" in the PostgreSQL Documentation to change the output destination to the server log file rather than the system log.

### 4.5.2 Configuring Automatic Start and Stop of an Instance

You can automatically start or stop an instance when the operating system on the database server is started or stopped.

Use the following procedure to configure automatic start and stop of an instance.

Note that, if an instance is activated in a failover operation, the cluster system will control the start or stop, therefore this feature should not be used. Also, when performing database multiplexing, refer to "Enabling Automatic Start and Stop of Mirroring Controller and Multiplexed Instances" in the Cluster Operation Guide.

Note that "<xy>" in paths indicates the product version and level.

If using an rc script

1. Set the OS user account of the instance administrator
   If you logged in using the OS user account of the instance administrator, set the environment variables required for starting the instance.

2. Copy the shell script and set access permissions
   Copy the sample shell script (stored in the location shown below) to /etc/rc.d/init.d, then set and register the access rights. After that, revise the shell script according to the target instance.

   ```
fujitsuEnterprisePostgresInstallDir/share/rc_fsepsvoi.sample
   ```

   The content to be revised is as follows:
   - In the "SYMDATA" variable, set the data storage destination.
   - In the "SYMUSER" variable, set the OS user account of the instance administrator mentioned in step 1.
   - Ensure that the file name in "/var/lock/subsys" of the "LOCKFILE" variable is the same as the shell script name.

   **Example**
   In the following example, the installation directory is "/opt/fsepv<xy>server64", and the shell script has been created as "rc_fsepsvoi_inst1".
3. Register and enable automatic start and stop

As the OS superuser, execute the chkconfig command to register and enable the script.

Execute "chkconfig --add" to register the script, and execute "chkconfig --level" to set the run level and enable the script.

Example

```bash
# chkconfig --add rc_fsepsvoi_inst1
# chkconfig --level 35 rc_fsepsvoi_inst1 on
```

If using systemd

1. Create a unit file

Copy the unit file sample stored in the directory below, and revise it to match the target instance.

```bash
fujitsuEnterprisePostgresInstallDir/share/fsepsvoi.service.sample
```

Example

In the following example, the installation directory is "/opt/fsepv<xy>server64", and the instance name is "inst1".

```bash
# cp /opt/fsepv<xy>server64/share/fsepsvoi.service.sample /usr/lib/systemd/system/
```

Revise the underlined portions of the options below in the unit file.

<table>
<thead>
<tr>
<th>Section</th>
<th>Option</th>
<th>Specified value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Description</td>
<td>FUJITSU Enterprise Postgres</td>
<td>Specifies the feature overview.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>instanceName</code></td>
<td>Specifies the name of the target instance. (*1)</td>
</tr>
</tbody>
</table>
| Service   | ExecStart     | '/bin/bash -c 'installDir/bin/pgx_symstd start
|           |               | `installDir dataStorageDestinationDir` | Command to be executed when the service is started.     |
|           | ExecStop      | '/bin/bash -c 'installDir/bin/pgx_symstd stop
|           |               | `installDir dataStorageDestinationDir` | Command to be executed when the service is stopped.    |
|           | ExecReload    | '/bin/bash -c 'installDir/bin/pgx_symstd reload
|           |               | `installDir dataStorageDestinationDir` | Command to be executed when the service is reloaded.   |
| User      | User          | `User`                               | OS user account of the instance administrator.          |
| Group     | Group         | `Group`                              | Group to which the instance administrator user belongs. |

*1: The instance name should be as follows:

If WebAdmin is used to create the instance: `instanceName`

If the initdb command is used to create the instance: `nameThatIdentifiesTheInstance`

The naming conventions for the instance name or for identifying the instance are as follows:

- Up to 16 bytes
- The first character must be an ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

2. Enable automatic start and stop

As the OS superuser, use the systemctl command to enable automatic start and stop.
### 4.5.3 Settings when Using the features compatible with Oracle databases

The compatibility feature for Oracle databases enables FUJITSU Enterprise Postgres to be used without any special settings by creating a database instance. Note that settings are required only when using the SUBSTR function.

See

Refer to "Notes on SUBSTR" in the Application Development Guide for details.

### 4.6 Integration with Message-Monitoring Software

To monitor messages output by FUJITSU Enterprise Postgres using software, configure the product to monitor SQLSTATE, instead of the message text - this is because the latter may change when FUJITSU Enterprise Postgres is upgraded.

Configure FUJITSU Enterprise Postgres to output messages in a format that can be read by the message-monitoring software by specifying "%e" in the log_line_prefix parameter of postgresql.conf to output the SQLSTATE value.

A setting example is shown below - it outputs the output time, executing host, application name, and user ID, in addition to the SQLSTATE value.

#### Example

```
log_line_prefix = '%e: %t [\%p]: [\%l\-1] user = \%u, db = \%d, remote = \%r app = \%a '
```

See

Refer to "What To Log" in the PostgreSQL Documentation for information on how to configure the settings.

### 4.7 Deleting Instances

This section explains how to delete an instance.

- 4.7.1 Using WebAdmin
- 4.7.2 Using Server Commands

Note

- Always use WebAdmin to delete instances that were created using it. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.
- If you have set automatic start and stop of the instance, execute the following commands to disable the script and cancel registration.

  If using systemctl

  ```bash
  # systemctl enable fsepsvoi_inst1.service
  # systemctl disable fsepsvoi_inst1.service
  # systemctl stop fsepsvoi_inst1
  # systemctl --del fsepsvoi_inst1
  # rm /etc/rc.d/init.d/fsepsvoi_inst1
  ```

  Example

  ```bash
  # systemctl enable fsepsvoi_inst1.service
  # systemctl disable fsepsvoi_inst1.service
  # systemctl stop fsepsvoi_inst1
  # systemctl --del fsepsvoi_inst1
  # rm /etc/rc.d/init.d/fsepsvoi_inst1
  ```
If using systemd

    systemctl disable nameOfUnitFileThatPerformsAutomaticStartAndStop

    rm /usr/lib/systemd/system/nameOfUnitFileThatPerformsAutomaticStartAndStop

Example

    # systemctl disable fsepsvoi_inst1.service
    # rm /usr/lib/systemd/system/fsepsvoi_inst1.service

---

4.7.1 Using WebAdmin

This section explains how to delete an instance using WebAdmin.

Use the following procedure to delete an instance.

1. Stop the instance
   
   In the [Instances] tab, select the instance to stop and click 📋.

2. Back up files.

   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and the transaction log storage destination.

3. Delete the instance

   In the [Instances] tab, select the instance to delete and click ⚙.

Note

Deleting an instance deletes only the following lowest-level directories. If they are not required, delete them manually.

- Data storage destination
- Backup data storage destination
- Transaction log storage destination (if different from the data storage destination)

---

4.7.2 Using Server Commands

This section explains how to delete an instance using server commands.

Use the following procedure to delete an instance.

1. Stop the instance

   Execute the stop mode of the pg_ctl command.

   An example is shown below:

   Example

   ```
   $ pg_ctl stop -D /data/inst1
   ```

2. Back up files.

   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and the transaction log storage destination.

3. Delete the instance

   Use a standard UNIX tool (the rm command) to delete the following directories:

   - Data storage destination
- Backup data storage destination
- Transaction log storage destination (if a directory different from the data storage directory was specified)
Chapter 5 Uninstallation

This chapter describes the procedure for uninstalling FUJITSU Enterprise Postgres.

5.1 Uninstallation in Interactive Mode

Uninstall according to the following procedure:

Note that "x.y SPz" in sample windows indicates the version level of products to uninstall, and similarly, "<xy>" in paths indicates the product version level.

Note

To reinstall FUJITSU Enterprise Postgres after it was uninstalled, and reuse an instance that was already created so that it can be managed from WebAdmin, back up the directory shown below in which the WebAdmin instance management information had been defined before uninstalling FUJITSU Enterprise Postgres, and then restore the backed up directory to its original location once FUJITSU Enterprise Postgres has been reinstalled.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following directory:
   \webAdminInstallDir\data\fepwa

Information

If an error occurs while the product is being uninstalled, refer to "Appendix F Uninstall (middleware) Messages" and take the required action.

1. Delete the operation information

If the FUJITSU Enterprise Postgres operation information has been registered in the operating system or another middleware product, for example, then it must be deleted. Cases in which deletion is required are as follows:

- If you have set automatic start and stop of the instance, execute the following commands to disable the script and cancel registration.

  If using an rc script

  \chkconfig nameOfShellScriptForAutomaticStartAndStop off
  \chkconfig --del nameOfShellScriptForAutomaticStartAndStop
  \rm /etc/rc.d/init.d/nameOfShellScriptForAutomaticStartAndStop

  Example

  # \chkconfig rc_fsepsvoi_inst1 off
  # \chkconfig --del rc_fsepsvoi_inst1
  # \rm /etc/rc.d/init.d/rc_fsepsvoi_inst1

  If using systemd

  systemctl disable nameOfUnitFileThatPerformsAutomaticStartAndStop
  \rm /usr/lib/systemd/system/nameOfUnitFileThatPerformsAutomaticStartAndStop

  Example

  # systemctl disable fsepsvoi_inst1.service
  # \rm /usr/lib/systemd/system/fsepsvoi_inst1.service
2. Stop applications and the client program

Before starting the uninstallation, stop the following:

- Applications that use the product
- Instance

**Using WebAdmin**

In the [Instances] tab, select the instance to stop and click  

**Using server commands**

Execute the pg_ctl command in stop mode.

```
$ /opt/fsepv<xy>server64/bin/pg_ctl stop -D /database/inst1
```

- Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

**Example**

If WebAdmin is installed in `/opt/fsepv<xy>webadmin`:

```
# cd /opt/fsepv<xy>webadmin/sbin
# ./WebAdminStop
```

- Mirroring Controller

Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

**Example**

```
$ mc_ctl stop -M /mcdir/inst1
```

3. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

4. Start the Uninstall (middleware)

Execute the following command:

```
# /opt/FJSVcir/cimanager.sh -c
```

5. Select the software

Type the number for the product to be uninstalled, and press Enter.

```
Loading Uninstaller...

Currently installed products
1. FUJITSU Enterprise Postgres Client(64bit)  x.y SPz
2. FUJITSU Enterprise Postgres WebAdmin  x.y SPz
3. FUJITSU Enterprise Postgres Standard Edition(64bit)  x.y SPz
4. FUJITSU Enterprise Postgres Client(32bit)  x.y SPz

Type [number] to select the software you want to uninstall. [number,q]
=>3
```
6. Start the uninstallation

To start the uninstallation, type "y" and press Enter.

To display the list of products again, type "b" and press Enter.

```
FUJITSU Enterprise Postgres Standard Edition(64bit)
  Description: FUJITSU Enterprise Postgres Standard Edition(64bit)
  Version: x.y SPz
  Manufacturer: Fujitsu Limited.
  Install directory: /opt/fsepsv64
  Date of install: 2016-7-1

Starting the uninstall of the software. Are you sure you want to continue? [y,b,q]y
```

7. Finish the uninstallation

Upon successful completion, the window below is displayed.

The installation directory may remain after uninstallation. If it is not required, delete it.

```
Uninstalling...

FUJITSU Enterprise Postgres Standard Edition(64bit) is being uninstalled now.
  100% # # # # # # # # # # # # # #

The following products have been uninstalled successfully:
  FUJITSU Enterprise Postgres Standard Edition(64bit)

Uninstallation of "FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz" has completed successfully.

Exiting Uninstaller.
```

5.2 Uninstallation in Silent Mode

Uninstall according to the following procedure:

**Note**
To reinstall FUJITSU Enterprise Postgres after it was uninstalled, and reuse an instance that was already created so that it can be managed from WebAdmin, back up the directory shown below in which the WebAdmin instance management information had been defined before uninstalling FUJITSU Enterprise Postgres, and then restore the backed up directory to its original location once FUJITSU Enterprise Postgres has been reinstalled.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following directory:
   ```
   webAdminInstallDir/data/fepwa
   ```

1. Delete the operation information

If the FUJITSU Enterprise Postgres operation information has been registered in the operating system or another middleware product, for example, then it must be deleted. Cases in which deletion is required are as follows:
- If you have set automatic start and stop of the instance, execute the following commands to disable the script and cancel registration.

If using an rc script

```
chkconfig nameOfShellScriptForAutomaticStartAndStop off
chkconfig --del nameOfShellScriptForAutomaticStartAndStop
rm /etc/rc.d/init.d/nameOfShellScriptForAutomaticStartAndStop
```

**Example**

```
# chkconfig rc_fsepsvoi_inst1 off
# chkconfig --del rc_fsepsvoi_inst1
# rm /etc/rc.d/init.d/rc_fsepsvoi_inst1
```

If using systemd

```
systemctl disable nameOfUnitFileThatPerformsAutomaticStartAndStop
rm /usr/lib/systemd/system/nameOfUnitFileThatPerformsAutomaticStartAndStop
```

**Example**

```
# systemctl disable fsepsvoi_inst1.service
# rm /usr/lib/systemd/system/fsepsvoi_inst1.service
```

2. Stop applications and the client program

Before starting the uninstallation, stop the following:

- Applications that use the product

- Instance

  **Using WebAdmin**

  In the [Instances] tab, select the instance to stop and click

  **Using server commands**

  Execute the pg_ctl command with the stop mode option specified.

  ```
  $ /opt/fsepv<xy>/server64/bin/pg_ctl stop -D /database/inst1
  ```

- Web server feature of WebAdmin

  Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

  **Example**

  If WebAdmin is installed in /opt/fsepv<xy>/weadmin:

  ```
  # cd /opt/fsepv<xy>/weadmin/sbin
  # ./WebAdminStop
  ```

- Mirroring Controller

  Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

  **Example**

  ```
  $ mc_ctl stop -M /mcdir/inst1
  ```

3. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```
4. Run the uninstallation

Execute the command below.

The installation directory may remain after uninstallation. If it is not required, delete it.

Example

```
# /opt/fsepv<xy>server64/setup/suninst.sh
```

In the example above, /opt/fsepv<xy>server64/setup is the name of the installation directory in which the server product is installed.

```
# /opt/fsepv<xy>webadmin/setup/suninst.sh
```

In the example above, /opt/fsepv<xy>webadmin/setup is the name of the installation directory in which the WebAdmin is installed.

5. Check the results

The uninstaller result is output to the log file.

Log file

`xyz` is the number part when the product version level is `x.y.SPz`.

**Server products**

Path name: /var/log/fsep_SERVER64_`xyz`_uninstall.log

**WebAdmin**

Path name: /var/log/fsep_WEBADMIN_`xyz`_uninstall.log

**Return values**

The following return values are output:

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for uninstallation do not exist.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>Uninstall (middleware) has not been installed, or there are no execution privileges.</td>
</tr>
<tr>
<td>99</td>
<td>A system error occurred.</td>
</tr>
<tr>
<td>100</td>
<td>The command argument is invalid.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
</tbody>
</table>
Appendix A  Installation in Silent Mode

This appendix provides specifications for installation in silent mode.

A.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>sectionName</strong></td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td><strong>parameterName</strong></td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**Note**

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name “parameters”.
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (”) and commas (,).
- The following characters can be used in the setting for rows with the section name "installInfo":
  - Alphanumeric characters and double quotation marks
- The following characters can be used in the setting for rows with the section name "parameters":
  - Alphanumeric characters, hyphens and forward slashes

**Information**

The template for the installation parameters CSV file is "mountpoint/sample/sample.csv".

A.2 List of Parameters

This section describes the parameters that can be set for each section.
installInfo section

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td><strong>Parameter name</strong></td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong></td>
<td>None</td>
</tr>
<tr>
<td></td>
<td>Mandatory.</td>
<td></td>
<td>Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td>For this software, specify the following value:</td>
<td></td>
<td>&quot;FUJITSU Enterprise Postgres&quot;</td>
</tr>
</tbody>
</table>

- Information

- In addition to "Name", the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition

- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.

- The values set in these parameters do not affect silent installation.

Example

```
installInfo,Name,FUJITSU Enterprise Postgres
```

parameters section

The parameters that can be set in the parameters section are shown below.

Note that "<xy>" indicates the product version and level.

- Table

<table>
<thead>
<tr>
<th>No.</th>

A.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error is detected during installation of the product, a message is output to the log:

Log file

`xyz` is the number part when the product version level is `x.y SPz`.

64-bit product

Path name: `/var/log/fsep_SERVER64_media_` `xyz` `_install.log`

Messages and return values

CSV file errors

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error: code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>Either installInfo or the Name parameter has not been specified.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value is specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>There is no line in the “parameters” section.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified parameter is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values. The parameter name is displayed in @1@ and @2@.</td>
</tr>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path.</td>
</tr>
</tbody>
</table>
## Product installer errors

The following return values are returned when errors occur while the product installer is running.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>11</td>
<td>A product that cannot coexist with FUJITSU Enterprise Postgres has been installed.</td>
</tr>
<tr>
<td>12</td>
<td>This OS is not supported.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for installation do not exist.</td>
</tr>
<tr>
<td>16</td>
<td>Unable to change the permission because the directory does not exist.</td>
</tr>
<tr>
<td>17</td>
<td>Failed to install because a required package is missing.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>30</td>
<td>Failed to copy the installation material.</td>
</tr>
<tr>
<td>32</td>
<td>The product is already installed.</td>
</tr>
<tr>
<td>33</td>
<td>Server product and WebAdmin product cannot be installed in the same machine.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>61</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>The uninstallation cannot be performed either because Uninstall (middleware) does not exist or because there are no execution privileges.</td>
</tr>
<tr>
<td>68</td>
<td>Failed to set up WebAdmin.</td>
</tr>
<tr>
<td>99</td>
<td>A system error occurred.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
</tbody>
</table>
A.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

Records
- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,,ccc</td>
<td>aaa</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa</td>
</tr>
</tbody>
</table>

- Headers cannot be specified.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>field1</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa</td>
</tr>
</tbody>
</table>
Appendix B  Recommended WebAdmin Environments

This appendix describes the recommended WebAdmin environment. The following explanation is based on the assumption that Internet Explorer 11.0 or later is used unless otherwise stated.

B.1 Recommended Browser Settings

- Use a display resolution of 1280 x 768 or higher, and 256 colors or more.
- Select [View] >> [Text size] >> [Medium].
- Select [View] >> [Zoom] >> [100%].
- Click [Tools] >> [Internet options] >> [General] >> [Fonts], and then:
  - Set [Webpage font] to [Times New Roman].
  - Set [Plain text font] to [Courier New].

B.2 How to Set Up the Pop-up Blocker

If the Pop-up Blocker is enabled, use the procedure below to configure settings to allow pop-ups from the server where FUJITSU Enterprise Postgres is installed.

1. Click [Tools] >> [Internet options], and then select the [Privacy] tab.
   If [Turn on Pop-up Blocker] is not selected, the Pop-up Blocker feature will not operate, and therefore steps below are not required.
2. Click [Settings].
3. In the [Pop-up Blocker Settings] window, enter in the [Address of website to allow] the URL of the server where FUJITSU Enterprise Postgres is installed, and then click [Add].
4. Click [Close].
5. In the [Internet Options] window, click [OK].
Appendix C Setting Up and Removing WebAdmin

This appendix describes how to set up and remove WebAdmin.

Note that "<xy>" in paths indicates the product version and level.

C.1 Setting Up WebAdmin

This section explains how to set up WebAdmin.

C.1.1 Setting Up WebAdmin

Follow the procedure below to set up WebAdmin.

1. Change to the superuser
   
   Acquire superuser privileges on the system.
   
   Example
   
   ```
   $ su -
   Password:******
   ```

2. Set up WebAdmin
   
   Set up WebAdmin.
   
   Example
   
   ```
   If WebAdmin is installed in /opt/fsepv<xy>webadmin:
   
   # cd /opt/fsepv<xy>webadmin/sbin
   # ./WebAdminSetup
   ```

3. Specify the port number
   
   Specify the following port numbers to be used in WebAdmin.
   
   Refer to the "/etc/services" file and only change to a different port number if there is overlap with a port number from another service.
   
   Make a note of the port number for the Web server, because it will be required for activating the WebAdmin window.

<table>
<thead>
<tr>
<th>Item</th>
<th>Value (recommended value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web server port number</td>
<td>27515</td>
</tr>
<tr>
<td>enter port number of Web Server</td>
<td></td>
</tr>
<tr>
<td>(default: 27515):</td>
<td></td>
</tr>
<tr>
<td>WebAdmin internal port number</td>
<td>27516</td>
</tr>
<tr>
<td>enter Internal port number for WebAdmin</td>
<td></td>
</tr>
<tr>
<td>(default: 27516):</td>
<td></td>
</tr>
<tr>

</tbody>
</table>

Web server port number

Specify a numeric value from 1024 to 32767 for the port number to be used for communication between the Web browser and the Web server.

The Web server port number will be registered as a port number with the following service name in the "/etc/services" file.

```
xy is the number part when the version is x.y.
```

```
fsep_xySPz_edition_64_WebAdmin_Port1
```
**WebAdmin internal port number**

Specify a numeric value from 1024 to 32767 for the port number to be used for communication between the Web server and the WebAdmin runtime environment.

The WebAdmin internal port number will be registered as a port number with the following service name in the /etc/services file.

- xy is the number part when the version is x.y.
- `fsep_xySPz_edition_64_WebAdmin_Port2`

**WebAdmin automatic start**

Select whether or not to start WebAdmin when the machine is started.

---

### Note

- **Unused port numbers**
  Irrespective of the information specified in the "/etc/services" file, unused port numbers in the OS and other products can sometimes be automatically numbered and then used, or port numbers specified in environment files within products may also be used. Check the port numbers used by the OS and other products, and ensure that these are not duplicated.

- **Access restrictions**
  Prevent unauthorized access and maintain security by using a firewall product, or the packet filtering feature of a router device, to restrict access to the server IP address and the various specified port numbers.

- **Port access permissions**
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

- **Changing port numbers**
  When using WebAdmin in multiserver mode, it is recommended not to change WebAdmin ports after creating instances. Otherwise, the created instances may not be accessible through WebAdmin after the port is changed.

---

### C.1.2 Activating the Web Server Feature of WebAdmin

Follow the procedure below to activate the Web server feature of WebAdmin.

1. **Change to the superuser**
   
   Acquire superuser privileges on the system.

   **Example**
   ```bash
   $ su -
   Password:******
   ```

2. **Activate the Web server feature of WebAdmin**
   
   Execute the WebAdminStart command to activate the Web server feature of WebAdmin.

   **Example**
   ```bash
   If WebAdmin is installed in /opt/fsep<xy>/webadmin:
   
   # cd /opt/fsep<xy>/webadmin/sbin
   # ./WebAdminStart
   ```

### C.1.3 Stopping the Web Server Feature of WebAdmin

Follow the procedure below to stop the Web server feature of WebAdmin.

1. **Change to the superuser**
   
   Acquire superuser privileges on the system.

   **Example**
   ```bash
   ```
Example

$ su -
Password:******

2. Stop the Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

Example

If WebAdmin is installed in /opt/fsepv<xy>webadmin:

# cd /opt/fsepv<xy>webadmin/sbin
# ./WebAdminStop

Note

- For efficient operation of WebAdmin, it is recommended that the Web server feature be stopped only during a scheduled maintenance period.
- When WebAdmin is used to create and manage instances in a multiserver configuration, the Web server feature must be started and running on all servers at the same time.

C.2 Removing WebAdmin

This section explains how to remove WebAdmin.

This removal procedure stops WebAdmin and ensures that it no longer starts automatically when the machine is restarted.

1. Change to the superuser

Acquire superuser privileges on the system.

Example

$ su -
Password:******

2. Remove WebAdmin setup

Execute the WebAdminSetup command to remove WebAdmin setup.

Example

If WebAdmin is installed in /opt/fsepv<xy>webadmin:

# cd /opt/fsepv<xy>webadmin/sbin
# ./WebAdminSetup -d

C.3 Using an External Repository for WebAdmin

WebAdmin can be configured to use an external database, where it can store the various metadata information it uses. WebAdmin will use this database as a repository to store the information it uses to manage all the created instances. This can be a FUJITSU Enterprise Postgres database or an Open Source PostgreSQL V9.2 or later database.

Using an external database as a WebAdmin repository provides you with more flexibility in managing WebAdmin. This repository can be managed, backed up and restored as needed using pgAdmin or command line tools, allowing users to have greater flexibility and control.

Follow the procedure below to set up the repository.

1. Activate WebAdmin, and log in to the database server.
2. Click the [Settings] tab, and then click in the [WebAdmin repository configuration] section.

3. Enter the following items:
   - [Host name]: Host name of the database server
   - [Port]: Port number of the database server
   - [Database name]: Name of the database
   - [User name]: User name to access the database
   - [Password]: Password of the database user

   **Note**
   - Database type
     It is recommended to use a FUJITSU Enterprise Postgres database as a repository. A compatible PostgreSQL database can also be used as an alternative.
   - It is recommended to click [Test connection] to ensure that the details entered are valid and WebAdmin is able to connect to the target database.

4. Click to register the repository details.

   **Note**
   - Once the repository is set up, it can be changed any number of times by the user logged into WebAdmin. When a repository is changed:
     - It is recommended to preload the backup into this database.
- If the data is not preloaded, WebAdmin will create a new repository.
- The database repository can be set up even after WebAdmin was already used to create instances. In that scenario, the instances already created are retained and can continue to be operated on.
- If the instance used as a repository is stopped, WebAdmin will be unusable. For this reason, it is recommended to be familiar with starting an instance from the command line. If the instance is stopped for any reason, start it from the command line and WebAdmin will be usable again.

C.4 Using the WebAdmin Auto-Refresh Feature

The WebAdmin auto-refresh feature automatically refreshes the operating status of all instances in the Instance list at the specified interval. It also refreshes the details of the selected instance.

Follow the procedure below to configure the auto-refresh options.

1. Click the [Settings] tab, and then click in the [User preferences] section.
2. Enter the following items:
   - [Auto-refresh instance]: To use the auto-refresh feature, select "Enabled". The default is "Disabled".
   - [Refresh interval (seconds)]: Number of seconds between each refresh. This is a countdown timer, which is reset every time the instance status is refreshed by any operation. Specify a value from 30 to 3600 (seconds). The default is 30.
3. Click to save the auto-refresh settings.

Note
- Auto-refresh will run only if the [Instances] page is displayed and no user-initiated operation is in progress.
- A text indicator, which is independent of auto-refresh, is displayed at the top of the Instance list. It is dynamically updated to display when the page was last refreshed.
Appendix D Configuring Parameters

WebAdmin operates and manages databases according to the contents of the following configuration files:

- **postgresql.conf**
  Contains various items of information that define the operating environment of FUJITSU Enterprise Postgres.

- **pg_hba.conf**
  Contains various items of information related to client authentication.

These configuration files are deployed to a data storage destination. Data is written to them when the instance is created by WebAdmin and when settings are changed, and data is read from them when the instance is started and when information from the [Setting] menu is displayed.

Direct editing of each configuration file is possible with a text editor.

See

Refer to "Server Configuration" and "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on the parameters.

Note

WebAdmin checks for port number and backup storage path anomalies when various operations are performed. An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of the corresponding parameter in postgresql.conf. Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.

**postgresql.conf**

Parameters that can be changed in WebAdmin

The postgresql.conf parameters that can be changed in WebAdmin are shown below:

<table>
<thead>
<tr>
<th>Section</th>
<th>WebAdmin item</th>
<th>postgresql.conf file parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Configuration</td>
<td>Character encoding</td>
<td>client_encoding</td>
</tr>
<tr>
<td></td>
<td>Message locale</td>
<td>le_messages</td>
</tr>
<tr>
<td>Communication</td>
<td>Max connections</td>
<td>max_connections</td>
</tr>
<tr>
<td>SQL options</td>
<td>Transform NULL format</td>
<td>transform_null_equals</td>
</tr>
<tr>
<td></td>
<td>Date output format</td>
<td>DateStyle (*1)</td>
</tr>
<tr>
<td></td>
<td>Interval output format</td>
<td>IntervalStyle</td>
</tr>
<tr>
<td></td>
<td>Number of digits for floating values</td>
<td>extra_float_digits</td>
</tr>
<tr>
<td></td>
<td>Transaction isolation levels</td>
<td>default_transaction_isolation</td>
</tr>
<tr>
<td></td>
<td>Currency format</td>
<td>lc_monetary</td>
</tr>
<tr>
<td></td>
<td>Date and time format</td>
<td>lc_time</td>
</tr>
<tr>
<td>Memory</td>
<td>Sort memory (KB)</td>
<td>work_mem</td>
</tr>
<tr>
<td></td>
<td>Shared buffers (KB)</td>
<td>shared_buffers</td>
</tr>
<tr>
<td>Streaming replication</td>
<td>WAL level</td>
<td>wal_level</td>
</tr>
</tbody>
</table>
**Information**

- Calculate the maximum number of connections using the formula below:

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + 3 \quad (*)1
\]

*1: 3 is the default number of connections required by the system.

Calculate the maximum number of connections using the following formula when changing either `max_wal_senders` (using streaming replication) or `superuser_reserved_connections` (connections reserved for use by the superuser) in `postgresql.conf`.

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + \text{superuser_reserved_connections} + \text{max_wal_senders}
\]

- Also check if the memory used exceeds the memory installed (refer to "Parameters automatically set by WebAdmin according to the amount of memory").

**Parameters set by WebAdmin**

The following `postgresql.conf` parameters are set by WebAdmin during instance startup (they will be ignored even if specified in `postgresql.conf`):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>listen_addresses</td>
<td>*</td>
</tr>
<tr>
<td>log_destination</td>
<td><code>stderr,syslog</code></td>
</tr>
<tr>
<td>logging_collector</td>
<td>on</td>
</tr>
<tr>
<td>log_line_prefix</td>
<td><code>%e: %t [%p]: [%I-1] user = %u, db = %d, remote = %r app = %a</code></td>
</tr>
<tr>
<td>log_filename (*1)</td>
<td><code>logfile-%a.log</code></td>
</tr>
<tr>
<td>log_file_mode</td>
<td>0600</td>
</tr>
<tr>
<td>log_truncate_on_rotation</td>
<td>on</td>
</tr>
<tr>
<td>log_rotation_age</td>
<td>1d</td>
</tr>
</tbody>
</table>

*1: The server logs are split into files based on the day of the week, and are rotated after each week.

*2: If the date changes while the instance is stopped, old logs are not deleted and continue to exist. Manually delete old logs that are no longer required to release disk space.
Parameters automatically set by WebAdmin according to the amount of memory

The postgresql.conf parameters automatically set according to the amount of installed memory, during the creation of instances by WebAdmin, are shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30% of the machine's installed memory (*1)</td>
</tr>
<tr>
<td>work_mem</td>
<td>30% of the machine's installed memory / max_connections / 2 (*2)</td>
</tr>
<tr>
<td>effective_cache_size</td>
<td>75% of the machine's installed memory (*3)</td>
</tr>
<tr>
<td>maintenance_work_mem</td>
<td>10% of the machine's installed memory / (1 + autovacuum_max_workers) (*4)</td>
</tr>
</tbody>
</table>

*1: The value will be capped at 2097151 MB.
*2: The value will be capped at 2147483646.
*3: The value will be capped at 2147483647.
*4: The value will be capped at 2097151 MB.

When determining the values to be configured in the above parameters, you must take into account any anticipated increases in access volume or effects on performance during business operations, such as the number of applications and commands that will access the instance, and the content of processes. Also, note that in addition to FUJITSU Enterprise Postgres, other software may be running on the actual database server. You will need to determine the degree of priority for the database and other software, as well as the memory allocation size.

WebAdmin automatically configures complex parameter settings such as those mentioned above, based on the size of the internal memory of the machine. This enables maximum leverage of the machine memory to facilitate resistance against fluctuations during business operations.

Accordingly, the effects of the above-mentioned factors must be estimated and taken into account when determining and configuring parameter values, so that memory resources can be effectively allocated among other software or instances, and so that adverse effects can be mutually avoided. Refer to "Memory" in "Resource Consumption", and "Planner Cost Constants" in "Query Planning", under "Server Administration" in the PostgreSQL Documentation for information on parameter values and required considerations.

Parameter values can be modified using the WebAdmin [Setting] menu, or edited directly using a text editor.

If adding an instance, determine the parameter values, including for existing instances, and make changes accordingly.

See

Kernel parameters need to be tuned according to the parameters being changed. Refer to "Appendix J Configuring Kernel Parameters", and "Managing Kernel Resources" in "Server Administration" in the PostgreSQL Documentation for information on tuning kernel parameters.

Note

- Do not directly edit the following postgresql.conf parameters with a text editor, otherwise WebAdmin may not work properly if you make a mistake):
  - archive_mode
  - archive_command
  - wal_level
  - core_directory
  - log_line_prefix
  - log_destination
You must take care with the following parameter:

- superuser_reserved_connections

Set it to a number that includes the 3 connections required in WebAdmin (the default is 3).

Parameters automatically set by WebAdmin for streaming replication

The postgresql.conf parameters automatically set when a streaming replication standby is created, are shown below. These changes are performed in both the master as well as the standby instance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>wal_level (*1)</td>
<td>replica</td>
</tr>
<tr>
<td>max_wal_senders (*1)</td>
<td>5</td>
</tr>
<tr>
<td>hot_standby</td>
<td>on</td>
</tr>
</tbody>
</table>

*1: These values are set only if the master and standby instance are created at the same time. If only the standby instance is created, you need to set these values before the standby instance is created.

Streaming replication parameters need to be tuned according to the requirements for replication performance and reliability. Refer to "Log-Shipping Standby Servers" in "Server Administration" in the PostgreSQL Documentation for information on tuning streaming replication parameters.

pg_hba.conf

Refer to "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on content that can be configured in pg_hba.conf.

Configure the instance administrator permissions in the "local" connection format settings. WebAdmin may not work properly if permissions are not configured.

- If you specify an item or value that cannot be set by WebAdmin when editing the pg_hba.conf file with a text editor, it will not be possible to reference that line from WebAdmin.
## Appendix E Uninstall (middleware)

### E.1 Features that are Installed

#### [Windows]

<table>
<thead>
<tr>
<th>Feature</th>
<th>Package name</th>
<th>Component name</th>
<th>Remarks</th>
<th>Selectively installed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common tool</td>
<td>FJSVcir</td>
<td>CIRuntime Application</td>
<td>Controls the installation and uninstallation of Fujitsu middleware products. Manages the installation information of Fujitsu middleware products and includes a management function for viewing installation information and launching the uninstaller of each product. (&quot;Uninstall (middleware)&quot;)</td>
<td>No</td>
</tr>
</tbody>
</table>

#### [Linux/Solaris]

<table>
<thead>
<tr>
<th>Feature</th>
<th>Package name</th>
<th>Component name</th>
<th>Remarks</th>
<th>Selectively installed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common tool</td>
<td>FJSVcir</td>
<td>CIRuntime Application</td>
<td>Controls the installation and uninstallation of Fujitsu middleware products. Manages the installation information of Fujitsu middleware products and includes a management function for viewing installation information and launching the uninstaller of each product. (&quot;Uninstall (middleware)&quot;)</td>
<td>No</td>
</tr>
</tbody>
</table>

### E.2 Notes

#### E.2.1 Notes on the Uninstall (middleware) Tool

"Uninstall (middleware)" is a tool used by Fujitsu middleware products. It performs information management for middleware products, and also, launching the uninstaller for removing these products from the installed systems.

**Note**

- To uninstall FUJITSU Enterprise Postgres, uninstall from "Uninstall (middleware)".
- This tool manages information about other Fujitsu middleware products as well as FUJITSU Enterprise Postgres. For this reason, do not uninstall it unless absolutely necessary. If you have accidentally uninstalled this tool, re-install it as described below.

#### [Windows]

1. Log on to the machine to be installed using a user name belonging to the Administrators group, or switch to an account with administrator privileges.
2. Insert the server program DVD in the drive device.
3. Execute the installation command.

```
z:\CIR\Windows\cirinst.exe
```

In the example above, for z, specify the drive name of the drive where the DVD has been inserted.
[Linux/Solaris]
1. Log in as a superuser to the installation target machine, or switch to a user with administrative privileges.
2. Insert the product media in the drive.
3. Execute the installation command.
   
   [Linux]
   ```
   # /media/dvd/CIR/Linux/cirinst.sh
   ```
   In the example above, /media/dvd is the DVD mount point.
   
   [Solaris]
   ```
   # /dvd/dvd0/CIR/Solaris/cirinst.sh
   ```
   In the example above, /dvd/dvd0 is the DVD mount point.

- If you uninstall this tool as described below.

1. Check that there are no Fujitsu middleware products installed in the system.
   You can check this by using "Uninstall (middleware)", which is launched by the command below.
   
   [Windows]
   Select [All Programs] > [Fujitsu] > [Uninstall (middleware)]
   
   [Linux/Solaris]
   ```
   /opt/FJSVcir/cir/bin/cimanager.sh -c
   ```
   -c: CUI

2. If no Fujitsu middleware products have been installed, then issue the command below.
   
   [Windows]
   ```
   %SystemDrive%\FujitsuF4CR\bin\cirremove.exe
   ```
   
   [Linux/Solaris]
   ```
   # /opt/FJSVcir/bin/cirremove.sh
   ```

3. At the uninstallation confirmation prompt, enter "y".
   ```
   This software is a common tool of Fujitsu products. Are you sure you want to remove it?[y/n]:
   ```
   Uninstallation will start.
Appendix F  Uninstall (middleware) Messages

F.1  Messages output by FJSVcir

Description
   The user does not have administrator privileges.
Action method
   Login with administrator privileges and run the command again.

FSP_FJSVCIR_CIRINST: ERROR: 102: CIRINST102: Failed to create %s
Parameters
   %s: Directory name
Description
   Failed to create a directory during the installation.
Action method
   Creating the directory might have failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

FSP_FJSVCIR_CIRINST: ERROR: 103: CIRINST103: It is required at least %d MB
Parameters
   %d: Disk spaces
Description
   Insufficient disk space.
Action method
   Confirm that the system has sufficient disk spaces.

Description
   Failed to copy files required for the installation.
Action method
   Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

FSP_FJSVCIR_CIRINST: ERROR: 105: CIRINST105: Failed to copy JRE.
Description
   Failed to copy JRE required for installation.
Action method
   Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.
**FSP_FJSVCIR_CIRINST: ERROR: 106: CIRINST106: Failed to copy CIR**

**Description**
Failed to copy files during the installation.

**Action method**
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

---

**FSP_FJSVCIR_CIRINST: ERROR: 107: CIRINST107: invalid option.**

**Description**
An invalid option was specified.

**Action method**
Specify a valid option. [-c]: CUI

---

**FSP_FJSVCIR_CIRINST: ERROR: 108: CIRINST108: JRE which should be deployed is not bundled.**

**Description**
An appropriate JRE for this system is not bundled.

**Action method**
Confirm that the product supports the platform.

---

**Description**
Unsupported operating system.

**Action method**
Confirm that the product supports the operating system.

---

**FSP_FJSVCIR_CIRINST: ERROR: 185: CIRINST185: lsb_release was not found. Please install the package below. - redhat-lsb**

**Description**
lsb_release command was not found.

**Action method**
Add redhat-lsb package and then execute install again.

---

**FSP_FJSVCIR_CIRINST: ERROR: 186: CIRINST186: lsb_release was not found.**

**Description**
lsb_release command was not found.

**Action method**
Add the relevant package and then execute install again.

---

**FSP_FJSVCIR_CIRINST: ERROR: 201: CIRINST201: Administrator privilege is required.**

**Description**
The user does not have administrator privileges.
Action method
Login with administrator privileges and run the command again.

Description
Failed to delete FJSVcir files.
Action method
Deleting the files failed for some reason. Run cirremove command again. If the problem persists, check the system log.

Description
Invalid option is specified.
Action method
No option is supported. Retry without any options.

Specified installation parameters file was not found.
Description
Specified installation parameters file was not found. (silent mode)
Action method
Specify the installation parameters file.

It failed to install. See log for details
Description
An error occurred during install. (silent mode)
Action method
Collect the files stored in the following directories.
[UNIX]
/var/opt/FJSVcir/cir/logs/cirlog0.log.0
[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0

Parameters are invalid. Please specify valid parameters.
Description
Invalid option is specified. (silent mode)
Action method
Specify a valid option.

Internal data is broken.
Description
Internal data used by this product is corrupt.
Action method
Collect the files stored in the following directories and contact Fujitsu technical support:
F.2 Messages output by Uninstall (middleware)

**It has already been running in another process.**

Description
An attempt was made to start Uninstall (middleware) more than once. Alternatively, an attempt was made to start Uninstall (middleware) while the installer was starting.

Action method
End any Uninstall (middleware) that have already started. Alternatively, start Uninstall (middleware) after the installer has ended.

**Specified option is invalid.**

Description
An invalid option was specified.

Action method
Specify valid options and run the command again.

**Please enter a valid option.**

Description
An invalid character was entered. Valid characters are y, n, or item numbers.

Action method
Enter a valid character.

**Failed to uninstall of the following software packages:**

Description
Failed to uninstall the software listed in this message.

Action method
Confirm the information shown after this message and take the appropriate action.

**Unable to uninstall the software as it is referred from more than one software.**

Description
Failed to uninstall the software because it is used by other software.

Action method
No specific action is required.

**Unable to uninstall the software as the software is mandatory.**

Description
Failed to uninstall the software because it is required by another program.
Action method
No specific action is required.

**Internal data is broken.**

Description
Internal data used by this product is corrupt.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

**[UNIX]**

/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

**[Windows]**

%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
**Unable to uninstall the software you were about to uninstall as the existence of the software is a precondition for the operation of another software.**

Description
Failed to uninstall the software because it is required by another program.

Action method
No specific action is required.

**The program terminated abnormally.**

Description
The program has terminated abnormally.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

**[UNIX]**

/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

**[Windows]**

%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
**An unexpected error has occurred during uninstall.**

Description
An error occurred during uninstall.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

**[UNIX]**

/var/opt/FJSVCIR/cir/
It failed to uninstall. See log for details.

Description
An error occurred during uninstall. (silent mode)

Action method
Collect the files stored in the following directories.

[UNIX]
/var/opt/FJSVCir/cir/logs/cirlog0.log.0

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0

Failed to initialize the temp directory.

Description
Can not start Uninstall (middleware) because failed to initialize the temp directory.

Action method
Run Uninstall (middleware) again. If the problem persists, check whether other processes have accessed the files in the following directories.

[UNIX]
/var/opt/FJSVCir/cir/temp/meta_db

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\temp\meta_db

[Notice] Need to restart for uninstall completion.

Description
Uninstallation was completed. (silent mode)

Action method
Restart the system.
Appendix G Estimating Database Disk Space Requirements

This appendix describes how to estimate database disk space requirements.

G.1 Estimating Table Size Requirements

The following tables provide the formulas for estimating table size requirements.

Table G.1 Estimation formula when the record length is 2032 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Record length</td>
<td>27(*1) + NULL map + OID + column data</td>
</tr>
<tr>
<td></td>
<td>NULL map: Number of columns / 8 (*2)</td>
</tr>
<tr>
<td></td>
<td>OID: 4 for a table &quot;WITH OID&quot;. The default is 0.</td>
</tr>
<tr>
<td></td>
<td>Column data: Sum of column lengths</td>
</tr>
<tr>
<td></td>
<td>*1: Record head section</td>
</tr>
<tr>
<td></td>
<td>*2: Round the result up to the next integer.</td>
</tr>
<tr>
<td></td>
<td>- Because the column data is placed in boundaries of 8 bytes, you need to make an</td>
</tr>
<tr>
<td></td>
<td>adjustment so that the sum of the record head section, NULL map and OID is a</td>
</tr>
<tr>
<td></td>
<td>multiple of 8.</td>
</tr>
<tr>
<td></td>
<td>For example, if the calculated length is 27 + 1 / 8 (rounded up) + 0 = 28 bytes, add</td>
</tr>
<tr>
<td></td>
<td>4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- Because the data of each column is placed in boundaries of the defined data type,</td>
</tr>
<tr>
<td></td>
<td>take the boundary of each data type into account for the length of the column data.</td>
</tr>
<tr>
<td></td>
<td>For example, the length of the column data in the table below will not be the sum of</td>
</tr>
<tr>
<td></td>
<td>the data types, which is 37 bytes, but will instead be 64 bytes following boundary</td>
</tr>
<tr>
<td></td>
<td>adjustment.</td>
</tr>
<tr>
<td></td>
<td>Definition: create table tb1(c1 char(1), c2 long, c3 int, c4 box)</td>
</tr>
<tr>
<td></td>
<td>Estimation: CHAR type 1 byte + boundary adjustment of 7 bytes for LONG type</td>
</tr>
<tr>
<td></td>
<td>8 bytes + LONG type 8 bytes + INT type 4 bytes + boundary adjustment of 12 bytes</td>
</tr>
<tr>
<td></td>
<td>for BOX type 32 bytes + BOX type 32 bytes = 64 bytes</td>
</tr>
<tr>
<td></td>
<td>- Because each record is placed in boundaries of 8 bytes, you need to make an</td>
</tr>
<tr>
<td></td>
<td>adjustment so that the length of the column data is a multiple of 8.</td>
</tr>
<tr>
<td></td>
<td>- If the calculated record length exceeds 2,032 bytes, the variable length data in the</td>
</tr>
<tr>
<td></td>

### G.2 Estimating Index Size Requirements

This section provides the formulas for estimating index size requirements.

FUJITSU Enterprise Postgres provides six index types: B-tree, Hash, GiST, GIN, SP-GiST, and VCI. If you do not specify the index type in the CREATE INDEX statement, a B-tree index is generated.

The following describes how to estimate a B-tree index. Refer to "G.7 Estimating VCI Disk Space Requirements" for information on how to estimate VCI.

A B-tree index is saved as a fixed-size page of 8 KB. The page types are meta, root, leaf, internal, deleted, and empty. Since leaf pages usually account for the highest proportion of space required, you need to calculate the requirements for these only.

Table G.3 Estimation formula when the key data length is 512 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Entry length</td>
<td>8 (*1) + key data length (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: Entry head</td>
</tr>
<tr>
<td></td>
<td>*2: The key data length depends on its data type (refer to &quot;G.3 Sizes of Data Types&quot; for details).</td>
</tr>
</tbody>
</table>

Because each entry is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the key data is a multiple of 8.

For example, if the calculated length is 28 bytes, add 4 to make the length 32 bytes.

- If the key data length exceeds 512 bytes, key data may be automatically compressed.

In this case, use the estimation formula given in "Table G.4 Estimation formula when the key data length exceeds 512 bytes" to estimate the key data length.

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

G.3.2 Sizes of Variable-Length Data Types

The following table lists the sizes of variable-length data types.

*2: Specify 0.7 or lower as the usage rate.*
## G.3.3 Sizes of Array Data Types

The following table lists the sizes of array data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Length of size portion + 12 + 8 x number of dimensions + data size of each item</td>
<td>If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes.</td>
</tr>
</tbody>
</table>

- Example of estimation when array data is "ARRAY[[1,2,3], [1,2,3]]"
  - Number of dimensions: 2
  - INTEGER data size: 4
  - Total size = 1+12+8x2+6x4 = 53

## G.3.4 Number of Bytes per Character

The following table lists the number of bytes per character.

The given values relate to the common character sets EUC-JP and UTF8.

<table>
<thead>
<tr>
<th>Character type</th>
<th>Character set</th>
<th>Number of bytes per character</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>

<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
</tbody>
</table>

## G.4 Estimating Transaction Log Space Requirements

This section provides the formula for estimating transaction log space requirements.
Transaction log space requirements = max_wal_size

However, if the update volume is extremely high (for example, due to a large data load and batch processing), disk writing at a checkpoint may not be able to keep up with the load, and a higher number of transaction logs than indicated here may temporarily be accumulated.

G.5 Estimating Archive Log Space Requirements

This section explains how to estimate archive log space requirements.

The archive log is an archive of the transaction logs from the time of a previous backup to the present, so it fluctuates depending on the backup period and the content of update transactions.

The longer the backup period and the more update transactions, the greater the space required for the archive log.

Therefore, measure the actual archive log space by using a test environment to simulate backup scheduling and database update in a real operating environment.

G.6 Estimating Backup Disk Space Requirements

This section provides the formula for estimating backup disk space requirements.

Backup disk space requirements = size of the database cluster x 2 + transaction log space requirements + archive log space requirements

G.7 Estimating VCI Disk Space Requirements

This section provides the formula for estimating VCI disk space requirements.

Disk space = (number of rows in tables) x (number of bytes per row) x (compression ratio) + (WOS size)

Number of bytes per row

Number of bytes per row = (19 + (number of columns specified in CREATE INDEX) / 8 + (number of bytes per single column value)) x 1.1

Note: Round up the result to the nearest integer.

Compression ratio

Specify a value between 0 and 1. Since compression ratio depends on the data being compressed, use actual data or test data that simulates it, then compare the value with the estimation result. As a guide, the compression ratio measured with the Fujitsu sample data is shown below:

- Data with high degree of randomness (difficult to compress): Up to approximately 0.9 times.
- Data with high degree of similarity (easy to compress): Up to approximately 0.5 times.

WOS size

WOS size = (number of WOS rows) / 185 x 8096

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Note

VCI does not support retrieval of disk space usage using the database object size function pg_indexes_size. To find out the actual total VCI disk space, check the disk space of the storage directory using an OS command or other method.
Appendix H Estimating Memory Requirements

This appendix explains how to estimate the memory.

H.1 FUJITSU Enterprise Postgres Memory Requirements

This section describes the formulas for estimating FUJITSU Enterprise Postgres memory requirements.

Use the following formula to obtain a rough estimate of memory required for FUJITSU Enterprise Postgres:

\[
\text{fujitsuEnterprisePostgresRequiredMemory} = \text{sharedMemoryAmount} + \text{localMemoryAmount}
\]

Shared memory amount

Refer to "Shared Memory and Semaphores" under "Server Administration" in the PostgreSQL Documentation for information on shared memory.

However, note that if instances have been created using WebAdmin, the parameters below will be configured automatically when the instances are created. Take this into account when calculating the shared memory size.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30 percent of the internal memory of the machine. (*1)</td>
</tr>
<tr>
<td>max_connections</td>
<td>100</td>
</tr>
<tr>
<td>max_prepared_transactions</td>
<td>100</td>
</tr>
</tbody>
</table>

*1: This value will be capped at 2097151 MB.

Local memory amount

\[
\text{localMemoryAmount} = \text{processStackArea} + \text{memoryUsedInDbSessionsThatUseTempTables} + \text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} + \text{memoryUsedInMaintenanceOperations} + \text{baseMemoryUsedInEachProcess} + \text{memoryUsedPreparingForDataAccess}
\]

Process stack area

\[
\text{processStackArea} = \text{max_stack_depth} \times (\text{max_connections} + \text{autovacuum_max_workers} + 9)
\]

This formula evaluates to the maximum value.

Actually it is used according to the growth of the stack.

In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used in database sessions that use temporary tables

\[
\text{memoryUsedInDbSessionsThatUseTempTables} = \text{temp_buffers} \times \text{max_connections}
\]

This formula evaluates to the maximum value.

Memory is gradually used as temporary buffers are used, and is released when the session ends.

Memory used in database sessions that perform sort and hash table operations

\[
\text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} = \text{work_mem} \times \text{max_connections}
\]

This formula evaluates to the maximum value.

Memory is gradually used as operations such as sort are performed, and is released when the query ends.
Memory used in maintenance operations

\[
\text{memoryUsedInMaintenanceOperations} = \text{maintenance_work_mem} \times (\text{numOfSessionsPerformingMaintenance} + \text{autovacuum_max_workers})
\]

Note that ‘maintenance operations’ are operations such as VACUUM, CREATE INDEX, and ALTER TABLE ADD FOREIGN KEY.

Base memory used in each process

\[
\text{baseMemoryUsedInEachProcess} = 3MB \times (\text{max_connections} + \text{autovacuum_max_workers} + 9)
\]

This formula evaluates to the memory used when server processes are running.

In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used preparing for data access

\[
\text{memoryUsedPreparingForDataAccess} = \text{variationAmount} \times (\text{max_connections} + \text{autovacuum_max_workers} + 4)
\]

where \(\text{variationAmount} = \frac{\text{shared_buffers}}{8KB} \times 4 \text{ bytes}\)

(note that 8KB is the page length, and 4 bytes is the size of page management data)

This formula evaluates to the memory required to access the database cache in the shared memory.

In the formula above, among the processes that perform roles specific to servers, 4 is the number of processes that access the database.

H.2 Database Multiplexing Memory Requirements

This section describes the formula for estimating database multiplexing memory requirements.

Use the following formula to obtain a rough estimate of memory required for database multiplexing:

Memory usage of the database multiplexing feature

= Peak memory usage of the Mirroring Controller processes
  Peak memory usage of the Mirroring Controller commands

Peak memory usage of the Mirroring Controller processes=150 MB

Peak memory usage of the Mirroring Controller commands=50 MB \times \text{Number of commands executed simultaneously}

H.3 VCI Memory Requirements

This section describes the formula for estimating VCI memory requirements.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{memUsedByVci} = \text{memForData} + \text{memForEachProcess}
\]

Memory required to store data in memory

Secure the space estimated using the formula below on the stable buffer (part of shared_buffers).

\[
\text{memForData} = (\text{numOfRowsInTables}) \times (\text{numOfBytesPerRow}) + (\text{wosSize})
\]

Number of bytes per row

\[
(19 + (\text{numOfColsInCreateIndexStatement}) / 8 + (\text{numOfBytesPerSingleColValue})) \times 1.1
\]

Note: Round up the result to the nearest integer.
WOS size

\[
\text{wosSize} = \frac{\text{numOfWosRows}}{185 \times 8096}
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Memory required for each process

\[
\text{memForEachProcess} = \text{memUsedPerScanning} + \text{memUsedForVciMaintenace} + \text{memUsedByCreateIndexStatement}
\]

Memory used per scanning

- **Parallel scan**

\[
\text{memUsedPerScanning} = \text{vci.shared_work_mem} + (\text{numOfParallelWorkers} + 1) \times \text{vci.maintenance_work_mem}
\]

Note: The number of parallel workers used by VCI simultaneously in the entire instance is equal to or less than vci.max_parallel_degree.

- **Non-parallel scan**

\[
\text{memUsedPerScanning} = \text{vci.max_local_ros} + \text{vci.maintenance_work_mem}
\]

- **Note**

- vci.shared_work_mem, and vci.max_local_ros are used to create local ROS. If local ROS exceeds these sizes, execute a query without using VCI according to the conventional plan.

- vci.maintenance_work_mem specifies the memory size to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.

Memory used for VCI maintenance

\[
\text{memUsedForVciMaintenace} = \text{vci.maintenance_work_mem} \times \text{vci.control_max_workers}
\]

Memory used by CREATE INDEX

\[
\text{memUsedByCreateIndexStatement} = \text{vci.maintenance_work_mem}
\]

- **Note**

vci.maintenance_work_mem specifies the memory to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.
Appendix I Quantitative Limits

This appendix lists the quantitative limits of FUJITSU Enterprise Postgres.

Table I.1 Length of identifier

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Schema name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>View name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Index name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table space name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cursor name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Aggregate function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Trigger name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Constraint name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Role name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cast name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Collation sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Encoding method conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Domain name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Extension name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator class name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator family name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Rewrite rule name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search settings name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search dictionary name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search parser name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search template name</td>
<td>Up to 63 bytes (*1) (*2)</td>

<td>No limit</td>
</tr>
<tr>
<td>Number of SQL statements or control statements that can be specified in a function processing implementation</td>
<td>No limit</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>---------------------------------------------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Maximum number of connections for one process in an application</td>
<td>4,000 connections</td>
</tr>
<tr>
<td>(remote access)</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in a selection list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of tables that can be specified in a FROM clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of unique expressions that can be specified in a selection list/</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>DISTINCT clause/ORDER BY clause/GROUP BY clause within one SELECT statement</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in a GROUP BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an ORDER BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of SELECT statements that can be specified in a UNION clause/</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>INTERSECT clause/EXCEPT clause</td>
<td></td>
</tr>
<tr>
<td>Number of nestings in joined tables that can be specified in one view</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of functions or operator expressions that can be specified in one expression</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row constructor</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an UPDATE statement</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>SET clause</td>
<td></td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row of a VALUES list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a RETURNING clause</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Total expression length that can be specified in the argument list of one function specification</td>
<td>Up to 800 megabytes (*2)</td>
</tr>
<tr>
<td>Number of cursors that can be processed simultaneously by one session</td>
<td>No limit</td>
</tr>
<tr>
<td>Character string length of one SQL statement</td>
<td>Up to 800 megabytes (*1) (*3)</td>
</tr>
<tr>
<td>Number of input parameter specifications that can be specified in one dynamic SQL statement</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of tokens that can be specified in one SQL statement</td>
<td>Up to 10,000</td>
</tr>
<tr>
<td>Number of values that can be specified as a list in a WHERE clause IN syntax</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a USING clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of JOINS that can be specified in a joined table</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of expressions that can be specified in COALESCE</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of WHEN clauses that can be specified for CASE in a simple format or a searched format</td>
<td>No limit</td>
</tr>
<tr>
<td>Data size per record that can be updated or inserted by one SQL statement</td>
<td>Up to one gigabyte minus 53 bytes</td>
</tr>
<tr>
<td>Number of objects that can share a lock simultaneously</td>
<td>Up to 256,000 (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.
*2: The total number of all database objects must be less than 4,294,967,296.
*3: This is the character string byte length when converted by the server character set character code.
Table I.8 Data size

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data size per record for input data files (COPY statement, psql command \copy meta command)</td>
<td>Up to 800 megabytes (*1)</td>
</tr>
<tr>
<td>Data size per record for output data files (COPY statement, psql command \copy meta command)</td>
<td>Up to 800 megabytes (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.
Appendix J  Configuring Kernel Parameters

Use the “System V IPC Parameters” table in “Managing Kernel Resources” in the PostgreSQL Documentation for the relationship between configuration parameters and kernel parameters, as well as calculation formulas.

Refer to the “Managing Kernel Resources” in the PostgreSQL Documentation to calculate shared memory usage.

For multiple instances, the kernel parameters should be evaluated for all instances. For example, in the case of the maximum number of shared memory segments for the entire system (SHMMNI), the total number of segments obtained by all instances should be added to the kernel parameters. In the case of the maximum number of semaphores for each process (SEMMSL), the largest of all sizes obtained by all instances should be compared to the current value prior to configuring the settings.

Note

If there is insufficient shared memory due to miscalculation of SHMMAX, a message will be output indicating that the shmget system call failed at “errno=22 (EINVAL)”. Review the calculation, and reconfigure.

The relationship between System V IPC parameters and kernel parameters in various operating systems is shown below.

<table>
<thead>
<tr>
<th>System</th>
<th>V IPC parameter</th>
<th>Kernel parameter action</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHMMAX</td>
<td>kernel.shmmax</td>
<td>If <code>currentValue &lt; calculatedValue</code>, configure the calculated value</td>
</tr>
<tr>
<td>SHMMIN</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMALL</td>
<td>kernel.shmall</td>
<td>Specify <code>currentValue + calculatedValue</code></td>
</tr>
<tr>
<td>SHMSEG</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMMNI</td>
<td>kernel.shmmni</td>
<td>Specify <code>currentValue + calculatedValue</code></td>
</tr>
<tr>
<td>SEMMNI</td>
<td>Fourth parameter of kernel.sem</td>
<td>Specify <code>currentValue + calculatedValue</code></td>
</tr>
<tr>
<td>SEMMNS</td>
<td>Second parameter of kernel.sem</td>
<td>Specify <code>currentValue + calculatedValue</code></td>
</tr>
<tr>
<td>SEMMSL</td>
<td>First parameter of kernel.sem</td>
<td>If <code>currentValue &lt; calculatedValue</code>, configure the calculated value</td>
</tr>
<tr>
<td>SEMMAP</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SEMVMX</td>
<td>No compatible parameter</td>
<td></td>
</tr>
</tbody>
</table>

Remark 1: kernel.shmall specifies the number of pages.
Remark 2: Specify all four parameters for kernel.sem. At this time, the value specified in the third parameter should be the same value as before configuration.
Appendix K  Determining the Preferred WebAdmin Configuration

This appendix describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration.

K.1  WebAdmin Configurations

WebAdmin can be installed in two configurations:
- Single-server
- Multiserver

K.1.1  Single-Server Configuration

A single-server configuration enables you to create and operate instances on a single server. In this configuration, WebAdmin must be installed on the same database server as the FUJITSU Enterprise Postgres Server component.

K.1.2  Multiserver Configuration

A multiserver configuration enables you to create and operate instances stored on multiple database servers. As shown in the figure below, WebAdmin can be installed on a dedicated management server and used to collectively manage the instances stored on the database servers.
K.2 Installing WebAdmin in a Single-Server Configuration

To install WebAdmin in a single-server configuration, the FUJITSU Enterprise Postgres Server component and WebAdmin must be installed on the same machine.

The example below shows the options that need to be selected for a single-server installation.

Example

```
# ./install.sh

The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): 1,4

Selected product
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
FUJITSU Enterprise Postgres WebAdmin x.y SPz
```

K.3 Installing WebAdmin in a Multiserver Configuration

In a multiserver configuration, install WebAdmin on one server, and both WebAdmin and the FUJITSU Enterprise Postgres Server component on any number of database servers.

1. Install WebAdmin (management server)

   The example below shows the option that needs to be selected during installation, to install WebAdmin on the management server.

   Example

   ```
   # ./install.sh
   ```
The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): 4

Selected product
FUJITSU Enterprise Postgres WebAdmin x.y SPz

2. Install the FUJITSU Enterprise Postgres Server component and WebAdmin (database servers)

The example below shows the options that need to be selected during installation, to install the FUJITSU Enterprise Postgres Server component and WebAdmin on the database servers.

Example

# ./install.sh

The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): 1, 4

Selected product
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
FUJITSU Enterprise Postgres WebAdmin x.y SPz
Appendix L  Supported contrib Modules and Extensions
Provided by External Projects

FUJITSU Enterprise Postgres supports PostgreSQL contrib modules, and extensions provided by external projects.

Refer to the following for details on the supported contrib modules:
- https://www.postgresql.org/docs/9.6/static/contrib.html
- https://www.postgresql.org/docs/9.6/static/contrib-prog.html

Information

You can also check the list of available extensions using the pg_available_extensions view.

The following extensions provided by external projects are supported:
- pg_hint_plan
- pg_dbms_stats

Installation and Setup Guide for Server
(Solaris)
Preface

Purpose of This Document

The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Solaris platform. This document describes how to install and set up “FUJITSU Enterprise Postgres”.

Intended Readers

This document is intended for those who install and operate FUJITSU Enterprise Postgres. Readers of this document are assumed to have general knowledge of:

- PostgreSQL
- SQL
- Oracle Solaris

Structure of This Document

This document is structured as follows:

Chapter 1 Overview of Installation
Describes the installation types and procedures

Chapter 2 Operating Environment
Describes the operating environment required to use FUJITSU Enterprise Postgres

Chapter 3 Installation
Describes how to perform a new installation of FUJITSU Enterprise Postgres

Chapter 4 Setup
Describes the setup to be performed after installation

Chapter 5 Uninstallation
Describes how to uninstall FUJITSU Enterprise Postgres

Appendix A Installation in Silent Mode
Provides specifications for installation in silent mode

Appendix B Recommended WebAdmin Environments
Describes the recommended WebAdmin environment.

Appendix C Setting Up and Removing WebAdmin
Describes how to set up and remove WebAdmin

Appendix D Configuring Parameters
Describes FUJITSU Enterprise Postgres parameters.

Appendix E Uninstall (middleware)
Describes the Uninstall (middleware)

Appendix F Uninstall (middleware) Messages
Describes the messages output by the Uninstall (middleware) tool.

Appendix G Estimating Database Disk Space Requirements
Describes how to estimate database disk space requirements

Appendix H Estimating Memory Requirements
Describes the formulas for estimating memory requirements
Appendix I Quantitative Limits
Describes the quantity range

Appendix J Configuring Kernel Parameters
Describes the settings for kernel parameters

Appendix K Determining the Preferred WebAdmin Configuration
Describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration

Appendix L Supported contrib Modules and Extensions Provided by External Projects
Lists the PostgreSQL contrib modules and the extensions provided by external projects supported by FUJITSU Enterprise Postgres.

Export Restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that can be Installed

Each FUJITSU Enterprise Postgres feature is installed on the machine that was used to build the database environment.

The following table shows the relationship between the product to be installed and the features that can be installed.

<table>
<thead>
<tr>
<th>Feature that can be installed</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic feature (server feature, client feature)</td>
<td>AE</td>
</tr>
<tr>
<td></td>
<td>SE</td>
</tr>
</tbody>
</table>

Y: Can be installed

1.2 Installation Types

The following three installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, FUJITSU Enterprise Postgres is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

FUJITSU Enterprise Postgres products can be installed on the same server if the product version (indicated by x.y in "x.y.SPz") is different from that of any version of the product that is already installed.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.

1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In the interactive mode installation, the installation state of FUJITSU Enterprise Postgres is determined automatically. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres.
Chapter 2 Operating Environment

This chapter describes the operating environment required to use FUJITSU Enterprise Postgres.

See

Refer to "Operating Environment" in the installation and Setup Guide for Client when installing the FUJITSU Enterprise Postgres client feature at the same time.

2.1 Required Operating System

One of the operating systems shown below is required in order to use FUJITSU Enterprise Postgres:

- Solaris 10
- Solaris 11

Note

- PL/Python supports PostgreSQL languages based on Python 2 only. PostgreSQL languages based on Python 3 are not supported.
- Notes on installing in a non-global zone
  Note the following when installing FUJITSU Enterprise Postgres in a non-global zone of Solaris 10 or Solaris 11
  - Set the non-global zone where the installation will take place as a whole root zone. When creating a non-global zone, do not create inherit-pkg-dir.
    The password of the operating system super user (root) will not be created after the non-global zone is created. Set the zone environment by logging in to the non-global zone using "zlogin -C".
  - Assign one or more logical network instances from the global zone.
  - Set the privileges for accessing the DVD drive in a non-global zone.

Information

Install the 64-bit package.
The following packages are required for operations on Solaris 10 and Solaris 11.

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>perl</td>
<td>Required when using PL/Perl. Install 5.12.</td>
</tr>
<tr>
<td>python</td>
<td>Required when using PL/Python. Install 2.7.</td>
</tr>
<tr>
<td></td>
<td>Use a package that was built with the UCS-4 option.</td>
</tr>
<tr>
<td>tcl</td>
<td>Required when using PL/Tcl. Install 8.5.</td>
</tr>
</tbody>
</table>

See

Refer to the relevant Solaris manual for information on how to set up a zone.
2.2 Related Software

There is no related software for FUJITSU Enterprise Postgres.

The following table lists servers that can be connected to the FUJITSU Enterprise Postgres client feature.

Table 2.1 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td>Linux</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

2.3 Excluded Software

This section describes excluded software.

FUJITSU Enterprise Postgres

If all the following conditions are met, FUJITSU Enterprise Postgres cannot be installed:

- The product version (indicated by \(x.y\) in "\(x.y\ SPz\)") of the product to be installed is the same as that of the installed product
- The editions are different

Example

In the following cases, FUJITSU Enterprise Postgres cannot be installed as an exclusive product:

The installed product is FUJITSU Software Enterprise Postgres Standard Edition (64bit) 9.5

The product to be installed is FUJITSU Software Enterprise Postgres Advanced Edition (64bit) 9.5

Other products

There are no exclusive products.

2.4 Required Patches

There are no required patches.

2.5 Hardware Environment

The following hardware is required to use FUJITSU Enterprise Postgres.

Memory

At least 512 MB of memory is required.

2.6 Disk Space Required for Installation

The following table shows the disk space requirements for new installation of FUJITSU Enterprise Postgres. If necessary, increase the size of the file system.

Table 2.2 Disk space required for installation

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space (Unit: MB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 4 (*1) +1 (*2)</td>
</tr>
<tr>
<td>Directory</td>
<td>Required disk space (Unit: MB)</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>/opt</td>
<td>110 (*1) +1 (*2)</td>
</tr>
<tr>
<td>Installation destination of the server</td>
<td>800</td>
</tr>
<tr>
<td>Installation destination of WebAdmin</td>
<td>500</td>
</tr>
<tr>
<td>Installation destination of the client (32-bit)</td>
<td>79</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>88</td>
</tr>
</tbody>
</table>

*1: Required for the installation of the Uninstall (middleware) tool.
*2: Required for the installation of FJQSS.

2.7 Supported System Environment

This section describes the supported system environment.

2.7.1 TCP/IP Protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

2.8 PostgreSQL Version Used for FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres is based on PostgreSQL 9.6.2.

2.9 Notes on Using Streaming Replication

To use streaming replication, build the primary server and all standby servers using the same FUJITSU Enterprise Postgres version (*1).

*1: The product version is indicated by "x.y" in the notation "x.y SPz".

Note

Streaming replication cannot be used in combination with Open Source PostgreSQL.
Chapter 3 Installation

This chapter explains each of the installation procedures of FUJITSU Enterprise Postgres.
Note that "x.y SPz" in window examples and "<xy>" in paths indicate the version and level of the installed product.

3.1 Pre-installation Tasks

Check the system environment below before installing FUJITSU Enterprise Postgres.

Check the disk space

Ensure that there is sufficient disk space to install FUJITSU Enterprise Postgres.
Refer to "2.6 Disk Space Required for Installation" for information on the required disk space.
Reconfigure the disk partition if disk space is insufficient.

Check the installed product and determine the installation method

Using the operation shown below, start Uninstall (middleware), and check the installed products.

Example

```
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. FUJITSU Enterprise Postgres Client(64bit) x.y SPz
2. FUJITSU Enterprise Postgres Client(32bit) x.y SPz
3. FUJITSU Enterprise Postgres Standard Edition(64bit) x.y SPz
4. FUJITSU Enterprise Postgres WebAdmin x.y SPz

Type [number] to select the software you want to uninstall.
[number,q]
=>q

Exiting Uninstaller.
```

If FUJITSU Enterprise Postgres is already installed, determine which installation method to use:
- Reinstallation
- Multi-version installation

Remove applied updates

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

Note

If a product is installed without removing applied updates, the following problems will occur:
- Performing reinstallation
  if an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.
  Perform reinstallation after removing the update.
1. Display the applied updates

   Execute the following command to display the applied updates:
   
   **Example**
   ```bash
   # /opt/FJSVfupde/bin/uam showup
   ```

2. Remove the updates

   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.
   
   **Example**
   ```bash
   # /opt/FJSVfupde/bin/uam remove -i update-number
   ```

**Determine the preferred WebAdmin configuration**

Starting with FUJITSU Enterprise Postgres 9.5, WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

Refer to "Appendix K Determining the Preferred WebAdmin Configuration" for details.

### 3.2 Installation in Interactive Mode

Install according to the following procedure:

**Note**

The following characters can be used as input values:

- Alphanumeric characters, hyphens and forward slashes

#### 1. Stop applications and the client program

If the installation method is one of the following, the applications and the program must be stopped:

- Reinstallation

Before starting the installation, stop the following:

- Applications that use the product
- Instance
- Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

**Example**

If WebAdmin is installed in /opt/fsepv<xy>/webadmin:

```bash
# cd /opt/fsepv<xy>/webadmin/sbin
# ./WebAdminStop
```

- Mirroring Controller

Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

**Example**

```bash
$ mc_ctl stop -M /mcdir/inst1
```
2. Change to the superuser

Run the following command to switch to the superuser on the system.

```bash
$ su -
Password:******
```

3. Mount the DVD drive

Insert the server program DVD in the DVD drive, and run the command given below.

Example

```
# /usr/sbin/mount -F hsfs -o ro /dev/dsk/c0t6d0s2 /dvd/dvd0
```

/dev/dsk/c0t6d0s2 is the DVD drive device, and /dvd/dvd0 is the mount point (which must already exist before calling the command)

Note

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

4. Run the installation

Execute the following command:

Example

```
# cd /dvd/dvd0
# ./install.sh
```

In the example above, /dvd/dvd0 is the DVD mount point.

5. Select the product for installation

The list of installation target products is displayed as shown below.
Type the number for the product to be installed, or "all", and press Enter.

Note that "x.y SPz" in sample windows indicates the version level of products to install.

The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): all

Selected product
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
FUJITSU Enterprise Postgres WebAdmin x.y SPz

Do you want to install the above product?
y: Proceed to the next step
n: Select the product again
- To develop or execute a 32-bit application in a 64-bit environment, FUJITSU Enterprise Postgres Client (32bit) is required.
- The FUJITSU Enterprise Postgres Server component and WebAdmin can be installed on the same machine by selecting options 1 and 4.
- The window below is displayed for each product that was selected but has already been installed.

To perform a reinstallation, type the number for the product and press Enter.

To perform a multi-version installation, type “m” and press Enter.

---

6. Check the settings

The window for checking the installation information is displayed as shown below.

If there is no problem with the settings, type “y” and press Enter to start the installation (refer to “10. Display the installation status”). To change the settings, type “c” and press Enter.
WebAdmin internal port number: 27516

Start installation using the above information?
y: Start the installation
c: Change the information (*1)
q: Quit without installing
[y,c,q](The default value is y): c (*1)

*1: This option is not displayed if there is no information that can be modified.
If the user types "c", then the window mentioned in the next step is displayed.

7. Enter the installation directory
If the installation method is one of the following, the window below is displayed for each product:
- New installation
- Multi-version installation

Enter the directory and press Enter.

FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz : Specify the installation directory.
[directory name,q](The default value is /opt/fsepsv<xy>server64): /opt/fsepsv64

8. Enter the WebAdmin setup information
If WebAdmin was selected, and the installation method is one of the following, the window below will be displayed:
- New installation
- Multi-version installation

Type the item name and press Enter.

Do you want to execute WebAdmin setup?
y: Execute
n: Do not execute
[y,n,q](The default value is y):

Specify the Web server port number.
Web server port number [1024-32767,q](The default value is 27515):

Specify the WebAdmin internal port number.
WebAdmin internal port number [1024-32767,q](The default value is 27516):

If you have not set up WebAdmin, refer to "Appendix C Setting Up and Removing WebAdmin" for details.

9. Check the changed settings
The changed settings are displayed as shown below.
If there is no problem with the settings, type "y" and press Enter.
To change the settings again, type "c" and press Enter.

Product to be installed
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
New installation
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
New installation
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
New installation

Installation directory information
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
/opt/fsepsv64
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
10. Display the installation status

The installation status is displayed as follows:

```
Starting installation.
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz Installation
   Installation is complete.
FUJITSU Enterprise Postgres Client (32bit) x.y SPz Installation
   Installation is complete.
FUJITSU Enterprise Postgres Client (64bit) x.y SPz Installation
   Installation is complete.
Starting setup.       (*1)
 Sets up WebAdmin.     (*1)
 Setup is complete.    (*1)
```

*1: Displayed only when "Execute" is selected for WebAdmin setup.
Even if WebAdmin setup fails, the process will still continue.
If the following message is displayed, manually execute WebAdmin setup after installation is completed.
Refer to "C.1 Setting Up WebAdmin" for information on the WebAdmin setup procedure.

```
Starting setup.
Setting up WebAdmin.
ERROR: WebAdmin setup failed.
```

11. Finish the installation

Upon completion, a message is displayed showing the status.
If installation was successful, a message like the one shown below is displayed:

```
Installed successfully.
```

Note

If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.

3.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:

- New installation
- Multi-version installation

The installation procedure is described below.

1. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

2. Mount the DVD drive

Insert the server program DVD in the DVD drive, and run the command given below.

Example

```
# /usr/sbin/mount -F hsfs -o ro /dev/dsk/c0t6d0s2 /dvd/dvd0
```

/dev/dsk/c0t6d0s2 is the DVD drive device, and /dvd/dvd0 is the mount point (which must already exist before calling the command).

**Note**

If the DVD was mounted automatically using the automatic mount daemon (autofs), “noexec” is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

3. Create an installation parameters CSV file

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Refer to "Appendix A Installation in Silent Mode" for information on installation parameters CSV files.

**Information**

The template for the installation parameters CSV file is "mountpoint/sample/sample.csv".

4. Run the installation

Execute the following command:

Example

```
# cd /dvd/dvd0
# ./silent.sh /home/work/inspara.csv
```

In the example above, /dvd/dvd0 is the DVD mount point, and /home/work/inspara.csv is the installation parameter CSV.

If the installer ends in an error, a message is output to the log file and return values are returned. Refer to "Appendix A Installation in Silent Mode" for details.
3.4 Post-installation Tasks

To use the features compatible with Oracle databases, it is necessary to load the Oracle compatibility module. Refer to "Precautions when Using the Features Compatible with Oracle Databases" in the Application Development Guide for details.
Chapter 4 Setup

This chapter describes the setup procedures to be performed after installation completes.

4.1 Operating Method Types and Selection

This section describes how to operate FUJITSU Enterprise Postgres.

There are two methods of managing FUJITSU Enterprise Postgres operations - select one that suits your purposes:

The Operation Guide describes the operating method using WebAdmin, and the equivalent operating method using the server commands.

Simple operation management using a web-based GUI tool (WebAdmin)

Suitable when using frequently used basic settings and operations for operation management.

This method allows you to perform simple daily tasks such as starting the system before beginning business, and stopping the system when business is over, using an intuitive operation.

Usage method

Usage is started by using WebAdmin to create the instance.

By using an external scheduler and the pgx_dmpall command, periodic backups can be performed, which can then be used in recovery using WebAdmin.

Note

- Do not use a server command other than pgx_dmpall or a server application. Operation modes that use server commands and server applications cannot be used in conjunction with WebAdmin. If used, WebAdmin will not be able to manage the instances correctly. Refer to Reference and the PostgreSQL Documentation for information on server commands and server applications.

Advanced operation management using server commands

When operating in a system that is automated by operation management middleware (Systemwalker Centric Manager, for example), this method allows you to use more detailed settings and operations and perform higher level operation management.

An overview of the operating method using the GUI, and its relationship with the operating method using the server commands, are shown below.

Refer to the Operation Guide for details.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>
<td>Creating an instance</td>
<td>WebAdmin is used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically.</td>
</tr>
<tr>
<td></td>
<td>Creating a standby instance</td>
<td>WebAdmin is used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>WebAdmin performs a base backup of the source instance and creates a standby instance.</td>
</tr>
<tr>
<td></td>
<td>Changing the configuration files</td>
<td>WebAdmin is used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The configuration file is edited directly using the initdb command.</td>
</tr>
<tr>
<td></td>
<td>Activating and stopping an instance</td>
<td>WebAdmin is used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The pg_ctl command is used.</td>
</tr>
<tr>
<td></td>
<td>Creating a database</td>
<td>This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement.</td>
</tr>
</tbody>
</table>
### Operation

<table>
<thead>
<tr>
<th>Backing up the database</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebAdmin, or the pgx_dmpall command, is used.</td>
<td>It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed.</td>
<td></td>
</tr>
</tbody>
</table>

| Database recovery                       | WebAdmin is used.      | To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used. |

<table>
<thead>
<tr>
<th>Monitoring</th>
<th>Database errors</th>
<th>The status in the WebAdmin window can be checked. (*1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebAdmin is used.</td>
<td>The messages that are output to the database server log are monitored (*1)</td>
<td></td>
</tr>
</tbody>
</table>

| Disk space                               | The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. (*1) |
|------------------------------------------| This is monitored using the df command of the operating system, for example. (*1) |

| Connection status                        | This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application. |

---

*1: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

---

**See**

Refer to “Periodic Operations” and “Actions when an Error Occurs” in the Operation Guide for information on monitoring and database recovery.

---

### 4.2 Preparations for Setup

This section describes the preparation required before setting up FUJITSU Enterprise Postgres.

#### 4.2.1 Creating an Instance Administrator

Decide which OS user account will be assigned the instance administrator role. You can assign it to a new user or to an existing one, but you cannot assign it to the OS superuser (root).

The following example shows an OS user account with the name “fsepuser” being assigned the instance administrator role.

**Example**

```
# useradd fsepuser
# passwd fsepuser
```

#### 4.2.2 Preparing Directories for Resource Deployment

Prepare the directories required when creating instances.

**Considerations when deploying resources**

The disk configuration on the resource deployment destination is important, because it affects not only recovery following disk corruption, but normal operation as well. The points for determining the disk configuration are as follows:

1. If the backup data storage destination and the data storage destination are both lost, it will not be possible to recover the data, so deploy them to separate disks.
2. To shorten the recovery time following a single disk fault, deploy the system disk and data storage destination to separate disks.
3. The backup data storage destination requires at least double the capacity of the data storage destination, so deploy it to the disk with the most space available.

4. When large amounts of data are updated, the write-to load for the data storage destination, transaction log storage destination, and backup data storage destination (mirrored transaction log) will also be great. For this reason, deploy them to separate disks, out of consideration for performance.

**Note**

- When using the volume manager provided by the operating system, be aware of which physical disk the file system has been created on, for example, by deploying the data storage destination and the backup data storage destination to separate disks.

- If using the ZFS file system, set failmode to "continue" in the ZFS pool properties. Otherwise, if the default failmode (wait) is used, there will be no response from the I/O until the ZFS pool is recovered following an error, causing timeouts in the meantime.

---

### Server resource of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Resource</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>The area where the database is stored. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Stores log information in preparation for a crash recovery or rollback.</td>
</tr>
<tr>
<td>Archive log</td>
<td>Stores log information for recovery</td>
</tr>
<tr>
<td>Corefile</td>
<td>FUJITSU Enterprise Postgres process corefile output when an error occurs with a FUJITSU Enterprise Postgres process.</td>
</tr>
</tbody>
</table>

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.
Examples of disk deployment

The following are examples of disk deployment:

<table>
<thead>
<tr>
<th>Number of disks</th>
<th>Disk</th>
<th>Deployment</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td>Corefile</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Backup data storage destination</td>
</tr>
<tr>
<td>2</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td>Corefile</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
</tbody>
</table>

Proposal for disk deployment using WebAdmin

To generate an instance using WebAdmin, we recommend an optimum deployment that takes into account the status of all disks at the time of instance generation, and items 1 to 3 in the “Considerations when deploying resources” subheading above, based on the limitations below (note that a different deployment can also be specified).

- The mount point does not include national characters
- The instance administrator has the proper permissions to read and write on the mount point

Preparing directories

The directories to be prepared depend on the way that you create the instances.

The following shows the directories that need to be prepared:

<table>
<thead>
<tr>
<th>Directory to be prepared</th>
<th>Using WebAdmin</th>
<th>Using the initdb command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data storage destination</td>
<td>Y (*1)</td>
<td>Y</td>
</tr>
<tr>
<td>Backup data storage destination</td>
<td>Y (*1)</td>
<td>O</td>
</tr>
<tr>
<td>Transaction log storage destination</td>
<td>O (*1) (+2)</td>
<td>O</td>
</tr>
<tr>
<td>Corefile output destination</td>
<td>N (*3)</td>
<td>O</td>
</tr>
</tbody>
</table>

Y: Required
O: Optional
N: Not required

*1: WebAdmin automatically creates a directory

*2: The default is to create in a directory in the data storage destination. When it is necessary to distribute the I/O load for the database data and the transaction log, consider putting the transaction log storage destination on a different disk from the data storage destination

*3: The corefile path is as follows:

```
/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core
```

version: product version_edition_architecture

instanceAdminUser: operating system user name

PortNumber: port number specified when creating the instance

Example:

```
/var/tmp/fsep_96_SE_64/naomi_myinst27599/core
```
To change the output destination, configure the `core_directory` and the `core_contents` parameters in `postgresql.conf`. Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

**Note**

- The directories must meet the following conditions:
  - The directory owner must be the OS user account that you want to be the instance administrator
  - The directory must have write permission
  - The directory must be empty
- It is not possible to use a directory mounted by NFS (Network File System) when using WebAdmin.

Example

The following example shows the OS superuser creating `/database/inst1` as the directory for storing the database data and changing the owner of the directory to the OS user account "fsepuser".

```bash
# mkdir /database/inst1
# chown fsepuser:fsep /database/inst1
# chmod 700 /database/inst1
```

4.2.3 Estimating Resources

Estimate the resources to be used on the FUJITSU Enterprise Postgres.

Refer to "Appendix G Estimating Database Disk Space Requirements" for information on estimating database disk space requirements.

Refer to "Parameters automatically set by WebAdmin according to the amount of memory" when creating multiple instances with WebAdmin.

Refer to "Appendix H Estimating Memory Requirements" when creating instances with the initdb command, to estimate memory usage.

4.2.4 Creating Projects

If using the project feature in Solaris 10 or later, projects that the instance administrator belongs to should be kept separate from other projects. This is because database processes are special processes that use a lot of shared memory.

WebAdmin automatically performs tuning of the kernel parameters for the default project (the project selected on login) of the instance administrator when creating an instance. Therefore, complete the configuration of projects related to the instance administrator before creating an instance using WebAdmin.

4.2.5 Configuring Corefile Names

If a process crashes, a corefile for the process will be generated by the operating system. If a corefile is generated with the same name as an existing corefile generated for a different process, the newly-generated corefile will overwrite the previously dumped corefile. To prevent this, configure a unique corefile name for each crash by appending the process ID, program name, and datetime.

Corefile names can be configured using the `coreadm` command.

Refer to the relevant manual of your system vendor for details.

4.3 Creating Instances

There are two methods that can be used to create an instance:

- 4.3.1 Using WebAdmin
- 4.3.2 Using the initdb Command
Creating multiple instances

Multiple instances can be created.

The memory allocated needs to be adjusted when multiple instances are created with WebAdmin (refer to "Parameters automatically set by WebAdmin according to the amount of memory" for details).

Features that cannot be set up using WebAdmin

The "Storage data protection using transparent data encryption" feature cannot be set up using WebAdmin.

To set up this feature in an instance created by WebAdmin, perform the additional setup tasks detailed in "Storage Data Protection using Transparent Data Encryption" in the Operation Guide.

Note

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.

- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.

- Databases with the names 'template0' and 'template1' are automatically created when an instance is created. These databases are used as the templates for databases created later. Furthermore, a default database with the name 'postgres' is automatically created, which will be used with FUJITSU Enterprise Postgres commands. It is important that you do not delete these databases created by default.

4.3.1 Using WebAdmin

This section describes how to create an instance using WebAdmin.

WebAdmin must be set up correctly before it can be used. Refer to "C.1 Setting Up WebAdmin" for details. Additionally, if WebAdmin needs to be configured to use an external repository database, refer to "C.3 Using an External Repository for WebAdmin" for details.

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build 38)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.

Configure your browser to allow cookies and pop-up requests from the server on which FUJITSU Enterprise Postgres is installed.

Refer to "Appendix B Recommended WebAdmin Environments" for information on how to change the pop-up request settings and other recommended settings.

Note

- WebAdmin does not run in Windows(R) safe mode.

- If the same instance is operated from multiple WebAdmin windows, it will not work correctly.

- If the same instance is operated from multiple WebAdmin versions, it will not work normally. It is always recommended to use the latest version of WebAdmin to operate the instance.

- For efficient use of WebAdmin, it is recommended not to use the browser [Back] and [Forward] navigation buttons, the [Refresh] button, and context-sensitive menus, including equivalent keyboard shortcuts.

- Copying and pasting the WebAdmin URLs are not supported. Additionally, bookmarking of WebAdmin URLs is not supported.

- It is recommended to match the language between the instance server locale and WebAdmin.

- WebAdmin supports only two languages: English and Japanese.

- It is recommended to change the WebAdmin language setting from the instance details page only.
- It is recommended to operate WebAdmin using the WebAdmin launcher.
- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.
- If the browser was not operated for a fixed period (about 30 minutes), the session will time out and the login page will be displayed again for the next operation.
- Port access permissions
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions.
  Consider the security risks carefully when opening ports.
- In environments where the non-global zone of Solaris 10 and Solaris 11 is used, WebAdmin cannot be used in the global zone.

**4.3.1.1 Logging in to WebAdmin**

This section describes how to log in to WebAdmin.

**Activation URL for WebAdmin**

In the browser address bar, type the activation URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- **hostNameOrIpAddress**: Host name or IP address of the server where WebAdmin is installed.
- **portNumber**: Port number of WebAdmin. The default port number is 27515.

The activation URL window shown below is displayed. From this window you can launch WebAdmin or access the product documentation.

---

**Logging in to the database server**

Click [Launch WebAdmin] in the activation URL window to activate WebAdmin and display the login window. Enter the instance administrator user ID (operating system user account name) and password, and log in to WebAdmin.
4.3.1.2 Creating an Instance

This section describes how to create an instance.

Information

WebAdmin calculates values using the formula indicated in "Managing Kernel Resources" under "Server Administration" in the PostgreSQL Documentation, and configures these in the kernel parameters. Refer to "Appendix J Configuring Kernel Parameters" for information on configuring parameter names.

Refer to "Appendix D Configuring Parameters" for information on the postgresql.conf values required to derive the set values.

1. Activate WebAdmin, and log in to the database server.

2. In the [Instances] tab, click 

---
3. Enter the information for the instance to be created.

Enter the following items:

- **[Configuration type]**: Whether to create a standalone instance or an instance that is part of a cluster.
- **[Server product type]**: Whether to create a FUJITSU Enterprise Postgres 9.5 instance or a FUJITSU Enterprise Postgres 9.6 instance. The default is "FUJITSU Enterprise Postgres 9.6".

WebAdmin can create and manage instances that are compatible with FUJITSU Enterprise Postgres 9.5, however, the new features in FUJITSU Enterprise Postgres 9.6 may not be supported for such instances, and may be disabled.
- **[Location]**: Whether to create the instance in the server that the current user is logged into, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.
- **[Instance name]**: Name of the database instance to manage

  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- **[Instance port]**: Port number of the database server
- **[Data storage path]**: Directory where the database data will be stored
- **[Backup]**: Whether to enable or disable the WebAdmin backup feature. The default is "Enabled". Select "Disabled" to disable all backup and restore functionality for the instance.

  If "Enabled" is selected, enter the following item:
  - **[Backup storage path]**: Directory where the database backup will be stored
- **[Transaction log path]**: Directory where the transaction log will be stored
- **[Encoding]**: Database encoding system

If "Remote" is selected for [Location], enter the following additional items:
- [Host name]: Name of the host where the instance is to be created
- [Operating system credential]: Operating system user name and password for the remote machine where the instance is to be created
- [Remote WebAdmin port for standalone]: Port in which WebAdmin is accessible in the remote machine

**Note**

- Refer to "4.2.2 Preparing Directories for Resource Deployment" - "Considerations when deploying resources" for information on points to consider when determining the data storage path, backup storage path, and transaction log path.
- The following items can be modified after the instance has been created. These items can be modified for FUJITSU Enterprise Postgres 9.6 instances only.
  - Instance name
  - Port number
  - Backup storage path

Refer to "Editing instance information" for details.
- Do not specify directories that include symbolic link or multibyte characters when specifying the data storage destination or backup data storage destination.
- In the instance that is created using WebAdmin, the locale of the character set to be used in the database, and the locale of the collating sequence, are fixed using C.

4. Click  to create the instance.

If the instance is created successfully, a message indicating the same will be displayed.

5. The instance will be started when it is created successfully.
6. Back up the basic information that was set

Back up the WebAdmin management information periodically to ensure operational continuity when a fault occurs on the system disk. Follow the procedure below to perform the backup.

   a. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin” for details.
   b. Back up the following directory:

   ```
   webAdminInstallDir/data/tepwa
   ```

4.3.1.3 Changing Instance Settings

You can change the information that is set when an instance is created.

Change the following settings to suit the operating and management environment for FUJITSU Enterprise Postgres.

- **Instance configuration**
  - Character encoding
  - Communication
  - SQL options
  - Used memory
  - Streaming replication
- **Changing client authentication information**
- **Editing instance information**

**Information**

These settings are the same as the parameters that can be set in the files shown below. Refer to "Appendix D Configuring Parameters" for information on the equivalence relationship between the item name and the parameter.

- postgresql.conf
- pg_hba.conf

**Note**

The files shown below can also be modified directly, however if a parameter not described in "Appendix D Configuring Parameters" was edited by mistake, WebAdmin may not run correctly.

- postgresql.conf
- pg_hba.conf

**Instance configuration**

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click .
3. Click to change the configuration.
4. Click to save your changes.
Select a client-side encoding system that can be converted to/from the database encoding system. Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the PostgreSQL Documentation for information on the encoding system combinations that can be converted.

Changing client authentication information

1. Start WebAdmin and log in to the database server.

2. In the [Instances] tab, click  

   Click  to register new authentication information.

   To change authentication information, select the information, and then click  .

   To delete authentication information, select the information, and then click  .

   **Note**

   When creating the instance, do not delete the entry below, because it is a connection required for WebAdmin to monitor the operational status of the database:
   Type=local, Database=all, User=all, and Method=md5
Click - the window will change as shown below.

![Image of the interface showing instance information]

Editing instance information

Use the [Edit instance] page to modify the following items for an instance:

- Instance name
- Port number
- Backup storage path

1. In the [Instances] tab, click . The [Edit instance] page is displayed.

![Image of the Edit instance page showing instance information and backup settings]
2. Modify the relevant items.

If [Backup storage path] is changed, [Backup management] is enabled. Select the required option:

- Retain existing backup: Create a backup in [Backup storage path] and retain the existing backup in its original location.
- Copy existing backup to new path: Copy the existing backup to [Backup storage path]. A new backup will not be created. The existing backup will be retained in its original location.
- Move existing backup to new path: Move the existing backup to [Backup storage path]. A new backup will not be created.
- Remove existing backup: Create a backup in [Backup storage path]. The existing backup will be removed.

3. Click ✔️ to save your changes.

**Note**

- The [Edit instance] page is also displayed when the user selects ‘Navigate to the “Edit instance” page’ from the [Anomaly Error] dialog box. Refer to “Anomaly Detection and Resolution” in the Operation Guide for information on what takes place when an anomaly is detected.
- When [Instance name] or [Instance port] is modified, the log_directory and core_directory parameters in postgresql.conf are updated. Also, the specified directories are created if they do not exist.

Refer to "4.3.1.4 Importing Instances" for information on the format of these directories.

---

### 4.3.1.4 Importing Instances

Instances can be created using WebAdmin, or via the command line using the initdb command. Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin.

This section explains how to import command line instances into WebAdmin.

1. In the [Instances] tab, click ✔️. The [Import instance] page is displayed.

2. Enter the information for the instance being imported. Refer to "4.3.1.2 Creating an Instance" for information on the items that need to be entered.

3. Click ✔️ to import the instance.

**Note**

- Importing neither starts nor stops the instance.
- The following restrictions apply to instance import:
  - Any instance already managed by WebAdmin cannot be imported again.
  - The postgresql.conf file must be located in the same directory as [Data storage path].
  - Read/write permissions are required for [Data storage path].
  - The location specified in postgresql.conf for the following files must not have been changed:
    - hba_file
    - ident_file
  - If the instance is part of a cluster that is monitored by Mirroring Controller, WebAdmin will be unable to detect the Mirroring Controller settings.
  - Instances making use of Mirroring Controller functionality should not be imported, because subsequent operations on those instances may cause unexpected and undesirable side-effects.
  - It is not possible to import and operate an instance that uses a directory mounted by Network File System (NFS).
- You must make the following changes to the parameters in postgresql.conf prior to importing the instance in WebAdmin.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The port parameter should be uncommented.</td>
</tr>
</tbody>
</table>

The log_directory and core_directory parameters in postgresql.conf are updated during import. Also, the specified directories are created if they do not exist.

The format of these directories is as follows:

log_directory: `/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/log`

core_directory: `/var/tmp/fsep_version/instanceAdminUser_instanceNamePortNumber/core`

version: product version_edition_architecture

instanceAdminUser: operating system user name

PortNumber: port number specified when creating the instance

Examples:

log_directory: `/var/tmp/fsep_96_SE_64/naomi_myinst27599/log`

core_directory: `/var/tmp/fsep_96_SE_64/naomi_myinst27599/core`

- When a standby instance is imported, a valid entry, using the IP address of the standby instance, must exist in the pg_hba.conf file of the master instance to allow the standby instance to connect to the master instance.
- When a standby instance is imported, the value for "host" in the primary_conninfo parameter of recovery.conf should match the host name of the master instance.
- Instances created by other operating systems cannot be imported.

---

### 4.3.2 Using the initdb Command

This section describes the procedure to create an instance using the initdb command.

Important note: If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

---

### 4.3.2.1 Editing Kernel Parameters

Refer to "Appendix J Configuring Kernel Parameters" prior to editing these settings. After the settings are complete, check the command specifications of the relevant operating system and restart the system if required.

---

### 4.3.2.2 Creating an Instance

Create an instance, with the database cluster storage destination specified in the PGDATA environment variable or in the -D option. Furthermore, the user that executed the initdb command becomes the instance administrator.

**Note**

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- If creating multiple instances, ensure that there is no duplication of port numbers or the directories that store database clusters.

See

Refer to "initdb" in "Reference" in the PostgreSQL Documentation for information on the initdb command.

The procedure to create an instance is described below.

1. Use the OS user account that you want as the instance administrator.
   Connect with the server using the OS user account that you want as the instance administrator.
   You cannot use the OS superuser (root).
   The following example shows the OS superuser connected to the server being changed to the OS user account "fsepuser".

   Example
   
   ```
   # su fsepuser
   ```

2. Configure the environment variables
   Configure the environment variables in the server with the newly created instance.
   Set the following environment variables:
   - PATH environment variables
     Add the installation directory "/bin".
   - MANPATH environment variables
     Add the installation directory "/share/man".
   - LD_LIBRARY_PATH_64 environment variables
     Add the installation directory "/lib".

   Example
   The following example configures environment variables when the installation directory is "/opt/fsepv<xy>server64".
   Note that "<xy>" indicates the product version and level.

   sh, bash
   
   ```
   $ PATH=/opt/fsepv<xy>server64/bin:$PATH ; export PATH
   $ MANPATH=/opt/fsepv<xy>server64/share/man:$MANPATH ; export MANPATH
   $ LD_LIBRARY_PATH_64=/opt/fsepv<xy>server64/lib:$LD_LIBRARY_PATH_64 ; export LD_LIBRARY_PATH_64
   ```

   csh, tcsh
   
   ```
   $ setenv PATH /opt/fsepv<xy>server64/bin:$PATH
   $ setenv MANPATH /opt/fsepv<xy>server64/share/man:$MANPATH
   $ setenv LD_LIBRARY_PATH_64 /opt/fsepv<xy>server64/lib:$LD_LIBRARY_PATH_64
   ```

3. Create a database cluster
   Create the database cluster with the initdb command, specifying the storage destination directory.
   Specify the transaction log storage destination and the locale setting option as required.

   Example

   ```
   $ initdb -D /database/inst1 --xlogdir=/transaction/inst1 --lc-collate="C" --lc-ctype="C" --encoding=UTF8
   ```
In some features, instance names are requested, and those names are required to uniquely identify the instance within the system. These features allow names that conform to WebAdmin naming conventions, so refer to the following points when determining the names:

- Maximum of 16 characters
- The first character must be ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

To balance I/O load, consider deploying the transaction log storage destination to a disk device other than the database cluster storage destination and the backup data storage destination.

Specify "C" or "POSIX" for collation and character category. Performance deteriorates if you specify a value other than "C" or "POSIX", although the behavior will follow the rules for particular languages, countries and regions. Furthermore, this may need to be revised when running applications on systems with different locales. For example, specify as follows:

```
initdb --lc-messages="C"
initdb --lc-collate="C" --lc-ctype="C"
```

Specify the same string in the LANG environment variable of the terminal that starts FUJITSU Enterprise Postgres as was specified in lc-messages of initdb (lc_messages of postgresql.conf). If the same string is not specified, messages displayed on the terminal that was started, as well as messages output to the log file specified in the -l option of the pg_ctl command or the postgres command used for startup, may not be output correctly.

Specify an encoding system other than SQL_ASCII for the database. If SQL_ASCII is used, there is no guarantee that the encryption system for data in the database will be consistent, depending on the application used to insert the data.

Refer to "Locale Support" in "Localization" in "Server Administration" in the PostgreSQL Documentation for information on locales.

4. Set port number.

Specify a port number in the port parameter of postgresql.conf. Ensure that the specified port number is not already used for other software. If a port number is not specified, "27500" is selected.

Register the specified port numbers in the /etc/services file if WebAdmin is used to create other instances. WebAdmin uses the /etc/services file to check if port numbers specified as available candidates have been duplicated.

Register any name as the service name.

5. Set the corefile output destination.

Specify the output destination of the corefile, which can later be used to collect information for investigation, by setting the core_directory and core_contents parameters of postgresql.conf.

Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

6. Set the backup storage destination.

Specify the backup data storage destination and other backup settings when backup is to be performed as a provision against database errors.
7. Start an instance.

Start with the start mode of the `pg_ctl` command.

It is recommended to specify the `-w` option, which causes the command to return after waiting for the instance to start. If the `-w` option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

If either of the following conditions are met, the message "FATAL: the database system is starting up(11189)" may be output.
- An application, command, or process connects to the database while the instance is starting
- An instance was started with the `-w` option specified

This message is output by the `pg_ctl` command to check if the instance has started successfully. Therefore, ignore this message if there are no other applications, commands, or processes that connect to the database.

Example

```
$ pg_ctl start -w -D /database/inst1
```

4.4 Configuring Remote Connections

This section describes the settings required when connecting remotely to FUJITSU Enterprise Postgres from a database application or a client command.

4.4.1 When an Instance was Created with WebAdmin

Settings related to connection

The default is to accept connections from remote computers to the database.

Change "listen_addresses" in `postgresql.conf` to modify the default behavior.

Refer to "Appendix D Configuring Parameters" for information on `postgresql.conf`.

Client Authentication Information settings

The following content is set by default when WebAdmin is used to create an instance.

- Authentication of remote connections from local machines is performed.
- Only the instance administrator can perform connections in a UNIX domain socket.

When changing Client Authentication Information, select [Client Authentication] from [Setting], and then change the settings.

4.4.2 When an Instance was Created with the `initdb` Command

Connection settings

The default setting only permits local connections from the client to the database. Remote connections are not accepted.

Change "listen_addresses" in `postgresql.conf` to perform remote connection.

All remote connections will be allowed when changed as shown below.
Example

```
listen_addresses = '*'
```

Also, configure the parameters shown below in accordance with the applications and number of client command connections.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
</tr>
</thead>
<tbody>
<tr>
<td>superuser_reserved_connections</td>
<td>Number of connections reserved for database maintenance, for example backup or index rebuilding. If you need to simultaneously perform a large number of processes that exceed the default value, change this value accordingly.</td>
</tr>
</tbody>
</table>
| max_connections                         | Set the value as:                                                                                                                            
|                                         | `numberOfSimultaneousConnectionsToInstance + superuser_reserved_connections`                                                                 |

Client authentication information settings

When trying to connect from a client to a database, settings are required to determine whether the instance permits connections from the client - if it does, then it is possible to make settings to determine if authentication is required.

Refer to "The pg_hba.conf File" in "Server Administration" in the PostgreSQL Documentation for details.

4.5 Other Settings

This section describes settings that are useful for operations.

4.5.1 Error Log Settings

This section explains the settings necessary to monitor errors in applications and operations, and to make discovering the causes easier.

Make error log settings only when instances are created with the initdb command.

When creating instances with WebAdmin, these settings are already made and hence do not need to be set.

However, if outputting system logs, the treatment described in "Settings related to operating system logs" is required.

Furthermore, some parameters are used by WebAdmin, and if changed, may cause WebAdmin to no longer work properly. Refer to "Appendix D Configuring Parameters" for details.

Settings related to operating system logs

By default, only errors (ERROR, FATAL, PANIC) are output to logs. To output messages other than errors, the superuser of the operating system must change the system log settings.

1. Edit the configuration file of the system log daemon
   
   In `/etc/syslog.conf`, add the facility and level of messages to be output to the lines containing the files targeted for output.
   
   Specify the facility in the syslog_facility parameter of postgresql.conf.
   
   Also, there are notes such as the rule for the sequence for specifying levels. Refer to the relevant manual of your operating system for details.
   
   Below is an example of the settings for outputting to the standard system log file (/var/adm/messages) at the information level (info) for the default facility LOCAL0 (the relevant portion is underlined):

   ```
   *.err; local0.info; kern.debug; daemon.info; mail.crit /var/adm/messages
   ```

2. Restart the system log daemon
   
   Use the svcadm command as follows:
# svcadm restart svc:/system/system-log

## Note

Set the output destination for the system log to the server log so that it cannot be viewed by administrators of other instances.

Application errors are output to the system log or server log. The output destination directory for the system log and server log should have access permissions set so that they cannot be viewed by people other than the instance administrator.

Edit the following parameters in postgresql.conf:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>How to enable the settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>syslog_ident</td>
<td>Used to specify labels to attach to messages, so that these can be identified when output to the system log if more than one FUJITSU Enterprise Postgres is used.</td>
<td>reload option of the pg_ctl mode</td>
</tr>
<tr>
<td>logging_collector</td>
<td>Specify &quot;on&quot; to ensure that messages are output by FUJITSU Enterprise Postgres to the server log file. The server log file is created in the pg_log directory in the database cluster.</td>
<td>restart option of the pg_ctl mode</td>
</tr>
<tr>
<td>log_destination</td>
<td>Specify &quot;stderr,syslog&quot; to output messages from FUJITSU Enterprise Postgres to the screen and either the system log or the event log.</td>
<td>reload option of the pg_ctl mode</td>
</tr>
<tr>
<td>log_line_prefix</td>
<td>Specify information to be added at the start of messages output by an instance. This information is useful for automatic monitoring of messages. You can output the SQLSTATE value, output time, executing host, application name, and user ID. Refer to &quot;What To Log&quot; in the PostgreSQL Documentation for details. Example: log_line_prefix = '%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a'</td>
<td>reload option of the pg_ctl mode</td>
</tr>
</tbody>
</table>

## Point

- If you want fewer application errors being output to the system log, refer to "When To Log" and "What To Log" in the PostgreSQL Documentation for information on how to reduce the output messages.
- If you want to separate errors output from other software, refer to "Where To Log" in the PostgreSQL Documentation to change the output destination to the server log file rather than the system log.

### 4.5.2 Configuring Automatic Start and Stop of an Instance

You can automatically start or stop an instance when the operating system on the database server is started or stopped.

Use the following procedure to configure automatic start and stop of an instance.

Note that, if an instance is activated in a failover operation, the cluster system will control the start or stop, therefore this feature should not be used. Also, when performing database multiplexing, refer to "Enabling Automatic Start and Stop of Mirroring Controller and Multiplexed Instances" in the Cluster Operation Guide.

Note that "<xy>" in paths indicates the product version and level.

1. Set the OS user account of the instance administrator
   - If you are logged in using the OS user account of the instance administrator, set the environment variables required for starting the instance.

- 34 -
2. Create a shell script.

Copy the sample shell script (stored in the location shown below) to /etc/init.d, then set and register the access rights. After that, revise the shell script according to the target instance.

```
fujitsuEnterprisePostgresInstallDir/share/rc_fsepsvoi.sample
```

The content to be revised is as follows:

- In the “SYMDATA” variable, set the data storage destination.
- In the “SYMUSER” variable, set the OS user account of the instance administrator mentioned in step 1.

Example

In the following example the installation directory is "/opt/fsepv<xy>server64", and the shell script has been created as "rc_fsepsvoi_inst1".

```
# cp /opt/fsepv<xy>server64/share/rc_fsepsvoi.sample /etc/init.d/rc_fsepsvoi_inst1
# chmod 755 /etc/init.d/rc_fsepsvoi_inst1
```

3. Create a symbolic link

Create a symbolic link to the shell script mentioned in step 2.

- Create a symbolic link for the directory below to enable automatic start.
  
  - /etc/rc2.d

Append an uppercase "S" and 2-digit number to the symbolic link name and specify the starting sequence with other services that are to be started automatically.

For FUJITSU Enterprise Postgres, basic services of the operating system such as network must be started beforehand, so append as high a number as possible so that instances will start later than such services.

In the following example, the instance "inst1" is set to start automatically.

Example

```
# ln -s /etc/init.d/rc_fsepsvoi_inst1 /etc/rc2.d/S85fsepsvoi_inst1
```

- Create a symbolic link for the directories below to enable automatic stop.

  - /etc/rc0.d
  - /etc/rc1.d
  - /etc/rcS.d

Append an uppercase "K" and 2-digit number to the symbolic link name and specify the stopping sequence with other services that are to be stopped automatically.

For FUJITSU Enterprise Postgres, instances must be stopped before basic services of the operating system such as network, so append as low a number as possible to ensure that instances are stopped first. However, in order to coordinate the start and stop order, the value to be specified here is the result of the value specified in the automatic start setting subtracted from 100.

In the following example, the instance "inst1" is set to stop automatically.

Example

```
# ln -s /etc/init.d/rc_fsepsvoi_inst1 /etc/rc0.d/K15fsepsvoi_inst1
# ln -s /etc/init.d/rc_fsepsvoi_inst1 /etc/rc1.d/K15fsepsvoi_inst1
# ln -s /etc/init.d/rc_fsepsvoi_inst1 /etc/rcS.d/K15fsepsvoi_inst1
```

4.5.3 Settings when Using the features compatible with Oracle databases

The compatibility feature for Oracle databases enables FUJITSU Enterprise Postgres to be used without any special settings by creating a database instance. Note that settings are required only when using the SUBSTR function.
4.6 Integration with Message-Monitoring Software

To monitor messages output by FUJITSU Enterprise Postgres using software, configure the product to monitor SQLSTATE, instead of the message text - this is because the latter may change when FUJITSU Enterprise Postgres is upgraded.

Configure FUJITSU Enterprise Postgres to output messages in a format that can be read by the message-monitoring software by specifying "%e" in the log_line_prefix parameter of postgresql.conf to output the SQLSTATE value.

A setting example is shown below - it outputs the output time, executing host, application name, and user ID, in addition to the SQLSTATE value.

Example

```
log_line_prefix = '%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a '
```

Refer to "What To Log" in the PostgreSQL Documentation for information on how to configure the settings.

To monitor messages output to the system log, it is also necessary to configure the operating system. Refer to "Settings related to operating system logs" for details.

4.7 Deleting Instances

This section explains how to delete an instance.

- 4.7.1 Using WebAdmin
- 4.7.2 Using Server Commands

Note

- Always use WebAdmin to delete instances that were created using it. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.
- If you have set automatic start and stop of the instance, follow the procedure described in "4.5.2 Configuring Automatic Start and Stop of an Instance" to disable the shell script and symbolic link and cancel registration.

4.7.1 Using WebAdmin

This section explains how to delete an instance using WebAdmin.

Use the following procedure to delete an instance.

1. Stop the instance

   In the [Instances] tab, select the instance to stop and click 🟢.

2. Back up files.

   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and the transaction log storage destination.
3. Delete the instance
   In the [Instances] tab, select the instance to delete and click 

Note
Deleting an instance deletes only the following lowest-level directories. If they are not required, delete them manually.
- Data storage destination
- Backup data storage destination
- Transaction log storage destination (if different from the data storage destination)

4.7.2 Using Server Commands
This section explains how to delete an instance using server commands.
Use the following procedure to delete an instance.
1. Stop the instance
   Execute the stop mode of the pg_ctl command.
   An example is shown below:
   Example
   ```bash
   $ pg_ctl stop -D /data/inst1
   ```
2. Back up files.
   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and the transaction log storage destination.
3. Delete the instance
   Use a standard UNIX tool (the rm command) to delete the following directories:
   - Data storage destination
   - Backup data storage destination
   - Transaction log storage destination (if a directory different from the data storage directory was specified)
Chapter 5 Uninstallation

This chapter describes the procedure for uninstalling FUJITSU Enterprise Postgres.

5.1 Uninstallation in Interactive Mode

Uninstall according to the following procedure:

Note that "x.y SPz" in sample windows indicates the version level of products to uninstall, and similarly, "<xy>" in paths indicates the product version level.

Note

To reinstall FUJITSU Enterprise Postgres after it was uninstalled, and reuse an instance that was already created so that it can be managed from WebAdmin, back up the directory shown below in which the WebAdmin instance management information had been defined before uninstalling FUJITSU Enterprise Postgres, and then restore the backed up directory to its original location once FUJITSU Enterprise Postgres has been reinstalled.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following directory:
   
   webAdminInstallDir/data/fepwa

Information

If an error occurs while the product is being uninstalled, refer to "Appendix F Uninstall (middleware) Messages" and take the required action.

1. Delete the operation information

If the FUJITSU Enterprise Postgres operation information has been registered in the operating system or another middleware product, for example, then it must be deleted. Cases in which deletion is required are as follows:

- If you have set automatic start and stop of the instance, follow the procedure described in "4.5.2 Configuring Automatic Start and Stop of an Instance" to disable the shell script and symbolic link and cancel registration.

2. Stop applications and the client program

Before starting the uninstallation, stop the following:

- Applications that use the product
- Instance
  
  Using WebAdmin
  
  In the [Instances] tab, select the instance to stop and click .

  Using server commands
  
  Execute the pg_ctl command in stop mode.

  $ /opt/fsepv<xy>/server64/bin/pg_ctl stop -D /database/inst1

- Web server feature of WebAdmin
  
  Execute the WebAdminStop command to stop the Web server feature of WebAdmin.
Example

If WebAdmin is installed in /opt/fsepv<xy>webadmin:

```bash
# cd /opt/fsepv<xy>webadmin/sbin
# ./WebAdminStop
```

- Mirroring Controller

Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

Example

```bash
$ mc_ctl stop -M /mcdir/instl
```

### 3. Change to the superuser

Run the following command to switch to the superuser on the system.

```bash
$ su -
Password:******
```

### 4. Start the Uninstall (middleware)

Execute the following command:

```bash
# /opt/FJSVcir/cimanager.sh -c
```

### 5. Select the software

Type the number for the product to be uninstalled, and press Enter.

```
Loading Uninstaller...

Currently installed products
1. FUJITSU Enterprise Postgres Client(64bit)  x.y SPz
2. FUJITSU Enterprise Postgres WebAdmin  x.y SPz
3. FUJITSU Enterprise Postgres Standard Edition(64bit)  x.y SPz
4. FUJITSU Enterprise Postgres Client(32bit)  x.y SPz

Type [number] to select the software you want to uninstall. [number,q]
-->3
```

### 6. Start the uninstallation

To start the uninstallation, type "y" and press Enter.

To display the list of products again, type "b" and press Enter.

```
FUJITSU Enterprise Postgres Standard Edition(64bit)
   Description: FUJITSU Enterprise Postgres Standard Edition(64bit)
   Version:  x.y SPz
   Manufacturer: Fujitsu Limited.
   Install directory: /opt/fsepsv64
   Date of install: 2016-7-1

Starting the uninstall of the software. Are you sure you want to continue? [y,b,q] y
```

### 7. Finish the uninstallation

Upon successful completion, the window below is displayed.
The installation directory may remain after uninstallation. If it is not required, delete it.

Uninstalling...

FUJITSU Enterprise Postgres Standard Edition(64bit) is being uninstalled now.
100% ################################

The following products have been uninstalled successfully:

FUJITSU Enterprise Postgres Standard Edition(64bit)

Uninstallation of "FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz" has completed successfully.

Exiting Uninstaller.

5.2 Uninstallation in Silent Mode

Uninstall according to the following procedure:

Note

To reinstall FUJITSU Enterprise Postgres after it was uninstalled, and reuse an instance that was already created so that it can be managed from WebAdmin, back up the directory shown below in which the WebAdmin instance management information had been defined before uninstalling FUJITSU Enterprise Postgres, and then restore the backed up directory to its original location once FUJITSU Enterprise Postgres has been reinstalled.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following directory:

   webAdminInstallDir/data/fepwa

1. Delete the operation information

   If the FUJITSU Enterprise Postgres operation information has been registered in the operating system or another middleware product, for example, then it must be deleted. Cases in which deletion is required are as follows:
   - If you have set automatic start and stop of the instance, follow the procedure described in "4.5.2 Configuring Automatic Start and Stop of an Instance" to disable the shell script and symbolic link and cancel registration.

2. Stop applications and the client program

   Before starting the uninstallation, stop the following:
   - Applications that use the product
   - Instance

   Using WebAdmin
   
   In the [Instances] tab, select the instance to stop and click .

   Using server commands

   Execute the pg_ctl command with the stop mode option specified.

   $ /opt/fsepv<xy>/server64/bin/pg_ctl stop -D /database/inst1
- Web server feature of WebAdmin

Execute the WebAdminStop command to stop the Web server feature of WebAdmin.

**Example**

If WebAdmin is installed in /opt/fsepv<xy>webadmin:

```
# cd /opt/fsepv<xy>/webadmin/sbin
# ./WebAdminStop
```

- Mirroring Controller

Execute the mc_ctl command with the stop mode option specified and stop the Mirroring Controller.

**Example**

```
$ mc_ctl stop -M /mcdir/inst1
```

3. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

4. Run the uninstallation

Execute the command below.

The installation directory may remain after uninstallation. If it is not required, delete it.

**Example**

```
# /opt/fsepv<xy>/server64/setup/suninst.sh
```

In the example above, /opt/fsepv<xy>/server64/setup is the name of the installation directory in which the server product is installed.

```
# /opt/fsepv<xy>/webadmin/setup/suninst.sh
```

In the example above, /opt/fsepv<xy>/webadmin/setup is the name of the installation directory in which the WebAdmin is installed.

5. Check the results

The uninstaller result is output to the log file.

**Log file**

`xyz` is the number part when the product version level is `x.y.SPz`.

**Server products**

Path name: `/var/log/fsep_SERVER64_\_xyz\_uninstall.log`

**WebAdmin**

Path name: `/var/log/fsep_WEBADMIN_\_xyz\_uninstall.log`

**Return values**

The following return values are output:

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for uninstallation do not exist.</td>
</tr>
<tr>
<td>Return values</td>
<td>Meaning</td>
</tr>
<tr>
<td>--------------</td>
<td>---------</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>Uninstall (middleware) has not been installed, or there are no execution privileges.</td>
</tr>
<tr>
<td>99</td>
<td>A system error occurred.</td>
</tr>
<tr>
<td>100</td>
<td>The command argument is invalid.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
</tbody>
</table>
Appendix A Installation in Silent Mode

This appendix provides specifications for installation in silent mode.

A.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sectionName</code></td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td><code>parameterName</code></td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**Note**
- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (") and commas (,).
- The following characters can be used in the setting for rows with the section name "installInfo":
  - Alphanumeric characters and double quotation marks
- The following characters can be used in the setting for rows with the section name "parameters":
  - Alphanumeric characters, hyphens and forward slashes

**Information**

The template for the installation parameters CSV file is "mountpoint/sample/sample.csv".

A.2 List of Parameters

This section describes the parameters that can be set for each section.
**installInfo section**

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Name</td>
<td>Mandatory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>For this software, specify the following value:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>&quot;FUJITSU Enterprise Postgres&quot;</td>
</tr>
</tbody>
</table>

**Information**

- In addition to "Name", the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition

- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.

- The values set in these parameters do not affect silent installation.

**Example**

```
installInfo,Name,FUJITSU Enterprise Postgres
```

**parameters section**

The parameters that can be set in the parameters section are shown below.

Note that "<xy>" indicates the product version and level.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the server</td>

A.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error is detected during installation of the product, a message is output to the log:

Log file

.xyz is the number part when the product version level is x.y SPz.

Path name: /var/log/fsep_SERVER64_media_xyz_install.log

Messages and return values

CSV file errors

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error: code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>Either installInfo or the Name parameter has not been specified.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value is specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>There is no line in the “parameters” section.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified parameter is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The same value at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values. The parameter name is displayed in @1@ and @2@.</td>
</tr>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path. The parameter name is displayed in @1@.</td>
</tr>
<tr>
<td>Return value</td>
<td>Message</td>
<td>Explanation and actions</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>26</td>
<td>Port number @1@ is already used in the service file/etc/services.</td>
<td>The port number is already being used. Specify an unused port number. The port number is displayed in @1@</td>
</tr>
</tbody>
</table>
| 28           | There is no product for installation.                                   | No product was specified for installation. Specify “Y” for at least one of the following parameters:
|              |                                                                        | - ServerInstallExecute  |
|              |                                                                        | - Client32InstallExecute|
|              |                                                                        | - Client64InstallExecute|
|              |                                                                        | - WebAdminInstallExecute|
| 29           | USAGE : silent.sh inputfile                                            | The argument specified in the command is incorrect. Specify the correct argument. |

**Product installer errors**

The following return values are returned when errors occur while the product installer is running.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>11</td>
<td>A product that cannot coexist with FUJITSU Enterprise Postgres has been installed.</td>
</tr>
<tr>
<td>12</td>
<td>This OS is not supported.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for installation do not exist.</td>
</tr>
<tr>
<td>16</td>
<td>Unable to change the permission because the directory does not exist.</td>
</tr>
<tr>
<td>17</td>
<td>Failed to install because a required package is missing.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>30</td>
<td>Failed to copy the installation material.</td>
</tr>
<tr>
<td>32</td>
<td>The product is already installed.</td>
</tr>
<tr>
<td>33</td>
<td>Server product and WebAdmin product cannot be installed in the same machine.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>61</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>The uninstallation cannot be performed either because Uninstall (middleware) does not exist or because there are no execution privileges.</td>
</tr>
<tr>
<td>68</td>
<td>Failed to set up WebAdmin.</td>
</tr>
<tr>
<td>99</td>
<td>A system error occurred.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
</tbody>
</table>
A.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

Records

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa, bbb, ccc</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,,ccc</td>
<td>aaa, ccc</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa, bbb</td>
</tr>
</tbody>
</table>

- Headers cannot be specified.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>field1,field2,field3</td>
<td>field1,field2,field3</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa, bbb, ccc</td>
</tr>
</tbody>
</table>
Appendix B  Recommended WebAdmin Environments

This appendix describes the recommended WebAdmin environment. The following explanation is based on the assumption that Internet Explorer 11.0 or later is used unless otherwise stated.

B.1  Recommended Browser Settings

- Use a display resolution of 1280 x 768 or higher, and 256 colors or more.
- Select [View] >> [Text size] >> [Medium].
- Select [View] >> [Zoom] >> [100%].
- Click [Tools] >> [Internet options] >> [General] >> [Fonts], and then:
  - Set [Webpage font] to [Times New Roman].
  - Set [Plain text font] to [Courier New].

B.2  How to Set Up the Pop-up Blocker

If the Pop-up Blocker is enabled, use the procedure below to configure settings to allow pop-ups from the server where FUJITSU Enterprise Postgres is installed.

1. Click [Tools] >> [Internet options], and then select the [Privacy] tab.
   If [Turn on Pop-up Blocker] is not selected, the Pop-up Blocker feature will not operate, and therefore steps below are not required.
2. Click [Settings].
3. In the [Pop-up Blocker Settings] window, enter in the [Address of website to allow] the URL of the server where FUJITSU Enterprise Postgres is installed, and then click [Add].
4. Click [Close].
5. In the [Internet Options] window, click [OK].
Appendix C Setting Up and Removing WebAdmin

This appendix describes how to set up and remove WebAdmin.

Note that "<xy>" in paths indicates the product version and level.

C.1 Setting Up WebAdmin

This section explains how to set up WebAdmin.

C.1.1 Setting Up WebAdmin

Follow the procedure below to set up WebAdmin.

1. Change to the superuser
   
   Acquire superuser privileges on the system.
   
   Example
   
   ```
   $ su -
   Password:******
   ```

2. Set up WebAdmin
   
   Set up WebAdmin.
   
   Example
   
   If WebAdmin is installed in /opt/fsepv<xy>webadmin:
   
   ```
   # cd /opt/fsepv<xy>/webadmin/sbin
   # ./WebAdminSetup
   ```

3. Specify the port number
   
   Specify the following port numbers to be used in WebAdmin.
   
   Refer to the "/etc/services" file and only change to a different port number if there is overlap with a port number from another service.
   
   Make a note of the port number for the Web server, because it will be required for activating the WebAdmin window.

<table>
<thead>
<tr>
<th>Item</th>
<th>Value (recommended value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web server port number</td>
<td>27515</td>
</tr>
<tr>
<td>enter port number of Web Server (default: 27515):</td>
<td></td>
</tr>
<tr>
<td>WebAdmin internal port number</td>
<td>27516</td>
</tr>
<tr>
<td>enter Internal port number for WebAdmin (default: 27516):</td>
<td></td>
</tr>
<tr>
<td>WebAdmin automatic start</td>
<td>y</td>
</tr>
<tr>
<td>Start WebAdmin automatically when system starting? [y,n] (default: y)</td>
<td></td>
</tr>
</tbody>
</table>

Web server port number

Specify a numeric value from 1024 to 32767 for the port number to be used for communication between the Web browser and the Web server.

The Web server port number will be registered as a port number with the following service name in the "/etc/services" file.

<xy> is the number part when the version is x.y.

fsep_xySPz_edition_64_WebAdmin_Port1
WebAdmin internal port number

Specify a numeric value from 1024 to 32767 for the port number to be used for communication between the Web server and the WebAdmin runtime environment.

The WebAdmin internal port number will be registered as a port number with the following service name in the /etc/services file.

`xy` is the number part when the version is `x.y`.

`fsep_xySPz_edition_64_WebAdmin_Port2`

WebAdmin automatic start

Select whether or not to start WebAdmin when the machine is started.

---

**Note**

- Unused port numbers
  Irrespective of the information specified in the `/etc/services` file, unused port numbers in the OS and other products can sometimes be automatically numbered and then used, or port numbers specified in environment files within products may also be used. Check the port numbers used by the OS and other products, and ensure that these are not duplicated.

- Access restrictions
  Prevent unauthorized access and maintain security by using a firewall product, or the packet filtering feature of a router device, to restrict access to the server IP address and the various specified port numbers.

- Port access permissions
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

- Changing port numbers
  When using WebAdmin in multiregion mode, it is recommended not to change WebAdmin ports after creating instances. Otherwise, the created instances may not be accessible through WebAdmin after the port is changed.

---

C.1.2 Activating the Web Server Feature of WebAdmin

Follow the procedure below to activate the Web server feature of WebAdmin.

1. Change to the superuser
   Acquire superuser privileges on the system.

   **Example**

   ```
   $ su -
   Password:******
   ```

2. Activate the Web server feature of WebAdmin
   Execute the WebAdminStart command to activate the Web server feature of WebAdmin.

   **Example**

   If WebAdmin is installed in `/opt/fsep<xy>/webadmin`:

   ```
   # cd /opt/fsep<xy>/webadmin/sbin
   # ./WebAdminStart
   ```

C.1.3 Stopping the Web Server Feature of WebAdmin

Follow the procedure below to stop the Web server feature of WebAdmin.

1. Change to the superuser
   Acquire superuser privileges on the system.
Example

```
$ su -
Password:******
```

2. Stop the Web server feature of WebAdmin

Execute the `WebAdminStop` command to stop the Web server feature of WebAdmin.

Example

If WebAdmin is installed in `/opt/fsepv<xy>webadmin`:

```
# cd /opt/fsepv<xy>webadmin/sbin
# ./WebAdminStop
```

**Note**

- For efficient operation of WebAdmin, it is recommended that the Web server feature be stopped only during a scheduled maintenance period.
- When WebAdmin is used to create and manage instances in a multiserver configuration, the Web server feature must be started and running on all servers at the same time.

## C.2 Removing WebAdmin

This section explains how to remove WebAdmin.

This removal procedure stops WebAdmin and ensures that it no longer starts automatically when the machine is restarted.

1. Change to the superuser

   Acquire superuser privileges on the system.

   Example

   ```
   $ su -
   Password:******
   ```

2. Remove WebAdmin setup

   Execute the `WebAdminSetup` command to remove WebAdmin setup.

   Example

   If WebAdmin is installed in `/opt/fsepv<xy>webadmin`:

   ```
   # cd /opt/fsepv<xy>webadmin/sbin
   # ./WebAdminSetup -d
   ```

## C.3 Using an External Repository for WebAdmin

WebAdmin can be configured to use an external database, where it can store the various metadata information it uses. WebAdmin will use this database as a repository to store the information it uses to manage all the created instances. This can be a FUJITSU Enterprise Postgres database or an Open Source PostgreSQL V9.2 or later database.

Using an external database as a WebAdmin repository provides you with more flexibility in managing WebAdmin. This repository can be managed, backed up and restored as needed using pgAdmin or command line tools, allowing users to have greater flexibility and control.

Follow the procedure below to set up the repository.

1. Activate WebAdmin, and log in to the database server.
2. Click the [Settings] tab, and then click in the [WebAdmin repository configuration] section.

3. Enter the following items:
   - [Host name]: Host name of the database server
   - [Port]: Port number of the database server
   - [Database name]: Name of the database
   - [User name]: User name to access the database
   - [Password]: Password of the database user

   **Note**
   - Database type
     It is recommended to use a FUJITSU Enterprise Postgres database as a repository. A compatible PostgreSQL database can also be used as an alternative.
     - It is recommended to click [Test connection] to ensure that the details entered are valid and WebAdmin is able to connect to the target database.

4. Click to register the repository details.

   **Note**
   - Once the repository is set up, it can be changed any number of times by the user logged into WebAdmin. When a repository is changed:
     - It is recommended to preload the backup into this database.
- If the data is not preloaded, WebAdmin will create a new repository.
- The database repository can be set up even after WebAdmin was already used to create instances. In that scenario, the instances already created are retained and can continue to be operated on.
- If the instance used as a repository is stopped, WebAdmin will be unusable. For this reason, it is recommended to be familiar with starting an instance from the command line. If the instance is stopped for any reason, start it from the command line and WebAdmin will be usable again.

C.4 Using the WebAdmin Auto-Refresh Feature

The WebAdmin auto-refresh feature automatically refreshes the operating status of all instances in the Instance list at the specified interval. It also refreshes the details of the selected instance.

Follow the procedure below to configure the auto-refresh options.

1. Click the [Settings] tab, and then click in the [User preferences] section.
2. Enter the following items:
   - [Auto-refresh instance]: To use the auto-refresh feature, select "Enabled". The default is "Disabled".
   - [Refresh interval (seconds)]: Number of seconds between each refresh. This is a countdown timer, which is reset every time the instance status is refreshed by any operation. Specify a value from 30 to 3600 (seconds). The default is 30.
3. Click to save the auto-refresh settings.

Note

- Auto-refresh will run only if the [Instances] page is displayed and no user-initiated operation is in progress.
- A text indicator, which is independent of auto-refresh, is displayed at the top of the Instance list. It is dynamically updated to display when the page was last refreshed.
Appendix D Configuring Parameters

WebAdmin operates and manages databases according to the contents of the following configuration files:

- **postgresql.conf**
  
  Contains various items of information that define the operating environment of FUJITSU Enterprise Postgres.

- **pg_hba.conf**
  
  Contains various items of information related to client authentication.

These configuration files are deployed to a data storage destination. Data is written to them when the instance is created by WebAdmin and when settings are changed, and data is read from them when the instance is started and when information from the [Setting] menu is displayed.

Direct editing of each configuration file is possible with a text editor.

---

### See

Refer to "Server Configuration" and "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on the parameters.

---

### Note

WebAdmin checks for port number and backup storage path anomalies when various operations are performed. An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of the corresponding parameter in `postgresql.conf`. Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.

---

### postgresql.conf

**Parameters that can be changed in WebAdmin**

The `postgresql.conf` parameters that can be changed in WebAdmin are shown below:

<table>
<thead>
<tr>
<th>Section</th>
<th>WebAdmin item</th>
<th><code>postgresql.conf</code> file parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Instance Configuration</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Character encoding</td>
<td>Character set</td>
<td><code>client_encoding</code></td>
</tr>
<tr>
<td></td>
<td>Message locale</td>
<td><code>lc_messages</code></td>
</tr>
<tr>
<td>Communication</td>
<td>Max connections</td>
<td><code>max_connections</code></td>
</tr>
<tr>
<td>SQL options</td>
<td>Transform NULL format</td>
<td><code>transform_null_equals</code></td>
</tr>
<tr>
<td></td>
<td>Date output format</td>
<td><code>DateStyle (*1)</code></td>
</tr>
<tr>
<td></td>
<td>Interval output format</td>
<td><code>IntervalStyle</code></td>
</tr>
<tr>
<td></td>
<td>Number of digits for floating values</td>
<td><code>extra_float_digits</code></td>
</tr>
<tr>
<td></td>
<td>Transaction isolation levels</td>
<td><code>default_transaction_isolation</code></td>
</tr>
<tr>
<td></td>
<td>Currency format</td>
<td><code>lc_monetary</code></td>
</tr>
<tr>
<td></td>
<td>Date and time format</td>
<td><code>lc_time</code></td>
</tr>
<tr>
<td></td>
<td>Numerical value format</td>
<td><code>lc_numeric</code></td>
</tr>
<tr>
<td>Memory</td>
<td>Sort memory (KB)</td>
<td><code>work_mem</code></td>
</tr>
<tr>
<td></td>
<td>Shared buffers (KB)</td>
<td><code>shared_buffers</code></td>
</tr>
<tr>
<td>Streaming replication</td>
<td>WAL level</td>
<td><code>wal_level</code></td>
</tr>
</tbody>
</table>
Maximum WAL senders  |  max_wal_senders  
WAL keep segments  |  wal_keep_segments  
Hot standby  |  hot_standby  
Synchronous standby names  |  synchronous_standby_names  

| Section | Edit instance  
|---|---  
| | Instance name  | n/a  
| | Instance port  | port  
| | Backup storage path  | backup_destination  

*1: If you specify “Postgres” as the output format, dates will be output in the "12-17-1997" format, not the “Wed Dec 17 1997” format used in the PostgreSQL Documentation.

- Calculate the maximum number of connections using the formula below:

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + 3 \quad (*1)
\]

*1: 3 is the default number of connections required by the system.

Calculate the maximum number of connections using the following formula when changing either max_wal_senders (using streaming replication) or superuser_reserved_connections (connections reserved for use by the superuser) in postgresql.conf.

\[
\text{maximumNumberOfConnections} = \text{maximumNumberOfConnectionsFromApplications} + \text{superuser_reserved_connections} + \text{max_wal_senders}
\]

- Also check if the memory used exceeds the memory installed (refer to "Parameters automatically set by WebAdmin according to the amount of memory").

- When modifying "Shared buffers" or "Max connections", edit the kernel parameter. Refer to “Appendix J Configuring Kernel Parameters”, and “Managing Kernel Resources” in “Server Administration” in the PostgreSQL Documentation for details.

Parameters set by WebAdmin

The following postgresql.conf parameters are set by WebAdmin during instance startup (they will be ignored even if specified in postgresql.conf):

| Parameter | Value  
|---|---  
| listen_addresses | *  
| log_destination | ‘stderr,syslog’  
| logging_collector | on  
| log_line_prefix | ‘%c: %t [%p]: [%l-1] user = %u, db = %d, remote = %r app = %a ’  
| log_filename (*1) (*2) | ‘logfile-%a.log’  
| log_file_mode | 0600  
| log_truncate_on_rotation | on  
| log_rotation_age | 1d  

*1: The server logs are split into files based on the day of the week, and are rotated after each week.

*2: If the date changes while the instance is stopped, old logs are not deleted and continue to exist. Manually delete old logs that are no longer required to release disk space.
Parameters automatically set by WebAdmin according to the amount of memory

The postgresql.conf parameters automatically set according to the amount of installed memory, during the creation of instances by WebAdmin, are shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30% of the machine's installed memory (*1)</td>
</tr>
<tr>
<td>work_mem</td>
<td>30% of the machine's installed memory / max_connections / 2 (*2)</td>
</tr>
<tr>
<td>effective_cache_size</td>
<td>75% of the machine's installed memory (*3)</td>
</tr>
<tr>
<td>maintenance_work_mem</td>
<td>10% of the machine's installed memory / (1 + autovacuum_max_workers) (*4)</td>
</tr>
</tbody>
</table>

*1: The value will be capped at 2097151 MB.
*2: The value will be capped at 2147483646.
*3: The value will be capped at 2147483647.
*4: The value will be capped at 2097151 MB.

When determining the values to be configured in the above parameters, you must take into account any anticipated increases in access volume or effects on performance during business operations, such as the number of applications and commands that will access the instance, and the content of processes. Also, note that in addition to FUJITSU Enterprise Postgres, other software may be running on the actual database server. You will need to determine the degree of priority for the database and other software, as well as the memory allocation size.

WebAdmin automatically configures complex parameter settings such as those mentioned above, based on the size of the internal memory of the machine. This enables maximum leverage of the machine memory to facilitate resistance against fluctuations during business operations.

Accordingly, the effects of the above-mentioned factors must be estimated and taken into account when determining and configuring parameter values, so that memory resources can be effectively allocated among other software or instances, and so that adverse effects can be mutually avoided. Refer to "Memory" in "Resource Consumption", and "Planner Cost Constants" in "Query Planning", under "Server Administration" in the PostgreSQL Documentation for information on parameter values and required considerations.

Parameter values can be modified using the WebAdmin [Setting] menu, or edited directly using a text editor.

If adding an instance, determine the parameter values, including for existing instances, and make changes accordingly.

See

Kernel parameters need to be tuned according to the parameters being changed. Refer to "Appendix J Configuring Kernel Parameters", and "Managing Kernel Resources" in "Server Administration" in the PostgreSQL Documentation for information on tuning kernel parameters.

Note

- Do not directly edit the following postgresql.conf parameters with a text editor, otherwise WebAdmin may not work properly if you make a mistake:
  - archive_mode
  - archive_command
  - wal_level
  - core_directory
  - log_line_prefix
  - log_destination
- logging_collector
- log_directory
- log_file_mode
- log_filename
- log_truncate_on_rotation
- log_rotation_age
- You must take care with the following parameter:
  - superuser_reserved_connections

  Set it to a number that includes the 3 connections required in WebAdmin (the default is 3).

---

**Parameters automatically set by WebAdmin for streaming replication**

The postgresql.conf parameters automatically set when a streaming replication standby is created, are shown below. These changes are performed in both the master as well as the standby instance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>wal_level (*1)</td>
<td>replica</td>
</tr>
<tr>
<td>max_wal_senders (*1)</td>
<td>5</td>
</tr>
<tr>
<td>hot_standby</td>
<td>on</td>
</tr>
</tbody>
</table>

*1: These values are set only if the master and standby instance are created at the same time. If only the standby instance is created, you need to set these values before the standby instance is created.

---

See

Streaming replication parameters need to be tuned according to the requirements for replication performance and reliability. Refer to "Log-Shipping Standby Servers" in "Server Administration" in the PostgreSQL Documentation for information on tuning streaming replication parameters.

---

**pg_hba.conf**

Refer to "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on content that can be configured in pg_hba.conf.

---

Note

- Configure the instance administrator permissions in the "local" connection format settings. WebAdmin may not work properly if permissions are not configured.
- If you specify an item or value that cannot be set by WebAdmin when editing the pg_hba.conf file with a text editor, it will not be possible to reference that line from WebAdmin.
Appendix E Uninstall (middleware)

E.1 Features that are Installed

[Windows]

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

E.2 Notes

E.2.1 Notes on the Uninstall (middleware) Tool

"Uninstall (middleware)" is a tool used by Fujitsu middleware products. It performs information management for middleware products, and also, launching the uninstaller for removing these products from the installed systems.

**Note**

- To uninstall FUJITSU Enterprise Postgres, uninstall from "Uninstall (middleware)".
- This tool manages information about other Fujitsu middleware products as well as FUJITSU Enterprise Postgres. For this reason, do not uninstall it unless absolutely necessary. If you have accidentally uninstalled this tool, re-install it as described below.

[Windows]

1. Log on to the machine to be installed using a user name belonging to the Administrators group, or switch to an account with administrator privileges.
2. Insert the server program DVD in the drive device.
3. Execute the installation command.

```
z:\CIR\Windows\cirinst.exe
```

In the example above, for z, specify the drive name of the drive where the DVD has been inserted.
1. Log in as a superuser to the installation target machine, or switch to a user with administrative privileges.

2. Insert the product media in the drive.

3. Execute the installation command.

   [Linux]
   
   ```
   # /media/dvd/CIR/Linux/cirinst.sh
   ```
   
   In the example above, /media/dvd is the DVD mount point.

   [Solaris]
   
   ```
   # /dvd/dvd0/CIR/Solaris/cirinst.sh
   ```
   
   In the example above, /dvd/dvd0 is the DVD mount point.

- If you uninstall this tool as described below.

1. Check that there are no Fujitsu middleware products installed in the system.
   
   You can check this by using "Uninstall (middleware)", which is launched by the command below.

   [Windows]
   
   Select [All Programs] > [Fujitsu] > [Uninstall (middleware)]

   [Linux/Solaris]
   
   ```
   /opt/FJSVcir/cir/bin/cimanager.sh -c
   ```
   
   -c: CUI

2. If no Fujitsu middleware products have been installed, then issue the command below.

   [Windows]
   
   ```
   %SystemDrive%\FujitsuF4CR\bin\cirremove.exe
   ```

   [Linux/Solaris]
   
   ```
   # /opt/FJSVcir/bin/cirremove.sh
   ```

3. At the uninstallation confirmation prompt, enter "y".

   ```
   This software is a common tool of Fujitsu products. Are you sure you want to remove it? [y/n]:
   ```

   Uninstallation will start.
Appendix F  Uninstall (middleware) Messages

F.1  Messages output by FJSVcir

**FSP_FJSVCIR_CIRINST: ERROR: 101: CIRINST101: Administrator privilege is required.**

Description
The user does not have administrator privileges.

Action method
Login with administrator privileges and run the command again.

**FSP_FJSVCIR_CIRINST: ERROR: 102: CIRINST102: Failed to create %s**

Parameters
%s: Directory name

Description
Failed to create a directory during the installation.

Action method
Creating the directory might have failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 103: CIRINST103: It is required at least %dMB**

Parameters
%d: Disk spaces

Description
Insufficient disk space.

Action method
Confirm that the system has sufficient disk spaces.

**FSP_FJSVCIR_CIRINST: ERROR: 104: CIRINST104: Failed to copy CIR files.**

Description
Failed to copy files required for the installation.

Action method
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 105: CIRINST105: Failed to copy JRE.**

Description
Failed to copy JRE required for installation.

Action method
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.
**FSP_FJSVCIR_CIRINST: ERROR: 106: CIRINST106: Failed to copy CIR**

**Description**
Failed to copy files during the installation.

**Action method**
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 107: CIRINST107: invalid option.**

**Description**
An invalid option was specified.

**Action method**
Specify a valid option. [-c]: CUI

**FSP_FJSVCIR_CIRINST: ERROR: 108: CIRINST108: JRE which should be deployed is not bundled.**

**Description**
An appropriate JRE for this system is not bundled.

**Action method**
Confirm that the product supports the platform.

**Description**
Unsupported operating system.

**Action method**
Confirm that the product supports the operating system.

**FSP_FJSVCIR_CIRINST: ERROR: 201: CIRINST201: Administrator privilege is required.**

**Description**
The user does not have administrator privileges.

**Action method**
Login with administrator privileges and run the command again.

**FSP_FJSVCIR_CIRINST: ERROR: 203: CIRINST203: Failed to delete files.**

**Description**
Failed to delete FJSVcir files.

**Action method**
Deleting the files failed for some reason. Run cirremove command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 205: CIRINST205: invalid option.**

**Description**
Invalid option is specified.

**Action method**
No option is supported. Retry without any options.
Specified installation parameters file was not found.

Description
Specified installation parameters file was not found. (silent mode)

Action method
Specify the installation parameters file.

It failed to install. See log for details

Description
An error occurred during install. (silent mode)

Action method
Collect the files stored in the following directories.

[UNIX]
/var/opt/FJSVCIR/cir/logs/cirlog0.log.0

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0

Parameters are invalid. Please specify valid parameters.

Description
Invalid option is specified. (silent mode)

Action method
Specify a valid option.

Internal data is broken.

Description
Internal data used by this product is corrupt.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\

F.2 Messages output by Uninstall (middleware)

It has already been running in another process.

Description
An attempt was made to start Uninstall (middleware) more than once. Alternatively, an attempt was made to start Uninstall (middleware) while the installer was starting.
Action method
End any Uninstall (middleware) that have already started. Alternatively, start Uninstall (middleware) after the installer has ended.

**Specified option is invalid.**
Description
An invalid option was specified.

**Action method**
Specify valid options and run the command again.

**Please enter a valid option.**
Description
An invalid character was entered. Valid characters are y, n, or item numbers.

**Action method**
Enter a valid character.

**Failed to uninstall of the following software packages:**
Description
Failed to uninstall the software listed in this message.

**Action method**
Confirm the information shown after this message and take the appropriate action.

**Unable to uninstall the software as it is referred from more than one software.**
Description
Failed to uninstall the software because it is used by other software.

**Action method**
No specific action is required.

**Unable to uninstall the software as the software is mandatory.**
Description
Failed to uninstall the software because it is required by another program.

**Action method**
No specific action is required.

**Internal data is broken.**
Description
Internal data used by this product is corrupt.

**Action method**
Collect the files stored in the following directories and contact Fujitsu technical support:

- UNIX
  /var/opt/FJSVCIR/cir/
  /etc/opt/FJSVCIR/cir/CIR.properties
Unable to uninstall the software you were about to uninstall as the existence of the software is a precondition for the operation of another software.

**Description**
Failed to uninstall the software because it is required by another program.

**Action method**
No specific action is required.

---

The program terminated abnormally.

**Description**
The program has terminated abnormally.

**Action method**
Collect the files stored in the following directories and contact Fujitsu technical support:

**[UNIX]**

/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

**[Windows]**

%ProgramData%\Fujitsu\FujitsuF4CR\cir\

An unexpected error has occurred during uninstall.

**Description**
An error occurred during uninstall.

**Action method**
Collect the files stored in the following directories and contact Fujitsu technical support:

**[UNIX]**

/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

**[Windows]**

%ProgramData%\Fujitsu\FujitsuF4CR\cir\

It failed to uninstall. See log for details.

**Description**
An error occurred during uninstall. (silent mode)

**Action method**
Collect the files stored in the following directories.

**[UNIX]**

/var/opt/FJSVCIR/cir/logs/cirlog0.log.0
Failed to initialize the temp directory.

Description
Can not start Uninstall (middleware) because failed to initialize the temp directory.

Action method
Run Uninstall (middleware) again. If the problem persists, check whether other processes have accessed the files in the following directories.

[UNIX]
/var/opt/FJSVcir/cir/temp/meta_db

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\temp\meta_db

[Notice] Need to restart for uninstall completion.

Description
Uninstallation was completed. (silent mode)

Action method
Restart the system.
Appendix G Estimating Database Disk Space Requirements

This appendix describes how to estimate database disk space requirements.

G.1 Estimating Table Size Requirements

The following tables provide the formulas for estimating table size requirements.

Table G.1 Estimation formula when the record length is 2032 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Record length</td>
<td>27(*1) + NULL map + OID + column data</td>
</tr>
<tr>
<td></td>
<td>NULL map: Number of columns / 8 (*2)</td>
</tr>
<tr>
<td></td>
<td>OID: 4 for a table &quot;WITH OID&quot;. The default is 0.</td>
</tr>
<tr>
<td></td>
<td>Column data: Sum of column lengths</td>
</tr>
<tr>
<td></td>
<td>*1: Record head section</td>
</tr>
<tr>
<td></td>
<td>*2: Round the result up to the next integer.</td>
</tr>
<tr>
<td></td>
<td>- Because the column data is placed in boundaries of 8 bytes, you need to make an</td>
</tr>
<tr>
<td></td>
<td>adjustment so that the sum of the record head section, NULL map and OID is a</td>
</tr>
<tr>
<td></td>
<td>multiple of 8.</td>
</tr>
<tr>
<td></td>
<td>For example, if the calculated length is 27 + 1 / 8 (rounded up) + 0 = 28 bytes, add</td>
</tr>
<tr>
<td></td>
<td>4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- Because the data of each column is placed in boundaries of the defined data type,</td>
</tr>
<tr>
<td></td>
<td>take the boundary of each data type into account for the length of the column data.</td>
</tr>
<tr>
<td></td>
<td>For example, the length of the column data in the table below will not be the sum of</td>
</tr>
<tr>
<td></td>
<td>the data types, which is 37 bytes, but will instead be 64 bytes following boundary</td>
</tr>
<tr>
<td></td>
<td>adjustment.</td>
</tr>
<tr>
<td></td>
<td>Definition: create table tb1(c1 char(1), c2 long, c3 int, c4 box)</td>
</tr>
<tr>
<td></td>
<td>Estimation: CHAR type 1 byte + boundary adjustment of 7 bytes for LONG type</td>
</tr>
<tr>
<td></td>
<td>8 bytes + LONG type 8 bytes + INT type 4 bytes + boundary adjustment of 12 bytes</td>
</tr>
<tr>
<td></td>
<td>for BOX type 32 bytes + BOX type 32 bytes = 64 bytes</td>
</tr>
<tr>
<td></td>
<td>- Because each record is placed in boundaries of 8 bytes, you need to make an</td>
</tr>
<tr>
<td></td>
<td>adjustment so that the length of the column data is a multiple of 8.</td>
</tr>
<tr>
<td></td>
<td>- If the calculated record length exceeds 2,032 bytes, the variable length data in the</td>
</tr>
<tr>
<td></td>
<td>record might be compressed automatically. If so, use the estimation formulas in</td>
</tr>
<tr>
<td></td>
<td>&quot;Table G.2 Estimation formula when the record length exceeds 2032 bytes&quot; to</td>
</tr>
<tr>
<td></td>
<td>estimate the table size.</td>
</tr>
<tr>
<td>(2) Number of records per page</td>
<td>8168 (*1) / ((1) record length + 4 (*2))</td>
</tr>
<tr>
<td></td>
<td>*1: Page length (8192) - page head (24)</td>
</tr>
<tr>
<td></td>
<td>*2: Pointer length (4)</td>
</tr>
<tr>
<td></td>
<td>- The result will be rounded down to the next integer.</td>
</tr>
<tr>
<td>(3) Number of pages required for storing records</td>
<td>Total number of records / (2) number of records per page</td>
</tr>
<tr>
<td></td>
<td>- The result will be rounded up to the next integer.</td>
</tr>
<tr>
<td>(4) Amount of space</td>
<td>(3) Number of pages required for storing records x page length x safety factor (*1)</td>
</tr>
<tr>
<td></td>
<td>*1: Specify 2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>- This is the safety factor assumed if vacuuming is performed for garbage collection</td>
</tr>
<tr>
<td></td>
<td>in tables and indexes.</td>
</tr>
</tbody>
</table>
**Table G.2 Estimation formula when the record length exceeds 2032 bytes**

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(4) Amount of space</td>
<td>Total number of records x (1) record length x safety factor (*1)</td>
</tr>
<tr>
<td></td>
<td>*1: Specify 2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>- This is the safety factor assumed if vacuuming is performed for garbage collection in tables and indexes.</td>
</tr>
</tbody>
</table>

**G.2 Estimating Index Size Requirements**

This section provides the formulas for estimating index size requirements.

FUJITSU Enterprise Postgres provides six index types: B-tree, Hash, GiST, GIN, SP-GiST, and VCI. If you do not specify the index type in the CREATE INDEX statement, a B-tree index is generated.

The following describes how to estimate a B-tree index. Refer to "G.7 Estimating VCI Disk Space Requirements" for information on how to estimate VCI.

A B-tree index is saved as a fixed-size page of 8 KB. The page types are meta, root, leaf, internal, deleted, and empty. Since leaf pages usually account for the highest proportion of space required, you need to calculate the requirements for these only.

**Table G.3 Estimation formula when the key data length is 512 bytes or less**

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Entry length</td>
<td>8 (*1) + key data length (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: Entry head</td>
</tr>
<tr>
<td></td>
<td>*2: The key data length depends on its data type (refer to &quot;G.3 Sizes of Data Types&quot; for details).</td>
</tr>
</tbody>
</table>

Because each entry is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the key data is a multiple of 8.

For example, if the calculated length is 28 bytes, add 4 to make the length 32 bytes.

- If the key data length exceeds 512 bytes, key data may be automatically compressed. In this case, use the estimation formula given in "Table G.4 Estimation formula when the key data length exceeds 512 bytes" to estimate the key data length.

| (2) Page size requirement | 8152 (*1)                                                             |
|                         | *1: Page length (8192) - page header (24) - special data (16) = 8152|

| (3) Number of entries per page | (2) Page size requirement / ((1) entry length + 4 (*1)) |
|                               | *1: Pointer length                                                  |
|                               | - Result of (3) number of entries per page will be rounded down to the nearest integer. |

| (4) Number of pages required for storing indexes | Total number of records / (3) number of entries per page |
|                                                | - Result of (4) number of pages required for storing indexes will be rounded up to the nearest integer. |

| (5) Space requirement | (4) Number of pages required for storing indexes x 8192 (*1) / usage rate (*2) |
|                       | *1: Page length                                                       |
|                       | *2: Specify 0.7 or lower.                                             |

**Table G.4 Estimation formula when the key data length exceeds 512 bytes**

</tbody>
</table>

G.3.2 Sizes of Variable-Length Data Types

The following table lists the sizes of variable-length data types.
### G.3.3 Sizes of Array Data Types

The following table lists the sizes of array data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Length of size portion + 12 + 8 x number of dimensions + data size of each item</td>
<td>If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes. - Example of estimation when array data is &quot;ARRAY[[1,2,3], [1,2,3]]&quot; Number of dimensions: 2 INTEGER data size: 4 Total size = 1+12+8x2+6x4 = 53</td>
</tr>
</tbody>
</table>

### G.3.4 Number of Bytes per Character

The following table lists the number of bytes per character.

The given values relate to the common character sets EUC-JP and UTF8.

<table>
<thead>
<tr>
<th>Character type</th>
<th>Character set</th>
<th>Number of bytes per character</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>
<td>EUC_JP</td>
<td>1</td>

<td>3</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
</tbody>
</table>

### G.4 Estimating Transaction Log Space Requirements

This section provides the formula for estimating transaction log space requirements.
However, if the update volume is extremely high (for example, due to a large data load and batch processing), disk writing at a checkpoint may not be able to keep up with the load, and a higher number of transaction logs than indicated here may temporarily be accumulated.

G.5 Estimating Archive Log Space Requirements

This section explains how to estimate archive log space requirements.

The archive log is an archive of the transaction logs from the time of a previous backup to the present, so it fluctuates depending on the backup period and the content of update transactions.

The longer the backup period and the more update transactions, the greater the space required for the archive log.

Therefore, measure the actual archive log space by using a test environment to simulate backup scheduling and database update in a real operating environment.

G.6 Estimating Backup Disk Space Requirements

This section provides the formula for estimating backup disk space requirements.

\[
\text{Backup disk space requirements} = \text{size of the database cluster} \times 2 + \text{transaction log space requirements} + \text{archive log space requirements}
\]

G.7 Estimating VCI Disk Space Requirements

This section provides the formula for estimating VCI disk space requirements.

\[
\text{Disk space} = (\text{number of rows in tables}) \times (\text{number of bytes per row}) \times (\text{compression ratio}) + \text{(WOS size)}
\]

Number of bytes per row

\[
\text{Number of bytes per row} = (19 + (\text{number of columns specified in CREATE INDEX}) / 8 + (\text{number of bytes per single column value})) \times 1.1
\]

Note: Round up the result to the nearest integer.

Compression ratio

Specify a value between 0 and 1. Since compression ratio depends on the data being compressed, use actual data or test data that simulates it, then compare the value with the estimation result. As a guide, the compression ratio measured with the Fujitsu sample data is shown below:

- Data with high degree of randomness (difficult to compress): Up to approximately 0.9 times.
- Data with high degree of similarity (easy to compress): Up to approximately 0.5 times.

WOS size

\[
\text{WOS size} = (\text{number of WOS rows}) / 185 \times 8096
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Note

VCI does not support retrieval of disk space usage using the database object size function pg_indexes_size. To find out the actual total VCI disk space, check the disk space of the storage directory using an OS command or other method.
Appendix H Estimating Memory Requirements

This appendix explains how to estimate the memory.

H.1 FUJITSU Enterprise Postgres Memory Requirements

This section describes the formulas for estimating FUJITSU Enterprise Postgres memory requirements.

Use the following formula to obtain a rough estimate of memory required for FUJITSU Enterprise Postgres:

\[
f_{\text{fujitsuEnterprisePostgresRequiredMemory}} = f_{\text{sharedMemoryAmount}} + f_{\text{localMemoryAmount}}
\]

Shared memory amount

Refer to "Shared Memory and Semaphores" under "Server Administration" in the PostgreSQL Documentation for information on shared memory.

However, note that if instances have been created using WebAdmin, the parameters below will be configured automatically when the instances are created. Take this into account when calculating the shared memory size.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30 percent of the internal memory of the machine. ((^1))</td>
</tr>
<tr>
<td>max_connections</td>
<td>100</td>
</tr>
<tr>
<td>max_prepared_transactions</td>
<td>100</td>
</tr>
</tbody>
</table>

\(^1\): This value will be capped at 2097151 MB.

Local memory amount

\[
l_{\text{localMemoryAmount}} = l_{\text{processStackArea}} + l_{\text{memoryUsedInDbSessionsThatUseTempTables}} + l_{\text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations}} + l_{\text{memoryUsedInMaintenanceOperations}} + l_{\text{baseMemoryUsedInEachProcess}} + l_{\text{memoryUsedPreparingForDataAccess}}
\]

Process stack area

\[
l_{\text{processStackArea}} = \text{max\_stack\_depth} \times (\text{max\_connections} + \text{autovacuum\_max\_workers} + 9)
\]

This formula evaluates to the maximum value.

Actually it is used according to the growth of the stack.

In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used in database sessions that use temporary tables

\[
l_{\text{memoryUsedInDbSessionsThatUseTempTables}} = l_{\text{temp\_buffers}} \times l_{\text{max\_connections}}
\]

This formula evaluates to the maximum value.

Memory is gradually used as temporary buffers are used, and is released when the session ends.

Memory used in database sessions that perform sort and hash table operations

\[
l_{\text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations}} = l_{\text{work\_mem}} \times l_{\text{max\_connections}}
\]

This formula evaluates to the maximum value.

Memory is gradually used as operations such as sort are performed, and is released when the query ends.
Memory used in maintenance operations

\[
\text{memoryUsedInMaintenanceOperations} = \text{maintenance}\_\text{work}\_\text{mem} \times (\text{numOfSessionsPerformingMaintenance} + \text{autovacuum}\_\text{max}\_\text{workers})
\]

Note that ‘maintenance operations’ are operations such as VACUUM, CREATE INDEX, and ALTER TABLE ADD FOREIGN KEY.

Base memory used in each process

\[
\text{baseMemoryUsedInEachProcess} = 3\text{MB} \times (\text{max}\_\text{connections} + \text{autovacuum}\_\text{max}\_\text{workers} + 9)
\]

This formula evaluates to the memory used when server processes are running.

In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used preparing for data access

\[
\text{memoryUsedPreparingForDataAccess} = \text{variationAmount} \times (\text{max}\_\text{connections} + \text{autovacuum}\_\text{max}\_\text{workers} + 4)
\]

where \[
\text{variationAmount} = \frac{\text{shared}\_\text{buffers}}{8\text{KB}} \times 4\ \text{bytes}
\]

(note that 8KB is the page length, and 4 bytes is the size of page management data)

This formula evaluates to the memory required to access the database cache in the shared memory.

In the formula above, among the processes that perform roles specific to servers, 4 is the number of processes that access the database.

### H.2 Database Multiplexing Memory Requirements

This section describes the formula for estimating database multiplexing memory requirements.

Use the following formula to obtain a rough estimate of memory required for database multiplexing:

\[
\text{Memory usage of the database multiplexing feature} = \text{Peak memory usage of the Mirroring Controller processes} + \text{Peak memory usage of the Mirroring Controller commands}
\]

Peak memory usage of the Mirroring Controller processes = 150 MB

Peak memory usage of the Mirroring Controller commands = 50 MB \times \text{Number of commands executed simultaneously}

### H.3 VCI Memory Requirements

This section describes the formula for estimating VCI memory requirements.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{memUsedByVci} = \text{memForData} + \text{memForEachProcess}
\]

Memory required to store data in memory

Secure the space estimated using the formula below on the stable buffer (part of shared\_buffers).

\[
\text{memForData} = (\text{numOfRowsInTables}) \times (\text{numOfBytesPerRow}) + (\text{wosSize})
\]

Number of bytes per row

\[
\text{numOfBytesPerRow} = (19 \div (\text{numOfColsInCreateIndexStatement} \div 8 + (\text{numOfBytesPerSingleColValue}))) \times 1.1
\]

Note: Round up the result to the nearest integer.
WOS size

\[
\text{wosSize} = \frac{\text{numOfWosRows}}{185 \times 8096}
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Memory required for each process

\[
\text{memForEachProcess} = \text{memUsedPerScanning} + \text{memUsedForVciMaintenace} + \text{memUsedByCreateIndexStatement}
\]

Memory used per scanning

- Parallel scan

\[
\text{memUsedPerScanning} = \text{vci.shared_work_mem} + (\text{numOfParallelWorkers} + 1) \times \text{vci.maintenance_work_mem}
\]

Note: The number of parallel workers used by VCI simultaneously in the entire instance is equal to or less than \text{vci.max_parallel_degree}.

- Non-parallel scan

\[
\text{memUsedPerScanning} = \text{vci.max_local_ros} + \text{vci.maintenance_work_mem}
\]

Note

- \text{vci.shared_work_mem}, and \text{vci.max_local_ros} are used to create local ROS. If local ROS exceeds these sizes, execute a query without using VCI according to the conventional plan.
- \text{vci.maintenance_work_mem} specifies the memory size to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.

Memory used for VCI maintenance

\[
\text{memUsedForVciMaintenace} = \text{vci.maintenance_work_mem} \times \text{vci.control_max_workers}
\]

Memory used by CREATE INDEX

\[
\text{memUsedByCreateIndexStatement} = \text{vci.maintenance_work_mem}
\]

Note

\text{vci.maintenance_work_mem} specifies the memory to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.
This appendix lists the quantitative limits of FUJITSU Enterprise Postgres.

### Table I.1 Length of identifier

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Schema name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>View name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Index name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table space name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cursor name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Aggregate function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Trigger name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Constraint name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Role name</td>
<td>Up to 63 bytes (*1) (*2)</td>

<tr>
<td>Cast name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Collation sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Encoding method conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Domain name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Extension name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator class name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator family name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Rewrite rule name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search settings name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search dictionary name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search parser name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search template name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Data type name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Enumerator type label</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

*2: If an identifier that exceeds 63 bytes in length is specified, the excess characters are truncated and it is processed.

### Table I.2 Database object

<table>

<td>Up to 800 megabytes (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.
Appendix J  Configuring Kernel Parameters

Use the “System V IPC Parameters” table in “Managing Kernel Resources” in the PostgreSQL Documentation for the relationship between configuration parameters and kernel parameters, as well as calculation formulas. Refer to the "Managing Kernel Resources" in the PostgreSQL Documentation to calculate shared memory usage.

For multiple instances, the kernel parameters should be evaluated for all instances. For example, in the case of the maximum number of shared memory segments for the entire system (SHMMNI), the total number of segments obtained by all instances should be added to the kernel parameters. In the case of the maximum number of semaphores for each process (SEMMSL), the largest of all sizes obtained by all instances should be compared to the current value prior to configuring the settings.

Note

If there is insufficient shared memory due to miscalculation of SHMMAX, a message will be output indicating that the shmget system call failed at "errno=22 (EINVAL)". Review the calculation, and reconfigure.

The relationship between System V IPC parameters and kernel parameters in various operating systems is shown below.

<table>
<thead>
<tr>
<th>System</th>
<th>V IPC parameter</th>
<th>Kernel parameter action</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHMMAX</td>
<td>project.max-shm-memory</td>
<td>Specify ( currentValue + calculatedValue )</td>
</tr>
<tr>
<td>SHMMIN</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMALL</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMSEG</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SHMMNI</td>
<td>project.max-shm-ids</td>
<td>Specify ( currentValue + calculatedValue )</td>
</tr>
<tr>
<td>SEMMNI</td>
<td>project.max-sem-ids</td>
<td>Specify ( currentValue + calculatedValue )</td>
</tr>
<tr>
<td>SEMMNS</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SEMMSL</td>
<td>process.max-sem-nsems</td>
<td>If ( currentValue &lt; calculatedValue ), configure the calculated value</td>
</tr>
<tr>
<td>SEMMAP</td>
<td>No compatible parameter</td>
<td></td>
</tr>
<tr>
<td>SEMVMX</td>
<td>No compatible parameter</td>
<td></td>
</tr>
</tbody>
</table>

Note

- Perform the above tuning for the default project (the project selected at log in) of the operating system user who will be the instance administrator.
- If using FUJITSU Enterprise Postgres in a non-global zone and the maximum number of resources has been specified for the applicable non-global zone, increase the specified value as well.
Appendix K Determining the Preferred WebAdmin Configuration

This appendix describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration.

K.1 WebAdmin Configurations

WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

K.1.1 Single-Server Configuration

A single-server configuration enables you to create and operate instances on a single server. In this configuration, WebAdmin must be installed on the same database server as the FUJITSU Enterprise Postgres Server component.

Single-server configuration

![Database server diagram]

K.1.2 Multiserver Configuration

A multiserver configuration enables you to create and operate instances stored on multiple database servers. As shown in the figure below, WebAdmin can be installed on a dedicated management server and used to collectively manage the instances stored on the database servers.

Multiserver configuration
K.2 Installing WebAdmin in a Single-Server Configuration

To install WebAdmin in a single-server configuration, the FUJITSU Enterprise Postgres Server component and WebAdmin must be installed on the same machine.

The example below shows the options that need to be selected for a single-server installation.

Example

```
# ./install.sh

The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): 1,4

Selected product
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
FUJITSU Enterprise Postgres WebAdmin x.y SPz
```

K.3 Installing WebAdmin in a Multiserver Configuration

In a multiserver configuration, install WebAdmin on one server, and both WebAdmin and the FUJITSU Enterprise Postgres Server component on any number of database servers.

1. Install WebAdmin (management server)

The example below shows the option that needs to be selected during installation, to install WebAdmin on the management server.

Example

```
# ./install.sh
```
The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): 4

Selected product
FUJITSU Enterprise Postgres WebAdmin x.y SPz

2. Install the FUJITSU Enterprise Postgres Server component and WebAdmin (database servers)

The example below shows the options that need to be selected during installation, to install the FUJITSU Enterprise Postgres Server component and WebAdmin on the database servers.

Example

```
# ./install.sh

The following products can be installed:
1: FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
3: FUJITSU Enterprise Postgres Client (64bit) x.y SPz
4: FUJITSU Enterprise Postgres WebAdmin x.y SPz

Select the product to be installed.
Note: If installing the Server, it is strongly recommended to install WebAdmin.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): 1, 4

Selected product
FUJITSU Enterprise Postgres Standard Edition (64bit) x.y SPz
FUJITSU Enterprise Postgres WebAdmin x.y SPz
```
Appendix L  Supported contrib Modules and Extensions Provided by External Projects

FUJITSU Enterprise Postgres supports PostgreSQL contrib modules, and extensions provided by external projects.

Refer to the following for details on the supported contrib modules:

- https://www.postgresql.org/docs/9.6/static/contrib.html
- https://www.postgresql.org/docs/9.6/static/contrib-prog.html

Information

You can also check the list of available extensions using the pg_available_extensions view.

The following extensions provided by external projects are supported:

- pg_hint_plan
- pg_dbms_stats

Installation and Setup Guide for Server

(Windows)
Preface

Purpose of This Document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Windows platform. This document describes how to install and set up “FUJITSU Enterprise Postgres”.

Intended Readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres. Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Windows

Structure of This Document
This document is structured as follows:

Chapter 1 Overview of Installation
Describes the installation types and procedures

Chapter 2 Operating Environment
Describes the operating environment required to use FUJITSU Enterprise Postgres

Chapter 3 Installation
Describes how to perform a new installation of FUJITSU Enterprise Postgres

Chapter 4 Setup
Describes the setup to be performed after installation

Chapter 5 Uninstallation
Describes how to uninstall FUJITSU Enterprise Postgres

Appendix A Installation in Silent Mode
Provides specifications for installation in silent mode

Appendix B Recommended WebAdmin Environments
Describes the recommended WebAdmin environment

Appendix C Setting Up and Removing WebAdmin
Describes how to set up and remove WebAdmin

Appendix D Configuring Parameters
Describes FUJITSU Enterprise Postgres parameters

Appendix E Uninstall (middleware)
Describes the Uninstall (middleware)

Appendix F Uninstall (middleware) Messages
Explains the messages output by the Uninstall (middleware) tool

Appendix G Estimating Database Disk Space Requirements
Describes how to estimate database disk space requirements

Appendix H Estimating Memory Requirements
Describes the formulas for estimating memory requirements
Appendix I Quantitative Limits
Describes the quantity range

Appendix J Determining the Preferred WebAdmin Configuration
Describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration

Appendix K Supported contrib Modules and Extensions Provided by External Projects
Lists the PostgreSQL contrib modules and the extensions provided by external projects supported by FUJITSU Enterprise Postgres.

Export Restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that can be Installed

Each FUJITSU Enterprise Postgres feature is installed on the machine that was used to build the database environment. The following table shows the relationship between the product to be installed and the features that can be installed.

<table>
<thead>
<tr>
<th>Feature that can be installed</th>
<th>Product name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic feature (server feature, client feature)</td>
<td>AE</td>
</tr>
</tbody>
</table>

Y: Can be installed

1.2 Installation Types

The following three installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, FUJITSU Enterprise Postgres is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

FUJITSU Enterprise Postgres products can be installed on the same server if the product version (indicated by x.y in "x.y SPz") is different from that of any version of the product that is already installed.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.

Note

If you have antivirus software installed, the server may crash, fail to start, or stop responding, during installation or when starting up after installation. Set scan exception settings for the installation directory and resource allocation directory so that the files in these directories are not scanned for viruses.
1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In the interactive mode installation, the installation state of FUJITSU Enterprise Postgres is determined automatically. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
- Multi-version installation

1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres.
Chapter 2 Operating Environment

This chapter describes the operating environment required to use FUJITSU Enterprise Postgres.

See

Refer to "Operating Environment" in the Installation and Setup Guide for Client when installing the FUJITSU Enterprise Postgres client feature at the same time.

2.1 Required Operating System

One of the operating systems shown below is required in order to use FUJITSU Enterprise Postgres.

Table 2.1 Operating systems

<table>

</table>

Y: Can be used

Note

- The following components of Windows Server(R) 2016 are not supported:
  - Server Core
- Nano Server
- Windows Server Container

- The TCP/IP protocol must be installed.
- One of the following basic software products is required if performing failover that is linked to the cluster software of the operating system:
  - Microsoft(R) Windows Server(R) 2008 Enterprise
  - Microsoft(R) Windows Server(R) 2008 Datacenter
  - Microsoft(R) Windows Server(R) 2008 Enterprise without Hyper-V
  - Microsoft(R) Windows Server(R) 2008 Datacenter without Hyper-V
  - Microsoft(R) Windows Server(R) 2008 R2 Datacenter
  - Microsoft(R) Windows Server(R) 2008 R2 Enterprise
  - Microsoft(R) Windows Server(R) 2012 Datacenter
  - Microsoft(R) Windows Server(R) 2012 Standard
  - Microsoft(R) Windows Server(R) 2012 Essentials
  - Microsoft(R) Windows Server(R) 2012 Foundation
  - Microsoft(R) Windows Server(R) 2012 R2 Datacenter
  - Microsoft(R) Windows Server(R) 2012 R2 Standard
  - Microsoft(R) Windows Server(R) 2012 R2 Essentials
  - Microsoft(R) Windows Server(R) 2012 R2 Foundation
  - Microsoft(R) Windows Server(R) 2016 Datacenter
  - Microsoft(R) Windows Server(R) 2016 Standard
  - Microsoft(R) Windows Server(R) 2016 Essentials

2.2 Related Software

Y: Can be used

**Note**

- PL/Python supports PostgreSQL languages based on Python 2 only.
  PostgreSQL languages based on Python 3 are not supported.
- The following programs are installed during installation of FUJITSU Enterprise Postgres:
  - Microsoft Visual C++ 2010 Redistributable Package version 10.0.30319.01
  - Microsoft Visual C++ 2013 Redistributable Package version 12.0.40649.5
  Do not uninstall the above programs as they are required for running FUJITSU Enterprise Postgres.

The following table lists servers that can be connected to the FUJITSU Enterprise Postgres client feature.

**Table 2.3 Connectable servers**

<table>
<thead>
<tr>
<th>OS</th>

<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

**2.3 Excluded Software**

This section describes excluded software.

**FUJITSU Enterprise Postgres**

FUJITSU Enterprise Postgres cannot be installed if all the following conditions are met:
- The product version (indicated by x.y in "x.y SPz") of the product to be installed is the same as that of the installed product
- The editions are different

**Example**

In the following cases, FUJITSU Enterprise Postgres cannot be installed as an exclusive product:
- The installed product is FUJITSU Software Enterprise Postgres Standard Edition (64bit) 9.5
- The product to be installed is FUJITSU Software Enterprise Postgres Advanced Edition (64bit) 9.5

**Other products**

There are no exclusive products.

**2.4 Required Patches**

There are no required patches.
2.5 Hardware Environment

The following hardware is required to use FUJITSU Enterprise Postgres.

Memory

256 MB or more is recommended (at least 128 MB is required).

2.6 Disk Space Required for Installation

The following table shows the disk space requirements for new installation of FUJITSU Enterprise Postgres. If necessary, increase the size of the file system.

Table 2.4 Disk space required for installation

<table>
<thead>
<tr>
<th>Directory</th>

<tr>
<td>Installation destination of the Client (64 bit)</td>
<td>212</td>
</tr>
</tbody>
</table>

*1: Required for the installation of the Uninstall (middleware) tool.

*2: Required for the installation of FJQSS.

2.7 Supported System Environment

This section describes the supported system environment.

2.7.1 TCP/IP Protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

2.7.2 File System

You can install FUJITSU Enterprise Postgres only if the system folder is an NTFS volume.

2.8 PostgreSQL Version Used for FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres is based on PostgreSQL 9.6.2.

2.9 Notes on Using Streaming Replication

To use streaming replication, build the primary server and all standby servers using the same FUJITSU Enterprise Postgres version (*1).

*1: The product version is indicated by “x,y” in the notation “x,y SPz”.
Streaming replication cannot be used in combination with Open Source PostgreSQL.
Chapter 3 Installation

This chapter describes the procedures for the installation of FUJITSU Enterprise Postgres.

Note that "x.y SPz" in window examples indicates the version and level and "<xy>" in paths indicates the version of the installed product. ("SPz" is output when the product level is upgraded).

Note

- The installation must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).
- Stop all applications before starting the installation.
- The Windows Installer service must be running.
- In either of the following cases, it is necessary to switch to install mode by executing the command shown below before installation. Also, after the installation is completed, execute the command shown below to switch back to execute mode.
  - In Windows Server(R) 2008, the terminal server is installed in application server mode.
  - In Windows Server(R) 2008 R2, Windows Server(R) 2012, Windows Server(R) 2012 R2 or Windows Server(R) 2016, the remote desktop service is installed in application server mode.

[Before the installation]

CHANGE USER /INSTALL

[After the installation]

CHANGE USER /EXECUTE

- The following window may be displayed when executing the installation program:

If this window is displayed, perform the following operations:

1. Perform the installation steps until the [InstallShield Wizard Complete] window is displayed.
2. At the window shown above, click [Next].
3. The window shown below is displayed. Click [Finish].

![Image of Finish Admin Install window]

**Information**

- If a [User Account Control] dialog box such as the following is displayed at the start of the installation, click [Yes] to continue processing:

![Image of User Account Control dialog box]

If [No] is clicked, permission to continue is denied and an [Error] dialog box will be displayed. To continue the installation, click [Retry] at the [Error] dialog box. To end the installation, click [Cancel].
- If installation is suspended or processing terminates abnormally, a dialog box of the program compatibility assistant similar to the one shown below may be displayed. Click [This program installed correctly] and continue operation.

3.1 Pre-installation Tasks

Check the system environment below before installing FUJITSU Enterprise Postgres.

Check the disk space

Ensure that there is sufficient disk space to install FUJITSU Enterprise Postgres.

Refer to "2.6 Disk Space Required for Installation" for information on the required disk space.

Check the installed product and determine the installation method

Using the operation shown below, start Uninstall (middleware), and check the installed products.

The installed products are displayed in the window below.

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

If FUJITSU Enterprise Postgres is already installed, determine which installation method to use:

- Reinstallation
- Multi-version installation
Remove applied updates

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

Note

If a product is installed without removing applied updates, the following problems will occur:

- Performing reinstallation
  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

1. Display the applied updates
   Execute the following command to display the applied updates:
   
   Example
   
   ```
   C:\>uam showup
   ```

2. Remove the updates
   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.
   
   Example
   
   ```
   C:\>uam remove -i update-number
   ```

Determine the preferred WebAdmin configuration

Starting with FUJITSU Enterprise Postgres 9.5, WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

See

Refer to "Appendix J Determining the Preferred WebAdmin Configuration" for details.

3.2 Installation in Interactive Mode

The installation must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).

Note

- When reinstalling the product, back up the following folder in which the WebAdmin instance management information is stored:
  
  `webAdminInstallFolder\data\fepwa`

  Follow the procedure below to perform the backup.

  1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.

  2. Back up the following folder:

     `webAdminInstallFolder\data\fepwa`

  Replace the above folder with the backed up folder when the reinstallation is complete.
The installation procedure is described below.

**1. Stop applications and the client program**

When reinstalling the product, the applications and the program must be stopped.

Before starting the installation, stop the following:
- Applications that use the product
- pgAdmin
- Instance
- Web server feature of WebAdmin
  
  If you are using WebAdmin, stop WebAdmin.
  
  Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
- Mirroring Controller
  
  Execute the `mc_ctl` command with the `stop` mode option specified and stop the Mirroring Controller.

  **Example**

  ```
  > mc_ctl stop -M D:\mcdir\inst1
  ```

**2. Inserting the DVD**

Insert the FUJITSU Enterprise Postgres DVD into the drive.

**3. Run the installation**

The installation menu will be displayed. Click [Installation].
**Note**

If the Autorun feature of Windows is disabled, or a remote desktop service (terminal service) is used, the installation program is not automatically started. Execute the following file using [Run] or Windows Explorer.

```
Z:\autorun.exe
```

For Z, specify the drive name of the drive where the DVD has been inserted.

---

**4. Select the products to install**

The [Installation product] window will be displayed.

Select the products to install, and then click [Next].

If a selected product can only be reinstalled, refer to "8. Check the settings".
- To develop or execute a 32-bit application in a 64-bit environment, FUJITSU Enterprise Postgres Client (32bit) is required.

- The FUJITSU Enterprise Postgres Server component and WebAdmin can be installed on the same machine by selecting the first and last options.

- A window is displayed for each product that was selected but has already been installed. An example is shown below. To perform a multi-version installation, click [Next].

Example
5. Checking the installation content

The [Confirm installation] window will be displayed.

If there are no issues with the settings content, click [Next].

The installation process will then start. Proceed to "9. Completing installation".

To modify the settings content, select [Modify], and then click [Next].
**Note**

If using WebAdmin for operation, make a note of the Web server port number displayed in the settings, for use in the Windows firewall settings.

### 6. Enter the installation destination

If the installation method is one of the following, the [Select installation destination] window is displayed for each product:

- New installation
- Multi-version installation

Enter the installation destination, and then click [Next].
Note

- It is necessary to specify a local disk as the installation destination of FUJITSU Enterprise Postgres.

7. Setting up WebAdmin

The [WebAdmin setup] window is displayed. To perform setup, confirm that the port numbers are unused port numbers in the following ranges, and then click [Next]:
Note

Make a note of the Web server port number for use in the Windows firewall settings.

8. Check the settings

The [Confirm installation] window is displayed.

If there are no issues with the settings content, click [Install].

To change any settings, click [Back].
9. Completing installation

The [Installation complete] window is displayed. Click [Finish].
From [All Programs] or [All apps], click [Fujitsu] >> [Uninstall (middleware)]. If the following have been added under [Software Name], installation is complete:
- FUJITSU Enterprise Postgres Standard Edition(64bit)
- FUJITSU Enterprise Postgres WebAdmin(64bit)
- FUJITSU Enterprise Postgres Client(64bit)
- FUJITSU Enterprise Postgres Client(32bit)

3.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

The installation procedure is described below.

1. Insert the DVD

Insert the "server program" DVD in the DVD drive.
The [Install Menu] window will be displayed automatically. Click [Finish].

2. Create an installation parameters CSV file

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.
Refer to "Appendix A Installation in Silent Mode" for information on installation parameters CSV files.

**Note**

If using WebAdmin for operation, make a note of the Web server port number displayed in the settings (the port number defined in WebPortNumber1), for use in the Windows firewall settings.

**Information**

The template for the installation parameters CSV file is "Z:\sample\sample.csv" (for Z, specify the drive name of the drive where the DVD has been inserted).

3. Start the command prompt

   In Windows, right-click [Command Prompt] and then select [Run as administrator].

4. Run the installation

   Execute the command below.

   ```
   Z:\>silent.bat c:\temp\inspara.csv
   ```

   For Z, specify the drive name of the drive where the DVD has been inserted.

   Also in the example above, c:\temp\inspara.csv is the installation parameter CSV file name.

   If the installer ends in an error, a message is output to the log file and return values are returned. Refer to "Appendix A Installation in Silent Mode" for details.

3.4 Post-installation Tasks

   To use the features compatible with Oracle databases, it is necessary to load the Oracle compatibility module. Refer to "Precautions when Using the Features Compatible with Oracle Databases" in the Application Development Guide for details.
Chapter 4 Setup

This chapter describes the setup procedures to be performed after installation completes.

4.1 Operating Method Types and Selection

This section describes how to operate FUJITSU Enterprise Postgres.

There are two methods of managing FUJITSU Enterprise Postgres operations - select one that suits your purposes:

The Operation Guide describes the operating method using WebAdmin, and the equivalent operating method using the server commands.

Simple operation management using a web-based GUI tool (WebAdmin)

Suitable when using frequently used basic settings and operations for operation management.

This method allows you to perform simple daily tasks such as starting the system before beginning business, and stopping the system when business is over, using an intuitive operation.

Usage method

Usage is started by using WebAdmin to create the instance.

By using an external scheduler and the pgx_dmpall command, periodic backups can be performed, which can then be used in recovery using WebAdmin.

Note

- Do not use a server command other than pgx_dmpall or a server application. Operation modes that use server commands and server applications cannot be used in conjunction with WebAdmin. If used, WebAdmin will not be able to manage the instances correctly. Refer to Reference and the PostgreSQL Documentation for information on server commands and server applications.

Advanced operation management using server commands

When operating in a system that is automated by operation management middleware (Systemwalker Centric Manager, for example), this method allows you to use more detailed settings and operations and perform higher level operation management.

An overview of the operating method using the GUI, and its relationship with the operating method using the server commands, are shown below.

Refer to the Operation Guide for details.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operation with the GUI</th>
<th>Operation with commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating an instance</td>
<td>WebAdmin is used. The server machine capacity, and the optimum parameter for operations using WebAdmin, are set automatically.</td>
<td>The configuration file is edited directly using the initdb command.</td>
</tr>
<tr>
<td>Creating a standby instance</td>
<td>WebAdmin is used. WebAdmin performs a base backup of the source instance and creates a standby instance.</td>
<td>A standby instance is created using the pg_basebackup command.</td>
</tr>
<tr>
<td>Changing the configuration files</td>
<td>WebAdmin is used.</td>
<td>The configuration file is edited directly.</td>
</tr>
<tr>
<td>Activating and stopping an instance</td>
<td>WebAdmin is used.</td>
<td>The net command or sc command of the operating system is used.</td>
</tr>
<tr>
<td>Creating a database</td>
<td>This is defined using pgAdmin of the GUI tool, or using the psql command or the application after specifying the DDL statement.</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>---------------------------</td>
<td>----------------------------------------</td>
<td>-----------------------------------------------</td>
</tr>
<tr>
<td>Backing up the database</td>
<td>WebAdmin, or the pgx_dmpall command, is used.</td>
<td>It is recommended that the pgx_dmpall command be used. Recovery to the latest database can be performed.</td>
</tr>
<tr>
<td>Database recovery</td>
<td>WebAdmin is used.</td>
<td>To use the backup that was performed using the pgx_dmpall command, the pgx_rcvall command is used.</td>
</tr>
<tr>
<td>Monitoring</td>
<td><strong>Database errors</strong></td>
<td>The status in the WebAdmin window can be checked. (*1) The messages that are output to the database server log are monitored (*1)</td>
</tr>
<tr>
<td></td>
<td><strong>Disk space</strong></td>
<td>The status in the WebAdmin window can be checked. A warning will be displayed if the free space falls below 20%. (*1) This is monitored using the fsutil command (check free space), and the dir command (check used space), of the operating system, for example. (*1)</td>
</tr>
<tr>
<td></td>
<td><strong>Connection status</strong></td>
<td>This can be checked using pgAdmin of the GUI tool, or referencing pg_stat_activity of the standard statistics view from psql or the application.</td>
</tr>
</tbody>
</table>

*1: This can be used together with system log monitoring using operations management middleware (Systemwalker Centric Manager, for example).

See

Refer to "Periodic Operations" and "Actions when an Error Occurs" in the Operation Guide for information on monitoring and database recovery.

### 4.2 Preparations for Setup

This section describes the preparation required before setting up FUJITSU Enterprise Postgres.

#### 4.2.1 Creating an Instance Administrator

Decide the OS user account that will become the instance administrator. Use either a new user, or a user that already exists.

To create a user in Windows, select [Administrative Tools], [Computer Management], and then create the user in [Local Users and Groups]. Refer to "Help and Support" for details.

The following characters can be used for user names:
- - (hyphen)
- _ (underscore)
- Space
- A-Z, a-z, 0-9 (alphanumeric)

**Note**

The following notes apply if using WebAdmin for operations:
- The instance administrator must have a local OS user account.
- After creating the user account of the instance administrator, log in to the operating system. A profile directory is created for the user when logging in to the operating system for the first time. This directory will be used by WebAdmin.
If changing the password for the user account of the instance administrator, always ensure to stop the instance and log out of WebAdmin before making the change. If you mistakenly change the password while logged in to WebAdmin or while the instance is running, log out from WebAdmin, and then log in again, and stop and start the instance.

### 4.2.1.1 Security policy settings

If using commands for operation, security settings that allow logon as a service are required for the operating system user account of the instance administrator in order to start and stop an instance using a Windows service.

**Information**

If using WebAdmin for operation, these settings are not required as WebAdmin performs the settings automatically for the user ID (operating system user account) that logged in to the database server.

The following explains how to perform the security settings to allow logon as a service:

1. **Displaying the Local Security Policy window**
   
   In Windows, select [Administrative Tools], and then click [Local Security Policy].

2. **Setting up security**

   1. In the [Local Security Policy] window, select [Security Settings], select [Local Policies], and then click [User Rights Assignment].
   3. In the [Log on as a service Properties] window, set the following:
      
      b. On the [Local Security Setting] tab, click [Add User or Group].
      c. In the [Select Users or Groups] window, enter the operating system user account of the instance administrator in [Enter the object names to select].
      d. Click [OK].
   4. In the [Log on as a service Properties] window, click [OK].

### 4.2.2 Preparing Directories for Resource Deployment

Prepare the directories required when creating instances.

**Considerations when deploying resources**

The disk configuration on the resource deployment destination is important, because it affects not only recovery following disk corruption, but normal operation as well. The points for determining the disk configuration are as follows:

1. If the backup data storage destination and the data storage destination are both lost, it will not be possible to recover the data, so deploy them to separate disks.
2. To shorten the recovery time following a single disk fault, deploy the system disk and data storage destination to separate disks.
3. The backup data storage destination requires at least double the capacity of the data storage destination, so deploy it to the disk with the most space available.
4. When large amounts of data are updated, the write-to load for the data storage destination, transaction log storage destination, and backup data storage destination (mirrored transaction log) will also be great. For this reason, deploy them to separate disks, out of consideration for performance.

**Note**

- When using the volume manager provided by the operating system, be aware of which physical disk the file system has been created on, for example, by deploying the data storage destination and the backup data storage destination to separate disks.
- If using WebAdmin, specify an NTFS volume for the data storage destination and backup data storage destination. A network drive cannot be specified.

---

**Server resource of FUJITSU Enterprise Postgres**

<table>
<thead>
<tr>
<th>System disk</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>Core file</td>
</tr>
</tbody>
</table>

**Data storage destination**

- Tablespace
- Transaction log (*1)

**Backup data storage destination**

- Archive log
- Mirrored transaction log

---

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>The area where the database is stored. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Stores log information in preparation for a crash recovery or rollback.</td>
</tr>
<tr>
<td>Archive log</td>
<td>Stores log information for recovery</td>
</tr>
<tr>
<td>Corefile</td>
<td>FUJITSU Enterprise Postgres process corefile output when an error occurs with a FUJITSU Enterprise Postgres process.</td>
</tr>
</tbody>
</table>

**Examples of disk deployment**

The following are examples of disk deployment:

<table>
<thead>
<tr>
<th>Number of disks</th>
<th>Disk</th>
<th>Deployment</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>System disk</td>
<td>FUJITSU Enterprise Postgres program</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Corefile</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Data storage destination, transaction log storage destination</td>
</tr>
<tr>
<td></td>
<td>Connected physical disk</td>
<td>Backup data storage destination</td>
</tr>
</tbody>
</table>
Proposal for disk deployment using WebAdmin

To generate an instance using WebAdmin, we recommend an optimum deployment that takes into account the status of all disks at the time of instance generation, and items 1 to 3 in the "Considerations when deploying resources" subheading above, based on the limitations below (note that a different deployment can also be specified).

- The instance administrator has read and write privileges for the volumes.

Preparing directories

The directories to be prepared depend on the way that you create the instances.

The following shows the directories that need to be prepared:

<table>
<thead>
<tr>
<th>Directory to be prepared</th>
<th>Using WebAdmin</th>
<th>Using the initdb command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data storage destination</td>
<td>Y (*1)</td>
<td>Y</td>
</tr>
<tr>
<td>Backup data storage destination</td>
<td>Y (*1) (*4)</td>
<td>O</td>
</tr>
<tr>
<td>Transaction log storage destination</td>
<td>O (*1) (*2)</td>
<td>O</td>
</tr>
<tr>
<td>Corefile output destination</td>
<td>N (*3)</td>
<td>O</td>
</tr>
</tbody>
</table>

Y: Required
O: Optional
N: Not required

*1: WebAdmin automatically creates a directory

*2: The default is to create in a directory in the data storage destination. When it is necessary to distribute the I/O load for the database data and the transaction log, consider putting the transaction log storage destination on a different disk from the data storage destination

*3: The corefile path is as follows:

```
userProfileFolder\LocalSettingsFolder\Fujitsu\fsep_version\instanceName\PortNumber\core
```

Note: The product version is normally the version of WebAdmin used to create the instance. In addition, WebAdmin 9.6 also allows a user to create a FUJITSU Enterprise Postgres 9.5 instance on a database server having WebAdmin 9.5. In this case the product version will be "95".

PortNumber: port number specified when creating the instance

Example for Windows Server(R) 2008 R2

C:\Users\naomi\AppData\Local\Fujitsu\fsep_96_SE_64\myinst27599\core

To change the output destination, specify in the core_directory parameter and core_contents parameter in postgresql.conf. Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.

*4: This directory is required when instance backup is enabled.
Note

- The directories must meet the following conditions:
  - The directory owner must be the OS user account that you want to be the instance administrator
  - The directory must have write permission
  - The directory must be empty

- If using WebAdmin, network drives cannot be used.

- If using WebAdmin, the following halfwidth characters can be used for directory names:
  - \\
  - - (hyphen)
  - _ (underscore)
  - : (colon)
  - Space
  - A-Z, a-z, 0-9 (alphanumeric)

- If anti-virus software is used, set scan exception settings for folders so that none of the server resources that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the server resources that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop the instance and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

Confirm and configure directory access permissions

If the instance administrator user has "Administrator" permissions (user ID belonging to the Administrators group), it is necessary to configure the settings so that each directory inherits the file and directory access permissions for the instance administrator user.

Therefore, ensure that the setting to inherit permissions has been configured.

The following is an explanation on how to confirm and configure the settings.

How to confirm access permissions

Perform the following operations in Windows Explorer on the directories to be prepared in advance:

1. Right-click on the applicable directory, and then click [Properties] from the menu that is displayed.
2. In the [applicableDir Properties] window, select [Security] >> [Advanced].
3. In the [Advanced Security Settings for applicableDir] window, and in the [Permission entries] list under the [Permissions] tab, confirm that [Applies to] for the instance administrator user is "This folder, subfolders and files".
4. Click [OK].

A confirmation example using Windows Server(R) 2012 is shown below.
How to configure the access permissions

Perform the following operations in Windows Explorer if there are any directories that have not been configured for the access permissions to be inherited.

Windows Server(R) 2008 or Windows Server(R) 2008 R2:

1. Right-click on the applicable directory, and then click [Properties] from the menu that is displayed.
2. In the [applicableDir Properties] window, select [Security] >> [Advanced].
3. In the [Advanced Security Settings for applicableDir] window, under the [Permissions] tab, click [Change Permissions].
4. Click [Add].
5. In the [Select User or Group] window, enter the instance administrator user name as the object name to select, and then click [OK].
6. In the [Permission Entry for applicableDir] window, allow read and write permissions, and then click [OK].
7. In the [Advanced Security Settings for applicableDir] window, confirm that the instance administrator user has been added, with [This folder, subfolders and files] set for [Apply to] in the [Permission entries] list.
8. Click [OK].

Windows Server(R) 2012, Windows Server(R) 2012 R2 or Windows Server(R) 2016:

1. Right-click on the applicable directory, and then click [Properties] from the menu that is displayed.
2. In the [applicableDir Properties] window, select [Security] >> [Advanced].
3. In the [Advanced Security Settings for applicableDir] window, click [Add].
4. In the [Permission Entry for applicableDir] window, click [Select a principal].
5. In the [Select User or Group] window, enter the instance administrator user name as the object name to select, and then click [OK].
6. In the [Permission Entry for applicableDir] window, set [This folder, subfolders and files] for [Apply to] ([Applies to:] for Windows Server(R) 2016), and under [Basic permissions], allow read and write permissions, and then click [OK].
7. In the [Advanced Security Settings for applicableDir] window, confirm that the instance administrator user has been added, with [This folder, subfolders and files] set for [Apply to] ([Applies to] for Windows Server(R) 2016) in the [Permission entries] list.

8. Click [OK].

--- Information ---

The access permissions can also be configured using the icacls command provided by the operating system.

The following is an execution example in which the application destination is set to "(OI)(CI)" and the access permissions are set to "(F) (Full access permissions)" when the data storage destination is "D:\database\inst1" and the instance administrator user is "fsepuser":

```bash
>icacls D:\database\inst1 /grant fsepuser:(OI)(CI)(F)
processed file: D:\database\inst1
Successfully processed 1 files; Failed processing 0 files
```

--- 4.2.3 Estimating Resources ---

Estimate the resources to be used on the FUJITSU Enterprise Postgres.

Refer to "Appendix G Estimating Database Disk Space Requirements" for information on estimating database disk space requirements.

Refer to "Parameters automatically set by WebAdmin according to the amount of memory" when creating multiple instances with WebAdmin.

Refer to "Appendix H Estimating Memory Requirements" when creating instances with the initdb command, to estimate memory usage.

--- 4.2.4 Windows Firewall Settings ---

This section explains the Windows firewall settings required if using WebAdmin for operation.

These settings are not required if using server commands for operation.

If the Windows firewall feature is to be enabled, you should enable a port number on the Web server. The following explains how to enable a port number:

**Windows Server(R) 2008:**

1. In the [Start] menu, click [Control Panel].
2. Click [Security] and then click [Windows Firewall].
3. In the [Windows Firewall] window, click [Change settings].
4. On the [Exceptions] tab, click [Add port].
5. In the [Add a Port] window, set the following:
   a. In [Name], specify the desired name.
   b. In [Port number], specify the Web server port number that was specified during the WebAdmin setup.
   c. Select [TCP].
6. Click [OK].
7. On the [Exceptions] tab, in the [Program or port] list, check if the added port is enabled.
8. In the [Windows Firewall] window, click [OK].

**Windows Server(R) 2008 R2:**

1. In the [Start] menu, click [Control Panel].
2. Click [System and Security], and then click [Windows Firewall].
5. Click [New Rule] on the right side of the window.
6. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
7. Select [TCP] and [Specific local ports], then specify the Web server port number specified during the WebAdmin setup, and click [Next].
8. Select [Allow the connection], and then click [Next].
9. Select the profiles for which this rule applies, and then click [Next].
10. In [Name], specify the desired name, and then click [Finish].
11. In the [Windows Firewall with Advanced Security] window, check if the added rule is enabled under [Inbound Rules] in the center of the window.

Windows Server(R) 2012 or Windows Server(R) 2012 R2 or Windows Server(R) 2016:
1. In the [Start] screen, click [Control Panel].
2. Click [System and Security], and then click [Windows Firewall].
4. In the [Windows Firewall with Advanced Security] window, in the left pane, click [Inbound Rules].
5. In the right pane, click [New Rule].
6. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
7. Select [TCP] and [Specific local ports], then specify the Web server port number specified during the WebAdmin setup, and click [Next].
8. Select [Allow the connection], and then click [Next].
9. Select the profiles for which this rule applies, and then click [Next].
10. In [Name], specify the desired name, and then click [Finish].
11. In the [Windows Firewall with Advanced Security] window, in the center pane, check if the added rule is enabled under [Inbound Rules].

4.2.5 Preparing for Output to the Event Log

This section provides an explanation on the preparation to be carried out if you are outputting error logs to the event log.

If outputting error logs to the event log, you should register an event source name beforehand.

If you do not register an event source name, the message content output to the event log may be incomplete.

Due to the default event source name “FUJITSU Enterprise Postgres Server” being output to the event log when using the following commands, you should register this default event source name beforehand:
- pg_ctl command
- pgx_dmpall command
- pgx_rcvall command

The following is an example in which the DLL of a 64-bit product is registered under the default event source name:

```
> regsvr32 "C:\Program Files\Fujitsu\fsepv\xy\server64\lib\pgevent.dll"
```

Note that this step is not required if using WebAdmin to create an instance.
If using multiple instances

You can output messages corresponding to the event source name assigned by the user, so that messages output to the event log can be identified by instance.

The following is an example in which the DLL of a 64-bit product is registered under the event source name "FUJITSU Enterprise Postgres inst1":

```
> regsvr32 /n /i:"FUJITSU Enterprise Postgres inst1" "C:\Program Files\Fujitsu\fsepv<xy>server64\lib\pgevent.dll"
```

You will need to edit the parameters for each instance, therefore, after creating an instance, refer to "4.5.1 Error Log Settings" when performing this setting.

If installing multiple versions

If FUJITSU Enterprise Postgres is already installed on the same machine, search for the key below in Registry Editor, and make a note of the path of the registered DLL. Afterwards, register a new DLL under the default event source name.

Use the DLL path that you made a note of in the above step when re-registering the default event source name during an uninstall.

FUJITSU Enterprise Postgres Server

See

Refer to "Registering Event Log on Windows" in "Server Setup and Operation" in the PostgreSQL Documentation for information on how to register event source names.

4.3 Creating Instances

There are two methods that can be used to create an instance:

- 4.3.1 Using WebAdmin
- 4.3.2 Using the initdb Command

Creating multiple instances

Multiple instances can be created.

The memory allocated needs to be adjusted when multiple instances are created with WebAdmin (refer to "Parameters automatically set by WebAdmin according to the amount of memory" for details).

Features that cannot be set up using WebAdmin

The “Storage data protection using transparent data encryption” feature cannot be set up using WebAdmin.

To set up this feature in an instance created by WebAdmin, perform the additional setup tasks detailed in “Storage Data Protection using Transparent Data Encryption” in the Operation Guide.

Note

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.
- Databases with the names 'template0' and 'template1' are automatically created when an instance is created. These databases are used as the templates for databases created later. Furthermore, a default database with the name 'postgres' is automatically created, which will be used with FUJITSU Enterprise Postgres commands. It is important that you do not delete these databases created by default.
When an instance that uses WebAdmin is created successfully, the following Windows service is registered:

`fsep_version_edition_architecture_userName_instanceNamePortNumber`

The account and password of the instance administrator are registered in the Windows service. If the password for this account is changed, you must also change the password registered in the service. Change this at the Properties window registered in the Windows service.

Note: The product version is normally the version of WebAdmin used to create the instance. In addition, WebAdmin 9.6 also allows a user to create a FUJITSU Enterprise Postgres 9.5 instance on a database server having WebAdmin 9.5. In this case the product version will be “95”.

- Refer to “4.5.2 Configuring Automatic Start and Stop of an Instance” for information on how to start and stop the operating system of the database server, and how to start and stop linked instances.

### 4.3.1 Using WebAdmin

This section describes how to create an instance using WebAdmin.

WebAdmin must be set up correctly before it can be used. Refer to "C.1 Setting Up WebAdmin" for details. Additionally, if WebAdmin needs to be configured to use an external repository database, refer to "C.3 Using an External Repository for WebAdmin" for details.

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build 38)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different. Configure your browser to allow cookies and pop-up requests from the server on which FUJITSU Enterprise Postgres is installed.

Refer to "Appendix B Recommended WebAdmin Environments" for information on how to change the pop-up request settings and other recommended settings.

**Note**

- WebAdmin does not run in Windows(R) safe mode.
- If the same instance is operated from multiple WebAdmin windows, it will not work correctly.
- If the same instance is operated from multiple WebAdmin versions, it will not work normally. It is always recommended to use the latest version of WebAdmin to operate the instance.
- For efficient use of WebAdmin, it is recommended not to use the browser [Back] and [Forward] navigation buttons, the [Refresh] button, and context-sensitive menus, including equivalent keyboard shortcuts.
- Copying and pasting the WebAdmin URLs are not supported. Additionally, bookmarking of WebAdmin URLs is not supported.
- It is recommended to match the language between the instance server locale and WebAdmin.
- WebAdmin supports only two languages: English and Japanese.
- It is recommended to change the WebAdmin language setting from the instance details page only.
- It is recommended to operate WebAdmin using the WebAdmin launcher.
- WebAdmin uses the labels “Data storage path”, “Backup storage path” and “Transaction log path” to indicate “data storage destination”, “backup data storage destination” and “transaction log storage destination” respectively. In this manual these terms are used interchangeably.
- If the browser was not operated for a fixed period (about 30 minutes), the session will time out and the login page will be displayed again for the next operation.
- Port access permissions

If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the
vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

- When creating or importing an instance in WebAdmin, set the log_directory parameter in postgresql.conf in the following format:
  `log_directory='userProfileFolder\localSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\log'`

  Example: If using Windows Server(R) 2008 R2, `userProfileFolder\localSettingsFolder` will be `C:\Users\userName\AppData\Local`.

4.3.1.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

Activation URL for WebAdmin

In the browser address bar, type the activation URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- `hostNameOrIpAddress`: Host name or IP address of the server where WebAdmin is installed
- `portNumber`: Port number of WebAdmin. The default port number is 27515.

Example

For a server with IP address "192.0.2.0" and port number "27515":

```
http://192.0.2.0:27515/
```

The activation URL window shown below is displayed. From this window you can launch WebAdmin or access the product documentation.

Logging in to the database server

Click [Launch WebAdmin] in the activation URL window to activate WebAdmin and display the login window. Enter the instance administrator user ID (operating system user account name) and password, and log in to WebAdmin.
4.3.1.2 Creating an Instance

This section describes how to create an instance.

1. Activate WebAdmin, and log in to the database server.
2. In the [Instances] tab, click
3. Enter the information for the instance to be created.

Enter the following items:

- [Configuration type]: Whether to create a standalone instance or an instance that is part of a cluster.
- [Server product type]: Whether to create a FUJITSU Enterprise Postgres 9.5 instance or a FUJITSU Enterprise Postgres 9.6 instance. The default is "FUJITSU Enterprise Postgres 9.6".

WebAdmin can create and manage instances that are compatible with FUJITSU Enterprise Postgres 9.5, however, the new features in FUJITSU Enterprise Postgres 9.6 may not be supported for such instances, and may be disabled.

- [Location]: Whether to create the instance in the server that the current user is logged into, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.

- [Instance name]: Name of the database instance to manage
  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- [Instance port]: Port number of the database server

- [Data storage path]: Directory where the database data will be stored

- [Backup]: Whether to enable or disable the WebAdmin backup feature. The default is "Enabled". Select "Disabled" to disable all backup and restore functionality for the instance.
  If "Enabled" is selected, enter the following item:
  - [Backup storage path]: Directory where the database backup will be stored

- [Transaction log path]: Directory where the transaction log will be stored

- [Encoding]: Database encoding system

If "Remote" is selected for [Location], enter the following additional items:

- [Host name]: Name of the host where the instance is to be created

- [Operating system credential]: Operating system user name and password for the remote machine where the instance is to be created

- [Remote WebAdmin port for standalone]: Port in which WebAdmin is accessible in the remote machine

**Note**

- Refer to "4.2.2 Preparing Directories for Resource Deployment" - "Considerations when deploying resources" for information on points to consider when determining the data storage path, backup storage path, and transaction log path.

- The following items can be modified after the instance has been created. These items can be modified for FUJITSU Enterprise Postgres 9.5 and 9.6 instances only.
  - Instance name
  - Port number
  - Backup storage path

Refer to "Editing instance information" for details.

- Do not specify shortcuts for the data storage path, backup storage path, or transaction log path.

- In the instance that is created using WebAdmin, the locale of the character set to be used in the database, and the locale of the collating sequence, are fixed using C.

- The following characters can be used for the data storage path, backup storage path, and transaction log path:
  - \ (backslash)
  - - (hyphen)
  - _ (underscore)
- : (colon)
- Space
- A-Z, a-z, 0-9 (alphanumeric)

- Instance administrator read and write permissions are required for the data storage path, backup storage path, and transaction log path.

- For the port number, specify an unused port number in the following range:
  - 1024 to 49151

- Make a note of the port number for use in the Windows firewall settings.

- Refer to “4.5.2 Configuring Automatic Start and Stop of an Instance” for information on configuring the automatic start and stop of instances.

---

4. Click to create the instance.

If the instance is created successfully, a message indicating the same will be displayed.

5. The instance will be started when it is created successfully.

6. Back up the basic information that was set

   Back up the WebAdmin management information periodically to ensure operational continuity when a fault occurs on the system disk. Follow the procedure below to perform the backup.

   - Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
- Back up the following directory:
  
  `webAdminInstallDir\data\fepwa`

---

**Note**

The following message is output during startup of an instance when the startup process is operating normally, therefore, the user does not need to be aware of this message.

```
FATAL:  the database system is starting up (XXXXX)
```

---

### 4.3.1.3 Changing Instance Settings

You can change the information that is set when an instance is created.

Change the following settings to suit the operating and management environment for FUJITSU Enterprise Postgres.

- **Instance configuration**
  - Character encoding
  - Communication
  - SQL options
  - Used memory
  - Streaming replication
- **Changing client authentication information**
- **Editing instance information**

---

**Information**

These settings are the same as the parameters that can be set in the files shown below. Refer to "Appendix D Configuring Parameters" for information on the equivalence relationship between the item name and the parameter.

- `postgresql.conf`
- `pg_hba.conf`

---

**Note**

The files shown below can also be modified directly, however if a parameter not described in "Appendix D Configuring Parameters" was edited by mistake, WebAdmin may not run correctly.

- `postgresql.conf`
- `pg_hba.conf`

---

**Instance configuration**

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click 
3. Click to change the configuration.
4. Click ☑️ to save your changes.

See

Select a client-side encoding system that can be converted to/from the database encoding system. Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the "PostgreSQL Documentation" for information on the encoding system combinations that can be converted.

Changing client authentication information

1. Start WebAdmin and log in to the database server.
2. In the [Instances] tab, click ✪.

   Click ✪ to register new authentication information.

   To change authentication information, select the information, and then click ✪.

   To delete authentication information, select the information, and then click ✪.

**Note**

When creating the instance, do not delete the entry below, because it is a connection required for WebAdmin to monitor the operational status of the database:
Type= host, Database=all, User=all, and Method=md5

---

Click ✪ - the window will change as shown below.

**Editing instance information**

Use the [Edit instance] page to modify the following items for an instance:
- Instance name
- Port number
- Backup storage path
1. In the [Instances] tab, click [Edit instance]. The [Edit instance] page is displayed.

![Edit instance page](image)

2. Modify the relevant items.
   
   If [Backup storage path] is changed, [Backup management] is enabled. Select the required option:
   
   - Retain existing backup: Create a backup in [Backup storage path] and retain the existing backup in its original location.
   - Copy existing backup to new path: Copy the existing backup to [Backup storage path]. A new backup will not be created. The existing backup will be retained in its original location.
   - Move existing backup to new path: Move the existing backup to [Backup storage path]. A new backup will not be created.
   - Remove existing backup: Create a backup in [Backup storage path]. The existing backup will be removed.

   3. Click [Save] to save your changes.

**Note**

- The [Edit instance] page is also displayed when the user selects 'Navigate to the “Edit instance” page' from the [Anomaly Error] dialog box. Refer to "Anomaly Detection and Resolution" in the Operation Guide for information on what takes place when an anomaly is detected.

- When [Instance name] or [Instance port] is modified, the log_directory and core_directory parameters in postgresql.conf are updated. Also, the specified directories are created if they do not exist.

Refer to "4.3.1.4 Importing Instances" for information on the format of these directories.

### 4.3.1.4 Importing Instances

Instances can be created using WebAdmin, or via the command line using the initdb command. Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin.

This section explains how to import command line instances into WebAdmin.
1. In the [Instances] tab, click ![Import instance]. The [Import instance] page is displayed.

2. Enter the information for the instance being imported. Refer to “4.3.1.2 Creating an Instance” for information on the items that need to be entered.

3. Click ![Import instance] to import the instance.

**Note**

- Importing neither starts nor stops the instance.

- A Windows service is automatically registered when an instance is imported into WebAdmin. If a Windows service was registered by the user prior to importing the instance, that service will not be deleted. After importing the instance into WebAdmin, it is recommended to discontinue the use of the user-created service.

- The following restrictions apply to instance import:
  - Any instance already managed by WebAdmin cannot be imported again.
  - The postgresql.conf file must be located in the same directory as [Data storage path].
  - Read/write permissions are required for [Data storage path].
  - The location specified in postgresql.conf for the following files must not have been changed:
    - hba_file
    - ident_file
  - If the instance is part of a cluster that is monitored by Mirroring Controller, WebAdmin will be unable to detect the Mirroring Controller settings.
  - Instances making use of Mirroring Controller functionality should not be imported, because subsequent operations on those instances may cause unexpected and undesirable side-effects.
  - It is not possible to import and operate an instance that uses a directory mounted by Network File System (NFS).
  - You must make the following changes to the parameters in postgresql.conf prior to importing the instance in WebAdmin.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>- port</td>
<td>- The port parameter should be uncommented.</td>
</tr>
</tbody>
</table>

The log_directory and core_directory parameters in postgresql.conf are updated during import. Also, the specified directories are created if they do not exist.

The format of these directories is as follows:

log_directory: `userProfileFolder\LocalSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\log`  
core_directory: `userProfileFolder\LocalSettingsFolder\Fujitsu\fsep_version\instanceNamePortNumber\core`  

**version**: product version_edition_architecture  

**PortNumber**: port number specified when creating the instance

Examples:

log_directory: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_96_SE_64\myinst27599\log`  
core_directory: `C:\Users\naomi\AppData\Local\Fujitsu\fsep_96_SE_64\myinst27599\core`  

- When a standby instance is imported, a valid entry, using the IP address of the standby instance, must exist in the pg_hba.conf file of the master instance to allow the standby instance to connect to the master instance.

- When a standby instance is imported, the value for "host" in the primary_conninfo parameter of recovery.conf should match the host name of the master instance.

- Instances created by other operating systems cannot be imported.
4.3.2 Using the initdb Command

This section describes the procedure to create an instance using the initdb command.

**Note**

If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions. Consider the security risks carefully when opening ports.

4.3.2.1 Creating an Instance

Create an instance, with the database cluster storage destination specified in the PGDATA environment variable or in the -D option. Furthermore, the user that executed the initdb command becomes the instance administrator.

**Note**

- Instances created using the initdb command (command line instances) can be managed using WebAdmin, however, they must first be imported into WebAdmin. Refer to "4.3.1.4 Importing Instances" for details.
- If creating multiple instances, ensure that there is no duplication of port numbers or the directories that store database clusters.

**See**

Refer to "initdb" in "Reference" in the PostgreSQL Documentation for information on the initdb command.

The procedure to create an instance is described below.

1. Use the OS user account that you want as the instance administrator.
   Connect with the server using the OS user account that you want as the instance administrator.

2. Configure the environment variables
   Configure the environment variables in the server with the newly created instance.
   Set the following environment variables:
   - PATH environment variables
     Add installDir\bin and installDir\lib.

   **Example**
   The following is a setting example for environment variables in which "C:\Program Files\Fujitsu\fsepv<xy>\server64" is used as the installation folder:
   
   ```
   > SET PATH=C:\Program Files\Fujitsu\fsepv<xy>\server64\bin;C:\Program Files\Fujitsu\fsepv<xy>\server64\lib;%PATH%
   ```

3. Create a database cluster
   Create the database cluster with the initdb command, specifying the storage destination directory.
   Specify the transaction log storage destination and the locale setting option as required.

   **Example**
   ```
   > initdb -D D:\database\inst1 --xlogdir=E:\transaction\inst1 --lc-collate="C" --lc-type="C" --encoding=UTF8
   ```
In some features, instance names are requested, and those names are required to uniquely identify the instance within the system. These features allow names that conform to WebAdmin naming conventions, so refer to the following points when determining the names:

- Maximum of 16 characters
- The first character must be ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters

To balance I/O load, consider deploying the transaction log storage destination to a disk device other than the database cluster storage destination and the backup data storage destination.

Messages may not display correctly if a value other than "C" is specified as the display language for messages.

Specify "C" for collation and character category. Performance deteriorates if you specify a value other than "C", although the behavior will follow the rules for particular languages, countries and regions. Furthermore, this may need to be revised when running applications on systems with different locales.

For example, specify as follows:

```
initdb --locale="C" --lc-messages="C"
initdb --lc-collate="C" --lc-ctype="C"
```

Specify an encoding system other than SQL_ASCII for the database. If SQL_ASCII is used, there is no guarantee that the encryption system for data in the database will be consistent, depending on the application used to insert the data.

Refer to "Locale Support" in "Localization" in "Server Administration" in the PostgreSQL Documentation for information on locales.

4. Set port number.

Specify a port number in the port parameter of postgresql.conf. Ensure that the specified port number is not already used for other software. If a port number is not specified, "27500" is selected.

Register the specified port numbers in the C:\Windows\System32\drivers\etc\services file if WebAdmin is used to create other instances. WebAdmin uses the services file to check if port numbers specified as available candidates have been duplicated. Register any name as the service name.

Make a note of the port number for use in the Windows firewall settings.

5. Set the corefile output destination.

Specify the output destination of the corefile, which can later be used to collect information for investigation, by setting the core_directory and core_contents parameters of postgresql.conf.

Refer to "Parameters" in the Operation Guide for information on the settings for these parameters.
6. Set the backup storage destination.

Specify the backup data storage destination and other backup settings when backup is to be performed as a provision against database errors.

**See**

Refer to “Backup Methods” in the Operation Guide for information on specifying backup settings.

7. Register an instance in the Windows service

Use the register mode of the pg_ctl command to register an instance in the Windows service.

Specify the service name, user name, password and path to the instance in the pg_ctl command, and register the instance in the Windows service.

**Example**

The following is a setting example, in which the service name to register is "inst1", the user name is "fepuser", and the storage destination directory of the database cluster is "D:\database\inst1":

```
> pg_ctl register -N "inst1" -U fepuser -P ******** -D D:\database\inst1 -w
```

**Note**

- This command must be executed by an instance administrator user with administrator privileges. Execute the command from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

- For the following reasons, a user name and password must always be specified:
  Because the Windows service is started up by the Network Service account, all user resources are created as resources of that account. This can result in error events such as failing to access database resources and not being able to perform backups/recovery.
  Note that if not specifying a user name and password for security reasons, you should specify the account from the Windows services list immediately after registering the instance in Windows services.

- When entering the password that is specified in the pg_ctl command, for security reasons, you should be careful not to allow other users to access it.

Commands such as sc query can be used to check the registration status.

8. Start an instance

Use the following procedure to start the service:

a. Display the [Services] window.

   In Windows, select [Administrative Tools], and then click [Services].

b. Start the service

   From the services list, select the instance name that you wish to start, and click [Start Service].

If using commands to start the service, specify the service name using either the net start command or sc start command from the command prompt.

### 4.4 Configuring Remote Connections

This section describes the settings required when connecting remotely to FUJITSU Enterprise Postgres from a database application or a client command.
4.4.1 When an Instance was Created with WebAdmin

**Settings related to connection**

The default is to accept connections from remote computers to the database.

Change "listen_addresses" in postgresql.conf to modify the default behavior.

Refer to "Appendix D Configuring Parameters" for information on postgresql.conf.

**Client Authentication Information settings**

The following content is set by default when WebAdmin is used to create an instance.

- Authentication of remote connections from local machines is performed.

When changing Client Authentication Information, select [Client Authentication] from [Setting], and then change the settings.

4.4.2 When an Instance was Created with the initdb Command

**Connection settings**

The default setting only permits local connections from the client to the database. Remote connections are not accepted.

Change "listen_addresses" in postgresql.conf to perform remote connection.

All remote connections will be allowed when changed as shown below.

**Example**

```
listen_addresses = '*'
```

Also, configure the parameters shown below in accordance with the applications and number of client command connections.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
</tr>
</thead>
<tbody>
<tr>
<td>superuser_reserved_connections</td>
<td>Number of connections reserved for database maintenance, for example backup or index rebuilding. If you need to simultaneously perform a large number of processes that exceed the default value, change this value accordingly.</td>
</tr>
<tr>
<td>max_connections</td>
<td>Set the value as:</td>
</tr>
<tr>
<td></td>
<td>numberOfSimultaneousConnectionsToInstance + superuser_reserved_connections</td>
</tr>
</tbody>
</table>

**Client authentication information settings**

When trying to connect from a client to a database, settings are required to determine whether the instance permits connections from the client - if it does, then it is possible to make settings to determine if authentication is required.

---

**See**

Refer to "The pg_hba.conf File" in "Server Administration" in the PostgreSQL Documentation for details.

4.4.3 Windows Firewall Settings

If the Windows firewall feature is to be enabled, you should enable a port number on the database server. The following explains how to enable a port number:

**Windows Server(R) 2008:**

1. In the [Start] menu, click [Control Panel].
2. Click [Security] and then click [Windows Firewall].
3. In the [Windows Firewall] window, click [Change settings].
4. On the [Exceptions] tab, click [Add port].
5. In the [Add a Port] window, set the following:
   a. In [Name], specify the desired name.
   b. In [Port number], specify the Web server port number that was specified when creating the instance.
   c. Select [TCP].
6. Click [OK].
7. On the [Exceptions] tab, in the [Program or port] list, check if the added port is enabled.
8. In the [Windows Firewall] window, click [OK].

**Windows Server(R) 2008 R2:**

1. In the [Start] menu, click [Control Panel].
2. Click [System and Security], and then click [Windows Firewall].
5. Click [New Rule] on the right side of the window.
6. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
7. Select [TCP] and [Specific local ports], then specify the Web server port number specified when creating the instance, and then click [Next].
8. Select [Allow the connection], and then click [Next].
9. Select the profiles for which this rule applies, and then click [Next].
10. In [Name], specify the desired name, and then click [Finish].
11. In the [Windows Firewall with Advanced Security] window, check if the added rule is enabled under [Inbound Rules] in the center of the window.

**Windows Server(R) 2012 or Windows Server(R) 2012 R2 or Windows Server(R) 2016:**

1. In the [Start] screen, click [Control Panel].
2. Click [System and Security], and then click [Windows Firewall].
4. In the [Windows Firewall with Advanced Security] window, in the left pane, click [Inbound Rules].
5. In the right pane, click [New Rule].
6. In the [New Inbound Rule Wizard] window, select [Port], and then click [Next].
7. Select [TCP] and [Specific local ports], then specify the Web server port number specified when creating the instance, and click [Next].
8. Select [Allow the connection], and then click [Next].
9. Select the profiles for which this rule applies, and then click [Next].
10. In [Name], specify the desired name, and then click [Finish].
11. In the [Windows Firewall with Advanced Security] window, in the center pane, check if the added rule is enabled under [Inbound Rules].
4.5 Other Settings

This section describes settings that are useful for operations.

4.5.1 Error Log Settings

This section explains the settings necessary to monitor errors in applications and operations, and to make discovering the causes easier.

Make error log settings only when instances are created with the `initdb` command.

When creating instances with WebAdmin, these settings are already made and hence do not need to be set. Furthermore, some parameters are used by WebAdmin, and if changed, may cause WebAdmin to no longer work properly. Refer to "Appendix D Configuring Parameters" for details.

Edit the following parameters in `postgresql.conf`:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>How to enable the settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_source</td>
<td>Specify the event source name to be attached to messages, for identifying messages output to the event log when using multiple instances.</td>
<td>- Restart services from the Windows services window.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Use the <code>net</code> command or <code>sc</code> command to stop and start services.</td>
</tr>
<tr>
<td>logging_collector</td>
<td>Specify &quot;on&quot; to ensure that messages are output by FUJITSU Enterprise Postgres to the server log file. The server log file created in the <code>pg_log</code> directory in the database cluster.</td>
<td>- Restart services from the Windows services window.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Use the <code>net</code> command or <code>sc</code> command to stop and start services.</td>
</tr>
<tr>
<td>log_destination</td>
<td>Specify &quot;stderr, eventlog&quot; to output messages from FUJITSU Enterprise Postgres to the screen and either the system log or the event log.</td>
<td>reload option of the <code>pg_ctl</code> mode</td>
</tr>
<tr>
<td>log_line_prefix</td>
<td>Specify information to be added at the start of messages output by an instance. This information is useful for automatic monitoring of messages. You can output the SQLSTATE value, output time, executing host, application name, and user ID. Refer to &quot;What To Log&quot; in the PostgreSQL Documentation for details. Example: <code>log_line_prefix = '%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a'</code></td>
<td>reload option of the <code>pg_ctl</code> mode</td>
</tr>
</tbody>
</table>

- If you want fewer application errors being output to the eventlog, refer to "When To Log" and "What To Log" in the PostgreSQL Documentation for information on how to reduce the output messages.
- If you want to separate errors output from other software, refer to "Where To Log" in the PostgreSQL Documentation to change the output destination to the server log file rather than the system log.

4.5.2 Configuring Automatic Start and Stop of an Instance

You can automatically start or stop an instance when the operating system on the database server is started or stopped.

Use the following procedure to configure automatic start and stop of an instance.
Note that, if an instance is activated in a failover operation, the cluster system will control the start or stop, therefore this feature should not be used. Also, when performing database multiplexing, refer to "Enabling Automatic Start and Stop of Mirroring Controller and Multiplexed Instances" in the Cluster Operation Guide.

**When an instance was created with WebAdmin**

When an instance is created with WebAdmin, the instance is registered in the Windows service and automatic start and stop is set for the instance.

To change the automatic start and stop setting for an instance, select the service for the applicable instance in the Windows services window, and in [Startup Type], select [Automatic] or [Manual].

**When an instance was created with the initdb command**

When the startup type of the service is set to [Manual], change it to [Automatic]. By setting the startup type to [Automatic], the service will start up automatically when the Windows(R) system is started up, and will stop automatically when the Windows(R) system is shut down.

---

**Note**

The settings should be performed by a user with administrator privileges.

Use the following procedure to switch the service:

1. Display the [Services] window.
   - In Windows, select [Administrative Tools], and then click [Services].
2. Switch the startup type
   - Select the FUJITSU Enterprise Postgres service name, display the [Properties] dialog box, and then switch the startup type from [Manual] to [Automatic].

The above setting can also be changed using the `sc config` command.

---

**4.5.3 Settings when Using the features compatible with Oracle databases**

The compatibility feature for Oracle databases enables FUJITSU Enterprise Postgres to be used without any special settings by creating a database instance. Note that settings are required only when using the SUBSTR function.

---

**See**

Refer to "Notes on SUBSTR" in the Application Development Guide for details.

---

**4.6 Integration with Message-Monitoring Software**

To monitor messages output by FUJITSU Enterprise Postgres using software, configure the product to monitor SQLSTATE, instead of the message text - this is because the latter may change when FUJITSU Enterprise Postgres is upgraded.

Configure FUJITSU Enterprise Postgres to output messages in a format that can be read by the message-monitoring software by specifying "%e" in the `log_line_prefix` parameter of `postgresql.conf` to output the SQLSTATE value.

A setting example is shown below - it outputs the output time, executing host, application name, and user ID, in addition to the SQLSTATE value.

**Example**

```
log_line_prefix = '%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a '
```
Refer to "What To Log" in the PostgreSQL Documentation for information on how to configure the settings.

4.7 Deleting Instances

This section explains how to delete an instance.

- 4.7.1 Using WebAdmin
- 4.7.2 Using Server Commands

Note

- Always use WebAdmin to delete instances that were created or imported using WebAdmin. Because WebAdmin management information cannot be deleted, WebAdmin will determine that the instance is abnormal.

4.7.1 Using WebAdmin

This section explains how to delete an instance using WebAdmin.

Use the following procedure to delete an instance.

1. Stop the instance
   In the [Instances] tab, select the instance to stop and click  

2. Back up files.
   Before deleting the instance, back up any required files under the data storage destination, the backup data storage destination, and the transaction log storage destination.

3. Delete the instance
   In the [Instances] tab, select the instance to delete and click  

Note

Deleting an instance deletes only the following lowest-level directories. If they are not required, delete them manually.

- Data storage destination
- Backup data storage destination
- Transaction log storage destination (if different from the data storage destination)

4.7.2 Using Server Commands

This section explains how to delete an instance using server commands.

Use the following procedure to delete an instance.

1. Stop the instance
   Stop the instance in Windows services, or use the pg_ctl command stop mode.
   Use the following procedure to stop a service in Windows services:
   a. Display the [Services] window.
      In Windows, select [Administrative Tools], and then click [Services].
b. Stop the service

Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.

You can also stop a service by specifying the service name in the net stop command or sc stop command.

2. Back up files

Before deleting the instance, you should back up all necessary files contained in the data storage destination, backup data storage destination, and transaction log storage destination.

3. Delete the instance

Use a command such as rmdir to delete the following directories:
- Data storage destination directory
- Backup data storage destination directory
- Transaction log storage destination directory (if a different directory to the data storage destination directory was specified)
Chapter 5 Uninstallation

This chapter explains the uninstallation of FUJITSU Enterprise Postgres.

Note that "x.y SPz" in window examples indicates the version and level and "<xy>" in paths indicates the version of the installed product.

**Information**

- If a [User Account Control] dialog box such as the following is displayed at the start of the uninstallation, click [Yes] to continue processing:

![User Account Control](image)

If [No] is clicked, permission to continue is denied and an [Error] dialog box will be displayed. To continue the uninstallation, click [Retry] in the [Error] dialog box. To end the operation, click [Cancel].

- If uninstallation is suspended or processing terminates abnormally, a dialog box of the Program Compatibility Assistant similar to the one shown below may be displayed. Click [This program uninstalled correctly] and continue operation.

![Program Compatibility Assistant](image)

5.1 Uninstallation in Interactive Mode

The uninstallation procedure is described below.
- If performing operation with WebAdmin, back up the following folder before uninstallation. Instances will not be recognized by WebAdmin even if FUJITSU Enterprise Postgres is reinstalled after uninstallation. If performing operation with WebAdmin after reinstalling FUJITSU Enterprise Postgres, replace the following backed up file after installation.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following folder:

   `webAdminInstallFolder\data\fepwa`

By replacing the above folder in the installation folder after installation, the instance will be recognized by WebAdmin, and the recognized instance will be set to automatically start and stop. To disable the automatic start and stop setting for an instance, select the service for the applicable instance in the Windows services window, and in [Startup Type], select [Manual].

- If using database multiplexing mode, refer to "Uninstalling in Database Multiplexing Mode" in the FUJITSU Enterprise Postgres Cluster Operation Guide before performing the uninstallation.

---

See

Refer to the Installation and Setup Guide for Client when uninstalling the FUJITSU Enterprise Postgres client feature.

---

Information

If an error occurs while the product is being uninstalled, refer to "Appendix F Uninstall (middleware) Messages" and take the required action.

---

1. Stop applications and the client program

   Before starting the uninstallation, stop the following:
   
   - Applications that use the product
   - pgAdmin

2. Stop instances

   Stop all instances that are using the product to be uninstalled.
   Stopping of instances should be performed by the appropriate instance administrator.

   When an instance was created with WebAdmin

   In the [Instances] tab, select the instance to stop and click [Stop].

   When an instance was created with the initdb command

   Use the following procedure to stop a service:
   
   a. Display the [Services] window

      In Windows, select [Administrative Tools], and then click [Services].
b. Stop the service

Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.

You can also stop a service by specifying the service name in the `net stop` command or `sc stop` command.

3. Stop WebAdmin

If you are using WebAdmin, stop WebAdmin.

Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.

4. Unregister Windows services

Perform this step if the instance was created with the `initdb` command.

Unregister the instance registered in Windows services.

Use the unregister mode of the `pg_ctl` command to specify the registered service name and unregister the instance from Windows services.

Example

The following is an example showing execution of this command on the registered service name "inst1".

```
> pg_ctl unregister -N "inst1"
```

Note

You should unregister services before uninstalling FUJITSU Enterprise Postgres. If you uninstall FUJITSU Enterprise Postgres while services are running, several files will remain after the uninstallation.

If you have carried out the uninstallation without unregistering services beforehand, use the server command `sc delete` to unregister the services.

This command must be executed by an instance administrator user with administrator privileges. Execute the command from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

5. Delete registrations related to the event log

If you are outputting to the event log, a DLL registration mentioned in "4.2.5 Preparing for Output to the Event Log" has been performed.

To prevent unnecessary issues from occurring, you should delete this registration. Refer to "Server Setup and Operation", "Registering Event Log on Windows" in the PostgreSQL Documentation for details.

The following is an example showing deletion of the DLL registration for a 64-bit product under the default event source name.

```
> regsvr32 /u "C:\Program Files\Fujitsu\fsepv<xy>server64\lib\pgevent.dll"
```

If using multiple instances

DLL registration is performed so that you can output messages corresponding to the event source name assigned by the user, allowing you to identify messages output to the event log by instance.

Since it is necessary to delete the DLL registration for each instance, delete the DLL registration by event source name.

The following is an example showing deletion of the DLL of a 64-bit product registered under the event source name "Enterprise Postgres inst1".

```
> regsvr32 /u /i:"Enterprise Postgres inst1" "C:\Program Files\Fujitsu\fsepv<xy>server64\lib\pgevent.dll"
```

Note that this step is not required if the instance was created with WebAdmin.
If installing multiple versions

If the instances you created using this package have been set to output error logs to the event log, use the DLL path name that you took note of previously as explained in “4.2.5 Preparing for Output to the Event Log” to reregister the default event source name.

Note

Ensure to delete DLLs before the uninstallation. If you perform the uninstallation without doing so, you may not be able to delete the DLLs at a later time.

6. Start the Uninstall (middleware) tool

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

7. Select the software

Select the product to be uninstalled from [Software Name], and then click [Remove].

8. Start the uninstallation

Click [Uninstall].
9. Finish the uninstallation

The uninstallation completion window will be displayed. Click [Finish].

The installation folder may remain after uninstallation. If it is not required, delete it.

10. Stop the Uninstall (middleware) tool

Click [Close].

5.2 Uninstallation in Silent Mode

The uninstallation procedure is described below.

Note

- If performing operation with WebAdmin, back up the following folder before uninstallation.
  Instances will not be recognized by WebAdmin even if FUJITSU Enterprise Postgres is reinstalled after uninstallation.
If performing operation with WebAdmin after reinstalling FUJITSU Enterprise Postgres, replace the following backed up file after installation.

Follow the procedure below to perform the backup.

1. Stop the WebAdmin server. Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.
2. Back up the following folder:
   
   `webAdminInstallFolder\data\fepwa`

By replacing the above folder in the installation folder after installation, the instance will be recognized by WebAdmin, and the recognized instance will be set to automatically start and stop.

To disable the automatic start and stop setting for an instance, select the service for the applicable instance in the Windows services window, and in [Startup Type], select [Manual].

- If using database multiplexing mode, refer to "Uninstalling in Database Multiplexing Mode" in the FUJITSU Enterprise Postgres Cluster Operation Guide before performing the uninstallation.

---

**See**

Refer to the Installation and Setup Guide for Client when uninstalling the FUJITSU Enterprise Postgres client feature.

---

1. **Stop applications and the client program**

   Before starting the uninstallation, stop the following:
   
   - Applications that use the product
   - `pgAdmin`

2. **Stop all instances**

   Stop all instances that are using the product to be uninstalled.

   **When an instance was created with WebAdmin**

   In the [Instances] tab, select the instance to stop and click 

   **When an instance was created with the initdb command**

   Use the following procedure to stop a service:
   
   a. Display the [Services] window.
      
      In Windows, select [Administrative Tools], and then click [Services].
   b. Stop the service
      
      Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.

      You can also stop a service by specifying the service name in the net stop command or sc stop command.

3. **Stop WebAdmin**

   If you are using WebAdmin, stop WebAdmin.

   Refer to "C.1.3 Stopping the Web Server Feature of WebAdmin" for details.

4. **Unregister Windows services**

   Perform this step if the instance was created with the initdb command.

   Unregister the instance registered in Windows services.
Use the unregister mode of the `pg_ctl` command to specify the registered service name and unregister the instance from Windows services.

**Example**

The following is an example showing execution of this command for the registered service name "inst1".

```
> pg_ctl unregister -N "inst1"
```

**Note**

You should unregister services before uninstalling FUJITSU Enterprise Postgres. If you uninstall FUJITSU Enterprise Postgres while services are running, several files will remain after the uninstallation.

If you have carried out the uninstallation without unregistering services beforehand, use the server command `sc delete` to unregister the services.

This command must be executed by an instance administrator user with administrator privileges. Execute the command from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the menu to display the [Administrator: Command Prompt] window.

---

**5. Delete registrations related to the event log**

If you are outputting to the event log, a DLL registration mentioned in "4.2.5 Preparing for Output to the Event Log" has been performed.

To prevent unnecessary issues from occurring, you should delete this registration. Refer to "Server Setup and Operation", "Registering Event Log on Windows" in the PostgreSQL Documentation for details.

The following is an example showing deletion of the DLL registration for a 64-bit product under the default event source name.

```
> regsvr32 /u "c:\Program Files\Fujitsu\fsepv<xy>server64\lib\pgevent.dll"
```

If using multiple instances

DLL registration is performed so that you can output messages corresponding to the event source name assigned by the user, allowing you to identify messages output to the event log by instance.

Since it is necessary to delete the DLL registration for each instance, delete the DLL registration by event source name.

The following is an example showing deletion of the DLL of a 64-bit product registered under the event source name "Enterprise Postgres inst1".

```
> regsvr32 /u /i:"Enterprise Postgres inst1" "c:\Program Files\Fujitsu\fsepv<xy>server64\lib\pgevent.dll"
```

Note that this step is not required if the instance was created with WebAdmin.

If installing multiple versions

If the instances you created using this package have been set to output error logs to the event log, use the DLL path name that you took note of previously as explained in "4.2.5 Preparing for Output to the Event Log" to reregister the default event source name.

**Note**

Ensure to delete DLLs before the uninstallation. If you perform the uninstallation without doing so, you may not be able to delete the DLLs at a later time.

---

**6. Start the command prompt**

In Windows, right-click [Command Prompt] and then select [Run as administrator].

**7. Run the uninstaller**

Execute the command below.
The installation directory may remain after uninstallation. If it is not required, delete it.

Example

```
X:\> installFolder\suninst.bat
```

X: Drive on which the product is installed

**Note**

In Windows(R)7, Windows Server(R) 2008 or Windows Server(R) 2008 R2, an empty folder may remain in the [Start] menu after uninstallation. In Windows, select [All Programs], right-click the following, and then click [Delete]. "x.y SPz" indicates the version level of the uninstalled product.

- FUJITSU Enterprise Postgres Client (32-bit) x.y SPz
- FUJITSU Enterprise Postgres Client (64-bit) x.y SPz

---

### 8. Check the results

Uninstaller results will be output to the log file.

**Log file**

```
xyz is the number part when the product version level is x.y SPz.
pathName:%TEMP%\fsep_SERVER64_0xyz_uninstall.log
```

**Return values**

The following return values are output:

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation was successful.</td>
</tr>
<tr>
<td>64</td>
<td>Failed to install because &quot;Uninstall (middleware)&quot; is running.</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write product information (updating registry).</td>
</tr>
<tr>
<td>79</td>
<td>Failed to read product information (viewing registry).</td>
</tr>
<tr>
<td>83</td>
<td>Failed to delete the information from FJQSS.</td>
</tr>
<tr>
<td>129</td>
<td>Unsupported operating system.</td>
</tr>
<tr>
<td>144</td>
<td>Not executed with administrator privileges.</td>
</tr>
<tr>
<td>251</td>
<td>An error occurred when running a system function.</td>
</tr>
<tr>
<td>255</td>
<td>An internal inconsistency occurred.</td>
</tr>
</tbody>
</table>
Appendix A Installation in Silent Mode

This appendix provides specifications for installation in silent mode.

A.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

[sectionName, parameterName, value]
[sectionName, parameterName, value]

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td></td>
</tr>
</tbody>
</table>

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumeric characters (at least one), and symbols, excluding double quotation marks (") and commas (,).
  Specify values up to 32 bytes.
- The following characters can be used for the setting value in the line of the section name parameters:
  [a-zA-Z0-9], halfwidth space, hyphen (-), backslash (\), and comma (,)
  For path names, specify up to 160 bytes.

The installation parameter CSV template is "driveInWhichDvdIsSet\sample\sample.csv".

A.2 List of Parameters

This section describes the parameters that can be set for each section.

installInfo section

The parameters that can be set in the installInfo section are shown below.
<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Parameter name</td>
<td>Mandatory. Specify the software identifier. For this software, specify the following value: “FUJITSU Enterprise Postgres”</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>None</td>
</tr>
</tbody>
</table>

**Information**

- In addition to "Name", the following parameters can be used in the “installInfo” section.
  - softwareName
  - OS
  - Version
  - Edition
- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.
- The values set in these parameters do not affect silent installation.

**Example**

```
installInfo,Name,FUJITSU Enterprise Postgres
```

**parameters section**

The parameters that can be set in the parameters section are shown below.

Note that "<xy>" indicates the product version and level.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Whether to install the server</td>
<td>ServerInstallExecute</td>
<td>Optional. Specify whether to run the installation of the server. Y: Install No: Do not install</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>Y or N</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Installation destination of the server</td>
<td>ServerInstallPath</td>
<td>Optional. Specify the installation destination of the software. The root folder (such as C:) cannot be specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>Path name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>C:\Program Files\Fujitsu\fsepv&lt;xy&gt;server64</td>
</tr>
<tr>
<td>3</td>
<td>Whether to install the client (32-bit)</td>
<td>Client32InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (32-bit). Y: Install N: Do not install</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>Y or N</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Value/Range</td>
<td>Path name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value</td>
<td>C:\Program Files\Fujitsu\fsepv&lt;xy&gt;client32 or C:</td>
</tr>
<tr>
<td>No.</td>
<td>Type</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----</td>
<td>------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>5</td>
<td>Whether to install the client (64-bit)</td>
<td><strong>Parameter name</strong> Client64InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (64-bit). Y: Install N: Do not install This parameter is ignored on 32-bit operating systems.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> Y or N</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> Y</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Installation destination of the client (64-bit)</td>
<td><strong>Parameter name</strong> Client64InstallPath</td>
<td>Optional. Specify the installation destination of the client (64-bit). This parameter is ignored on 32-bit operating systems. The root folder (such as C:) cannot be specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> Path name</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> C:\Program Files\Fujitsu \fsepv&lt;xy&gt;client64</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Whether to install WebAdmin</td>
<td><strong>Parameter name</strong> WebAdminInstallExecute</td>
<td>Optional. Specify whether to run the installation of WebAdmin in multi-server mode. Y: Install N: Do not install</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> Y or N</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> Y</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Installation destination of WebAdmin (64-bit)</td>
<td><strong>Parameter name</strong> WebAdminInstallPath</td>
<td>Optional. Specify the installation destination of WebAdmin. This parameter is ignored on 32-bit operating systems. The root folder (such as C:) cannot be specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> Path name</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> C:\Program Files\Fujitsu \fsepv&lt;xy&gt;webadmin64</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>Whether to set up WebAdmin</td>
<td><strong>Parameter name</strong> WebSetupExecute</td>
<td>Optional. Specify whether to set up WebAdmin. Y: Install N: Do not install</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> Y or N</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> Y</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>Web server port number</td>
<td><strong>Parameter name</strong> WebPortNumber1</td>
<td>Optional. Specify the port number of the Web server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> 1024 to 49151</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> 27515</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>WebAdmin internal port number</td>
<td><strong>Parameter name</strong> WebPortNumber2</td>
<td>Optional. Specify the WebAdmin internal port number.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Value/Range</strong> 1024 to 49151</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Default value</strong> 27516</td>
<td></td>
</tr>
</tbody>
</table>

Example

```text
installInfo,Name,FUJITSU Enterprise Postgres parameters,ServerInstallExecute,Y parameters,ServerInstallPath, parameters,Client32InstallExecute,Y
```
### A.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error is detected during installation of the product, a message is output to the log:

**Log file**

`xyz` is the number part when the product version level is `x.y SPz

```
%TEMP%\fsep_SERVER64_media_0\xyz\install.log
```

**Note**

Directories under the TEMP environment variable may be deleted when the operating system is restarted. Therefore, ensure that you browse or save the file before restarting the operating system.

**Messages and return values**

#### CSV file errors

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error: code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>Either installInfo or the Name parameter has not been specified.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value is specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid format or character set is being used for the character string.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>There is no line in the &quot;parameters&quot; section.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified parameter is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values.</td>
</tr>
</tbody>
</table>
### Product installer errors

The following return values are returned when errors occur while the product installer is running.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>3</td>
<td>Failed to set up WebAdmin.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>32</td>
<td>The same version of the same product is already installed.</td>
</tr>
<tr>
<td>33</td>
<td>Server product and WebAdmin product cannot be installed in the same machine.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>64</td>
<td>Installation failed because Uninstall (middleware) is running.</td>
</tr>
<tr>
<td>65</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write to the registry.</td>
</tr>
<tr>
<td>79</td>
<td>Failed to read the registry.</td>
</tr>
<tr>
<td>85</td>
<td>Different editions of the same generation are installed.</td>
</tr>
<tr>
<td>86</td>
<td>A newer version of the product is already installed.</td>
</tr>
<tr>
<td>88</td>
<td>The Japanese version and the overseas version of the product cannot be installed on the same machine.</td>
</tr>
<tr>
<td>129</td>
<td>Unsupported operating system.</td>
</tr>
<tr>

</tbody>
</table>

## A.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

### Records

- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a comma "," (comma: ASCII (single-byte character)).

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa  bbb  ccc</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,ccc</td>
<td>aaa  ccc</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa  bbb</td>
</tr>
</tbody>
</table>

- Headers cannot be specified

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>field1 field2 field3</td>
<td>field1 field2 field3</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa  bbb  ccc</td>
</tr>
</tbody>
</table>

### Double quotation marks

- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb b&quot;,&quot;ccc&quot;</td>
<td>aaa  bb  ccc</td>
</tr>
<tr>
<td>&quot;aaa&quot;,&quot;bb,b&quot;,&quot;ccc&quot;</td>
<td>aaa  bb,b  ccc</td>
</tr>
</tbody>
</table>

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;b&quot;,&quot;ccc&quot;</td>
<td>aaa  bb&quot;b  ccc</td>
</tr>
</tbody>
</table>

### Note

An error occurs in the following cases:

- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.
- A space is entered before or after a field enclosed with double quotation marks.

```
"zzz", "yyy", "xxx"
```

- The number of fields differs between records.

```
aaa,bbb
aaa,bbb,ccc
aaa,bbb,ccc,ddd
```

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

```
aaa,"bbb",ccc
"xxx",yyy,"zzz"
```

- The double quotation escape characters are not positioned correctly.

```
"aaa","bb","ccc"
```

- Double quotation marks enclose the entire field.

```
"aaa,bbb,ccc"
```
Appendix B  Recommended WebAdmin Environments

This appendix describes the recommended WebAdmin environment. The following explanation is based on the assumption that Internet Explorer 11.0 or later is used unless otherwise stated.

B.1  Recommended Browser Settings

- Use a display resolution of 1280 x 768 or higher, and 256 colors or more.
- Select [View] >> [Text size] >> [Medium].
- Select [View] >> [Zoom] >> [100%].
- Click [Tools] >> [Internet options] >> [General] >> [Fonts], and then:
  - Set [Webpage font] to [Times New Roman].
  - Set [Plain text font] to [Courier New].

B.2  How to Set Up the Pop-up Blocker

If the Pop-up Blocker is enabled, use the procedure below to configure settings to allow pop-ups from the server where FUJITSU Enterprise Postgres is installed.

1. Click [Tools] >> [Internet options], and then select the [Privacy] tab. If [Turn on Pop-up Blocker] is not selected, the Pop-up Blocker feature will not operate, and therefore steps below are not required.
2. Click [Settings].
3. In the [Pop-up Blocker Settings] window, enter in the [Address of website to allow] the URL of the server where FUJITSU Enterprise Postgres is installed, and then click [Add].
4. Click [Close].
5. In the [Internet Options] window, click [OK].
Appendix C Setting Up and Removing WebAdmin

This appendix describes how to set up and remove WebAdmin.
Note that "<xy>" in paths indicates the product version and level.

C.1 Setting Up WebAdmin

This section explains how to set up WebAdmin.

C.1.1 Setting Up WebAdmin

Follow the procedure below to set up WebAdmin.

1. Log in
   Log in as a user that belongs to the Administrators group.

2. Display the setup window
   In Windows, click [All Programs] or [All apps], then [Product name], and then [WebAdmin Setup].

![WebAdmin Setup window]

Note

If the same [User Account Control] dialog box as that shown below is displayed, click [Yes] to continue processing.
3. Specify the port number

Specify the following port numbers to be used in WebAdmin.

Refer to the services file. Only change to a different port number if the same port number is being used by another service.

Make a note of the Web server port number, because it will be required for activating the WebAdmin window.

<table>
<thead>
<tr>
<th>Item</th>
<th>Value (recommended value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web server port number</td>
<td>27515</td>
</tr>
<tr>
<td>WebAdmin internal port number</td>
<td>27516</td>
</tr>
<tr>
<td>WebAdmin automatic start</td>
<td>Selected</td>
</tr>
</tbody>
</table>

**Web server port number**

Specify an unused port number in the following range for the port number used for communication between the Web browser and Web server:

- 1024 to 49151

The Web server port number is registered as a port number of the following service name in the services file. xy is the number part when the product version level is x.y.

fep_xySPz_edition_64_WebAdmin_Port1

**WebAdmin internal port number**

Specify an unused port number in the following range for the port number used for communication between the Web server and WebAdmin runtime environment:

- 1024 to 49151

The WebAdmin internal port number is registered as a port number of the following service name in the services file. xy is the number part when the product version level is x.y.

fep_xySPz_edition_64_WebAdmin_Port2

**WebAdmin automatic start**

Select whether or not to start WebAdmin when the machine is started.

**Note**

- Make a note of the Web server port number for use in the Windows firewall settings.
- Unused port numbers
  In the operating system and other products, regardless of the information in the service file, unused port numbers may be automatically numbered and then used, or port numbers specified in environment files within products may also be used. Check the port numbers used by the OS and other products, and ensure that these are not duplicated.

- Access restrictions
  Prevent unauthorized access and maintain security by using a firewall product, or the packet filtering feature of a router device, to restrict access to the server IP address and the various specified port numbers.

- Port access permissions
  If a port is blocked (access permissions have not been granted) by a firewall, enable use of the port by granting access. Refer to the vendor document for information on how to grant port access permissions.
  Consider the security risks carefully when opening ports.

- Changing port numbers
  When using WebAdmin in multiserver mode, it is recommended not to change WebAdmin ports after creating instances. Otherwise, the created instances may not be accessible through WebAdmin after the port is changed.

4. Prepare for setup
Click [OK] in the setup window, and after completing the WebAdmin setup, refer to "4.2 Preparations for Setup" and perform the required preparations for setting up FUJITSU Enterprise Postgres if using WebAdmin for operation.

C.1.2 Activating the Web Server Feature of WebAdmin

Follow the procedure below to activate the Web server feature of WebAdmin.

1. Display the Services window
   In Windows, select [Administrative Tools], and then click [Services].

2. Start the service
   Select the displayed name "FUJITSU Enterprise Postgres WebAdmin version", and then click [Start Service].
   You can also start the service by specifying the service name of the Web server feature of WebAdmin in the net start command or sc start command.

C.1.3 Stopping the Web Server Feature of WebAdmin

Follow the procedure below to stop the Web server feature of WebAdmin.

1. Display the Services window
   In Windows, select [Administrative Tools], and then click [Services].

2. Stop the service
   Select the displayed name "FUJITSU Enterprise Postgres WebAdmin version", and then click [Stop Service].
   You can also stop the service by specifying the service name of the Web server feature of WebAdmin in the net stop command or sc stop command.

Note

- For efficient operation of WebAdmin, it is recommended that the Web server feature be stopped only during a scheduled maintenance period.
- When WebAdmin is used to create and manage instances in a multiserver configuration, the Web server feature must be started and running on all servers at the same time.
C.2 Removing WebAdmin

This section explains how to remove WebAdmin. This removal procedure stops WebAdmin and ensures that it no longer starts automatically when the machine is restarted.

To remove the setup, execute the command shown below.

**Example**

When WebAdmin is installed in "C:\Program Files\Fujitsu\fsep\xy\webadmin":

```
> C:
> cd C:\Program Files\Fujitsu\fsep\xy\webadmin\sbin
> WebAdminSetup --delete
```

**Note**

- The removal of the WebAdmin setup must be performed by a user with administrator privileges (a user ID that belongs to the Administrators group).
- Commands that require administrator privileges must be executed from the [Administrator: Command Prompt] window. Right-click [Command Prompt], and then select [Run as administrator] from the context menu to display the [Administrator: Command Prompt] window.

C.3 Using an External Repository for WebAdmin

WebAdmin can be configured to use an external database, where it can store the various metadata information it uses. WebAdmin will use this database as a repository to store the information it uses to manage all the created instances. This can be a FUJITSU Enterprise Postgres database or an Open Source PostgreSQL V9.2 or later database.

Using an external database as a WebAdmin repository provides you with more flexibility in managing WebAdmin. This repository can be managed, backed up and restored as needed using pgAdmin or command line tools, allowing users to have greater flexibility and control.

Follow the procedure below to set up the repository.

1. Activate WebAdmin, and log in to the database server.
2. Click the [Settings] tab, and then click in the [WebAdmin repository configuration] section.

Enter the following items:
- [Host name]: Host name of the database server
- [Port]: Port number of the database server
- [Database name]: Name of the database
- [User name]: User name to access the database
- [Password]: Password of the database user

**Note**
- Database type
  It is recommended to use a FUJITSU Enterprise Postgres database as a repository. A compatible PostgreSQL database can also be used as an alternative.
- It is recommended to click [Test connection] to ensure that the details entered are valid and WebAdmin is able to connect to the target database.

3. Click to register the repository details.

**Note**
- Once the repository is set up, it can be changed any number of times by the user logged into WebAdmin. When a repository is changed:
  - It is recommended to preload the backup into this database.
  - If the data is not preloaded, WebAdmin will create a new repository.
- The database repository can be set up even after WebAdmin was already used to create instances. In that scenario, the instances already created are retained and can continue to be operated on.
- If the instance used as a repository is stopped, WebAdmin will be unusable. For this reason, it is recommended to be familiar with starting an instance from the command line. If the instance is stopped for any reason, start it from the command line and WebAdmin will be usable again.

C.4 Using the WebAdmin Auto-Refresh Feature

The WebAdmin auto-refresh feature automatically refreshes the operating status of all instances in the Instance list at the specified interval. It also refreshes the details of the selected instance.

Follow the procedure below to configure the auto-refresh options.

1. Click the [Settings] tab, and then click 📋 in the [User preferences] section.
2. Enter the following items:
   - [Auto-refresh instance]: To use the auto-refresh feature, select "Enabled". The default is "Disabled".
   - [Refresh interval (seconds)]: Number of seconds between each refresh. This is a countdown timer, which is reset every time the instance status is refreshed by any operation. Specify a value from 30 to 3600 (seconds). The default is 30.
3. Click ✅ to save the auto-refresh settings.

Note

- Auto-refresh will run only if the [Instances] page is displayed and no user-initiated operation is in progress.
- A text indicator, which is independent of auto-refresh, is displayed at the top of the Instance list. It is dynamically updated to display when the page was last refreshed.
Appendix D  Configuring Parameters

WebAdmin operates and manages databases according to the contents of the following configuration files:

- **postgresql.conf**
  Contains various items of information that define the operating environment of FUJITSU Enterprise Postgres.

- **pg_hba.conf**
  Contains various items of information related to client authentication.

These configuration files are deployed to a data storage destination. Data is written to them when the instance is created by WebAdmin and when settings are changed, and data is read from them when the instance is started and when information from the [Setting] menu is displayed.

Direct editing of each configuration file is possible with a text editor.

---

**See**

Refer to "Server Configuration" and "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on the parameters.

---

**Note**

WebAdmin checks for port number and backup storage path anomalies when various operations are performed. An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of the corresponding parameter in postgresql.conf. Refer to "Anomaly Detection and Resolution" in the Operation Guide for details.

---

### postgresql.conf

**Parameters that can be changed in WebAdmin**

The postgresql.conf parameters that can be changed in WebAdmin are shown below:

<table>
<thead>
<tr>
<th>Section</th>
<th>WebAdmin item</th>
<th>postgresql.conf file parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Configuration</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Character encoding</td>
<td>Character set</td>
<td>client_encoding</td>
</tr>
<tr>
<td></td>
<td>Message locale</td>
<td>lc_messages</td>
</tr>
<tr>
<td>Communication</td>
<td>Max connections</td>
<td>max_connections</td>
</tr>
<tr>
<td>SQL options</td>
<td>Transform NULL format</td>
<td>transform_null_equals</td>
</tr>
<tr>
<td></td>
<td>Date output format</td>
<td>DateStyle (*1)</td>
</tr>
<tr>
<td></td>
<td>Interval output format</td>
<td>IntervalStyle</td>
</tr>
<tr>
<td></td>
<td>Number of digits for floating values</td>
<td>extra_float_digits</td>
</tr>
<tr>
<td></td>
<td>Transaction isolation levels</td>
<td>default_transaction_isolation</td>
</tr>
<tr>
<td></td>
<td>Currency format</td>
<td>lc_monetary</td>
</tr>
<tr>
<td></td>
<td>Date and time format</td>
<td>lc_time</td>
</tr>
<tr>
<td>Memory</td>
<td>Sort memory (KB)</td>
<td>work_mem</td>
</tr>
<tr>
<td></td>
<td>Shared buffers (KB)</td>
<td>shared_buffers</td>
</tr>
<tr>
<td>Streaming replication</td>
<td>WAL level</td>
<td>wal_level</td>
</tr>
</tbody>
</table>
### Parameters set by WebAdmin

The following `postgresql.conf` parameters are set by WebAdmin during instance startup (they will be ignored even if specified in `postgresql.conf`):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_source (*1)</td>
<td><code>fsep_version_userName_instanceNamePortNumber</code></td>
</tr>
<tr>
<td>listen_addresses</td>
<td><code>*</code></td>
</tr>
<tr>
<td>log_destination</td>
<td><code>stderr,eventlog</code></td>
</tr>
<tr>
<td>logging_collector</td>
<td><code>on</code></td>
</tr>
<tr>
<td>log_line_prefix</td>
<td><code>%e: %t [%p]: [%l-1] user = %u,db = %d,remote = %r app = %a</code></td>
</tr>
<tr>
<td>log_filename (*2) (*3)</td>
<td><code>logfile-%a.log</code></td>
</tr>
<tr>
<td>log_truncate_on_rotation</td>
<td><code>on</code></td>
</tr>
<tr>
<td>log_rotation_age</td>
<td><code>1d</code></td>
</tr>
</tbody>
</table>

*1: `PortNumber` is the port number of the database server specified when creating the instance.

*2: The server logs are split into files based on the day of the week, and are rotated after each week.

*3: If the date changes while the instance is stopped, old logs are not deleted and continue to exist. Manually delete old logs that are no longer required to release disk space.
Parameters automatically set by WebAdmin according to the amount of memory

The postgresql.conf parameters automatically set according to the amount of installed memory, during the creation of instances by WebAdmin, are shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30% of the machine's installed memory (*1)</td>
</tr>
<tr>
<td>work_mem</td>
<td>30% of the machine's installed memory / max_connections / 2 (*2)</td>
</tr>
<tr>
<td>effective_cache_size</td>
<td>75% of the machine's installed memory (*3)</td>
</tr>
<tr>
<td>maintenance_work_mem</td>
<td>10% of the machine's installed memory / (1 + autovacuum_max_workers) (*4)</td>
</tr>
</tbody>
</table>

*1: The value will be capped at 2097151 MB.
*2: The value will be capped at 2147483646.
*3: The value will be capped at 2147483647.
*4: The value will be capped at 2097151 MB.

When determining the values to be configured in the above parameters, you must take into account any anticipated increases in access volume or effects on performance during business operations, such as the number of applications and commands that will access the instance, and the content of processes. Also, note that in addition to FUJITSU Enterprise Postgres, other software may be running on the actual database server. You will need to determine the degree of priority for the database and other software, as well as the memory allocation size.

WebAdmin automatically configures complex parameter settings such as those mentioned above, based on the size of the internal memory of the machine. This enables maximum leverage of the machine memory to facilitate resistance against fluctuations during business operations.

Accordingly, the effects of the above-mentioned factors must be estimated and taken into account when determining and configuring parameter values, so that memory resources can be effectively allocated among other software or instances, and so that adverse effects can be mutually avoided. Refer to "Memory" in "Resource Consumption", and "Planner Cost Constants" in "Query Planning", under "Server Administration" in the PostgreSQL Documentation for information on parameter values and required considerations.

Parameter values can be modified using the WebAdmin [Setting] menu, or edited directly using a text editor.

If adding an instance, determine the parameter values, including for existing instances, and make changes accordingly.

Note

- Do not directly edit the following postgresql.conf parameters with a text editor, otherwise WebAdmin may not work properly if you make a mistake):
  - archive_mode
  - archive_command
  - wal_level
  - core_directory
  - wal_sync_method
  - log_line_prefix
  - log_destination
  - logging_collector
  - log_directory
  - log_file_mode
  - log_filename
  - log_truncate_on_rotation
- log_rotation_age
- event_source

- You must take care with the following parameter:
  - superuser_reserved_connections

  Set it to a number that includes the 3 connections required in WebAdmin (the default is 3).

### Parameters automatically set by WebAdmin for streaming replication

The postgresql.conf parameters automatically set when a streaming replication standby is created, are shown below. These changes are performed in both the master as well as the standby instance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>wal_level (*1)</td>
<td>replica</td>
</tr>
<tr>
<td>max_wal_senders (*1)</td>
<td>5</td>
</tr>
<tr>
<td>hot_standby</td>
<td>on</td>
</tr>
</tbody>
</table>

*1: These values are set only if the master and standby instance are created at the same time. If only the standby instance is created, you need to set these values before the standby instance is created.

---

### pg_hba.conf

Refer to "Client Authentication" in "Server Administration" in the PostgreSQL Documentation for information on content that can be configured in pg_hba.conf.

---

### Note

- Use the following client authentication settings to allow the instance administrator to connect to the database using WebAdmin:
  - The connection type: "host"
  - The IP address is a loopback address ("127.0.0.1/32")

- If you specify an item or value that cannot be set by WebAdmin when editing the pg_hba.conf file with a text editor, it will not be possible to reference that line from WebAdmin.
## Appendix E Uninstall (middleware)

### E.1 Features that are Installed

#### [Windows]

<table>
<thead>
<tr>
<th>Feature</th>
<th>Package name</th>
<th>Component name</th>
<th>Remarks</th>
<th>Selectively installed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common tool</td>
<td>FJSVcir</td>

(&quot;Uninstall (middleware)&quot;)</td>
<td>No</td>
</tr>
</tbody>
</table>

### E.2 Notes

#### E.2.1 Notes on the Uninstall (middleware) Tool

"Uninstall (middleware)" is a tool used by Fujitsu middleware products. It performs information management for middleware products, and also, launching the uninstaller for removing these products from the installed systems.

**Note**

- To uninstall FUJITSU Enterprise Postgres, uninstall from "Uninstall (middleware)".
- This tool manages information about other Fujitsu middleware products as well as FUJITSU Enterprise Postgres. For this reason, do not uninstall it unless absolutely necessary. If you have accidentally uninstalled this tool, re-install it as described below.

[Windows]

1. Log on to the machine to be installed using a user name belonging to the Administrators group, or switch to an account with administrator privileges.
2. Insert the server program DVD in the drive device.
3. Execute the installation command.

```
z:\CIR\Windows\cirinst.exe
```

In the example above, for z, specify the drive name of the drive where the DVD has been inserted.
1. Log in as a superuser to the installation target machine, or switch to a user with administrative privileges.
2. Insert the product media in the drive.
3. Execute the installation command.

[Linux]

```
# /media/dvd/CIR/Linux/cirinst.sh
```

In the example above, /media/dvd is the DVD mount point.

[Solaris]

```
# /dvd/dvd0/CIR/Solaris/cirinst.sh
```

In the example above, /dvd/dvd0 is the DVD mount point.

- If you uninstall this tool as described below.

1. Check that there are no Fujitsu middleware products installed in the system.
   You can check this by using "Uninstall (middleware)", which is launched by the command below.
   [Windows]
   Select [All Programs] > [Fujitsu] > [Uninstall (middleware)]
   [Linux/Solaris]
   `/opt/FJSVcir/cir/bin/cimanager.sh -c`
   -c: CUI

2. If no Fujitsu middleware products have been installed, then issue the command below.
   [Windows]
   `%%SystemDrive%%\FujitsuF4CR\bin\cirremove.exe`
   [Linux/Solaris]
   `/opt/FJSVcir/bin/cirremove.sh`

3. At the uninstallation confirmation prompt, enter "y".

   This software is a common tool of Fujitsu products. Are you sure you want to remove it?[y/n]:

   Uninstallation will start.
F.1 Messages output by FJSVcir

**FSP_FJSVCIR_CIRINST: ERROR: 101: CIRINST101: Administrator privilege is required.**

**Description**

The user does not have administrator privileges.

**Action method**

Login with administrator privileges and run the command again.

**FSP_FJSVCIR_CIRINST: ERROR: 102: CIRINST102: Failed to create %s**

**Parameters**

%s: Directory name

**Description**

Failed to create a directory during the installation.

**Action method**

Creating the directory might have failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 103: CIRINST103: It is required at least %dMB**

**Parameters**

%d: Disk spaces

**Description**

Insufficient disk space.

**Action method**

Confirm that the system has sufficient disk spaces.

Action method
Confirm the information shown after this message and take the appropriate action.

**Unable to uninstall the software as it is referred from more than one software.**

Description
Failed to uninstall the software because it is used by other software.

Action method
No specific action is required.

**Unable to uninstall the software as the software is mandatory.**

Description
Failed to uninstall the software because it is required by another program.

Action method
No specific action is required.

**Internal data is broken.**

Description
Internal data used by this product is corrupt.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

**[UNIX]**

/var/opt/FJSVCIR/cir/

/etc/opt/FJSVCIR/cir/CIR.properties
Unable to uninstall the software you were about to uninstall as the existence of the software is a precondition for the operation of another software.

Description
Failed to uninstall the software because it is required by another program.

Action method
No specific action is required.

The program terminated abnormally.

Description
The program has terminated abnormally.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
An unexpected error has occurred during uninstall.

Description
An error occurred during uninstall.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
It failed to uninstall. See log for details.

Description
An error occurred during uninstall. (silent mode)

Action method
Collect the files stored in the following directories.

[UNIX]
/var/opt/FJSVCIR/cir/logs/cirlog0.log.0

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
Failed to initialize the temp directory.

Description
Can not start Uninstall (middleware) because failed to initialize the temp directory.

Action method
Run Uninstall (middleware) again. If the problem persists, check whether other processes have accessed the files in the following directories.

[UNIX]
/var/opt/FJSVcir/cir/temp/meta_db

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\temp\meta_db

[Notice]Need to restart for uninstall completion.

Description
Uninstallation was completed. (silent mode)

Action method
Restart the system.
Appendix G Estimating Database Disk Space Requirements

This appendix describes how to estimate database disk space requirements.

G.1 Estimating Table Size Requirements

The following tables provide the formulas for estimating table size requirements.

Table G.1 Estimation formula when the record length is 2032 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Record length</td>
<td>27(*1) + NULL map + OID + column data</td>
</tr>
<tr>
<td></td>
<td>NULL map: Number of columns / 8 (*2)</td>
</tr>
<tr>
<td></td>
<td>OID: 4 for a table &quot;WITH OID&quot;. The default is 0.</td>
</tr>
<tr>
<td></td>
<td>Column data: Sum of column lengths</td>
</tr>
<tr>
<td></td>
<td>*1: Record head section</td>
</tr>
<tr>
<td></td>
<td>*2: Round the result up to the next integer.</td>
</tr>
<tr>
<td></td>
<td>- Because the column data is placed in boundaries of 8 bytes, you need to make an adjustment so that the sum of the record head section, NULL map and OID is a multiple of 8. For example, if the calculated length is 27 + 1 / 8 (rounded up) + 0 = 28 bytes, add 4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- Because the data of each column is placed in boundaries of the defined data type, take the boundary of each data type into account for the length of the column data. For example, the length of the column data in the table below will not be the sum of the data types, which is 37 bytes, but will instead be 64 bytes following boundary adjustment.</td>
</tr>
<tr>
<td></td>
<td>Definition: create table tb1(c1 char(1), c2 long, c3 int, c4 box)</td>
</tr>
<tr>
<td></td>
<td>Estimation: CHAR type 1 byte + boundary adjustment of 7 bytes for LONG type 8 bytes + LONG type 8 bytes + INT type 4 bytes + boundary adjustment of 12 bytes for BOX type 32 bytes + BOX type 32 bytes = 64 bytes</td>
</tr>
<tr>
<td></td>
<td>- Because each record is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the column data is a multiple of 8.</td>
</tr>
<tr>
<td></td>
<td>- If the calculated record length exceeds 2,032 bytes, the variable length data in the record might be compressed automatically. If so, use the estimation formulas in &quot;Table G.2 Estimation formula when the record length exceeds 2032 bytes&quot; to estimate the table size.</td>
</tr>
<tr>
<td>(2) Number of records per page</td>
<td>8168 (*1) / ((1) record length + 4 (*2))</td>
</tr>
<tr>
<td></td>
<td>*1: Page length (8192) - page head (24)</td>
</tr>
<tr>
<td></td>
<td>*2: Pointer length (4)</td>
</tr>
<tr>
<td></td>
<td>- The result will be rounded down to the next integer.</td>
</tr>
<tr>
<td>(3) Number of pages required for storing records</td>
<td>Total number of records / (2) number of records per page</td>
</tr>
<tr>
<td></td>
<td>- The result will be rounded up to the next integer.</td>
</tr>
<tr>
<td>(4) Amount of space</td>
<td>(3) Number of pages required for storing records x page length x safety factor (*1)</td>
</tr>
<tr>
<td></td>
<td>*1: Specify 2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>- This is the safety factor assumed if vacuuming is performed for garbage collection in tables and indexes.</td>
</tr>
</tbody>
</table>
### G.2 Estimating Index Size Requirements

This section provides the formulas for estimating index size requirements.

FUJITSU Enterprise Postgres provides six index types: B-tree, Hash, GiST, GIN, SP-GiST, and VCI. If you do not specify the index type in the CREATE INDEX statement, a B-tree index is generated.

The following describes how to estimate a B-tree index. Refer to "G.7 Estimating VCI Disk Space Requirements" for information on how to estimate VCI.

A B-tree index is saved as a fixed-size page of 8 KB. The page types are meta, root, leaf, internal, deleted, and empty. Since leaf pages usually account for the highest proportion of space required, you need to calculate the requirements for these only.

#### Table G.3 Estimation formula when the key data length is 512 bytes or less

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Entry length</td>
<td>8 (*1) + key data length (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: Entry head</td>
</tr>
<tr>
<td></td>
<td>*2: The key data length depends on its data type (refer to &quot;G.3 Sizes of Data Types&quot; for details).</td>
</tr>
<tr>
<td></td>
<td>Because each entry is placed in boundaries of 8 bytes, you need to make an adjustment so that the length of the key data is a multiple of 8. For example, if the calculated length is 28 bytes, add 4 to make the length 32 bytes.</td>
</tr>
<tr>
<td></td>
<td>- If the key data length exceeds 512 bytes, key data may be automatically compressed.</td>
</tr>
<tr>
<td></td>
<td>In this case, use the estimation formula given in &quot;Table G.4 Estimation formula when the key data length exceeds 512 bytes&quot; to estimate the key data length.</td>
</tr>
<tr>
<td>(2) Page size requirement</td>
<td>8152 (*1)</td>
</tr>
<tr>
<td></td>
<td>*1: Page length (8192) - page header (24) - special data (16) = 8152</td>
</tr>
<tr>
<td>(3) Number of entries per page</td>
<td>(2) Page size requirement / ((1) entry length + 4 (*1))</td>
</tr>
<tr>
<td></td>
<td>*1: Pointer length</td>
</tr>
<tr>
<td></td>
<td>- Result of (3) number of entries per page will be rounded down to the nearest integer.</td>
</tr>
<tr>
<td>(4) Number of pages required for storing indexes</td>
<td>Total number of records / (3) number of entries per page</td>
</tr>
<tr>
<td></td>
<td>- Result of (4) number of pages required for storing indexes will be rounded up to the nearest integer.</td>
</tr>
<tr>
<td>(5) Space requirement</td>
<td>(4) Number of pages required for storing indexes x 8192 (*1) / usage rate (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: Page length</td>
</tr>
<tr>
<td></td>
<td>*2: Specify 0.7 or lower.</td>
</tr>
</tbody>
</table>

#### Table G.4 Estimation formula when the key data length exceeds 512 bytes

<table>
<thead>
<tr>
<th>Item</th>
<th>Estimation formula (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5) Space requirement</td>
<td>Total number of records x key data length x compression ratio (*1) / usage rate (*2)</td>
</tr>
<tr>
<td></td>
<td>*1: The compression ratio depends on the data value, so specify 1.</td>
</tr>
</tbody>
</table>
G.3 Sizes of Data Types

This section lists the sizes of the data types.

G.3.1 Sizes of Fixed-Length Data Types

The following table lists the sizes of fixed-length data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMALLINT (INT2)</td>
<td>2</td>
</tr>
<tr>
<td>INTEGER (INT4)</td>
<td>4</td>
</tr>
<tr>
<td>BIGINT (INT8)</td>
<td>8</td>
</tr>
<tr>
<td>REAL</td>
<td>4</td>
</tr>
<tr>
<td>DOUBLE PRECISION</td>
<td>8</td>
</tr>
<tr>
<td>SERIAL (SERIAL4)</td>
<td>4</td>
</tr>
<tr>
<td>BIGSERIAL (SERIAL8)</td>
<td>8</td>
</tr>
<tr>
<td>MONEY</td>
<td>8</td>
</tr>
<tr>
<td>FLOAT</td>
<td>8</td>
</tr>
<tr>
<td>FLOAT (1-24)</td>
<td>4</td>
</tr>
<tr>
<td>FLOAT (25-53)</td>
<td>8</td>
</tr>
<tr>
<td>TIMESTAMP WITHOUT TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>DATE</td>
<td>4</td>
</tr>
<tr>
<td>TIME WITHOUT TIME ZONE</td>
<td>8</td>
</tr>
<tr>
<td>TIME WITH TIME ZONE</td>
<td>12</td>
</tr>
<tr>
<td>INTERVAL</td>
<td>12</td>
</tr>
<tr>
<td>BOOLEAN</td>
<td>1</td>
</tr>
<tr>
<td>CIDR</td>
<td>IPv4: 7</td>
</tr>
<tr>
<td></td>
<td>IPv6: 19</td>
</tr>
<tr>
<td>INET</td>
<td>IPv4: 7</td>
</tr>
<tr>
<td></td>
<td>IPv6: 19</td>
</tr>
<tr>
<td>MACADDR</td>
<td>6</td>
</tr>
<tr>
<td>POINT</td>
<td>16</td>
</tr>
<tr>
<td>LINE</td>
<td>32</td>
</tr>
<tr>
<td>LSEG</td>
<td>32</td>
</tr>
<tr>
<td>BOX</td>
<td>32</td>
</tr>
<tr>
<td>CIRCLE</td>
<td>24</td>
</tr>
</tbody>
</table>

G.3.2 Sizes of Variable-Length Data Types

The following table lists the sizes of variable-length data types.

*2: Specify 0.7 or lower as the usage rate.
### G.3.3 Sizes of Array Data Types

The following table lists the sizes of array data types.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Size (bytes)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Length of size portion + 12 + 8 x number of dimensions + data size of each item</td>
<td>If the real data length is less than 127, then the length of the size portion is 1 byte, otherwise it is 4 bytes.</td>
</tr>
</tbody>
</table>

- Example of estimation when array data is "ARRAY[[1,2,3], [1,2,3]]"
  - Number of dimensions: 2
  - INTEGER data size: 4
  - Total size = 1+12+8x2+6x4 = 53

### G.3.4 Number of Bytes per Character

The following table lists the number of bytes per character.

The given values relate to the common character sets EUC-JP and UTF8.

<table>
<thead>
<tr>
<th>Character type</th>
<th>Character set</th>
<th>Number of bytes per character</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>
<td>EUC_JP</td>
<td>1</td>
</tr>
<tr>
<td>Halfwidth katakana</td>
<td>EUC_JP</td>
<td>2</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>EUC_JP</td>
<td>2</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>EUC_JP</td>
<td>3</td>
</tr>
<tr>
<td>ASCII</td>
<td>UTF8</td>
<td>1</td>
</tr>
<tr>
<td>Halfwidth katakana</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0208 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
<tr>
<td>JIS X 0212 kanji characters</td>
<td>UTF8</td>
<td>3</td>
</tr>
</tbody>
</table>

### G.4 Estimating Transaction Log Space Requirements

This section provides the formula for estimating transaction log space requirements.
However, if the update volume is extremely high (for example, due to a large data load and batch processing), disk writing at a checkpoint may not be able to keep up with the load, and a higher number of transaction logs than indicated here may temporarily be accumulated.

### G.5 Estimating Archive Log Space Requirements

This section explains how to estimate archive log space requirements.

The archive log is an archive of the transaction logs from the time of a previous backup to the present, so it fluctuates depending on the backup period and the content of update transactions.

The longer the backup period and the more update transactions, the greater the space required for the archive log.

Therefore, measure the actual archive log space by using a test environment to simulate backup scheduling and database update in a real operating environment.

### G.6 Estimating Backup Disk Space Requirements

This section provides the formula for estimating backup disk space requirements.

\[
\text{Backup disk space requirements} = \text{size of the database cluster} \times 2 + \text{transaction log space requirements} + \text{archive log space requirements}
\]

### G.7 Estimating VCI Disk Space Requirements

This section provides the formula for estimating VCI disk space requirements.

\[
\text{Disk space} = (\text{number of rows in tables}) \times (\text{number of bytes per row}) \times (\text{compression ratio}) + \text{(WOS size)}
\]

**Number of bytes per row**

\[
\text{Number of bytes per row} = (19 + (\text{number of columns specified in CREATE INDEX}) / 8 + (\text{number of bytes per single column value})) \times 1.1
\]

Note: Round up the result to the nearest integer.

**Compression ratio**

Specify a value between 0 and 1. Since compression ratio depends on the data being compressed, use actual data or test data that simulates it, then compare the value with the estimation result. As a guide, the compression ratio measured with the Fujitsu sample data is shown below:

- Data with high degree of randomness (difficult to compress): Up to approximately 0.9 times.
- Data with high degree of similarity (easy to compress): Up to approximately 0.5 times.

**WOS size**

\[
\text{WOS size} = (\text{number of WOS rows}) / 185 \times 8096
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

---

**Note**

VCI does not support retrieval of disk space usage using the database object size function `pg_indexes_size`. To find out the actual total VCI disk space, check the disk space of the storage directory using an OS command or other method.
Appendix H Estimating Memory Requirements

This appendix explains how to estimate the memory.

H.1 FUJITSU Enterprise Postgres Memory Requirements

This section describes the formulas for estimating FUJITSU Enterprise Postgres memory requirements.

Use the following formula to obtain a rough estimate of memory required for FUJITSU Enterprise Postgres:

\[
\text{fujitsuEnterprisePostgresRequiredMemory} = \text{sharedMemoryAmount} + \text{localMemoryAmount}
\]

Shared memory amount

Refer to "Shared Memory and Semaphores" under "Server Administration" in the PostgreSQL Documentation for information on shared memory.

However, note that if instances have been created using WebAdmin, the parameters below will be configured automatically when the instances are created. Take this into account when calculating the shared memory size.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Set value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_buffers</td>
<td>30 percent of the internal memory of the machine.</td>
</tr>
<tr>
<td>max_connections</td>
<td>100</td>
</tr>
<tr>
<td>max_prepared_transactions</td>
<td>100</td>
</tr>
</tbody>
</table>

Local memory amount

\[
\text{localMemoryAmount} = \text{processStackArea} + \text{memoryUsedInDbSessionsThatUseTempTables} + \text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} + \text{memoryUsedInMaintenanceOperations} + \text{baseMemoryUsedInEachProcess} + \text{memoryUsedPreparingForDataAccess}
\]

Process stack area

\[
\text{processStackArea} = \text{max_stack_depth} \times (\text{max_connections} + \text{autovacuum_max_workers} + 9)
\]

This formula evaluates to the maximum value.

Actually it is used according to the growth of the stack.

In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used in database sessions that use temporary tables

\[
\text{memoryUsedInDbSessionsThatUseTempTables} = \text{temp_buffers} \times \text{max_connections}
\]

This formula evaluates to the maximum value.

Memory is gradually used as temporary buffers are used, and is released when the session ends.

Memory used in database sessions that perform sort and hash table operations

\[
\text{memoryUsedInDbSessionsThatPerformSortAndHashTableOperations} = \text{work_mem} \times \text{max_connections}
\]

This formula evaluates to the maximum value.

Memory is gradually used as operations such as sort are performed, and is released when the query ends.
Memory used in maintenance operations

\[
\text{memoryUsedInMaintenanceOperations} = \text{maintenance\_work\_mem} \times (\text{numOfSessionsPerformingMaintenance} + \text{autovacuum\_max\_workers})
\]

Note that ‘maintenance operations’ are operations such as VACUUM, CREATE INDEX, and ALTER TABLE ADD FOREIGN KEY.

Base memory used in each process

\[
\text{baseMemoryUsedInEachProcess} = 3\text{MB} \times (\text{max\_connections} + \text{autovacuum\_max\_workers} + 9)
\]

This formula evaluates to the memory used when server processes are running.
In the formula above, 9 is the number of processes that perform roles specific to servers.

Memory used preparing for data access

\[
\text{memoryUsedPreparingForDataAccess} = \text{variationAmount} \times (\text{max\_connections} + \text{autovacuum\_max\_workers} + 4)
\]

where \[\text{variationAmount} = \frac{\text{shared\_buffers}}{8\text{KB}} \times 4\text{ bytes}\]
(note that 8KB is the page length, and 4 bytes is the size of page management data)

This formula evaluates to the memory required to access the database cache in the shared memory.
In the formula above, among the processes that perform roles specific to servers, 4 is the number of processes that access the database.

### H.2 Database Multiplexing Memory Requirements

This section describes the formula for estimating database multiplexing memory requirements.

Use the following formula to obtain a rough estimate of memory required for database multiplexing:

\[
\text{Memory usage of the database multiplexing feature} = \text{Peak memory usage of the Mirroring Controller processes} + \text{Peak memory usage of the Mirroring Controller commands}
\]

Peak memory usage of the Mirroring Controller processes=150 MB
Peak memory usage of the Mirroring Controller commands=50 MB * Number of commands executed simultaneously

### H.3 VCI Memory Requirements

This section describes the formula for estimating VCI memory requirements.

Use the following formula to obtain a rough estimate of memory requirements:

\[
\text{memUsedByVci} = \text{memForData} + \text{memForEachProcess}
\]

Memory required to store data in memory

Secure the space estimated using the formula below on the stable buffer (part of shared_buffers).

\[
\text{memForData} = \text{(numOfRowsInTables)} \times \text{(numOfBytesPerRow)} + \text{(wosSize)}
\]

Number of bytes per row

\[
\text{numOfBytesPerRow} = \left(19 + \frac{\text{(numOfColsInCreateIndexStatement)}}{8} + \frac{\text{(numOfBytesPerSingleColValue)}}{}\right) \times 1.1
\]

Note: Round up the result to the nearest integer.
WOS size

\[
\text{wosSize} = (\text{numOfWosRows}) / 185 \times 8096
\]

One row is added to the number of WOS rows for each INSERT and DELETE, and two rows are added for UPDATE. On the other hand, the number decreases to 520,000 rows or less during conversion to ROS performed by the ROS control daemon.

Memory required for each process

\[
\text{memForEachProcess} = \text{memUsedPerScanning} + \text{memUsedForVciMaintenace} + \text{memUsedByCreateIndexStatement}
\]

Memory used per scanning

- Parallel scan

\[
\text{memUsedPerScanning} = \text{vci.shared_work_mem} + (\text{numOfParallelWorkers} + 1) \times \text{vci.maintenance_work_mem}
\]

Note: The number of parallel workers used by VCI simultaneously in the entire instance is equal to or less than \text{vci.max_parallel_degree}.

- Non-parallel scan

\[
\text{memUsedPerScanning} = \text{vci.max_local_ros} + \text{vci.maintenance_work_mem}
\]

Note

\[
- \text{vci.shared_work_mem}, \text{vci.max_local_ros} \text{are used to create local ROS. If local ROS exceeds these sizes, execute a query without using VCI according to the conventional plan.}
- \text{vci.maintenance_work_mem} \text{specifies the memory size to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.}
\]

Memory used for VCI maintenance

\[
\text{memUsedForVciMaintenace} = \text{vci.maintenance_work_mem} \times \text{vci.control_max_workers}
\]

Memory used by CREATE INDEX

\[
\text{memUsedByCreateIndexStatement} = \text{vci.maintenance_work_mem}
\]

Note

\[
\text{vci.maintenance_work_mem} \text{specifies the memory to be secured dynamically. If it exceeds the specified value, a disk temporary file is used for operation.}
\]
# Appendix I Quantitative Limits

This appendix lists the quantitative limits of FUJITSU Enterprise PostgreSQL.

## Table I.1 Length of identifier

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Schema name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>View name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Index name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table space name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cursor name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Aggregate function name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Trigger name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Constraint name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Role name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Cast name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Collation sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Encoding method conversion name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Domain name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Extension name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator class name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Operator family name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Rewrite rule name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Sequence name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search settings name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search dictionary name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search parser name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Text search template name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Data type name</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Enumerator type label</td>
<td>Up to 63 bytes (*1) (*2)</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

*2: If an identifier that exceeds 63 bytes in length is specified, the excess characters are truncated and it is processed.

## Table I.2 Database object

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of databases</td>
<td>Less than 4,294,967,296 (*1)</td>

</tr>
<tr>
<td>Number of index access methods</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
</tbody>
</table>

*1: The total number of all database objects must be less than 4,294,967,296.

**Table I.3 Schema element**

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns that can be defined in one table</td>
<td>From 250 to 1600 (according to the data type)</td>
</tr>
<tr>
<td>Table row length</td>
<td>Up to 400 gigabytes</td>
</tr>
<tr>
<td>Number of columns comprising a unique constraint</td>
<td>Up to 32 columns</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>Data length comprising a unique constraint</td>
<td>Less than 2,000 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table size</td>
<td>Up to 32 terabyte</td>
</tr>
<tr>
<td>Search condition character string length in a trigger definition statement</td>
<td>Up to 800 megabytes (*1) (*2)</td>
</tr>
<tr>
<td>Item size</td>
<td>Up to 1 gigabyte</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.

*2: This is the character string byte length when converted by the server character set character code.

Table I.4 Index

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>

</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.
Appendix J  Determining the Preferred WebAdmin Configuration

This appendix describes the two different configurations in which WebAdmin can be used and how to select the most suitable configuration.

J.1  WebAdmin Configurations

WebAdmin can be installed in two configurations:

- Single-server
- Multiserver

J.1.1  Single-Server Configuration

A single-server configuration enables you to create and operate instances on a single server. In this configuration, WebAdmin must be installed on the same database server as the FUJITSU Enterprise Postgres Server component.

J.1.2  Multiserver Configuration

A multiserver configuration enables you to create and operate instances stored on multiple database servers. As shown in the figure below, WebAdmin can be installed on a dedicated management server and used to collectively manage the instances stored on the database servers.
J.2 Installing WebAdmin in a Single-Server Configuration

To install WebAdmin in a single-server configuration, the FUJITSU Enterprise Postgres Server component and WebAdmin must be installed on the same machine.

The example below shows the options that need to be selected for a single-server installation.
J.3 Installing WebAdmin in a Multiserver Configuration

In a multiserver configuration, install WebAdmin on one server, and both WebAdmin and the FUJITSU Enterprise Postgres Server component on any number of database servers.

1. Install WebAdmin (management server)

The example below shows the option that needs to be selected during installation, to install WebAdmin on the management server.
2. Install the FUJITSU Enterprise Postgres Server component and WebAdmin (database servers)

The example below shows the options that need to be selected during installation, to install the FUJITSU Enterprise Postgres Server component and WebAdmin on the database servers.
Example

Installation product
Please select the product you want to install.

Select the product you want to install. Please click the [Next] button and continue the process.

- [ ] FUJITSU Enterprise Postgres Standard Edition (64-bit) x.y SPz
- [ ] FUJITSU Enterprise Postgres Client (32-bit) x.y SPz
- [ ] FUJITSU Enterprise Postgres Client (64-bit) x.y SPz
- [x] FUJITSU Enterprise Postgres WebAdmin (64-bit) x.y SPz

Note: If installing the Server, it is strongly recommended to install WebAdmin.
Appendix K  Supported contrib Modules and Extensions Provided by External Projects

FUJITSU Enterprise Postgres supports PostgreSQL contrib modules, and extensions provided by external projects.

Refer to the following for details on the supported contrib modules:

- https://www.postgresql.org/docs/9.6/static/contrib.html
- https://www.postgresql.org/docs/9.6/static/contrib-prog.html

Information

You can also check the list of available extensions using the pg_available_extensions view.

The following extensions provided by external projects are supported:

- pg_hint_plan
- pg_dbms_stats
Installation and Setup Guide for Client
Preface

Purpose of This Document

This document describes how to install and set up the “FUJITSU Enterprise Postgres client feature”.

Intended Readers

This document is intended for those who install and operate FUJITSU Enterprise Postgres.

Readers of this document are assumed to have general knowledge of:

- PostgreSQL
- SQL
- Windows
- PostgreSQL
- SQL
- Linux
- PostgreSQL
- SQL
- Oracle Solaris

Structure of This Document

This document is structured as follows:

Chapter 1 Overview of Installation
Describes the features that can be installed, and provides an overview of installation methods

Chapter 2 Installation and Uninstallation of the Windows Client
Describes how to install the FUJITSU Enterprise Postgres client feature (Windows client)

Chapter 3 Installation and Uninstallation of the Linux Client
Describes how to install the FUJITSU Enterprise Postgres client feature (Linux Client)

Chapter 4 Installation and Uninstallation of the Solaris Client
Describes how to install the FUJITSU Enterprise Postgres client feature (Solaris Client)

Chapter 5 Setup
Describes the setup procedures to be performed after installation completes

Appendix A Installation in Silent Mode
Provides specifications for installation in silent mode

Appendix B Uninstall (middleware)
Describes the Uninstall (middleware) tool.

Appendix C Uninstall (middleware) Messages
Describes the messages output by the Uninstall (middleware).

Export Restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Overview of Installation

This chapter provides an overview of FUJITSU Enterprise Postgres installation.

1.1 Features that Can Be Installed

FUJITSU Enterprise Postgres provides features to enable access to the database from a variety of platforms and languages, as the connection environment for the client and the database server.

The FUJITSU Enterprise Postgres client package must be installed on the client system to use these features.

The following table shows the relationship between the platforms and the features provided by client packages.

<table>
<thead>
<tr>
<th>Platform</th>
<th>JDBC</th>
<th>ODBC</th>
<th>.NET Data Provider</th>

1.2 Installation Types

The following three installation types are available for FUJITSU Enterprise Postgres:

- New installation
- Reinstallation
- Multi-version installation

1.2.1 New Installation

In initial installation, the FUJITSU Enterprise Postgres client feature is installed for the first time.

1.2.2 Reinstallation

Perform reinstallation to repair installed program files that have become unusable for any reason.

1.2.3 Multi-Version Installation

Perform multi-version installation to install different versions to the installed program files separately.

1.3 Installation Procedure

The following installation procedures are available for FUJITSU Enterprise Postgres:

- Installation in interactive mode
- Installation in silent mode

Select the installation procedure that corresponds to your environment.
1.3.1 Installation in Interactive Mode

Interactive mode enables installation to be performed while the required information is entered interactively.

In interactive mode installation, the FUJITSU Enterprise Postgres installer automatically determines the installation state of FUJITSU Enterprise Postgres. Install FUJITSU Enterprise Postgres using one of the following installation types in accordance with the installation state:

- New installation
- Reinstallation
- Multi-version installation

1.3.2 Installation in Silent Mode

Silent mode enables installation to be performed without the need to enter any information interactively.

New installations and multi-version installations can be performed in silent mode.

1.4 Uninstallation

Uninstallation removes the system files of the installed FUJITSU Enterprise Postgres client feature.
Chapter 2 Installation and Uninstallation of the Windows Client

This chapter explains how to install and uninstall the Windows client.

2.1 Operating Environment

This section describes the operating environment required to use the Windows client.

2.1.1 Required Operating System

One of the following operating systems is required to use the Windows client:

- Windows(R) 7 Home Premium
- Windows(R) 7 Professional
- Windows(R) 7 Enterprise
- Windows(R) 7 Ultimate
- Windows(R) 8.1
- Windows(R) 8.1 Pro
- Windows(R) 8.1 Enterprise
- Windows(R) 10 Home
- Windows(R) 10 Education
- Windows(R) 10 Pro
- Windows(R) 10 Enterprise
- Microsoft(R) Windows Server(R) 2008 Standard
- Microsoft(R) Windows Server(R) 2008 Enterprise
- Microsoft(R) Windows Server(R) 2008 Datacenter
- Microsoft(R) Windows Server(R) 2008 Foundation
- Microsoft(R) Windows(R) Web Server 2008
- Microsoft(R) Windows Server(R) 2008 Standard without Hyper-V
- Microsoft(R) Windows Server(R) 2008 Enterprise without Hyper-V
- Microsoft(R) Windows Server(R) 2008 Datacenter without Hyper-V
- Microsoft(R) Windows Server(R) 2008 R2 Datacenter
- Microsoft(R) Windows Server(R) 2008 R2 Enterprise
- Microsoft(R) Windows Server(R) 2008 R2 Standard
- Microsoft(R) Windows Server(R) 2008 R2 Foundation
- Microsoft(R) Windows Server(R) Web Server 2008 R2
- Microsoft(R) Windows Server(R) 2012 Datacenter
- Microsoft(R) Windows Server(R) 2012 Standard
- Microsoft(R) Windows Server(R) 2012 Essentials
- Microsoft(R) Windows Server(R) 2012 Foundation
- Microsoft(R) Windows Server(R) 2012 R2 Datacenter
- Microsoft(R) Windows Server(R) 2012 R2 Standard
- Microsoft(R) Windows Server(R) 2012 R2 Essentials
- Microsoft(R) Windows Server(R) 2012 R2 Foundation
- Microsoft Windows Server 2016 Datacenter
- Microsoft Windows Server 2016 Standard
- Microsoft Windows Server 2016 Essentials

## 2.1.2 Related Software

The following table lists the software compatible (that can operate) with the Windows client.
Before using any of these, confirm that the OS supports the software.

### Table 2.1 Related software

<table>
<thead>
<tr>
<th>No.</th>
<th>Software name</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>.NET Framework</td>
<td>3.5 SP1 or later 4 4.5 4.6</td>
</tr>
<tr>
<td>3</td>
<td>C compiler (*1)</td>
<td>-</td>

<td>NetCOBOL for .NET</td>
<td>(*3)</td>
</tr>
</tbody>
</table>

*1: Only operations using the C compiler provided with the operating system are guaranteed.

*2: NetCOBOL is available in the following editions:
- NetCOBOL Base Edition V10.5.0 or later
- NetCOBOL Standard Edition V10.5.0 or later
- NetCOBOL Professional Edition V10.5.0 or later
- NetCOBOL Enterprise Edition V10.5.0 or later

*3: NetCOBOL for .NET is available in the following editions:
- NetCOBOL Standard Edition for .NET V5.0.0 or later
- NetCOBOL Professional Edition for .NET V5.0.0 or later
- NetCOBOL Enterprise Edition for .NET V5.0.0 or later

Note

Either the JDK or JRE included with Interstage Application Server, or the Oracle JDK or JRE can be used. It is recommended that the JDK or JRE included with Interstage Application Server is used.

The following table lists servers that can be connected to the Windows client.
Table 2.2 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td>Linux</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

2.1.3 Excluded Software

There is no excluded software.

2.1.4 Hardware Environment

The following hardware is required to use the Windows client.

Memory

- At least 256 MB of memory is required.

Mandatory hardware

- None.

2.1.5 Disk Space Required for Installation

The disk space shown below is required for new installation of the Windows client.

- At the Windows (32-bit) client installation destination:
  - 188 MB
- At the Windows (64-bit) client installation destination:
  - 187 MB
- System folder:
  - 100 MB

2.1.6 Supported System Environment

This section describes the supported system environment.

TCP/IP protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

File system

You can install FUJITSU Enterprise Postgres only if the system folder is an NTFS volume.
2.1.7 Versions of Open-Source Software Used as the Base for FUJITSU Enterprise Postgres Drivers

The following table lists the versions of open-source software used as the base for the various FUJITSU Enterprise Postgres drivers.

<table>
<thead>
<tr>
<th>Driver</th>
<th>Open-source software version</th>
</tr>
</thead>
<tbody>
<tr>
<td>.NET Data Provider</td>
<td>Npgsql 2.2.7</td>
</tr>
<tr>
<td>JDBC</td>
<td>pgjdbc 9.4.1212</td>
</tr>
<tr>
<td>ODBC</td>
<td>psqlodbc 09.05.0400</td>
</tr>
<tr>
<td>libpq</td>
<td>PostgreSQL 9.6.2</td>
</tr>
</tbody>
</table>

2.2 Installation

This section explains how to install the Windows client.

2.2.1 Pre-installation Tasks

This section describes the operations to be performed before installing the Windows client.

Note that "x.y SPz" in sample windows indicates the version level of installed products.

hosts file settings

Using an editor, add the IP address and server name of the connected server to the \System32\drivers\etc\hosts file in the Folder where Windows is installed.

**Note**

For Windows(R) 7, Windows(R) 8.1, or Windows(R) 10, assign write privileges in advance to the user responsible for editing the hosts file.

Check the installed product and determine the installation method

Using the operation shown below, start Uninstall (middleware), and check the installed products.

In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].
If the Windows client is already installed, determine the installation method to use:

- Reinstallation
- Multi-version installation

**Remove applied updates**

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

**Note**

If a product is installed without removing applied updates, the following problems will occur:

- Performing reinstallation

  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

1. Display the applied updates

   Execute the following command to display the applied updates:

   **Example**

   ```
   C:\Program Files (x86)\Fujitsu\UpdateAdvisor\UpdateAdvisorMW>uam showup
   ```

2. Remove the updates

   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.

   **Example**

   ```
   C:\Program Files (x86)\Fujitsu\UpdateAdvisor\UpdateAdvisorMW>uam remove -i update-number
   ```
Confirm service

The Windows Installer service must be running.

2.2.2 Pre-installation Considerations

This section describes points that the user must take into account prior to installation.

- In any of the following cases, the command given below must be executed to switch to installation mode before performing installation. After installation is complete, the next command given below must be executed to switch to execution mode.
  - A terminal server is installed in application server mode on Windows Server 2008
  - A remote desktop service is installed in application server mode on Windows Server 2008 R2, Windows Server 2012 or Windows Server 2012 R2

Before installation:

```
CHANGE USER /INSTALL
```

After installation:

```
CHANGE USER /EXECUTE
```

- The following window may be displayed when the installation program is executed.

![After Installation Window]

If the above window is displayed, follow the procedure below:

1. Perform the steps in the installation procedure until the [InstallShield Wizard Complete] window is displayed.
2. Click [Next] in the [InstallShield Wizard Complete] window.
3. The following window is displayed. Click [Finish].

4. Restart the system.

**Information**

- If a [User Account Control] dialog box, such as the one shown below, is displayed when installation or uninstallation starts, click [Yes] to continue the operation.

If [No] is clicked, the [Error] dialog box will be displayed because continuing is not permitted. Click [Retry] in the displayed [Error] dialog box to proceed with installation or uninstallation. To end operations, click [Cancel].
- If installation or uninstallation is suspended or processing terminates abnormally, a dialog box of the program compatibility assistant similar to the one below may be displayed. If this happens, click [This program installed correctly] or [This program uninstalled correctly] and continue operation.

2.2.3 Installation in Interactive Mode

The installation procedure is described below.

Note that "x.y SPz" in sample windows indicates the version level of products to install.

1. Stop applications and the client program

If the installation method is one of the following, the applications and the client program must be stopped:
   - Reinstallation

Before starting the installation, stop the following:
   - Applications that use the product
   - pgAdmin

2. Insert the DVD

Insert the client program DVD in the DVD drive.

3. Run the installation

The installation menu is displayed. Click [Installation].
4. **Select the product to install**

Select the product to install, and then click [Next].
If a selected product can only be reinstalled, refer to "7. Check the settings".
If multi-version installation is possible, the [Select Installation Method] window is displayed for each selected product. Select "Multi-version installation" and click [Next].

5. Confirm the contents for installation

The [Confirm installation] window will be displayed.
If the settings are correct, click [Next] to start installation. Proceed to "8. Completion of installation".

To modify the settings, select [Modify] and click [Next].

6. Select the installation destination

If the installation method is one of the following, the [Select Destination Path] window is displayed for each product:

- New installation
- Multi-version installation

Select the installation destination, and then click [Next].
7. Check the settings

The [Confirm installation] window will be displayed.

If the settings are correct, click [Install] to start installation.

To modify the settings again, click [Back].
8. Completion of installation

The completion window is displayed. Click [Finish].
Note

If subsequently installing .NET Framework 3.5 SP1 or later, or .NET Framework 4.0 or later
If you intend to subsequently install .NET Framework 3.5 or .NET Framework 4.0 or later, install .NET Framework and then run the pgx_NpgsqlRegister.exe command to set up Fujitsu Npgsql .NET Data Provider.
The pgx_NpgsqlRegister.exe command is installed in fujitsuEnterprisePostgresClientFeatureInstallationFolder\DOTNET\bin.
Refer to “2.4 Registering .NET Data Provider” for details.

2.2.4 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

The installation procedure is described below.

1. Insert the DVD
Insert the client program DVD in the DVD drive.
The [Install Menu] window is displayed. Click [Finish].

2. Create an installation parameters CSV file
Consider the server type or features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.
Refer to "Appendix A Installation in Silent Mode" for information on section names, parameter names, and values that can be specified.

**Information**

The template for the installation parameters CSV file is "Z:\sample\sample_windows.csv (Z is the drive on which the DVD is mounted.)."

3. Start the command prompt

   In Windows, right-click [Command Prompt] and then select [Run as administrator].

4. Run the installation

   Execute the following command:

   ```
   Z:\>silent.bat c:\temp\inspara.csv
   ```

   Z: The drive on which the DVD is mounted.
   c:\temp\inspara.csv: The installation parameter CSV file name.

   If the silent installer ends in an error, a message is output to the log file and return values are returned. Refer to "Appendix A Installation in Silent Mode" for details.

2.3 Uninstallation

This section describes the procedure for uninstalling the Windows client.

**Note**

- Before uninstalling the product, close the product program and all applications that are using it.
- Log in using an account that has administrator privileges and then execute the command, or switch to an account that has administrator privileges and then uninstall the product.

2.3.1 Uninstallation in Interactive Mode

The uninstallation procedure is described below.

Note that "x.y SPz" in the following sample window indicates the version level of products to uninstall.

**Information**

If an error occurs while the product is being uninstalled, refer to "Appendix C Uninstall (middleware) Messages" and take the required action.

1. Stop applications and the client program

   Before starting the uninstallation, stop the following:
   - Applications that use the product
   - pgAdmin
2. Start the Uninstall (middleware) tool
   In Windows, click [All Programs] or [All apps], then [Fujitsu], and then [Uninstall (middleware)].

3. Select the software
   Select the product to be uninstalled from [Software Name], and then click [Remove].

4. Start the uninstallation
   Click [Uninstall].
5. Finish the uninstallation

The uninstallation completion window is displayed. Click [Finish].

The installation Folder may remain after uninstallation. If it is not required, delete it.

6. Stop the Uninstall (middleware) tool

Click [Close].
2.3.2 Uninstallation in Silent Mode

The uninstallation procedure is described below.

1. Stop applications and the client program

Before starting the uninstallation, stop the following:

- Applications that use the product
- pgAdmin

2. Start the command prompt

In Windows, right-click [Command Prompt] and then select [Run as administrator].

3. Start the uninstaller

Execute the command below.

The installation folder may remain after uninstallation. If it is not required, delete it.

Example

```
X:> installationFolder\suninst.bat
```

X: Drive where the product is installed

Note

On Windows(R) 7, Windows Server(R) 2008, and Windows Server(R) 2008 R2, an empty folder may remain in the [Start] menu after the uninstallation - if this happens, then click [Start], point to [All Programs], right-click one of the options below, and then click [Delete]: The notation "x.y SPz" indicates the version and level of the FUJITSU Enterprise Postgres client feature.

- FUJITSU Enterprise Postgres Client (32bit) x.y SPz
- FUJITSU Enterprise Postgres Client (64bit) x.y SPz

4. Check the uninstallation results

The uninstaller result is output to the log file.

Log file

```
x.y SPz is the number part when the version is x.y SPz.
```

64-bit product:

```
Path name: %TEMP%\fsep_CLIENT64_0xyz_uninstall.log
```

32-bit product:

```
Path name: %TEMP%\fsep_CLIENT32_0xyz_uninstall.log
```

Return values

The following return values are returned:

<table>
<thead>
<tr>
<th>Return values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Uninstallation completed successfully.</td>
</tr>
<tr>
<td>64</td>
<td>Uninstallation failed because Uninstall (middleware) is running.</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write product information (updating the registry).</td>
</tr>
</tbody>
</table>
2.4 Registering .NET Data Provider

This section explains how to register the .NET Data Provider feature using a command. The command is installed in `fujitsuEnterprisePostgresClientFeatureInstallationFolder\DOTNET\bin`, when the FUJITSU Enterprise Postgres client feature is installed.

**Name**

`pgx_NpgsqlRegister` -- Register the .NET Data Provider GAC

**Overview**

`pgx_NpgsqlRegister [option...]`

**Description**

Execute this command to register the .NET Data Provider GAC in the following cases:

- To install .NET Framework 3.5 SP1, or .NET Framework 4.0 or later, after installing the Windows client
- To apply a .NET Data Provider update using the FUJITSU Enterprise Postgres update patch.
- If the installation of the Windows client returns an error because the registration of .NET Data Provider has not completed

**Options**

`/x86`

Specify this option to perform the setup on the 32-bit product.

`/x64`

Specify this option to perform the setup on the 64-bit product.

**Diagnostics**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>1</td>
<td>.NET Data Provider that will run on .NET Framework 3.5 SP1 was registered normally. To run it on .NET Framework 4.0 or later, install the desired version of .NET Framework, and then execute the command again.</td>
</tr>
<tr>
<td>2</td>
<td>.NET Data Provider that will run on .NET Framework 4.0 or later was registered normally. To run it on .NET Framework 3.5 SP1, install .NET Framework 3.5 SP1, and then execute the command again.</td>
</tr>
<tr>
<td>105</td>
<td>The logged user does not have execute permission to this folder.</td>
</tr>
<tr>
<td>201</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>202</td>
<td>The specified option is invalid.</td>
</tr>
<tr>
<td>203</td>
<td>The Windows client is not installed.</td>
</tr>
<tr>
<td>Return value</td>
<td>Explanation</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>204</td>
<td>.NET Framework 3.5 SP1, or .NET Framework 4.0 or later, is not installed. Install the missing software, and then execute the command again.</td>
</tr>
<tr>
<td>401</td>
<td>Failed to set the machine.config file. Ensure that the machine.config file exists.</td>
</tr>
<tr>
<td>403</td>
<td></td>
</tr>
<tr>
<td>404</td>
<td></td>
</tr>
</tbody>
</table>

**Comments**

Execute this command with administrator privileges.

**Examples**

To perform the setup on the 32-bit product

```
> pgx_NpgsqlRegister.exe /x86
```

To perform the setup on the 64-bit product

```
> pgx_NpgsqlRegister.exe /x64
```
This chapter explains how to install and uninstall the Linux client.

3.1 Operating Environment

This section describes the operating environment required to use the Linux client.

3.1.1 Required Operating System

One of the following operating systems is required to use the Linux client:

- RHEL6(Intel64) (*1)
- RHEL6(x86) (*1)
- RHEL7 (*2)

*1: 6.5 or later
*2: 7.2 or later

Information

Select the x86_64 architecture package when installing the 64-bit product.
Select the i386 to i686 architecture packages when installing the 32-bit product.

- The following packages are required for operations on RHEL6 (x86).

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>glibc</td>
<td>-</td>
</tr>
<tr>
<td>libgcc</td>
<td>-</td>
</tr>
<tr>
<td>libstdc++</td>
<td>-</td>
</tr>
<tr>
<td>libtool-ltdl</td>
<td>-</td>
</tr>
<tr>
<td>ncurses-libs</td>
<td>-</td>
</tr>
<tr>
<td>nss-softokn-freebl</td>
<td>-</td>
</tr>
<tr>
<td>redhat-lsb</td>
<td>-</td>
</tr>
<tr>
<td>unixODBC</td>
<td>Required when using ODBC drivers</td>
</tr>
<tr>
<td>unzip</td>
<td>-</td>
</tr>
<tr>
<td>xz-libs</td>
<td>-</td>
</tr>
<tr>
<td>zlib</td>
<td>-</td>
</tr>
</tbody>
</table>

- The following packages are required for operations on RHEL6 (Intel64).

<table>
<thead>
<tr>
<th>Package name</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>glibc</td>
<td>-</td>
</tr>
<tr>
<td>libgcc</td>
<td>-</td>
</tr>
<tr>
<td>libstdc++</td>
<td>-</td>
</tr>
<tr>
<td>libtool-ltdl</td>
<td>-</td>
</tr>
<tr>
<td>ncurses-libs</td>
<td>-</td>
</tr>
</tbody>
</table>
### Related Software

The following table lists the software required to use the Linux client.

**Table 3.1 Related software**

<table>
<thead>
<tr>
<th>No.</th>
<th>Software name</th>
<th>Package name</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>C compiler (*1)</td>
<td>gcc Other related packages</td>
<td>-</td>
</tr>
<tr>
<td>2</td>
<td>JDK or JRE</td>
<td>-</td>
<td>Java SE 6 or later</td>
</tr>
<tr>
<td>3</td>
<td>NetCOBOL</td>
<td>-</td>
<td>(*2)</td>
</tr>
</tbody>
</table>

*1: Only operations using the C compiler provided with the operating system are guaranteed.

*2: NetCOBOL is available in the following editions:

(RHEL7)
- NetCOBOL Base Edition V11.1.0 or later
- NetCOBOL Standard Edition V11.1.0 or later
- NetCOBOL Enterprise Edition V11.1.0 or later

(RHEL6)
- NetCOBOL Base Edition V7.3L10 or later
- NetCOBOL Standard Edition V7.3L10 or later
- NetCOBOL Enterprise Edition V7.3L10 or later

Note

Either the JDK or JRE included with Interstage Application Server, or the Oracle JDK or JRE can be used. It is recommended that the JDK or JRE included with Interstage Application Server is used.

The following table lists servers that can be connected to the Linux client.

Table 3.2 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td>Linux</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

3.1.3 Excluded Software

There is no excluded software.

3.1.4 Required Patches

There are no required patches.

3.1.5 Hardware Environment

The following hardware is required to use the Linux client.

Memory

At least 70 MB of memory is required.

Mandatory hardware

None.

3.1.6 Disk Space Required for Installation

The following table lists the disk space requirements of the corresponding directories for new installation of the Linux client. If necessary, increase the size of the file system.

Table 3.3 Disk space required for installation

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space Unit: MB</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 4 (*1)</td>
</tr>
<tr>
<td>/opt</td>
<td>85 (*1)</td>
</tr>
<tr>
<td>Installation destination of the client (32-bit)</td>
<td>80</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>83</td>
</tr>
</tbody>
</table>

*1: Uninstall (middleware) must be installed.
3.1.7 Supported System Environment

This section describes the supported system environment.

TCP/IP protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.

Note

Do not use link-local addresses if TCP/IP protocol version 6 addresses are used.

3.1.8 Versions of Open-Source Software Used as the Base for FUJITSU Enterprise Postgres Drivers

The following table lists the versions of open-source software used as the base for the various FUJITSU Enterprise Postgres drivers.

<table>
<thead>
<tr>
<th>Driver</th>
<th>Open-source software version</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC</td>
<td>pgjdbc 9.4.1212</td>
</tr>
<tr>
<td>ODBC</td>
<td>psqlodbc 09.05.0400</td>
</tr>
<tr>
<td>libpq</td>
<td>PostgreSQL 9.6.2</td>
</tr>
</tbody>
</table>

3.2 Installation

This section explains how to install the Linux client.

3.2.1 Pre-installation Tasks

Check the system environment for the following before the Linux client is installed.

Check the disk capacity

Check if sufficient free disk space is available for installing the Linux client.

Refer to “Table 3.3 Disk space required for installation” for information on disk space requirements.

If sufficient free disk space is unavailable, reconfigure disk partitions.

Check the installed product and determine the installation method

Using the operation shown below, start Uninstall (middleware), and check the installed products.

Example

```
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. FUJITSU Enterprise Postgres Client(64bit) x.y SPz (*1)
2. FUJITSU Enterprise Postgres Client(32bit) x.y SPz (*1)

Type [number] to select the software you want to uninstall.
[number,q] =>q
```
Exiting Uninstaller.

*1: The notation "x.y SPz" indicates the version and level of the FUJITSU Enterprise Postgres client feature.

If the Linux client is already installed, determine the installation method to use:
- Reinstallation
- Multi-version installation

**Remove applied updates**

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

**Note**

If a product is installed without removing applied updates, the following will occur:
- Performing reinstallation
  - If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.
  - Perform the reinstallation after removing the update.

1. Display the applied updates
   
   Execute the following command to display the applied updates:
   
   **Example**
   ```
   # /opt/FJSVfupde/bin/uam showup
   ```

2. Remove the updates
   
   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.
   
   **Example**
   ```
   # /opt/FJSVfupde/bin/uam remove -i update-number
   ```

**3.2.2 Installation in Interactive Mode**

Install according to the following procedure:

The notation "x.y SPz" displayed in the window example of each procedure indicates the version and level of the FUJITSU Enterprise Postgres client feature, and similarly, "<xy>" in paths indicates the product version and level.

**Note**

The following characters can be used as input values:
- Alphanumeric characters, hyphens and forward slashes

1. Stop applications and the client program
   
   If the installation method is one of the following, the applications and the client program must be stopped:
   - Reinstallation
   
   Before starting the installation, stop the following:
   - Applications that use the product
2. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

3. Mount the DVD drive

Insert the client program DVD in the DVD drive, and then execute the following command:

Example

```
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```

/dev/dvd is the DVD drive device, and /media/dvd is the mount point (which must already exist before calling the command).

Note

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

4. Run the installation

Execute the following command:

Example

```
# cd /media/dvd
# ./install.sh
```

In the example above, /media/dvd is the DVD mount point.

5. Select the product to install

The list of installation target products is displayed as shown below.

Type the number for the product to be installed, or "all", and press Enter.

Selected product

FUJITSU Enterprise Postgres Client (32bit) x.y SPz
FUJITSU Enterprise Postgres Client (64bit) x.y SPz

Do you want to install the above product?

y: Proceed to the next step
n: Select the product again
q: Quit without installing
[y,n,q](The default value is y): y

Information

- To execute a 32-bit application in a 64-bit environment, FUJITSU Enterprise Postgres Client (32bit) is required.
- The window below is displayed for each product that was selected but has already been installed.

To perform a reinstallation, type the number for the product and press Enter.

```
Select the method to install FUJITSU Enterprise Postgres Client (32bit) x.y SPz. If performing a reinstallation, select the number of the product to be reinstalled.

1: FUJITSU Enterprise Postgres Client (32bit) x.y SPz (*1)
q: Quit without installing
[number,q]:
```

*1: Output if the installed product can undergo reinstallation.

To perform a multi-version installation, type "m" and press Enter.

```
Select the method to install FUJITSU Enterprise Postgres Client (32bit) x.y SPz. Select m for multi-version installation.

m: Multi-version installation (*1)
q: Quit without installing
[m,q]:
```

*1: Output if the installed product can undergo multi-version installation.

6. Check the settings

The window for checking the installation information is displayed as shown below. If there is no problem with the settings, type "y" and press Enter to start the installation (refer to "9. Display the installation status").

To change the settings, type "c" and press Enter.

```
Product to be installed
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
New installation
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
New installation

Installation directory information
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
/opt/fsepv<xy>client32
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
/opt/fsepv<xy>client64

Start installation using the above information?
y: Start the installation
c: Change the information (*1)
q: Quit without installing
[y,c,q] (The default value is y): c (*1)
```

*1: This option is not displayed if there is no information that can be modified.

If the user types "c", then the window mentioned in the next step is displayed.

7. Enter the installation directory

If the installation method is one of the following, the window below is displayed for each product:
- New installation
- Multi-version installation

Enter the directory and press Enter.

```
FUJITSU Enterprise Postgres Client (32bit) x.y SPz : Specify the installation directory.
[directory name,q] (The default value is /opt/fsepv<xy>client32): /opt/fsepc32
```
8. Check the changed settings

The changed settings are displayed as shown below.
If there is no problem with the settings, type "y" and press Enter.
To change the settings again, enter "c" and press Enter.

<table>
<thead>
<tr>
<th>Product to be installed</th>
<th>Installation directory information</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUJITSU Enterprise Postgres Client (32bit) x.y SPz New installation</td>
<td>FUJITSU Enterprise Postgres Client (32bit) x.y SPz /opt/fsepcl32</td>
</tr>
<tr>
<td>FUJITSU Enterprise Postgres Client (64bit) x.y SPz New installation</td>
<td>FUJITSU Enterprise Postgres Client (64bit) x.y SPz /opt/fsepcl64</td>
</tr>
</tbody>
</table>

Start installation using the above information?
- y: Start the installation
- c: Change the information
- q: Quit without installing

[y,c,q](The default value is y): y

9. Display the installation status

The installation completion status is displayed as shown below:

Starting installation.
FUJITSU Enterprise Postgres Client (32bit) x.y SPz Installation
Installation is complete.
FUJITSU Enterprise Postgres Client (64bit) x.y SPz Installation
Installation is complete.

10. Finish the installation

Upon completion, a message is displayed showing the status.
If installation was successful, a message like the one shown below is displayed:

Installed successfully.

Note

If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.

3.2.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

The installation procedure is described below.
1. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

2. Mount the DVD drive

Insert the client program DVD in the DVD drive, and then execute the following command:

Example

```
# mount -t iso9660 -r -o loop /dev/dvd /media/dvd
```

/dev/dvd is the DVD drive device, and /media/dvd is the mount point (which must already exist before calling the command).

Note

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

3. Create an installation parameters CSV file

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Refer to "Appendix A Installation in Silent Mode" for information on the installation parameters CSV file.

Information

The templates for the installation parameters CSV file is "mountPoint/sample/sample_linux.csv"

4. Run the installation

Execute the following command:

Example

```
# cd /media/dvd
# ./silent.sh /home/work/inspara.csv
```

In the example above, /media/dvd is the DVD mount point, and /home/work/inspara.csv is the installation parameter CSV.

If the silent installer ends in an error, a message is output to the log file and return values are returned. Refer to "Appendix A Installation in Silent Mode" for details.

3.3 Uninstallation

This section describes the procedure for uninstalling the Linux client.
Before uninstalling the product, close the product program and all applications that are using it.

3.3.1 Uninstallation in Interactive Mode

Uninstall according to the following procedure:

The notation "x.y SPz" displayed in the window example of each procedure indicates the version and level of the FUJITSU Enterprise Postgres client feature.

If an error occurs while the product is being uninstalled, refer to "Appendix C Uninstall (middleware) Messages" and take the required action.

1. Stop applications and the client program

   Before starting the uninstallation, stop the following:
   - Applications that use the product

2. Change to the superuser

   Run the following command to switch to the superuser on the system.

   ```
   $ su -
   Password:******
   ```

3. Start the Uninstall (middleware)

   Execute the following command:

   ```
   # /opt/FJSVcir/cimanager.sh -c
   ```

4. Select the product

   Enter the number for the product to be uninstalled, and press Enter.

   ```
   Loading Uninstaller...
   Currently installed products
   1. FUJITSU Enterprise Postgres Client (64bit) x.y SPz
   2. FUJITSU Enterprise Postgres Client (32bit) x.y SPz
   Type [number] to select the software you want to uninstall. [number,q] =>1
   ```

5. Start the uninstallation

   To start the uninstallation, type "y" and press Enter.

   To display the list of products again, type "b" and press Enter.

   ```
   FUJITSU Enterprise Postgres Client (64bit)
   Description: FUJITSU Enterprise Postgres Client (64bit)
   Version: x.y SPz
   Manufacturer: Fujitsu Limited.
   Install directory: /opt/fsepcl64
   ```
Date of install: 2015-6-2

Starting the uninstall of the software. Are you sure you want to continue?
[y,b,q]
=>y

6. Finish the uninstallation

The installation directory may remain after uninstallation. If it is not required, delete it.

Uninstalling...
FUJITSU Enterprise Postgres Client (64bit) is being uninstalled now.
100% ###################################################################

The following products have been uninstalled successfully:
FUJITSU Enterprise Postgres Client (64bit)

Uninstallation of "FUJITSU Enterprise Postgres Client (64bit) x.y SPz" has completed successfully.

Exiting Uninstaller.

3.3.2 Uninstallation in Silent Mode

Uninstall according to the following procedure:

1. Stop applications and the client program

Before starting the uninstallation, stop the following:
- Applications that use the product

2. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

3. Run the uninstallation

Execute the following command:

The installation directory may remain after uninstallation. If it is not required, delete it.

Example

```
# /opt/fsepv<xy>client64/setup/suninst.sh
```

In the example above, /opt/fsepv<xy>client64 is the installation directory, and "<xy>" indicates the product version and level.

4. Check the uninstallation results

The uninstaller result is output to the log file.

Log file

```
xyz is the number part when the product version level is x.y SPz.
```
64-bit products

Path name:/var/log/fsep_CLIENT64_0xyz_uninstall.log

32-bit products

Path name:/var/log/fsep_CLIENT32_0xyz_uninstall.log

Return values

The following return values are output:

<table>
<thead>
<tr>
<th>Return value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for uninstallation do not exist.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>Uninstall (middleware) has not been installed, or there are no execution privileges.</td>
</tr>
<tr>
<td>99</td>
<td>A system error has occurred.</td>
</tr>
<tr>
<td>100</td>
<td>The command argument is invalid.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
</tbody>
</table>
Chapter 4 Installation and Uninstallation of the Solaris Client

This chapter explains how to install and uninstall the Solaris client.

4.1 Operating Environment

This section describes the operating environment required to use the Solaris client.

4.1.1 Required Operating System

One of the following operating systems is required to use the Solaris client:

- Solaris 10
- Solaris 11

4.1.2 Related Software

The following table lists the software required to use the Solaris client.

<table>
<thead>
<tr>
<th>No.</th>
<th>Software name</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Sun WorkShop Compiler C (*1)</td>
<td>4.2 or later</td>
</tr>
<tr>
<td>2</td>
<td>JDK or JRE</td>
<td>Java SE 6 or later</td>
</tr>
<tr>
<td>3</td>
<td>NetCOBOL</td>
<td>(*2)</td>
</tr>
</tbody>
</table>

*1: “Sun WorkShop Compiler C” is a component provided with the following products:
- Oracle Solaris Studio 12.2 or later
- Sun Studio 12
- Sun Studio 11
- Sun Studio 10
- Sun Studio 9
- Sun Studio 8

*2: NetCOBOL is available in the following editions:
- NetCOBOL Base Edition V10.5.0 or later
- NetCOBOL Standard Edition V10.5.0 or later
- NetCOBOL Professional Edition V10.5.0 or later
- NetCOBOL Enterprise Edition V10.5.0 or later

Note

Either the JDK or JRE included with Interstage Application Server, or the Oracle JDK or JRE can be used. It is recommended that the JDK or JRE included with Interstage Application Server is used.

The following table lists servers that can be connected to the Solaris client.
Table 4.2 Connectable servers

<table>
<thead>
<tr>
<th>OS</th>
<th>Software name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>- FUJITSU Software Enterprise Postgres Advanced Edition 9.5 or later</td>
</tr>
<tr>
<td></td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.4 or later</td>
</tr>
<tr>
<td>Linux</td>
<td></td>
</tr>
<tr>
<td>Solaris</td>
<td>- FUJITSU Software Enterprise Postgres Standard Edition 9.6 or later</td>
</tr>
</tbody>
</table>

4.1.3 Excluded Software

There is no excluded software.

4.1.4 Required Patches

There are no required patches.

4.1.5 Hardware Environment

The following hardware is required to use the Solaris client.

Memory

At least 70 MB of memory is required.

Mandatory hardware

None.

4.1.6 Disk Space Required for Installation

The following table lists the disk space requirements of the corresponding directories for new installation of the Solaris client. If necessary, increase the size of the file system.

Table 4.3 Disk space required for installation

<table>
<thead>
<tr>
<th>Directory</th>
<th>Required disk space Unit: MB</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc</td>
<td>1 + 1 (*1)</td>
</tr>
<tr>
<td>/var</td>
<td>1 + 4 (*1)</td>
</tr>
<tr>
<td>/opt</td>
<td>100 (*1)</td>
</tr>
<tr>
<td>Installation destination of the client (32-bit)</td>
<td>79</td>
</tr>
<tr>
<td>Installation destination of the client (64-bit)</td>
<td>88</td>
</tr>
</tbody>
</table>

*1: Uninstall (middleware) must be installed.

4.1.7 Supported System Environment

This section describes the supported system environment.

TCP/IP protocol

FUJITSU Enterprise Postgres supports version 4 and 6 (IPv4 and IPv6) of TCP/IP protocols.
**4.1.8 Versions of Open-Source Software Used as the Base for FUJITSU Enterprise Postgres Drivers**

The following table lists the versions of open-source software used as the base for the various FUJITSU Enterprise Postgres drivers.

<table>
<thead>
<tr>
<th>Driver</th>
<th>Open-source software version</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC</td>
<td>pgjdbc 9.4.1212</td>
</tr>
<tr>
<td>ODBC</td>
<td>psqlodbc 09.05.0400</td>
</tr>
<tr>
<td>libpq</td>
<td>PostgreSQL 9.6.2</td>
</tr>
</tbody>
</table>

**4.2 Installation**

This section explains how to install the Solaris client.

### 4.2.1 Pre-installation Tasks

Check the system environment for the following before the Solaris client is installed.

**Check the disk capacity**

Check if sufficient free disk space is available for installing the Solaris client.

Refer to "4.1.6 Disk Space Required for Installation" for information on disk space requirements.

If sufficient free disk space is unavailable, reconfigure disk partitions.

**Check the installed product and determine the installation method**

Using the operation shown below, start Uninstall (middleware), and check the installed products.

**Example**

```
# /opt/FJSVcir/cimanager.sh -c
Loading Uninstaller...

Currently installed products
1. FUJITSU Enterprise Postgres Client(64bit) x.y SPz (*1)
2. FUJITSU Enterprise Postgres Client(32bit) x.y SPz (*1)

Type [number] to select the software you want to uninstall.
[number,q] => q
Exiting Uninstaller.
```

*1: The notation "x.y SPz" indicates the version and level of the FUJITSU Enterprise Postgres client feature.

If the Solaris client is already installed, determine the installation method to use:

- Reinstallation
- Multi-version installation
Remove applied updates

If you perform reinstallation as the installation method, remove applied updates using the procedure shown below.

Note

If a product is installed without removing applied updates, the following will occur:

- Performing reinstallation

  If an update with the same update and version number is applied, an error informing you that the update has already been applied is displayed.

  Perform the reinstallation after removing the update.

1. Display the applied updates

   Execute the following command to display the applied updates:

   Example
   
   ```
   # /opt/FJSVfupde/bin/uam showup
   ```

2. Remove the updates

   Execute the command below to remove the updates. If an update with the same update number was applied more than once, the updates are removed in order, starting from the highest version number.

   Example
   
   ```
   # /opt/FJSVfupde/bin/uam remove -i update-number
   ```

Notes on installing in a non-global zone

Note the following when installing Solaris client in a non-global zone of Solaris 10 or Solaris 11.

- Set the non-global zone where the installation will take place as a whole root zone. When creating a non-global zone, do not create inherit-pkg-dir.

  The password of the root user will not be created after the non-global zone is created. Set the zone environment by logging in to the non-global zone using "zlogin -C".

- Assign one or more logical network instances from the global zone.

- Set the privileges for accessing the DVD drive in a non-global zone.

See

Refer to the relevant Solaris manual for information on how to set up a zone.

4.2.2 Installation in Interactive Mode

Install according to the following procedure:

The notation "x.y SPz" displayed in the window example of each procedure indicates the version and level of the FUJITSU Enterprise Postgres client feature, and similarly, "<xy>" in paths indicates the product version and level.

Note

The following characters can be used as input values:

Alphanumeric characters, hyphens and forward slashes
1. Stop applications and the client program

If the installation method is one of the following, the applications and the client program must be stopped:

- Reinstallation

Before starting the installation, stop the following:

- Applications that use the product

2. Change to the superuser

Run the following command to switch to the superuser on the system.

```
$ su -
Password:******
```

3. Mount the DVD drive

Insert the client program DVD in the DVD drive, and then execute the following command:

Example

```
# /usr/sbin/mount -F hsfs -o ro /dev/dsk/c0t6d0s2 /dvd/dvd0
```

/dev/dsk/c0t6d0s2 is the DVD drive device, and /dvd/dvd0 is the mount point (which must already exist before calling the command).

**Note**

If the DVD was mounted automatically using the automatic mount daemon (autofs), "noexec" is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

4. Run the installation

Execute the following command:

Example

```
# cd /dvd/dvd0
# ./install.sh
```

In the example above, /dvd/dvd0 is the DVD mount point.

5. Select the product to install

The list of installation target products is displayed as shown below. Type the number for the product to be installed, or "all", and press Enter.

```
The following products can be installed:
1: FUJITSU Enterprise Postgres Client (32bit) x.y SPz
2: FUJITSU Enterprise Postgres Client (64bit) x.y SPz

Select the product to be installed.
To select multiple products, separate using commas (,). (Example: 1,2)
[number,all,q](The default value is all): all

Selected product:
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
FUJITSU Enterprise Postgres Client (64bit) x.y SPz

Do you want to install the above product?
y: Proceed to the next step
```
n: Select the product again
q: Quit without installing
[y,n,q](The default value is y): y

Information

- To execute a 32-bit application in a 64-bit environment, FUJITSU Enterprise Postgres Client (32bit) is required.
- The window below is displayed for each product that that was selected but has already been installed.

To perform a reinstallation, type the number for the product and press Enter.

```
Select the method to install FUJITSU Enterprise Postgres Client (32bit) x.y SPz.
If performing a reinstallation, select the number of the product to be reinstalled.
1: FUJITSU Enterprise Postgres Client (32bit) x.y SPz (*1)
q: Quit without installing
[number,q]:
```

*1: Output if the installed product can undergo reinstallation.

To perform a multi-version installation, type "m" and press Enter.

```
Select the method to install FUJITSU Enterprise Postgres Client (32bit) x.y SPz.
Select m for multi-version installation.
m: Multi-version installation (*1)
q: Quit without installing
[m,q]:
```

*1: Output if the installed product can undergo multi-version installation.

6. Check the settings

The window for checking the installation information is displayed as shown below.
If there is no problem with the settings, type "y" and press Enter to start the installation (refer to "9. Display the installation status").
To change the settings, type "c" and press Enter.

```
Product to be installed
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
   New installation
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
   New installation

Installation directory information
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
 /opt/fsepv<xy>client32
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
 /opt/fsepv<xy>client64

Start installation using the above information?
y: Start the installation
c: Change the information (*1)
q: Quit without installing
[y,c,q](The default value is y): c (*1)
```

*1: This option is not displayed if there is no information that can be modified.
If the user types "c", then the window mentioned in the next step is displayed.
7. Enter the installation directory

If the installation method is one of the following, the window below is displayed for each product:

- New installation
- Multi-version installation

Enter the directory and press Enter.

```
FUJITSU Enterprise Postgres Client (32bit) x.y SPz ; Specify the installation directory.
[directory name,q](The default value is /opt/fsepv<xy>client32): /opt/fsepcl32
```

8. Check the changed settings

The changed settings are displayed as shown below.
If there is no problem with the settings, type "y" and press Enter.
To change the settings again, enter "c" and press Enter.

```
Product to be installed
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
   New installation
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
   New installation

Installation directory information
FUJITSU Enterprise Postgres Client (32bit) x.y SPz
   /opt/fsepcl32
FUJITSU Enterprise Postgres Client (64bit) x.y SPz
   /opt/fsepcl64

Start installation using the above information?
y: Start the installation
c: Change the information
q: Quit without installing
[y,c,q](The default value is y): y
```

9. Display the installation status

The installation completion status is displayed as shown below:

```
Starting installation.
FUJITSU Enterprise Postgres Client (32bit) x.y SPz Installation
Installation is complete.
FUJITSU Enterprise Postgres Client (64bit) x.y SPz Installation
Installation is complete.
```

10. Finish the installation

Upon completion, a message is displayed showing the status.
If installation was successful, a message like the one shown below is displayed:

```
Installed successfully.
```

Note

If an error occurs during the installation, read the error message and remove the cause of the error, and then reexecute the install.sh command.
4.2.3 Installation in Silent Mode

Installation in silent mode can be performed only when the installation method is one of the following:
- New installation
- Multi-version installation

The installation procedure is described below.

1. Change to the superuser

Run the following command to switch to the superuser on the system.

```bash
$ su -
Password:******
```

2. Mount the DVD drive

Insert the client program DVD in the DVD drive, and then execute the following command:

Example

```bash
# /usr/sbin/mount -F hsfs -o ro /dev/dsk/c0t6d0s2 /dvd/dvd0
```

/dev/dsk/c0t6d0s2 is the DVD drive device, and /dvd/dvd0 is the mount point (which must already exist before calling the command).

Note

If the DVD was mounted automatically using the automatic mount daemon (autofs), “noexec” is set as the mount option, so the installer may fail to start. In this case, use the mount command to remount the DVD correctly, and then run the installation. Note that the mount options of a mounted DVD can be checked by executing the mount command without any arguments.

3. Create an installation parameters CSV file

Consider the features that will be required for system operations, and then create an installation parameters CSV file that uses the following specification format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Refer to “Appendix A Installation in Silent Mode” for information on the installation parameters CSV file.

Information

The templates for the installation parameters CSV file is "mountPoint/sample/sample_solaris.csv"

4. Run the installation

Execute the following command:

Example

```bash
# cd /dvd/dvd0
# ./silent.sh /home/work/inspara.csv
```

In the example above, /dvd/dvd0 is the DVD mount point, and /home/work/inspara.csv is the installation parameter CSV. If the silent installer ends in an error, a message is output to the log file and return values are returned. Refer to "Appendix A Installation in Silent Mode" for details.
4.3 Uninstallation

This section describes the procedure for uninstalling the Solaris client.

Note

Before uninstalling the product, close the product program and all applications that are using it.

4.3.1 Uninstallation in Interactive Mode

Uninstall according to the following procedure:

The notation “x.y SPz” displayed in the window example of each procedure indicates the version and level of the FUJITSU Enterprise Postgres client feature.

Information

If an error occurs while the product is being uninstalled, refer to "Appendix C Uninstall (middleware) Messages" and take the required action.

1. Stop applications and the client program

   Before starting the uninstallation, stop the following:
   - Applications that use the product

2. Change to the superuser

   Run the following command to switch to the superuser on the system.

   $ su -
   Password:******

3. Start the Uninstall (middleware)

   Execute the following command:

   # /opt/FJSVcir/cimanager.sh -c

4. Select the product

   Enter the number for the product to be uninstalled, and press Enter.

   Loading Uninstaller...

   Currently installed products
   1. FUJITSU Enterprise Postgres Client(64bit) x.y SPz
   2. FUJITSU Enterprise Postgres Client(32bit) x.y SPz

   Type [number] to select the software you want to uninstall.
   [number,q]
   =>1

5. Start the uninstallation

   To start the uninstallation, type "y" and press Enter.

   To display the list of products again, type "b" and press Enter.
6. Finish the uninstallation

The installation directory may remain after uninstallation. If it is not required, delete it.

Uninstalling...

FUJITSU Enterprise Postgres Client(64bit) is being uninstalled now.

100% ##############################

The following products have been uninstalled successfully:

FUJITSU Enterprise Postgres Client(64bit)

Uninstallation of "FUJITSU Enterprise Postgres Client (64bit) x.y SPz" has completed successfully.

Exiting Uninstaller.

4.3.2 Uninstallation in Silent Mode

Uninstall according to the following procedure:

1. Stop applications and the client program

Before starting the uninstallation, stop the following:

- Applications that use the product

2. Change to the superuser

Run the following command to switch to the superuser on the system.

$ su -
Password:******

3. Run the uninstallation

Execute the following command:

The installation directory may remain after uninstallation. If it is not required, delete it.

Example

```bash
# /opt/fsepv<xy>/client64/setup/suninst.sh
```

In the example above, /opt/fsepv<xy>/client64 is the installation directory, and "<xy>" indicates the product version and level.
4. Check the uninstallation results

The uninstaller result is output to the log file.

Log file

xyz is the number part when the product version level is x.y.SPz.

64-bit products

Path name:/var/log/fsep_CLIENT64_0xyz_uninstall.log

32-bit products

Path name:/var/log/fsep_CLIENT32_0xyz_uninstall.log

Return values

The following return values are output:

<table>
<thead>
<tr>
<th>Return value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for uninstallation do not exist.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
<tr>
<td>63</td>
<td>Uninstall (middleware) has not been installed, or there are no execution privileges.</td>
</tr>
<tr>
<td>99</td>
<td>A system error has occurred.</td>
</tr>
<tr>
<td>100</td>
<td>The command argument is invalid.</td>
</tr>
<tr>
<td>106</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
</tbody>
</table>
Chapter 5 Setup

This chapter describes the setup procedures to be performed after installation completes.

5.1 Configuring Environment Variables

Configure the following environment variables when using client commands.

5.1.1 Windows

PATH environment variable
Add "installationFolder\bin".

PGLOCALEDIR environment variable
Add "installationFolder\share\locale".

Examples of environment variable configurations are shown below.

Example

> SET PATH=%ProgramFiles%\Fujitsu\fsepclient32\bin;%PATH%
> SET PGLOCALEDIR=%ProgramFiles%\Fujitsu\fsepclient32\share\locale

5.1.2 Linux and Solaris

PATH environment variable
Add "installationDirectory/bin".

MANPATH environment variable
Add "installationDirectory/share/man".

PGLOCALEDIR environment variable
Add "installationDirectory/share/locale".

LD_LIBRARY_PATH environment variable
Add "installationDirectory/lib".

32-bit products

LD_LIBRARY_PATH environment variable
Add "installationDirectory/lib".

64-bit products

LD_LIBRARY_PATH_64 environment variable
Add "installationDirectory/lib".

Examples of environment variable configurations are shown below.

Example

This example is specific to 64-bit Linux.

Note that "<xy>" indicates the product version and level.

$ PATH=/opt/fsepv<xy>/client64/bin:$PATH ; export PATH
$ MANPATH=/opt/fsepv<xy>/client64/share/man:$MANPATH ; export MANPATH

- 46 -
$ PGLOCALEDIR=/opt/fsepv<xy>client64/share/locale ; export PGLOCALEDIR
$ LD_LIBRARY_PATH=/opt/fsepv<xy>client64/lib:$LD_LIBRARY_PATH ; export LD_LIBRARY_PATH
Appendix A Installation in Silent Mode

This appendix provides specifications for installation in silent mode.
Note that "<xy>" in paths indicates the product version and level.

A.1 Specification Format

The installation parameters CSV file, which is specified as the argument for the silent installer, has three columns per line in CSV format.

```
sectionName, parameterName, value
sectionName, parameterName, value
```

Enter the following settings in respective columns.

<table>
<thead>
<tr>
<th>Item</th>
<th>Settings</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectionName</td>
<td>Specify the section name. There are two types of section names:</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>&quot;installInfo&quot;: Set the product information.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;parameters&quot;: Set the parameter information for this product.</td>
<td></td>
</tr>
<tr>
<td>parameterName</td>
<td>Specify the parameter name. Each section has a valid parameter.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>value</td>
<td>Specify the value.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**Note**

- Blank lines cannot be included.
- Section names and parameter names cannot be omitted.
- Undefined parameters cannot be set in lines where the section name is "installInfo". Also, note that the same parameter cannot be specified multiple times.
- Specify at least one line with the section name "parameters".
- Undefined parameters specified in lines within the "parameters" section will be ignored during execution. Note that when the same parameter is specified multiple times, the settings in the lowest line will be valid.
- The setting values for lines where the section name is "installInfo" may contain alphanumerical characters (at least one), and symbols, excluding double quotation marks ("), and commas (,).
- Do not use the following halfwidth characters in the setting values for lines with the section name "parameters".

Windows: # $ & ' = ~ | @ ` [ ] ; < > / tab

Linux and Solaris: " # $ & = ' ( ) ^ ~ \ | @ ` [ ] { } ; : < > tab

**Information**

The templates for the installation parameters CSV file are as follows:

- Windows client: Z:\sample\sample_windows.csv (where Z is the drive on which the DVD is mounted.)
- Linux client: mountPoint/sample/sample_linux.csv
- Solaris client: mountPoint/sample/sample_solaris.csv
A.2 List of Parameters

This section describes the parameters that can be set for each section.

**installInfo section**

The parameters that can be set in the installInfo section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software ID</td>
<td>Name</td>
<td>Mandatory. Specify the software identifier.</td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>String</td>
<td>For this software, specify the following value:</td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td>None</td>
<td>“FUJITSU Enterprise Postgres”</td>
</tr>
</tbody>
</table>

**Information**

- In addition to "Name", the following parameters can be used in the "installInfo" section.
  - softwareName
  - OS
  - Version
  - Edition
- Note that specifying a parameter name other than "Name" and the parameters listed above will result in an error.
- The values set in these parameters do not affect silent installation.

**Example**

installInfo,Name,FUJITSU Enterprise Postgres

**parameters section**

The parameters that can be set in the parameters section are shown below.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter name</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Client32InstallExecute</td>
<td>Optional. Specify whether to run the installation of the client (32-bit).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>Y or N</td>
<td>Y: Install</td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td>Y</td>
<td>N: Do not install</td>
</tr>
<tr>
<td>2</td>
<td>Client32InstallPath</td>
<td>Optional. Specify the installation destination of the client (32-bit).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Value/Range</td>
<td>Path name</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default value</td>
<td>W Windows(32-bit)</td>
<td>A root folder (such as C:) cannot be specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>W %ProgramFiles%\Fujitsu\fsepclientx32</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>

### A.3 Messages and Return Values

Messages are output when errors are detected during parametric analysis.

If an error occurs during installation of the product, a message is output to the log.

**Log file**

*xyz* is the number part when the product version level is *x.y.SPz*.

**Windows**

Path name: `%TEMP%\fsep_CLIENT_media_0xyz.log`

**Linux or Solaris**

Path name: `/var/log/fsep_CLIENT_media_0xyz_install.log`

**Messages and return values**

**CSV file errors**

The following messages are output if errors are detected while parsing CSV files.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Message</th>
<th>Explanation and actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>CSV file error:code = 1, Invalid CSV error.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>Return value</td>
<td>Message</td>
<td>Explanation and actions</td>
</tr>
<tr>

<td>-------------------------------------------------------------</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 2, installInfo/Name is required.</td>
<td>There is an error in the specification format of the CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 3, Invalid installInfo key.</td>
<td>There is an error in the installInfo specification. Or the section name is invalid.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 4, Duplicated installInfo key.</td>
<td>The same parameter has been defined more than once in installInfo.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 5, Invalid character length.</td>
<td>No setting value has been specified, or the specified string is too long.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 6, Invalid character format or encoding.</td>
<td>An invalid character has been specified in the installation parameters CSV file.</td>
</tr>
<tr>
<td>4</td>
<td>CSV file error: code = 8, Parameter is required.</td>
<td>The &quot;parameters&quot; section has no lines.</td>
</tr>
<tr>
<td>20</td>
<td>The input file does not exist.</td>
<td>The input file does not exist.</td>
</tr>
<tr>
<td>21</td>
<td>The value of @1@ is incorrect, the value is @2@.</td>
<td>The value is incorrect. Specify the correct value. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>22</td>
<td>The value same at @1@ and @2@ is specified.</td>
<td>The same value is specified in different parameters. Specify different values. The parameter name is displayed in @1@ and @2@.</td>
</tr>
<tr>
<td>23</td>
<td>The @2@ of @1@ already exists.</td>
<td>The path already exists. Specify a different path. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>

<td>Drive @2@ of @1@ does not exist.</td>
<td>The drive does not exist. Specify an existing drive. The parameter name is displayed in @1@. The specified value is displayed in @2@.</td>
</tr>
<tr>
<td>28</td>
<td>There is no product for installation.</td>
<td>There is no product to be installed. Specify &quot;Y&quot; for either or both of the following parameters: Client32InstallExecute Client64InstallExecute</td>
</tr>
</tbody>
</table>

Product installer errors

The following return values are returned when errors occur while the product installer is running.

### Windows

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Failed to register .NET Data Provider. (*)</td>
</tr>
</tbody>
</table>
### Return value and Explanation

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Failed to register the ODBC drivers.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>32</td>
<td>The same version of the same product is already installed.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>64</td>
<td>Failed to install because Uninstall (middleware) is running.</td>
</tr>
<tr>
<td>65</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>74</td>
<td>Failed to write to the registry.</td>
</tr>
<tr>
<td>79</td>
<td>Failed to load the registry.</td>
</tr>
<tr>
<td>86</td>
<td>A newer version of the product is already installed.</td>
</tr>
<tr>
<td>88</td>
<td>The Japanese version and overseas version of the product cannot be installed on the same machine.</td>
</tr>
<tr>
<td>129</td>
<td>The operating system is not supported.</td>
</tr>
<tr>
<td>142</td>
<td>Insufficient disk space at the installation destination.</td>
</tr>
<tr>
<td>144</td>
<td>The command was not executed with administrator privileges.</td>
</tr>
<tr>
<td>220</td>
<td>Failed to create a Folder in the installation Folder.</td>
</tr>
<tr>
<td>221</td>
<td>Failed to create files in the installation Folder.</td>
</tr>
<tr>
<td>251</td>
<td>An error occurred when running a system function.</td>
</tr>
<tr>
<td>255</td>
<td>An internal inconsistency occurred.</td>
</tr>
</tbody>
</table>

*1: Refer to "2.4 Registering .NET Data Provider", and then register .NET Data Provider.

### Linux or Solaris

<table>
<thead>
<tr>
<th>Return value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Completed successfully.</td>
</tr>
<tr>
<td>11</td>
<td>A product that cannot coexist with FUJITSU Enterprise Postgres has been installed.</td>
</tr>
<tr>
<td>12</td>
<td>The operating system is not supported.</td>
</tr>
<tr>
<td>13</td>
<td>Processing was interrupted.</td>
</tr>
<tr>
<td>14</td>
<td>The resources required for installation do not exist on the media.</td>
</tr>
<tr>
<td>15</td>
<td>The resources required for installation do not exist.</td>
</tr>
<tr>
<td>16</td>
<td>Unable to change the permission because the directory does not exist.</td>
</tr>
<tr>
<td>17</td>
<td>Failed to install because a required package is missing.</td>
</tr>
<tr>
<td>19</td>
<td>A process is running.</td>
</tr>
<tr>
<td>30</td>
<td>Failed to copy the installation resources.</td>
</tr>
<tr>
<td>31</td>
<td>Upgrade installation cannot be performed.</td>
</tr>
<tr>
<td>32</td>
<td>The same version of the same product is already installed.</td>
</tr>
<tr>
<td>60</td>
<td>An error occurred in Uninstall (middleware).</td>
</tr>
<tr>
<td>61</td>
<td>Failed to install Uninstall (middleware).</td>
</tr>
<tr>
<td>62</td>
<td>Uninstall (middleware) was started.</td>
</tr>
</tbody>
</table>
Return value | Explanation
---|---
63 | The uninstallation cannot be performed either because Uninstall (middleware) does not exist or because there are no execution privileges.
99 | A system error occurred.
106 | The command was not executed with administrator privileges.

### A.4 CSV File Format

The format of CSV files is based on RFC4180, with the following specifications.

### Records
- Separate each record with a "CRLF" newline (operation is not guaranteed with only a "CR" or "LF" newline).
- Specify a newline at the end of a file.
- Separate each field within a record with a halfwidth comma ",".

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa bbb ccc</td>
</tr>
</tbody>
</table>

- If several commas are entered in succession, or if a comma precedes a newline, the data following the comma is regarded as empty.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa,ccc</td>
<td>aaa ccc</td>
</tr>
<tr>
<td>aaa,bbb,</td>
<td>aaa bbb</td>
</tr>
</tbody>
</table>

- You cannot specify a header.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>field1 field2 field 3</td>
</tr>
<tr>
<td>aaa,bbb,ccc</td>
<td>aaa bbb ccc</td>
</tr>
</tbody>
</table>

### Double quotation marks
- Enclose fields that contain newlines, double quotation marks, or commas in double quotation marks.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb b&quot;,&quot;ccc&quot;</td>
<td>aaa bb ccc</td>
</tr>
<tr>
<td>&quot;aaa&quot;,&quot;bb,b&quot;,&quot;ccc&quot;</td>
<td>aaa bb,b ccc</td>
</tr>
</tbody>
</table>

- If a double quotation mark is used in a field enclosed with double quotation marks, the first double quotation mark is regarded as an escape character.

<table>
<thead>
<tr>
<th>Format</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;aaa&quot;,&quot;bb&quot;&quot;b&quot;,&quot;ccc&quot;</td>
<td>aaa bb&quot;b ccc</td>
</tr>
</tbody>
</table>

### Note
An error occurs in the following cases:
- Each space, tab, or whitespace character is recognized as one character, and will cause a parameter error.

- A space is entered before or after a field enclosed with double quotation marks.

```
"zzz ", "yyy ", " xxx 
```

- The number of fields differs between records.

```
aaa,bbb
aaa,bbb,ccc
aaa,bbb,ccc,ddd
```

- Fields enclosed with double quotation marks and fields not enclosed with double quotation marks are both used.

```
aaa,"bbb",ccc
"xxx",yyy,"zzz"
```

- The double quotation escape characters are not positioned correctly.

```
"aaa","bb"="b","ccc"
```

- Double quotation marks enclose the entire field.

```
"aaa,bbb,ccc"
```
Appendix B Uninstall (middleware)

B.1 Features that are Installed

<table>

(&quot;Uninstall (middleware)&quot;)</td>
<td>No</td>
</tr>
</tbody>
</table>

B.2 Notes

B.2.1 Notes on the Uninstall (middleware) Tool

"Uninstall (middleware)" is a tool used by Fujitsu middleware products. It performs information management for middleware products, and also, launching the uninstaller for removing these products from the installed systems.

**Note**

- To uninstall FUJITSU Enterprise Postgres, uninstall from "Uninstall (middleware)".

  This tool manages information about other Fujitsu middleware products as well as FUJITSU Enterprise Postgres. For this reason, do not uninstall it unless absolutely necessary. If you have accidentally uninstalled this tool, re-install it as described below.

[Windows]

1. Log on to the machine to be installed using a user name belonging to the Administrators group, or switch to an account with administrator privileges.

2. Insert the server program DVD in the drive device.

3. Execute the installation command.

   \[z:\text{CIR}\text{Windows}\text{cirinst.exe}\]

In the example above, \(z\) is the drive on which the DVD is mounted.
1. Log in as a superuser to the installation target machine, or switch to a user with administrative privileges.

2. Insert the product media in the drive.

3. Execute the installation command.

   [Linux]
   
   # /media/dvd/CIR/Linux/cirinst.sh

   In the example above, /media/dvd is the DVD mount point.

   [Solaris]
   
   # /dvd/dvd0/CIR/Solaris/cirinst.sh

   In the example above, /dvd/dvd0 is the DVD mount point.

   - If you uninstall this tool as described below.

   1. Check that there are no Fujitsu middleware products installed in the system.
      You can check this by using "Uninstall (middleware)", which is launched by the command below.
      
      [Windows]
      Select [All Programs] > [Fujitsu] > [Uninstall (middleware)]

      [Linux/Solaris]
      
      /opt/FJSVcir/cir/bin/cimanager.sh -c

      -c : CUI

   2. If no Fujitsu middleware products have been installed, then issue the command below.

      [Windows]
      
      %SystemDrive%\FujitsuF4CR\bin\cirremove.exe

      [Linux/Solaris]
      
      # /opt/FJSVcir/bin/cirremove.sh

   3. At the uninstallation confirmation prompt, enter "y".

      This software is a common tool of Fujitsu products. Are you sure you want to remove it? [y/n]:

      Uninstallation will start.
Appendix C Uninstall (middleware) Messages

C.1 Messages output by FJSVcir

**FSP_FJSVCIR_CIRINST: ERROR: 101: CIRINST101: Administrator privilege is required.**

*Description*

The user does not have administrator privileges.

*Action method*

Login with administrator privileges and run the command again.

**FSP_FJSVCIR_CIRINST: ERROR: 102: CIRINST102: Failed to create %s**

*Parameters*

%s: Directory name

*Description*

Failed to create a directory during the installation.

*Action method*

Creating the directory might have failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 103: CIRINST103: It is required at least %d MB**

*Parameters*

%d: Disk spaces

*Description*

Insufficient disk space.

*Action method*

Confirm that the system has sufficient disk spaces.

**FSP_FJSVCIR_CIRINST: ERROR: 104: CIRINST104: Failed to copy CIR files.**

*Description*

Failed to copy files required for the installation.

*Action method*

Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

**FSP_FJSVCIR_CIRINST: ERROR: 105: CIRINST105: Failed to copy JRE.**

*Description*

Failed to copy JRE required for installation.

*Action method*

Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.
FSP_FJSVCIR_CIRINST: ERROR: 106: CIRINST106: Failed to copy CIR
Description
Failed to copy files during the installation.
Action method
Copying the files failed for some reason. Run the installer again, or run cirinst command again. If the problem persists, check the system log.

Description
An invalid option was specified.
Action method
Specify a valid option. [-c]: CUI

FSP_FJSVCIR_CIRINST: ERROR: 108: CIRINST108: JRE which should be deployed is not bundled.
Description
An appropriate JRE for this system is not bundled.
Action method
Confirm that the product supports the platform.

Description
Unsupported operating system.
Action method
Confirm that the product supports the operating system.

FSP_FJSVCIR_CIRINST: ERROR: 185: CIRINST185: lsb_release was not found. Please install the package below.
- redhat-lsb
Description
lsb_release command was not found.
Action method
Add redhat-lsb package and then execute install again.

FSP_FJSVCIR_CIRINST: ERROR: 186: CIRINST186: lsb_release was not found.
Description
lsb_release command was not found.
Action method
Add the relevant package and then execute install again.

FSP_FJSVCIR_CIRINST: ERROR: 201: CIRINST201: Administrator privilege is required.
Description
The user does not have administrator privileges.
Action method
   Login with administrator privileges and run the command again.

Description
   Failed to delete FJSVcir files.
Action method
   Deleting the files failed for some reason. Run cirremove command again. If the problem persists, check the system log.

Description
   Invalid option is specified.
Action method
   No option is supported. Retry without any options.

Specified installation parameters file was not found.
Description
   Specified installation parameters file was not found. (silent mode)
Action method
   Specify the installation parameters file.

It failed to install. See log for details
Description
   An error occurred during install. (silent mode)
Action method
   Collect the files stored in the following directories.
   [UNIX]
   /var/opt/FJSVcir/cir/logs/cirlog0.log.0
   [Windows]
   %ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0

Parameters are invalid. Please specify valid parameters.
Description
   Invalid option is specified. (silent mode)
Action method
   Specify a valid option.

Internal data is broken.
Description
   Internal data used by this product is corrupt.
Action method
   Collect the files stored in the following directories and contact Fujitsu technical support:
C.2 Messages output by Uninstall (middleware)

**It has already been running in another process.**

**Description**

An attempt was made to start Uninstall (middleware) more than once. Alternatively, an attempt was made to start Uninstall (middleware) while the installer was starting.

**Action method**

End any Uninstall (middleware) that have already started. Alternatively, start Uninstall (middleware) after the installer has ended.

**Specified option is invalid.**

**Description**

An invalid option was specified.

**Action method**

Specify valid options and run the command again.

**Please enter a valid option.**

**Description**

An invalid character was entered. Valid characters are y, n, or item numbers.

**Action method**

Enter a valid character.

**Failed to uninstall of the following software packages:**

**Description**

Failed to uninstall the software listed in this message.

**Action method**

Confirm the information shown after this message and take the appropriate action.

**Unable to uninstall the software as it is referred from more than one software.**

**Description**

Failed to uninstall the software because it is used by other software.

**Action method**

No specific action is required.

**Unable to uninstall the software as the software is mandatory.**
Description
Failed to uninstall the software because it is required by another program.

Action method
No specific action is required.

Internal data is broken.
Description
Internal data used by this product is corrupt.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
Unable to uninstall the software you were about to uninstall as the existence of the software is a precondition for the operation of another software.
Description
Failed to uninstall the software because it is required by another program.

Action method
No specific action is required.

The program terminated abnormally.
Description
The program has terminated abnormally.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:

[UNIX]
/var/opt/FJSVCIR/cir/
/etc/opt/FJSVCIR/cir/CIR.properties

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\n
An unexpected error has occurred during uninstall.
Description
An error occurred during uninstall.

Action method
Collect the files stored in the following directories and contact Fujitsu technical support:
It failed to uninstall. See log for details.

Description
An error occurred during uninstall. (silent mode)

Action method
Collect the files stored in the following directories.

[UNIX]
/var/opt/FJSVcir/cir/logs/cirlog0.log.0

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\logs\cirlog0.log.0

Failed to initialize the temp directory.

Description
Can not start Uninstall (middleware) because failed to initialize the temp directory.

Action method
Run Uninstall (middleware) again. If the problem persists, check whether other processes have accessed the files in the following directories.

[UNIX]
/var/opt/FJSVcir/cir/temp/meta_db

[Windows]
%ProgramData%\Fujitsu\FujitsuF4CR\cir\temp\meta_db

[Notice] Need to restart for uninstall completion.

Description
Uninstallation was completed. (silent mode)

Action method
Restart the system.

Application Development Guide >
Operation Guide >
Application Development Guide
Preface

Purpose of this document

This is a guide for the developers of FUJITSU Enterprise Postgres applications.

Intended readers

This document is intended for developers of applications that use FUJITSU Enterprise Postgres. Of the interfaces provided by FUJITSU Enterprise Postgres, this guide describes the PostgreSQL extended interface.

Readers of this document are also assumed to have general knowledge of:

- PostgreSQL
- SQL
- Linux
- PostgreSQL
- SQL
- Windows
- PostgreSQL
- SQL
- Oracle Solaris

Structure of this document

This document is structured as follows:

Chapter 1 Overview of the Application Development Function

Provides an overview of FUJITSU Enterprise Postgres application development.

Chapter 2 JDBC Driver

Explains how to use JDBC drivers.

Chapter 3 ODBC Driver

Explains how to use ODBC drivers.

Chapter 4 .NET Data Provider

Explains how to use .NET Data Provider.

Chapter 5 C Library (libpq)

Explains how to use C applications.

Chapter 6 Embedded SQL in C

Explains how to use embedded SQL in C.

Chapter 7 Embedded SQL in COBOL

Explains how to use embedded SQL in COBOL.

Chapter 8 SQL References

Explains the SQL statements which were extended in FUJITSU Enterprise Postgres development.

Chapter 9 Compatibility with Oracle Databases

Explains features that are compatible with Oracle databases.

Chapter 10 Application Connection Switch Feature

Explains the application connection switch feature.
Chapter 11 Performance Tuning
Explains how to tune application performance.

Chapter 12 Scan Using a Vertical Clustered Index (VCI)
Explains how to perform scan using a Vertical Clustered Index (VCI).

Appendix A Precautions when Developing Applications
Provides some points to note about application development.

Appendix B Conversion Procedures Required due to Differences from Oracle Database
Explains how to convert from an Oracle database to FUJITSU Enterprise Postgres, within the scope noted in “Compatibility with Oracle Databases” from the following perspectives.

Appendix C Tables Used by the Features Compatible with Oracle Databases
Explains the tables used by the features compatible with Oracle databases.

Appendix D ECOBPG - Embedded SQL in COBOL
Explains application development using embedded SQL in COBOL.

Appendix E Quantitative Limits
This appendix explains limitations.

Appendix F Reference
Provides a reference for each interface.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Issue date and version

    - 3.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions ......................................................... 33

### Chapter 4 .NET Data Provider
- 4.1 Development Environment........................................................................... 34
- 4.2 Setup............................................................................................................. 34
  - 4.2.1 Setting Up .NET Data Provider............................................................. 34
  - 4.2.2 Setting Up the Visual Studio Integration Add-On..................................... 35
  - 4.2.3 Message Language and Encoding System Used by Applications Settings ................................................................. 35
- 4.3 Connecting to the Database........................................................................... 36
Chapter 1 Overview of the Application Development Function

The interface for application development provided by FUJITSU Enterprise Postgres is perfectly compatible with PostgreSQL.

Along with the PostgreSQL interface, FUJITSU Enterprise Postgres also provides the following extended interfaces:

- Support for National Characters

  In order to secure portability from mainframes and databases of other companies, FUJITSU Enterprise Postgres provides data types that support national characters. The national characters are usable from the client application languages.
  
  Refer to "1.1 Support for National Characters" for details.

- Integration with Visual Studio

  By integrating with Visual Studio, applications can be created using a standard framework for the building of a database server.
  
  Refer to "1.2 Integration with Visual Studio" for details.

- Compatibility with Oracle Databases

  Compatibility with Oracle databases is offered. Use of the compatible features means that the revisions to existing applications can be isolated, and migration to open interfaces is made simpler.
  
  Refer to "1.3 Compatibility with Oracle Database" for details.

- Application connection switch feature

  The application connection switch feature is provided to enable automatic connection to the target server when there are multiple servers with redundant configurations.
  
  Refer to "1.4 Application Connection Switch Feature" for details.
Performance tuning

The following features are provided to control SQL statement query plans:
- Optimizer hints
- Locked statistics

Refer to "11.1 Enhanced Query Plan Stability" for details.

- Scanning using a Vertical Clustered Index (VCI)
Scans become faster during aggregation of many rows by providing the features below:
- Vertical clustered index (VCI)
- In-memory data

This feature can only be used in Advanced Edition.
Refer to "Chapter 12 Scan Using a Vertical Clustered Index (VCI)" for details.

1.1 Support for National Characters

NCHAR type is provided as the data type to deal with national characters.

The NCHAR type can be used with FUJITSU Enterprise Postgres pgAdmin.

Point

- NCHAR can only be used when the character set of the database is UTF-8.
- NCHAR can be used in the places where CHAR can be used (function arguments, etc.).
- For applications handling NCHAR type data in the database, the data format is the same as CHAR type. Therefore, applications handling data in NCHAR type columns can also be used to handle data stored in CHAR type columns.

Note

Note the following in order to cast NCHAR type data as CHAR type.
- When comparing NCHAR type data where the length differs, ASCII spaces are used to fill in the length of the shorter NCHAR type data so that it can be processed as CHAR type data.
- Depending on the character set, the data size may increase by between 1.5 and 2 times.

1.1.1 Literal

Syntax

\{ N | n \}'[national character [ ...]]'

General rules

National character string literals consist of an 'N' or 'n', and the national character is enclosed in single quotation marks ('). Example: N'ABCDEF'

The data type is national character string type.
1.1.2 Data Type

Syntax

\[
\{ \text{NATIONAL CHARACTER} \mid \text{NATIONAL CHAR} \mid \text{NCHAR} \} \{ \text{VARYING} \} [\{\text{(length)}\}]
\]

The data type of the NCHAR type column is as follows:

<table>
<thead>
<tr>
<th>Data type specification format</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NATIONAL CHARACTER(n)</td>
<td>National character string with a fixed length of ( n ) characters</td>
</tr>
<tr>
<td>NATIONAL CHAR(n)</td>
<td>This will be the same as (1) if ( n ) is omitted.</td>
</tr>
<tr>
<td>NCHAR(n)</td>
<td>( n ) is a whole number larger than 0.</td>
</tr>
<tr>
<td>NATIONAL CHARACTER VARYING(n)</td>
<td>National character string with a variable length with a maximum of ( n ) characters</td>
</tr>
<tr>
<td>NATIONAL CHAR VARYING(n)</td>
<td>Any length of national character string can be accepted when this is omitted.</td>
</tr>
<tr>
<td>NCHAR VARYING(n)</td>
<td>( n ) is a whole number larger than 0.</td>
</tr>
</tbody>
</table>

General rules

NCHAR is the national character string type data type. The length is the number of characters.

The length of the national character string type is as follows:

- When VARYING is not specified, the length of national character strings is fixed and will be the specified length.
- When VARYING is specified, the length of national character strings will be variable. In this case, the lower limit will be 0 and the upper limit will be the value specified for length.
- NATIONAL CHARACTER, NATIONAL CHAR, and NCHAR each have the same meaning.

When the national character string to be stored is shorter than the declared upper limit, the NCHAR value is filled with spaces, whereas NCHAR VARYING is stored as is.

The upper limit for character storage is approximately 1GB.

1.1.3 Functions and Operator

Comparison operator

When a NCHAR type or NCHAR VARYING type is specified in a comparison operator, comparison is only possible between NCHAR types or NCHAR VARYING types.

String functions and operators

All of the string functions and operators that can be specified by a CHAR type can also be specified by a NCHAR type. The behavior of these string functions and operators is also the same as with CHAR type.

Pattern matching (LIKE, SIMILAR TO regular expression, POSIX regular expression)

The patterns specified when pattern matching with NCHAR types and NCHAR VARYING types specify the percent sign (%) and the underline (_).

The underline (_) means a match with one national character. The percent sign (%) means a match with any number of national characters 0 or over.

1.2 Integration with Visual Studio

When developing an application to access database server resources, you can create applications and build database server environments integrated with Microsoft Visual Studio.
Refer to “Chapter 4 .NET Data Provider” for information on integration with Visual Studio.

1.2.1 Relationship between .NET Framework and FUJITSU Enterprise Postgres

FUJITSU Enterprise Postgres provides .NET Data Provider, which is an interface for ADO.NET of .NET Framework. This enables you to select FUJITSU Enterprise Postgres as the connection destination database of ADO.NET and use the intuitive and efficient application development features of Visual Studio.

The following provides an overview of application development integrated with Visual Studio.

Edit directory in Visual Studio’s text editor

By using a component specified in Visual Studio, applications to access database resources can be created manually.

Create an application with Visual Studio tools

By using basic drag-and-drop operations in the tools provided in Visual Studio, programs to access database resources can be generated automatically.
1.2.2 Automatic Application Generation

The Visual Studio tools used to automatically generate applications include TableAdapter and Server Explorer, which enable the following:

- Data manipulation of database resources with TableAdapter
- Management of database resources with Server Explorer

Whether you use TableAdapter or the Server Explorer, programs can be created with basic operations like drag and drop with the resources and tools that comprise Visual Studio.
The following features are available with TableAdapter and Server Explorer:

- Manipulation of database resources with TableAdapter
  - Generating queries using existing tables/views
  - Generating methods using existing tables/views
  - Generating queries using procedures
  - Generating methods using procedures

- Management of database resources with Server Explorer
  - Listing of database resources
  - Generating queries using existing tables/views
  - Generating methods using existing tables/views
  - Generating queries using procedures
  - Generating methods using procedures

1.3 Compatibility with Oracle Database

The following features have been extended in order to enhance compatibility with Oracle databases:

- Query (external join operator (+), DUAL table)
- Function (DECODE, SUBSTR, NVL)
- Built-in package (DBMS_OUTPUT, UTL_FILE, DBMS_SQL)

Refer to "Chapter 9 Compatibility with Oracle Databases" for information on the features compatible with Oracle databases.

1.4 Application Connection Switch Feature

The application connection switch feature enables automatic connection to the target server when there are multiple servers with redundant configurations.

Refer to "Chapter 10 Application Connection Switch Feature" for information on the application connection switch feature.
1.4.1 Integration with Database Multiplexing

The application connection switch feature is provided to enable automatic connection to the appropriate server when there are multiple servers with redundant configurations.

See
Refer to “Database Multiplexing Mode” in the Cluster Operation Guide for information on database multiplexing.

1.5 Notes on Application Compatibility

FUJITSU Enterprise Postgres upgrades contain feature improvements and enhancements that may affect the applications. Accordingly, note the points below when developing applications, to ensure compatibility after upgrade.

- Checking execution results
- Referencing system catalogs
- Using functions

1.5.1 Checking Execution Results

Refer to SQLSTATE output in messages to check the SQL statements used in applications and the execution results of commands used during development.

See
Refer to Messages for information on the message content and number.
Refer to “PostgreSQL Error Codes” under “Appendixes” in the PostgreSQL Documentation for information on SQLSTATE.

1.5.2 Referencing System Catalogs

System catalogs can be used to obtain information about the FUJITSU Enterprise Postgres system and database objects. However, system catalogs may change when the FUJITSU Enterprise Postgres version is upgraded. Also, there are many system catalogs that return information that is inherent to FUJITSU Enterprise Postgres.

Accordingly, reference the information schema defined in standard SQL (information_schema) wherever possible. Note also that queries specifying "*" in the selection list must be avoided to prevent columns being added.

See
Refer to “The Information Schema” under “Client Interfaces” in the PostgreSQL Documentation for details.

The system catalog must be referenced to obtain information not found in the information schema. Instead of directly referencing the system catalog in the application, define a view for that purpose. Note, however, that when defining the view, the column name must be clearly specified after the view name.

An example of defining and using a view is shown below.

Example

```
CREATE VIEW my_tablespace_view(spcname) AS SELECT spcname FROM pg_tablespace;
SELECT * FROM my_tablespace_view V1, pg_tables T1 WHERE V1.spcname = T1.tablespace;
```
If changes are made to a system catalog, the user will be able to take action by simply making changes to the view, without the need to make changes to the application.

The following shows an example of taking action by redefining a view as if no changes were made.

The pg_tablespace system catalog is redefined in response to the column name being changed from spcname to spacename.

```
Example

DROP VIEW my_tablespace_view;
CREATE VIEW my_tablespace_view(spcname) AS SELECT spacename FROM pg_tablespace;
```

### 1.5.3 Using Functions

The default functions provided with FUJITSU Enterprise Postgres enable a variety of operations and manipulations to be performed, and information to be obtained, using SQL statements.

However, it is possible that internal FUJITSU Enterprise Postgres functions, such as those relating to statistical information or for obtaining system-related information, may change as FUJITSU Enterprise Postgres versions are upgraded.

Accordingly, when using these functions, define them as new functions and then use the newly-defined functions in the applications.

An example of defining and using a function is shown below.

```
Example

CREATE FUNCTION my_func(relid regclass) RETURNS bigint LANGUAGE SQL AS 'SELECT pg_relation_size(relid)';
SELECT my_func(2619);
```

If changes are made to a function, the user will be able to take action by simply redefining the function, without the need to make changes to the application.

The following shows an example of taking action by redefining a function as if no changes were made.

The pg_relation_size function is redefined after arguments are added.

```
Example

DROP FUNCTION my_func(regclass);
CREATE FUNCTION my_func(relid regclass) RETURNS bigint LANGUAGE SQL AS 'SELECT pg_relation_size(relid,$$main$$)';
```
Chapter 2 JDBC Driver

This section describes how to use JDBC drivers.

2.1 Development Environment

This section describes application development using JDBC drivers and the runtime environment.

2.1.1 Combining with JDK or JRE

Refer to Installation and Setup Guide for Client for information on combining with JDK or JRE where JDBC drivers can operate.

2.2 Setup

This section describes the environment settings required to use JDBC drivers and how to encrypt communication data.

2.2.1 Environment Settings

Configuration of the CLASSPATH environment variable is required as part of the runtime environment for JDBC drivers. The name of the JDBC driver file is as follows:

- If using JDK 6 or JRE 6

  postgresql-jdbc4.jar

- If using JDK 7 or JRE 7

  postgresql-jdbc41.jar

- If using JDK 8 or JRE 8

  postgresql-jdbc42.jar

The examples below show how to set the CLASSPATH environment variable if JDK 6 or JRE 6 is used. If JDK 7, JRE 7, JDK 8, or JRE 8 is used, only the name of the JDBC driver file will be different. The method for configuring the CLASSPATH environment variable is the same.

Note that "<xy>" indicates the product version and level.

- Linux (32-bit)
  - Setting example (TC shell)

    ```bash
    setenv CLASSPATH /opt/fsepv<xy>/client32/jdbc/lib/postgresql-jdbc4.jar:${CLASSPATH}
    ```

  - Setting example (bash)

    ```bash
    CLASSPATH=/opt/fsepv<xy>/client32/jdbc/lib/postgresql-jdbc4.jar:$CLASSPATH;export CLASSPATH
    ```

- Linux (64-bit)
  - Setting example (TC shell)

    ```bash
    setenv CLASSPATH /opt/fsepv<xy>/client64/jdbc/lib/postgresql-jdbc4.jar:${CLASSPATH}
    ```
### 2.2.2 Message Language and Encoding System Used by Applications Settings

If the JDBC driver is used, it will automatically set the encoding system on the client to UTF-8, so there is no need to configure this.

See

Refer to “Automatic Character Set Conversion Between Server and Client” in "Server Administration" in the PostgreSQL Documentation for information on encoding systems.
Language settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Set language in the "user.language" system property.

Example

Example of running a Java command with system property specified

```
java -Duser.language=en TestClass1
```

2.2.3 Settings for Encrypting Communication Data

When using the communication data encryption feature to connect to the database server, set as follows:

Settings for encrypting communication data for connection to the server

This section describes how to create applications for encrypting communication data.

Set the property of the SSL parameter to "true" to encrypt. The default for the SSL parameter is "false".

Example

- Setting example 1

```
String url = "jdbc:postgresql://sv1/test";
Properties props = new Properties();
props.setProperty("user","fsepuser");
props.setProperty("password","secret");
props.setProperty("ssl","true");
Connection conn = DriverManager.getConnection(url, props);
```

- Setting example 2

```
String url = "jdbc:postgresql://sv1/test?user=fsepuser&password=secret&ssl=true";
Connection conn = DriverManager.getConnection(url);
```

To prevent spoofing of the database server, you need to use the keytool command included with Java to import the CA certificate to the Java keystore.

Refer to JDK documentation and the Oracle website for details.

Note

There is no need to set the ssl parameter if the connection string of the DriverManager class is specified, or if the sslmode parameter is specified in the data source, such as when the application connection switch feature is used. If the ssl parameter is set, the value in the sslmode parameter will be enabled.

See

Refer to “Secure TCP/IP Connections with SSL” in “Server Administration” in the PostgreSQL Documentation for information on encrypting communication data.
2.3 Connecting to the Database

This section explains how to connect to a database.

- Using the DriverManager Class
- Using the PGConnectionPoolDataSource Class
- Using the PGXADataSource Class

Note

Do not specify "V2" for the "protocolVersion" of the connection string.

2.3.1 Using the DriverManager Class

To connect to the database using the DriverManager class, first load the JDBC driver, then specify the connection string as a URI in the API of the DriverManager class.

Load the JDBC driver

Specify org.postgresql.Driver.

Connection string

URI connection is performed as follows:

```java
jdbc:postgresql://host:port/database?
user=user&password=password1&loginTimeout=loginTimeout&socketTimeout=socketTimeout
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>port</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is &quot;27500&quot;.</td>
</tr>
<tr>
<td>database</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>user</td>
<td>Specify the username that will connect with the database.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the username logged into the operating system that is executing the application will be used.</td>
</tr>
<tr>
<td>password</td>
<td>Specify a password when authentication is required.</td>
</tr>
<tr>
<td>loginTimeout</td>
<td>Specify the timeout for connections (in units of seconds).</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td>socketTimeout</td>
<td>Specify the timeout for communication with the server (in units of seconds).</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when data is not received from the server within the specified time.</td>
</tr>
</tbody>
</table>

Example

Code examples for applications

```java
import java.sql.*;
...
```
2.3.2 Using the PGConnectionPoolDataSource Class

To connect to databases using data sources, specify the connection information in the properties of the data source.

Method description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setServerName</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>setPortNumber</td>
<td>Specify the port number for the database server. The default is &quot;27500&quot;.</td>
</tr>
<tr>
<td>setDatabaseName</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>setUser</td>
<td>Specify the username of the database. By default, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>setPassword</td>
<td>Specify a password for server authentication.</td>
</tr>
<tr>
<td>setLoginTimeout</td>
<td>Specify the timeout for connections (in units of seconds). Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value. An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td>setSocketTimeout</td>
<td>Specify the timeout for communication with the server (in units of seconds). Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value. An error occurs when data is not received from the server within the specified time.</td>
</tr>
</tbody>
</table>

Example

Code examples for applications

```java
import java.sql.*;
import org.postgresql.ds.PGConnectionPoolDataSource;
...
PGConnectionPoolDataSource source = new PGConnectionPoolDataSource();
source.setServerName("sv1");
source.setPortNumber(27500);
source.setDatabaseName("mydb");
source.setUser("myuser");
source.setPassword("myuser01");
source.setLoginTimeout(20);
source.setSocketTimeout(20);
...
Connection con = source.getConnection();
```

2.3.3 Using the PGXADataSource Class

To connect to databases using data sources, specify the connection information in the properties of the data source.

Method description
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setServerName</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>setPortNumber</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is &quot;27500&quot;.</td>
</tr>
<tr>
<td>setDatabaseName</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>setUser</td>
<td>Specify the username that will connect with the database.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>setPassword</td>
<td>Specify a password when authentication by a password is required.</td>
</tr>
<tr>
<td>setLoginTimeout</td>
<td>Specify the timeout for connections.</td>
</tr>
<tr>
<td></td>
<td>The units are seconds. Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td>setSocketTimeout</td>
<td>Specify the timeout for communication with the server.</td>
</tr>
<tr>
<td></td>
<td>The units are seconds. Specify a value between 0 and 2147483647. There is no limit set if you set 0 or an invalid value.</td>
</tr>
<tr>
<td></td>
<td>An error occurs when data is not received from the server within the specified time.</td>
</tr>
</tbody>
</table>

### Example

Code examples for applications

```java
import java.sql.*;
import org.postgresql.xa.PGXADatasource;
...
PGXADatasource source = new PGXADatasource();
source.setServerName("sv1");
source.setPortNumber(27500);
source.setDatabaseName("mydb");
source.setUser("myuser");
source.setPassword("myuser01");
source.setLoginTimeout(20);
source.setSocketTimeout(20);...
Connection con = source.getConnection();
```

### 2.4 Application Development

This section describes the data types required when developing applications that will be connected with FUJITSU Enterprise Postgres.

#### 2.4.1 Relationship between the Application Data Types and Database Data Types

The following table shows the correspondence between data types in applications and data types in databases.

<table>
<thead>
<tr>
<th>Data type on the server</th>
<th>Java data type</th>
<th>Data types prescribed by java.sql.Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>character</td>
<td>String</td>
<td>java.sql.Types.CHAR</td>
</tr>
<tr>
<td>national character</td>
<td>String</td>
<td>java.sql.Types.NCHAR</td>
</tr>
<tr>
<td>Data type on the server</td>
<td>Java data type</td>
<td>Data types prescribed by java.sql.Types</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------</td>
<td>-----------------------------------------</td>
</tr>
<tr>
<td>character varying</td>
<td>String</td>
<td>java.sql.Types.VARCHAR</td>
</tr>
<tr>
<td>national character varying</td>
<td>String</td>
<td>java.sql.Types.NVARCHAR</td>
</tr>
<tr>
<td>text</td>
<td>String</td>
<td>java.sql.Types.VARCHAR</td>
</tr>
<tr>
<td>bytea</td>
<td>byte[]</td>
<td>java.sql.Types.BINARY</td>
</tr>
<tr>
<td>smallint</td>
<td>short</td>
<td>java.sql.Types.SMALLINT</td>
</tr>
<tr>
<td>integer</td>
<td>int</td>
<td>java.sql.Types.INTEGER</td>
</tr>
<tr>
<td>bigint</td>
<td>long</td>
<td>java.sql.Types.BIGINT</td>
</tr>
<tr>
<td>smallserial</td>
<td>short</td>
<td>java.sql.Types.SMALLINT</td>
</tr>
<tr>
<td>serial</td>
<td>int</td>
<td>java.sql.Types.INTEGER</td>
</tr>
<tr>
<td>bigserial</td>
<td>long</td>
<td>java.sql.Types.BIGINT</td>
</tr>
<tr>
<td>real</td>
<td>float</td>
<td>java.sql.Types.REAL</td>
</tr>
<tr>
<td>double precision</td>
<td>double</td>
<td>java.sql.Types.DOUBLE</td>
</tr>
<tr>
<td>numeric</td>
<td>java.math.BigDecimal</td>
<td>java.sql.Types.NUMERIC</td>
</tr>
<tr>
<td>decimal</td>
<td>java.math.BigDecimal</td>
<td>java.sql.Types.DECIMAL</td>
</tr>
<tr>
<td>money</td>
<td>String</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>date</td>
<td>java.sql.Date</td>
<td>java.sql.Types.DATE</td>
</tr>
<tr>
<td>time with time zone</td>
<td>java.sql.Time</td>
<td>java.sql.Types.TIME</td>
</tr>
<tr>
<td>time without time zone</td>
<td>java.sql.Time</td>
<td>java.sql.Types.TIME</td>
</tr>
<tr>
<td>timestamp without time zone</td>
<td>java.sql.Timestamp</td>
<td>java.sql.Types.TIMESTAMP</td>
</tr>
<tr>
<td>timestamp with time zone</td>
<td>java.sql.Timestamp</td>
<td>java.sql.Types.TIMESTAMP</td>
</tr>
<tr>
<td>interval</td>
<td>org.postgresql.util.PGInterval</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>boolean</td>
<td>boolean</td>
<td>java.sql.Types.BIT</td>
</tr>
<tr>
<td>bit</td>
<td>boolean</td>
<td>java.sql.Types.BIT</td>
</tr>
<tr>
<td>bit varying</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>oid</td>
<td>long</td>
<td>java.sql.Types.BIGINT</td>
</tr>
<tr>
<td>xml</td>
<td>java.sql.SQLXML</td>
<td>java.sql.Types.SQLXML</td>
</tr>
<tr>
<td>array</td>
<td>java.sql.Array</td>
<td>java.sql.Types.ARRAY</td>
</tr>
<tr>
<td>uuid</td>
<td>java.util.UUID</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>point</td>
<td>org.postgresql.geometric.Pgpoint</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>box</td>
<td>org.postgresql.geometric.Pgbox</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>lseg</td>
<td>org.postgresql.geometric.Pglseg</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>path</td>
<td>org.postgresql.geometric.PGpath</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>polygon</td>
<td>org.postgresql.geometric.PGpolygon</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>circle</td>
<td>org.postgresql.geometric.PGcircle</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>json</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>Network address type</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>(inet, cidr, macaddr)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Types related to text searches</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>(svector, tsquery)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Data type on the server

<table>
<thead>
<tr>
<th>Data type on the server</th>
<th>Java data type</th>
<th>Data types prescribed by java.sql.Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enumerated type</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>Composite type</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
<tr>
<td>Range type</td>
<td>org.postgresql.util.PGobject</td>
<td>java.sql.Types.OTHER</td>
</tr>
</tbody>
</table>

Although the `getString()` method of the ResultSet object can be used for all server data types, it is not guaranteed that it will always return a string in the same format for the same data type.

Strings in a format compatible with the JDBC specifications can be obtained using the Java `toString()` method of the appropriate data type (for example, `getInt()`, `getTimestamp()`) to conform to the data type on the server.

### 2.4.2 Statement Caching Feature

The statement caching feature caches SQL statements for each individual connection. This means that when an SQL statement with an identical string is next executed, the analysis and creation of the statement can be skipped. This improves performance in cases such as when an SQL statement with an identical string is executed within a loop or method that is executed repeatedly. Furthermore, the statement caching feature can be combined with the connection pooling feature to further enhance performance.

**Cache registration controls**

You can configure whether to cache SQL statements using the `setPoolable(boolean)` method of the `PreparedStatement` class when the statement caching feature is enabled.

Values that can be configured are shown below:

- **false**
  
  SQL statements will not be cached, even when the statement caching feature is enabled.

- **true**
  
  SQL statements will be cached if the statement caching feature is enabled.

### 2.4.3 Creating Applications during Cluster Operations

This section explains points to consider when creating applications during cluster operations.

**See**

Refer to the Cluster Operation Guide for information on cluster operations.

### 2.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs during cluster operations, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>57P01 08006</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td>Access during system failure</td>
<td>08001</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>Error information (*1)</td>
<td>Action</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------</td>
<td>--------</td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>57P01</td>
<td></td>
</tr>
<tr>
<td></td>
<td>08006</td>
<td></td>
</tr>
<tr>
<td>Switched during access</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Accessed during switch</td>
<td>08001</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of the getSQLState() method of SQLException.
Chapter 3 ODBC Driver

This section describes application development using ODBC drivers.

3.1 Development Environment

Applications using ODBC drivers can be developed using ODBC interface compatible applications, such as Access, Excel, and Visual Basic.

Refer to the manuals for the programming languages corresponding to the ODBC interface for information about the environment for development.

FUJITSU Enterprise Postgres supports ODBC 3.5.

3.2 Setup

You need to set up PsqlODBC, which is an ODBC driver, in order to use applications that use ODBC drivers with FUJITSU Enterprise Postgres. PsqlODBC is included in the FUJITSU Enterprise Postgres client package.

The following describes how to register the ODBC drivers and the ODBC data source.

3.2.1 Registering ODBC Drivers

When using the ODBC driver on Linux and Solaris platforms, register the ODBC driver using the following procedure:

1. Installing the ODBC driver manager (unixODBC)

   Information

   - FUJITSU Enterprise Postgres supports unixODBC Version 2.3 or later.
     You can download unixODBC from the following site:
     http://www.unixodbc.org/
   - To execute unixODBC, you must first install libtool 2.2.6 or later.
     You can download libtool from the following website:
     http://www.gnu.org/software/libtool/

   [Note]
   - ODBC driver operation is supported.
   - unixODBC operation is not supported.

2. Registering ODBC drivers

   Edit the ODBC driver manager (unixODBC) odbcinst.ini file.

   Information

   [location of the odbcinst.ini file]

   unixODBCInstallDir/etc/odbcinst.ini

   Set the following content:
<table>
<thead>
<tr>
<th>Definition name</th>
<th>Description</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Driver name]</td>
<td>ODBC driver name</td>
<td>Set the name of the ODBC driver. Select the two strings below that correspond to the application type. Concatenate the strings with no spaces, enclose in &quot;[ ]&quot;, and then specify this as the driver name.</td>
</tr>
</tbody>
</table>

**Note**

The placeholders shown below are enclosed in angle brackets '<>' to avoid confusion with literal text. Do not include the angle brackets in the string.

- Application architecture
  - For data sources used by 32-bit applications
    "FUJITSUEnterprisePostgres <fujitsuEnterprisePostgresClientVersAndLvl>"
  - For data sources used by 64-bit applications
    "FUJITSUEnterprisePostgres <fujitsuEnterprisePostgresClientVersAndLvl>x64" 
    "FUJITSUEnterprisePostgres <fujitsuEnterprisePostgresClientVersAndLvl>sparcv9"

- Encoding system used by the application
  - In Unicode (only UTF-8 can be used)
    "unicode"
  - Other than Unicode
    "ansi"

Example: In a 32-bit application, where the encoding system used by the application is Unicode:

"[FUJITSUEnterprisePostgres <fujitsuEnterprisePostgresClientVersAndLvl>/unicode]"

<table>
<thead>
<tr>
<th>Description</th>
<th>Specification of the ODBC driver</th>
<th>Description</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Driver name]</td>
<td>[Driver name]</td>
<td>ODBC driver name</td>
<td>Set the path of the ODBC driver (32-bit).</td>
</tr>
<tr>
<td>Path of the ODBC driver (32-bit)</td>
<td>Path of the ODBC driver (32-bit)</td>
<td>Set the path of the ODBC driver (32-bit).</td>
<td></td>
</tr>
</tbody>
</table>

- If the encoding system is Unicode:
  ```
fujitsuEnterprisePostgresClientInstallDir/odbc/lib/psqlodbcw.so
  ```

- If the encoding system is other than Unicode:
  ```
fujitsuEnterprisePostgresClientInstallDir/odbc/lib/psqlodbcax.so
  ```
<table>
<thead>
<tr>
<th>Definition name</th>
<th>Description</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Driver64</td>
<td>Path of the ODBC driver (64-bit)</td>
<td>Set the path of the ODBC driver (64-bit). Setting is not required when you are using a 32-bit operating system.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If the encoding system is Unicode:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FujitsuEnterprisePostgresClientInstallDir/odbc/lib/psqlodbcw.so</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If the encoding system is other than Unicode:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FujitsuEnterprisePostgresClientInstallDir/odbc/lib/psqlodbca.so</td>
</tr>
<tr>
<td>FileUsage</td>
<td>Use of the data source file</td>
<td>Specify 1.</td>
</tr>
<tr>
<td>Threading</td>
<td>Level of atomicity secured for connection pooling</td>
<td>Specify 2.</td>
</tr>
</tbody>
</table>

**Example**

Note that "<xy>" indicates the product version and level.

- Setting example when using 32-bit ODBC driver on 32-bit Linux

```plaintext
[FUJITSU Enterprise Postgres9.6unicode]
Description = FUJITSU Enterprise Postgres 9.6 unicode driver
Driver = /opt/fsepv<xy>/client32/odbc/lib/psqlodbcw.so
FileUsage = 1
Threading = 2
```

- Setting example when using 64-bit ODBC driver on 64-bit Linux

```plaintext
[FUJITSU Enterprise Postgres9.6x64unicode]
Description = FUJITSU Enterprise Postgres 9.6 x64 unicode driver
Driver64 = /opt/fsepv<xy>/client64/odbc/lib/psqlodbca.so
FileUsage = 1
Threading = 2
```

- Setting example when using both 32-bit and 64-bit ODBC drivers on 64-bit Linux

```plaintext
[FUJITSU Enterprise Postgres9.6unicode]
Description = FUJITSU Enterprise Postgres 9.6 unicode driver
Driver = /opt/fsepv<xy>/client32/odbc/lib/psqlodbcw.so
FileUsage = 1
Threading = 2

[FUJITSU Enterprise Postgres9.6x64unicode]
Description = FUJITSU Enterprise Postgres 9.6 x64 unicode driver
Driver64 = /opt/fsepv<xy>/client64/odbc/lib/psqlodbca.so
FileUsage = 1
Threading = 2
```
3.2.2 Registering ODBC Data Sources (for Windows(R))

This section describes how to register ODBC data sources.

There are the following two ways to register ODBC data sources on Windows(R).

3.2.2.1 Registering using GUI

This section describes how to start the [ODBC Data Source Administrator] and register ODBC data sources.

Use the following procedure to register ODBC data sources:

1. Start the [ODBC Data Source Administrator].
   
   Select [Start] >> [Control Panel] >> [Administrative Tools] >> [ODBC Data Source Administrator].

**Example**

This is an example of starting [ODBC Data Sources (32-bit)] from [Administrative Tools] in Windows Server(R) 2012.

**Note**

To register data sources for 32-bit applications in Windows(R) for 64-bit, execute the ODBC administrator (odbcad32.exe) for 32-bit, as shown below.

`%SYSTEMDRIVE%\WINDOWS\SysWOW64\odbcad32.exe`
2. When only the current user is to use the ODBC data source, select [User DSN]. When all users using the same computer are to use the ODBC data source, select [System DSN].

3. Click [Add].

4. Select one of the following drivers from the list of available ODBC drivers displayed in [Create New Data Source], and then click [Finish]. The notation “x.y” indicates the version and level of the FUJITSU Enterprise Postgres client feature.
   - FUJITSU Enterprise Postgres Unicode x.y
     Select this driver if using Unicode as the application encoding system.
- FUJITSU Enterprise Postgres ANSI x.y
Select this driver if using other than Unicode as the application encoding system.

5. The [PostgreSQL ANSI ODBC Driver (psqlODBC) Setup] window is displayed. Enter or select the required items, then click [Save].

Set the following content:

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Source</td>
<td>Specify the data source name to be registered in the ODBC driver manager. The application will select the name specified here and connect with the FUJITSU Enterprise Postgres database. This parameter cannot be omitted. Specify the following characters up to 32 bytes.</td>
</tr>
</tbody>
</table>
### Definition

<table>
<thead>
<tr>
<th>Name</th>
<th>Setting Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>National characters</td>
<td></td>
</tr>
<tr>
<td>Alphanumerics</td>
<td></td>
</tr>
</tbody>
</table>

### Description

Specify a supplementary description for the current data source. Specify characters up to 255 bytes.
- National characters
- Alphanumerics

### Database

Specify the database name to be connected.

### SSLMode

Specify to encrypt communications. The default is "disable".

The setting values for SSLMode are as follows:
- disable: Connect without SSL
- allow: Connect without SSL, and if it fails, connect using SSL
- prefer: Connect using SSL, and if it fails, connect without SSL
- require: Connect always using SSL
- verify-ca: Connect using SSL, and use a certificate issued by a trusted CA (*1)
- verify-full: Connect using SSL, and use a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)

### Server

Specify the host name of the database server to connect to, using up to 18 bytes. This parameter cannot be omitted.

### Port

Specify the port number to be used for remote access. The default value is "27500".

### Username(*2)

Specify the user that will access the database.

### Password(*2)

Specify the password for the user that will access the database.

---

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT of your operating system to specify the CA certificate file as shown below.

Example:

```
Variable name: PGSSLROOTCERT
Variable value: cACertificateFile
```

*2: In consideration of security, specify the Username and the Password by the application.

---

### 3.2.2.2 Registering using commands

This section describes how to use commands to register ODBC data sources.

Use the following tools from Microsoft to register ODBC data sources.
- ODBCConf.exe
- Add-OdbcDsn (can be used with Windows(R) 8.1 or later, or Windows Server(R) 2012 or later.)

Refer to the Microsoft Developer Network (MSDN) Library for information on how to use these tools.
When using ODBCConf.exe

ODBCConf.exe is a tool supported on all Windows(R) platforms.

Specification format

```
ODBCConf.exe /A { dataSourceType "odbcDriverName" "optionName=value[| optionName=value...]" } [/Lv fileName]
```

Refer to the Microsoft MSDN library for information on the format and parameters.

Description

Set the following content:

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source type</td>
<td>Specify the data source type.</td>
</tr>
<tr>
<td></td>
<td>- &quot;CONFIGSYSDSN&quot;: A system data source is created. This requires user admin rights. The data source can be used by all users of the same computer.</td>
</tr>
<tr>
<td></td>
<td>- &quot;CONFIGDSN&quot;: A user data source is created. The data source can be used by the current user only.</td>
</tr>
</tbody>
</table>

Note

When CONFIGSYSDSN is specified as the data source type, it is necessary to execute the command in the command prompt in administrator mode.

<table>
<thead>
<tr>
<th>ODBC driver name</th>
<th>Specify an ODBC driver name that has already been registered on the system. Specify one of the following.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- &quot;FUJITSU Enterprise Postgres Unicode &lt;fujitsuEnterprisePostgresClientVersAndLv1s&gt;&quot; Specify this driver name if using Unicode as the application encoding system.</td>
</tr>
<tr>
<td></td>
<td>- &quot;FUJITSU Enterprise Postgres ANSI &lt;fujitsuEnterprisePostgresClientVersAndLv1s&gt;&quot; Specify this driver name if using other than Unicode as the application encoding system.</td>
</tr>
</tbody>
</table>

Note

The placeholders shown below are enclosed in angle brackets ‘<>' to avoid confusion with literal text. Do not include the angle brackets in the string.

<table>
<thead>
<tr>
<th>Option name</th>
<th>The following items must be set:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- &quot;DSN&quot;: Specify the data source name.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Servername&quot;: Specify the host name for the database server.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Port&quot;: Specify the port number for connection to the database</td>
</tr>
<tr>
<td></td>
<td>- &quot;Database&quot;: Specify the database name.</td>
</tr>
</tbody>
</table>

Specify the following values as required:

- "UID": User ID
- "Password": Password
**Definition name** | **Setting value**
---|---
- "SSLMode": Specify to encrypt communications. The default is "disable". Refer to the SSLMode explanation in the table under step 5 of "3.2.2.1 Registering using GUI" for information on how to configure SSLMode.

**Example**

```
ODBCConf.exe /A {CONFIGYSDNSN "FUJITSU Enterprise Postgres Unicode 9.6" "DSN=odbcconf1|Servername=sv1|Port=27500|Database=db01|SSLMode=verify-ca"} /Lv log.txt
```

**Note**

In consideration of security, specify the UID and the Password by the application.

**When using Add-OdbcDsn**

Add-OdbcDsn is used in the PowerShell command interface.

**Specification format**

```
Add-OdbcDsn dataSourceName -DriverName "odbcDriverName" -DsnType dataSourceType -Platform oSArchitecture -SetPropertyValue @("optionName=value" [,"optionName=value"...])
```

Refer to the Microsoft MSDN library for information on the format and parameters.

**Description**

Set the following content:

**Definition name** | **Setting value**
---|---
Data source name | Specify any name for the data source name.
ODBC driver name | Specify an ODBC driver name that has already been registered on the system. Specify one of the following.

**Note**

The placeholders shown below are enclosed in angle brackets '<>' to avoid confusion with literal text. Do not include the angle brackets in the string.

- "FUJITSU Enterprise Postgres Unicode <fujitsuEnterprisePostgresClientVersAndLvl>" Specify this driver name if using Unicode as the application encoding system.
- "FUJITSU Enterprise Postgres ANSI <fujitsuEnterprisePostgresClientVersAndLvl>" Specify this driver name if using other than Unicode as the application encoding system.

Data source type | Specify the data source type.
### Definition name | Setting value
---|---
- "System": A system data source is created. Requires user admin rights. The data source can be used by all users of the same computer.
- "User": A user data source is created. The data source can be used by the current user only.

**Note**

When System is specified as the data source type, it is necessary to execute the command in the administrator mode of the command prompt.

<table>
<thead>
<tr>
<th>OS architecture</th>
<th>Specify the OS architecture of the system.</th>
</tr>
</thead>
<tbody>
<tr>
<td>- &quot;32-bit&quot;: 32-bit system</td>
<td></td>
</tr>
<tr>
<td>- &quot;64-bit&quot;: 64-bit system</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option name</th>
<th>The following items must be set:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- &quot;Servername&quot;: Specify the host name for the database server.</td>
<td></td>
</tr>
<tr>
<td>- &quot;Port&quot;: Specify the port number for connection to the database</td>
<td></td>
</tr>
<tr>
<td>- &quot;Database&quot;: Specify the database name.</td>
<td></td>
</tr>
</tbody>
</table>

Specify the following values as required:

- "SSLMode": Specify to encrypt communications. The default is "disable". Refer to the SSLMode explanation in the table under step 5 of "3.2.2.1 Registering using GUI" for information on how to configure SSLMode.

**Note**

When using Add-OdbcDsn, the strings "UID" and "Password" cannot be set as option names. These can only be used when using ODBCConf.exe.

---

### Example

```
Add-OdbcDsn odbcps1 -DriverName "FUJITSU Enterprise Postgres Unicode 9.6" -DsnType System -Platform 32-bit -SetPropertyValue @("Servername=sv1", "Port=27500", "Database=db01", "SSLMode=verify-ca")
```

---

### 3.2.3 Registering ODBC Data Sources(for Linux/Solaris)

This section describes how to register ODBC data sources on Linux and Solaris.

1. **Registering data sources**

   Edit the odbc.ini definition file for the data source.

### Information

Edit the file in the installation directory for the ODBC driver manager (unixODBC)

```
unixOdbcInstallDir/etc/odbc.ini
```

Or
Create a new file in the HOME directory  
`~/.odbc.ini`

**Point**

If `unixOdbcInstallDir` is edited, these will be used as the shared settings for all users that log into the system. If created in the HOME directory (~/), the settings are used only by the single user.

Set the following content:

<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Data source name]</td>
<td>Set the name for the ODBC data source.</td>
</tr>
<tr>
<td>Description</td>
<td>Set a description for the ODBC data source. Any description may be set.</td>
</tr>
</tbody>
</table>
| Driver | Set the following as the name of the ODBC driver. Do not change this value.  
Select the two strings below that correspond to the application type. Concatenate the strings with no spaces and then specify this as the driver name.  

**Note**

The placeholders shown below are enclosed in angle brackets `<>` to avoid confusion with literal text. Do not include the angle brackets in the string.

- Application architecture
  - For data sources used by 32-bit applications
    "FUJITSU Enterprise Postgres <fujitsuEnterprisePostgresClientVersAndLvl>"
  - For data sources used by 64-bit applications
    "FUJITSU Enterprise Postgres <fujitsuEnterprisePostgresClientVersAndLvl>x64"
    "FUJITSU Enterprise Postgres <fujitsuEnterprisePostgresClientVersAndLvl>sparcv9"

- Encoding system used by the application
  - In Unicode (only UTF-8 can be used)
    "unicode"
  - Other than Unicode
    "ansi"

Example: In a 32-bit application, where the encoding system used by the application is Unicode:
"FUJITSU Enterprise Postgres <fujitsuEnterprisePostgresClientVersAndLvl>unicode"

**Database** Specify the database name to be connected.  
**Servername** Specify the host name for the database server.  
**Username** Specify the user ID that will connect with the database.
<table>
<thead>
<tr>
<th>Definition name</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>Specify the password for the user that will connect to the database.</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the port number for the database server. The default is &quot;27500&quot;.</td>
</tr>
</tbody>
</table>
| SSLMode         | The setting values for SSLMode are as follows:  
|                 | - disable: Connect without SSL  
|                 | - allow: Connect without SSL, and if it fails, connect using SSL  
|                 | - prefer: Connect using SSL, and if it fails, connect without SSL  
|                 | - require: Connect always using SSL  
|                 | - verify-ca: Connect using SSL, and use a certificate issued by a trusted CA (*1)  
|                 | - verify-full: Connect using SSL, and use a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1) |
| ReadOnly        | Specify whether to set the database as read-only.  
|                 | - 1: Set read-only  
|                 | - 0: Do not set read-only |

*1: If specifying either "verify-ca" or "verify-full", use the environment variable PGSSLROOTCERT to specify the CA certificate file as shown below.

Example:

```bash
export PGSSLROOTCERT=cACertificateFileStorageDir/root.crt
```

Example:

Linux 32-bit

```plaintext
[MyDataSource]
Description    = FUJITSU Enterprise Postgres
Driver         = FUJITSU Enterprise Postgres9.6ansi
Database       = db01
Servername     = sv1
Port           = 27500
ReadOnly       = 0
```

**Note**
In consideration of security, specify the UserName and the Password by the application.

2. Environment variable settings

To execute applications that use ODBC drivers, all of the following settings must be configured in the LD_LIBRARY_PATH environment variable:

- `fujitsuEnterprisePostgresClientInstallDir/lib`
- `unixOdbcInstallDir(*1)/lib`
- `libtoolInstallDir(*1)/lib`

*1: If the installation directory is not specified when unixODBC and libtool are installed, they will be installed in /usr/local.
Note

Solaris

For 64-bit applications, set either LD_LIBRARY_PATH or LD_LIBRARY_PATH_64. If both are set, LD_LIBRARY_PATH_64 will be used.

3.2.4 Message Language and Encoding System Used by Applications Settings

This section explains the language settings for the application runtime environment and the encoding settings for the application.

Language settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Messages output by an application may include text from messages sent from the database server. In the resulting text, the text of the application message will use the message locale of the application, and the text of the message sent by the database server will use the message locale of the database server. If the message locales do not match, more than one language or encoding system will be used. Moreover, if the encoding systems do not match, characters in the resulting text can be garbled.

- Linux/Solaris

Set the locale for messages (LC_MESSAGES category) to match the message locale of the database server. This can be done in a few different ways, such as using environment variables. Refer to the relevant manual of the operating system for information on the setlocale function.

Example of specifying "en_US.UTF-8" with the setlocale function

```c
setlocale(LC_ALL,"en_US.UTF-8");
```

Specifying the locale of the LC_ALL category propagates the setting to LC_MESSAGE.

- Windows(R)

Align the locale of the operating system with the message locale of the database server.

Encoding System Settings

Ensure that the encoding system that is embedded in the application and passed to the database, and the encoding system setting of the runtime environment, are the same. The encoding system cannot be converted correctly on the database server.

Use one of the following methods to set the encoding system for the application:

- Set the PGCLIENTENCODING environment variable in the runtime environment.
- Set the client_encoding keyword in the connection string.
- Use the PQsetClientEncoding function.
Refer to “Supported Character Sets” in “Server Administration” in the PostgreSQL Documentation for information on the strings that represent the encoding system that can be set.

For example, when using "Unicode" and "8 bit", set the string "UTF8".

Example

Setting the "PGCLIENTENCODING" environment variable

An example of setting when the encoding of the client is "UTF8" (Bash)

```bash
> PGCLIENTENCODING=UTF8; export PGCLIENTENCODING
```

An example of setting when the encoding of the client is "UTF8"

```bash
> set PGCLIENTENCODING=UTF8
```

Note

Text may be garbled when outputting results to the command prompt. Review the font settings for the command prompt if this occurs.

3.3 Connecting to the Database

Refer to the manual for the programming language corresponding to the ODBC interface, i.e. Access, Excel, or Visual Basic, for example.

3.4 Application Development

This section describes how to develop applications using ODBC drivers.

3.4.1 Compiling Applications (for Windows (R))

Refer to the manual for the programming language corresponding to the ODBC interface, i.e. Access, Excel, or Visual Basic, for example.

Note

The cl command expects input to be a program that uses one of the following code pages, so convert the program to these code pages and then compile and link it (refer to the Microsoft documentation for details).

- ANSI console code pages (example: UTF8)
- UTF-16 little-endian with or without BOM (Byte Order Mark)
- UTF-16 big-endian with or without BOM
- UTF-8 with BOM
The `cl` command converts strings in a program to an ANSI console code page before generating a module, so the data sent to and received from the database server becomes an ANSI console code page. Therefore, set the coding system corresponding to the ANSI console code page as the coding system of the client.

Refer to "Character Set Support" in "Server Administration" in the PostgreSQL Documentation for information on how to set the client encoding system.

### 3.4.2 Compiling Applications (for Linux/Solaris)

Specify the following options when compiling applications.

<table>
<thead>
<tr>
<th>Table 3.1 Include file and library path</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Architecture</strong></td>
</tr>
<tr>
<td>32-bit</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>64-bit</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 3.2 ODBC library</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type of library</strong></td>
</tr>
<tr>
<td>Dynamic library</td>
</tr>
</tbody>
</table>

#### Note

- **Linux**
  Specify `-m64` when creating a 64-bit application. Specify `-m32` when creating a 32-bit application.

- **Solaris**
  When creating a 64-bit application, either `-m64` or `-xarch=v9` needs to be specified. When the compiler you are using is Oracle Solaris Studio 12.2 or later or Sun Studio 12, specify `-m64`. With Sun Studio 11, Sun Studio10, or Sun Studio 9, specify `-xarch=v9`.

#### Example

The following are examples of compiling ODBC applications:

- **Linux 64-bit**
  ```
  gcc -m64 -I/usr/local/include(*1) -L/usr/local/lib(*1) -lodbc testproc.c -o testproc
  ```

- **Linux 32-bit**
  ```
  gcc -m32 -I/usr/local/include(*1) -L/usr/local/lib(*1) -lodbc testproc.c -o testproc
  ```

- **Solaris 64-bit**
  ```
  cc -xarch=v9 -I/usr/local/include(*1) -L/usr/local/lib(*1) -lodbc testproc.c -o testproc
  ```

- **Solaris 32-bit**
  ```
  cc -I/usr/local/include(*1) -L/usr/local/lib(*1) -lodbc testproc.c -o testproc
  ```

*1: This is an example of building and installing from the source without specifying an installation directory for unixODBC. If you wish to specify a location, set the installation directory.
3.4.3 Creating Applications during Cluster Operations

This section explains points to consider when creating applications during cluster operations.

See

Refer to the Cluster Operation Guide for information on cluster operations.

3.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs during cluster operations, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access 57P01 08S01</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td>Access during system failure</td>
<td>08001</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access 57P01 08S01</td>
<td></td>
</tr>
<tr>
<td>Access during switch</td>
<td>08001</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of SQLSTATE.
Chapter 4 .NET Data Provider

This chapter describes how to configure for the purpose of creating .NET applications with Visual Studio.

4.1 Development Environment

.NET Data Provider can operate in the following environments:

<table>
<thead>
<tr>
<th>.NET Framework environment for the development and running of applications</th>
<th>.NET Framework 4.6</th>
</tr>
</thead>
<tbody>
<tr>
<td>.NET Framework 4.5</td>
<td></td>
</tr>
<tr>
<td>.NET Framework 4</td>
<td></td>
</tr>
<tr>
<td>.NET Framework 3.5 SP1 or later</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Integrated development environment for applications running in a .NET Framework environment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visual Studio 2015</td>
</tr>
<tr>
<td>Visual Studio 2013</td>
</tr>
<tr>
<td>Visual Studio 2012</td>
</tr>
<tr>
<td>Visual Studio 2010</td>
</tr>
<tr>
<td>Visual Studio 2008</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Combinations when TableAdapter is used</th>
<th>Visual Studio 2015</th>
<th>.NET Framework 4.6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visual Studio 2013</td>
<td>.NET Framework 4.5</td>
<td></td>
</tr>
<tr>
<td>Visual Studio 2012</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Visual Studio 2010</td>
<td>.NET Framework 4</td>
<td></td>
</tr>
<tr>
<td>Visual Studio 2008</td>
<td>.NET Framework 3.5 SP1 or later</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Available development languages</th>
</tr>
</thead>
<tbody>
<tr>
<td>C#</td>
</tr>
<tr>
<td>Visual Basic .NET</td>
</tr>
</tbody>
</table>

4.2 Setup

This section explains how to setup .NET Data Provider.

4.2.1 Setting Up .NET Data Provider

You need to make the .NET Data Provider available for use to create applications with Visual Studio.

Add the reference to Fujitsu Npgsql .NET Data Provider for each Visual Studio project using the procedure below. The following describes the setup procedure in Visual Studio 2010:

1. In a Windows application, select [Add Reference] from the [Project] menu.
   In a Web application, select [Add Reference] from the [Web Site] menu.
2. Select "Fujitsu Npgsql .NET Data Provider" in the [Component Name] column of the [.NET] tab, and then click [OK].

Point

There are two versions of "Fujitsu Npgsql .NET Data Provider". Decide the version of "Fujitsu Npgsql .NET Data Provider" to add according to the version of .NET Framework you will use. The notation "x.y.z" indicates the version and level of the FUJITSU Enterprise Postgres client feature.

<table>
<thead>
<tr>
<th>Version of .NET Data Provider</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.x.y.z</td>
<td>Specify when the version of .NET Framework is 3.5.SP1 or later.</td>
</tr>
<tr>
<td>Version of .NET Data Provider</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>4.x.y.z</td>
<td>Specify when the version of .NET Framework is 4.0 or later.</td>
</tr>
</tbody>
</table>

**Information**

When .NET Data Provider setup is complete, the following names will be displayed in [References] in Visual Studio Solution Explorer.

- Npgsql

**Example**

![References](image)

**4.2.2 Setting Up the Visual Studio Integration Add-On**

TableAdapter is available for use when you use Visual Studio integration. Visual Studio integration is provided as a Visual Studio .NET add-on ("Npgsql Development Tools for .NET").

A user with administrator privileges can register Npgsql Development Tools for .NET as an add-on by executing `pgx_ndtregister.exe` as administrator.

**Stored location of pgx_ndtregister.exe**

The `pgx_ndtregister.exe` command is stored in the following location:

`fujitsuEnterprisePostgresClientInstallDir\DOTNET\BIN\`

**Using pgx_ndtregister.exe**

```
> pgx_ndtregister.exe [-x86] [-x64]
```

**Options**

- `-x86`
  
  Use if registering a 32-bit add-on.

- `-x64`
  
  Use if registering a 64-bit add-on.

If no option is specified, a 32-bit add-on is registered.

**Note**

Execute this command after installing Visual Studio .NET.

**4.2.3 Message Language and Encoding System Used by Applications Settings**

If the .NET Data Provider is used, it will automatically set the encoding system on the client to UTF-8, so there is no need to configure this.
Refer to "Automatic Character Set Conversion Between Server and Client" in "Server Administration" in the PostgreSQL Documentation for information on encoding systems.

Language settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Example

Code example for changing the locale in a C# application

```csharp
```

4.3 Connecting to the Database

This section explains how to connect to a database.

- Using NpgsqlConnection
- Using NpgsqlConnectionStringBuilder
- Using the ProviderFactory Class

4.3.1 Using NpgsqlConnection

Connect to the database by specifying the connection string.

Example

Code examples for applications

```csharp
using Npgsql;

NpgsqlConnection conn = new NpgsqlConnection("Server=sv1;Port=27500;Database=mydb; User Id=myuser;Password=myuser01; Timeout=20;CommandTimeout=20;");
```

Refer to "4.3.4 Connection String" for information on database connection strings.

4.3.2 Using NpgsqlConnectionStringBuilder

Generate connection strings by specifying the connection information in the properties of the NpgsqlConnectionStringBuilder object.

Example

Code examples for applications

```csharp
using Npgsql;

NpgsqlConnectionStringBuilder sb = new NpgsqlConnectionStringBuilder();
```
sb.Host = "sv1";
sb.Port = 27500;
sb.Database = "mydb";
sb.UserName = "myuser";
sb.Password = "myuser01";
sb.Timeout = 20;
sb.CommandTimeout = 20;
NpgsqlConnection conn = new NpgsqlConnection(sb.ConnectionString);

Refer to "4.3.4 Connection String" for information on database connection strings.

4.3.3 Using the ProviderFactory Class

Obtain the NpgsqlConnection object from the provider factory.

Example

Code examples for applications

```csharp
using System.Data.Common;

DbProviderFactory factory = DbProviderFactories.GetFactory("FUJITSU.Npgsql");
DbConnection conn = factory.CreateConnection();
conn.ConnectionString = "Server=sv1;Port=27500;Database=mydb; User Id=myuser;Password=myuser01; Timeout=20;CommandTimeout=20;";
```

Refer to "4.3.4 Connection String" for information on database connection strings.

4.3.4 Connection String

Specify the following connection information to connect to the database.

```
Server=127.0.0.1;Port=27500;Database=mydb;User Id=myuser;Password=myuser01;...
```

(1) Specify the host name or IP address of the server to be connected. This must be specified.
(2) Specify the port number for the database server. The default is "27500".
(3) Specify the database name to be connected.
(4) Specify the user ID that will connect with the database.
(5) Specify the password for the user that will connect to the database.
(6) Refer to the following for information on how to specify other connection information.

The following shows the keywords that are available to specify in the connection string in .NET Data Provider (Npgsql):

Note that some settings require care if using an Oracle database-compatible feature (refer to "9.2.2 Notes when Integrating with the Interface for Application Development" for details).

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server, Host (*1)</td>
<td>None</td>
<td>Specify the host name or IP address of the server to be connected. Specify up to 63 bytes when specifying a host name. A host name or IP address must be specified.</td>
</tr>
<tr>
<td>Keyword</td>
<td>Default Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Port</td>
<td>27500</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td>User Id, User, UID, UserName, UserId (*1)</td>
<td>None</td>
<td>Specify the user ID that will connect with the database.</td>
</tr>
<tr>
<td>Password,Pwd,Psw (*1)</td>
<td>None</td>
<td>Specify the password for the user ID that will connect to the database.</td>
</tr>
<tr>
<td>Database, DB (*1)</td>
<td>User name</td>
<td>Specify the database name to be connected.</td>
</tr>
</tbody>
</table>
| SearchPath (*2) | | Specify the default schema name of the SQL statements used in the application.  
(*2): If omitted, the value set in the search_path parameter in postgresql.conf on the server will be used. |
| Timeout | 15 | Specify the timeout for connections.  
Specify a value between 0 and 1024 (in seconds). There is no limit if you specify 0. The default is 15 seconds. An error occurs when a connection cannot be established within the specified time. |
| ConnectionLifeTime | 15 | For specifying the retention time of the connection, starting from the time of connection to the server and including the period the connection is to be retained in the connection pool.  
Specify in the range between 0 and 2147483647 (in seconds).  
If “0” is specified, there will be no limit on the retention time. |
| Pooling | True | Specify whether to use connection pooling or not.  
- Connection pooling is used if you specify True.  
Connection pooling is not used if you specify False. |
| MaxPoolSize | 20 | Maximum size of a connection pool. If the request exceeds this limit, it will wait until the another connection closes and the pool is available.  
Specify in the range between 0 and 1024. Connection pooling is not used if you specify 0. |
| MinPoolSize | 1 | Minimum size of a connection pool. When you specify MinPoolSize, NpgsqlConnection will pre-allocate connections with the specified number of servers.  
Specify in the range from 0 to the value specified at MaxPoolSize.  
When you specify 0, NpgsqlConnection will not pre-allocate connections with the specified number of servers. |
| SSL | False | Specify whether to encrypt the communication route between the client and server with the SSL protocol.  
- Encryption is performed when True is specified.  
- Encryption is not performed when False is specified. |
| Sslmode | Disable | Specify one of the following values for the SSL connection control mode:  
- Prefer: SSL is used for connection wherever possible. |
### Keyword | Default value | Description
--- | --- | ---
| Require | - Require: An exception is thrown when SSL connection is not possible. - Allow: Not yet supported. Connection is performed without SSL. - Disable: SSL connection is not performed. | 
| Enlist | True | Specify whether to have connections participate in transactions with the transaction scope declared: - Connections will participate in transactions when True is specified. - Connections will not participate in transactions when False is specified. |
| CommandTimeout | 20 | Specify the timeout for communication with the server. Specify a value between 0 and 2147483647 (in seconds). There is no limit set if you set 0 or a negative value. The default is 20 seconds. An error occurs when data is not received from the server within the specified time. |
| Compatible | (*3) | Any effects from operational changes when performing future Npgsql version upgrades can be kept to a minimum by specifying the version of Npgsql that Fujitsu Npgsql .NET Data Provider is based on. Refer to the Installation and Setup Guide for Client for the version of Npgsql that Fujitsu Npgsql .NET Data Provider is based on. *3: If omitted, the version of Npgsql that Fujitsu Npgsql .NET Data Provider is based on will be set. |
| IntegratedSecurity | False | Set this when using Windows Integrated Security. |
| Protocol | 3 | Specify the protocol version to use. You must specify 3. |
| SyncNotification | False | Specify whether Npgsql will use synchronized notification. |
| Use Extended Types, UseExtendedTypes | False | This option determines how Npgsql data and time types are used by DataAdapter. Data and time types include the "System.DateTime" type of .NET and "NpgsqlTimestamp" ("NpgsqlTimestamp" has functionality and range that exceeds "System.DateTime"). Both can be used, whatever value is set. If the value set is "True", however, it is possible to pass a specific Npgsql type for the relevant field of DataAdapter. If the value set is "False", on the other hand, DataAdapter requests "System.DateTime". |
| PreloadReader, Preload Reader | False | If True is specified, the entire result set will be loaded to DataReader before ExecuteReader() returns. Performance may decline when "True" is set (especially noticeable when the recordset is large). According to ADO.NET documentation, other operations are not possible while IDbConnection is being used, as it is used to get IDataReader. Npgsql enforces this rule. While NpgsqlDataReader is open, most operations except for the NpgsqlDataReader on the NpgsqlConnection that is trying to get the NpgsqlConnection will return an InvalidOperationException. (If NpgsqlDataReader is called at the end of the resultset(s), then Npgsql relaxes the rules and allows use of the
connection even if it is not closed. This is because the connection is not being used by any resources at this point.)

*1: Only those keywords listed below can be used when using NpgsqlConnectionStringBuilder.
- Host
- UserName
- Password
- Database
- UseExtendedTypes
- PreloadReader

4.4 Application Development

This section explains the range of support provided with Visual Studio integration.

4.4.1 Data Types

A variety of data types can be used with FUJITSU Enterprise Postgres.

Data types belonging to base data types are supported whether you automatically generate applications using tools in Visual Studio (Query Builder in TableAdapter and Server Explorer), or create applications yourself (with DataProvider).

Table 4.1 List of supported data types

<table>
<thead>
<tr>
<th>Data Types</th>

<td>N</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Supported  
N: Not supported  
*1: When used as a dynamic parameter, only data values in the int32 range can be substituted.  
*2: As shown below, "time with time zone" and "time without time zone" values display the date portion as additional information. However, the actual data comprises the time data only, so with the exception of this displayed format, there are no other resulting issues.  
Example:  
Composition of table (t1)

<table>
<thead>
<tr>
<th>col1 (time with time zone)</th>
<th>col2 (time without time zone)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10:21:30 +08:00</td>
<td>10:21:30</td>
</tr>
<tr>
<td>23:34:03 +08:00</td>
<td>23:34:03</td>
</tr>
<tr>
<td>17:23:54 +08:00</td>
<td>17:23:54</td>
</tr>
</tbody>
</table>
"time with time zone" values display the execution date in the date portion, while "time without time zone" values display "0001/01/01" in the date portion.

```
SELECT * 
FROM t1;
<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
</tr>
</thead>
<tbody>
<tr>
<td>2014/09/03 10:21:30 +08:00</td>
<td>0001/01/01 10:21:30</td>
</tr>
<tr>
<td>2014/09/03 23:34:03 +08:00</td>
<td>0001/01/01 23:34:03</td>
</tr>
<tr>
<td>2014/09/03 17:23:54 +08:00</td>
<td>0001/01/01 17:23:54</td>
</tr>
</tbody>
</table>
```

*3: When updating a column of this data type, set the values as shown below.

The example here shows $c3$ being made the "time with time zone" data type.

```csharp
DataRow dr = ds.Tables[0].Rows[ds.Tables[0].Rows.Count - 1];
dr["c3"] = new DateTimeOffset(2000, 1, 1, 0, 0, 0, new TimeSpan(9, 0, 0));
```

*4: When used as a dynamic parameter, it is not possible to substitute parameter values in DataGridView automatically generated by DDEX.

*5: Only lengths of 2 or longer are supported.

*6: Only single hosts are supported.

### 4.4.2 Relationship between Application Data Types and Database Data Types

The data types available for SQL data types are as follows:

**List of data types belonging to base data types**

Data types belonging to these base data types are supported whether you automatically generate applications using tools in Visual Studio (Query Builder in TableAdapter and Server Explorer), or create applications yourself (with Data Provider).

<table>
<thead>
<tr>
<th>SQL data types</th>
<th>Npgsql</th>
<th>.NET CLS data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>character</td>
<td>NpgsqlDbType.Char</td>
<td>System.String</td>
</tr>
<tr>
<td>character varying</td>
<td>NpgsqlDbType.Varchar</td>
<td>System.String</td>
</tr>
<tr>
<td>national character</td>
<td>NpgsqlDbType.NChar</td>
<td>System.String</td>
</tr>
<tr>
<td>national character varying</td>
<td>NpgsqlDbType.NVarchar</td>
<td>System.String</td>
</tr>
<tr>
<td>text</td>
<td>NpgsqlDbType.Text</td>
<td>System.String</td>
</tr>
<tr>
<td>bytea</td>
<td>NpgsqlDbType.Bytea</td>
<td>System.Byte[]</td>
</tr>
<tr>
<td>smallint</td>
<td>NpgsqlDbType.Smallint</td>
<td>System.Int16</td>
</tr>
<tr>
<td>integer</td>
<td>NpgsqlDbType.Integer</td>
<td>System.Int32</td>
</tr>
<tr>
<td>bigint</td>
<td>NpgsqlDbType.Bigint</td>
<td>System.Int64</td>
</tr>
<tr>
<td>smallserial</td>
<td>NpgsqlDbType.Smallint</td>
<td>System.Int16</td>
</tr>
<tr>
<td>serial</td>
<td>NpgsqlDbType.Integer</td>
<td>System.Int32</td>
</tr>
<tr>
<td>bigserial</td>
<td>NpgsqlDbType.Bigint</td>
<td>System.Int64</td>
</tr>
<tr>
<td>real</td>
<td>NpgsqlDbType.Real</td>
<td>System.Single</td>
</tr>
<tr>
<td>double precision</td>
<td>NpgsqlDbType.Double</td>
<td>System.Double</td>
</tr>
<tr>
<td>numeric</td>
<td>NpgsqlDbType.Numeric</td>
<td>System.Decimal</td>
</tr>
<tr>
<td>decimal</td>
<td>NpgsqlDbType.Numeric</td>
<td>System.Decimal</td>
</tr>
<tr>
<td>SQL data types</td>
<td>Npgsql data type</td>
<td>.NET CLS data type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>date</td>
<td>NpgsqlDbType.Date</td>
<td>System.DateTime</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NpgsqlTypes.NpgsqlDate</td>
</tr>
<tr>

<td>NpgsqlDbType.TimeTZ</td>
<td>System.DateTimeOffset</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NpgsqlTypes.NpgsqlTimeTZ</td>
</tr>
<tr>
<td>time without time zone</td>
<td>NpgsqlDbType.Time</td>
<td>System.DateTime</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NpgsqlTypes.NpgsqlTime</td>
</tr>
<tr>
<td>timestamp without time zone</td>
<td>NpgsqlDbType.Timestamp</td>
<td>System.DateTime</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NpgsqlTypes.NpgsqlTimeStamp</td>
</tr>
<tr>
<td>timestamp with time zone</td>
<td>NpgsqlDbType.TimestampTZ</td>
<td>System.DateTime</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NpgsqlTypes.NpgsqlTimeStampTZ</td>
</tr>
<tr>
<td>interval</td>
<td>NpgsqlDbType.Interval</td>
<td>System.String/System.TimeSpan (+1)</td>
</tr>
<tr>
<td>boolean</td>
<td>NpgsqlDbType.Boolean</td>
<td>System.Boolean</td>
</tr>
<tr>
<td>bit</td>
<td>NpgsqlDbType.Bit</td>
<td>System.Boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NpgsqlTypes.BitString</td>
</tr>
<tr>
<td>uuid</td>
<td>NpgsqlDbType.Uuid</td>
<td>System.Guid</td>
</tr>
<tr>
<td>inet</td>
<td>NpgsqlDbType.Inet</td>
<td>NpgsqlTypes.NpgsqlInet</td>
</tr>
<tr>
<td></td>
<td></td>
<td>System.Net.IPAddress</td>
</tr>
<tr>
<td>macaddr</td>
<td>NpgsqlDbType.MacAddr</td>
<td>NpgsqlTypes.NpgsqlMacAddress</td>
</tr>
<tr>
<td></td>
<td></td>
<td>System.Net.NetworkInformation.PhysicalAddress</td>
</tr>
<tr>
<td>box</td>
<td>NpgsqlDbType.Box</td>
<td>NpgsqlTypes.NpgsqlBox</td>
</tr>
<tr>
<td>circle</td>
<td>NpgsqlDbType.Circle</td>
<td>NpgsqlTypes.NpgsqlCircle</td>
</tr>
<tr>
<td>lseg</td>
<td>NpgsqlDbType.LSeg</td>
<td>NpgsqlTypes.NpgsqlLSeg</td>
</tr>
<tr>
<td>path</td>
<td>NpgsqlDbType.Path</td>
<td>NpgsqlTypes.NpgsqlPath</td>
</tr>
<tr>
<td>point</td>
<td>NpgsqlDbType.Point</td>
<td>NpgsqlTypes.NpgsqlPoint</td>
</tr>
<tr>
<td>polygon</td>
<td>NpgsqlDbType.Polygon</td>
<td>NpgsqlTypes.NpgsqlPolygon</td>
</tr>
<tr>
<td>array</td>
<td>NpgsqlDbType.Array</td>
<td>System.Array</td>
</tr>
</tbody>
</table>

*1: The .NET CLS data types that can be used vary depending on the SQL interval type. If using interval year/interval month/interval year to month, use System.String. For other data types, use System.TimeSpan.

### 4.4.3 Creating Applications during Cluster Operations

This section explains points to consider when creating applications during cluster operations.

See

Refer to the Cluster Operation Guide for information on cluster operations.
4.4.3.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs during cluster operations, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access 57P01 (*1) Empty string (*1) NullReferenceException is generated</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td></td>
<td>Accessed during system failure Empty string (*1)</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access 57P01 (*1) Empty string (*1) NullReferenceException is generated</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accessed during switch Empty string (*1)</td>
<td></td>
</tr>
</tbody>
</table>

*1: This is the return value of the NpgsqlException attribute Code.

4.4.4 Notes

Notes on TableAdapter
- If [SELECT which returns a single value] is selected when adding a query to a TableAdapter, it will not be possible to execute the SQL statement displayed on the window - therefore, correct the SQL statement.
- If there is more than one Function with the same name, it will not be possible to create a TableAdapter using that Function.
- When defining Function, ensure that the OUT parameter is the last one defined. If the OUT parameter is not the last one defined, it will not be possible to enter any parameter values after the OUT parameter for the TableAdapter DataPreview.
  - Example incorrect definition: func(out p1 integer, inout p2 integer)
  - Example correct definition: func(inout p2 integer, out p1 integer)

Notes on the Query Builder
- Prefix named parameters with "@".
- Uppercase object names cannot be used, even when enclosed in double quotation marks. To use uppercase object names enclosed in double quotation marks, include them in SQL statements and enter these in the [Generate the SQL statements] window rather than in the Query Builder.
- SQL statements that specify date or time data literals cannot be used. To use these, enter the SQL statements directly in the [Generate the SQL statements] window rather than in the Query Builder.
- SQL statements cannot be correctly generated if the SQL statement specified in Filter matches any of the conditions below:
  - It uses PostgreSQL intrinsic operators such as << or ::.
- It uses functions with keywords such as AS, FROM, IN, OVER.
  Example: extract(field from timestamp), RANK( ) OVER
- It uses functions with the same names as those prescribed in SQL conventions, but that require different arguments.

**Notes on Server Explorer**
- The temporary table is not displayed.
- The database object function (FUNCTION) is displayed as a procedure.

**Notes on metadata**
- The CommandBehavior.KeyInfo argument must be specified if executing ExecuteReader before obtaining metadata using GetSchemaTable.

**Example**
```
NpgsqlDataReader ndr = cmd.ExecuteReader(CommandBehavior.KeyInfo);
DataTable dt = dr.GetSchemaTable();
```

**Notes on automatically generating update-type SQL statements**
- If the SQL statement includes a query (which cannot be updated) that matches any of the conditions below, an update-type SQL statement will be generated (note that it may not be possible to execute this SQL statement in some cases):
  - It includes derived tables
  - It includes the same column name as the select list

Update-type SQL statements will be automatically generated in the following cases:
- If update statements are obtained using NpgsqlCommandBuilder
- If data is updated using NpgsqlDataAdapter
- If data is updated using TableAdapter

**Notes on distributed transactions**
- Applications using transaction scope can use distributed transactions by linking with Microsoft Distributed Transaction Coordinator (MSDTC). In this case, note the following:
  - Ensure that the value of max_prepared_transactions is greater than max_connection, so that "PREPARE TRANSACTION" can be issued for each transaction that simultaneously connects to the database server.
  - If each transaction in the transaction scope accesses the same resource using different connections, the database server will perceive it as requests from different applications, and a deadlock may occur. By configuring a timeout value for the transaction scope beforehand, the deadlock can be broken.
Chapter 5 C Library (libpq)

This chapter describes how to use C libraries.

5.1 Development Environment

Install the FUJITSU Enterprise Postgres Client package for the architecture to be developed and executed.

See

Refer to Installation and Setup Guide for Client for information on the C compiler required for C application development.

5.2 Setup

This section describes the environment settings required to use C libraries and how to encrypt data for communication.

5.2.1 Environment Settings

To execute an application that uses libpq, set the environment variable as shown below.

Linux/Solaris

- Required for compile/link
  - LD_LIBRARY_PATH
    fujiEnterprisePostgresClientInstallDir/lib

- Required for execution of the application
  - PGLOCALEDIR
    fujiEnterprisePostgresClientInstallDir/share/locale

Note

Solaris

For 64-bit applications, set either LD_LIBRARY_PATH or LD_LIBRARY_PATH_64. If both are set, LD_LIBRARY_PATH_64 will be used.

Example

When the 32-bit version client package is installed.

Note that "<xy>" indicates the product version and level.

> LD_LIBRARY_PATH=/opt/fsepv<xy>client32/lib:$LD_LIBRARY_PATH;export LD_LIBRARY_PATH
> PGLOCALEDIR=/opt/fsepv<xy>client32/share/locale;export PGLOCALEDIR

Windows (R)

- Required for compile/link
  - LIB
    fujiEnterprisePostgresClientInstallDir\lib
  - INCLUDE
    fujiEnterprisePostgresClientInstallDir\include
Required for execution of the application

- PATH
  FujitsuEnterprisePostgresClientInstallDir\lib
- PGLOCALEDIR
  FujitsuEnterprisePostgresClientInstallDir\share\locale

Example

When the 32-bit version client package is installed on a 64-bit operating system.

Note that "<xy>" indicates the product version and level.

> SET PATH=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\lib;%PATH%
> SET LIB=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\lib;%LIB%
> SET INCLUDE=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\include;%INCLUDE%
> SET PGLOCALEDIR=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\share\locale

5.2.2 Message Language and Encoding System Used by Applications Settings

This section explains the language settings for the application runtime environment and the encoding settings for the application.

Language settings

You must match the language settings for the application runtime environment with the message locale settings of the database server.

Messages output by an application may include text from messages sent from the database server. In the resulting text, the text of the application message will use the message locale of the application, and the text of the message sent by the database server will use the message locale of the database server. If the message locales do not match, more than one language or encoding system will be used. Moreover, if the encoding systems do not match, characters in the resulting text can be garbled.

- Linux/Solaris

Set the locale for messages (LC_MESSAGES category) to match the message locale of the database server. This can be done in a few different ways, such as using environment variables. Refer to the relevant manual of the operating system for information on the setlocale function.

Example

Example of specifying "en_US.UTF-8" with the setlocale function

```plaintext
setlocale(LC_ALL,"en_US.UTF-8");
```

Specifying the locale of the LC_ALL category propagates the setting to LC_MESSAGE.

- Windows(R)

Align the locale of the operating system with the message locale of the database server.

Encoding System Settings

Ensure that the encoding system that is embedded in the application and passed to the database, and the encoding system setting of the runtime environment, are the same. The encoding system cannot be converted correctly on the database server.

Use one of the following methods to set the encoding system for the application:
- Set the PGCLIENTENCODING environment variable in the runtime environment.

- Set the client_encoding keyword in the connection string.

- Use the PQsetClientEncoding function.

See

Refer to "Supported Character Sets" in "Server Administration" in the PostgreSQL Documentation for information on the strings that represent the encoding system that can be set.

For example, when using "Unicode" and "8 bit", set the string "UTF8".

Note

Text may be garbled when outputting results to the command prompt. Review the font settings for the command prompt if this occurs.

5.2.3 Settings for Encrypting Communication Data

Set in one of the following ways when performing remote access using communication data encryption:

When setting from outside with environment variables

Specify "require", "verify-ca", or "verify-full" in the PGSSLMODE environment variable.

In addition, the parameters for the PGSSLROOTCERT and PGSSLCRL environment variables need to be set to prevent spoofing of the database server.

See

Refer to "Environment Variables" in "Client Interfaces" in the PostgreSQL Documentation for information on environment variables.

When specifying in the connection URI

Specify "require", "verify-ca", or "verify-full" in the "sslmode" parameter of the connection URI.

In addition, the parameters for the sslcert, sslkey, sslrootcert, and sslcrl need to be set to prevent spoofing of the database server.

See

Refer to "Secure TCP/IP Connections with SSL" in "Server Administration" in the PostgreSQL Documentation for information on encrypting communication data.

5.3 Connecting with the Database

Point

Use the connection service file to specify the connection destination. In the connection service file, a name (service name) is defined as a set, comprising information such as connection destination information and various types of tuning information set for connections. By using the service name defined in the connection service file when connecting to databases, it is no longer necessary to modify applications when the connection information changes.

Refer to "Client Interfaces", "The Connection Service File" in the PostgreSQL Documentation for details.
See

Refer to “Database Connection Control Functions” in “Client Interfaces” in the PostgreSQL Documentation.

In addition, refer to "6.3 Connecting with the Database" in “Embedded SQL in C” for information on connection string.

5.4 Application Development

See

Refer to "libpq - C Library" in “Client Interfaces” in the PostgreSQL Documentation for information on developing applications.

However, if you are using the C library, there are the following differences to the PostgreSQL C library (libpq).

5.4.1 Compiling Applications

Specify the following options when compiling applications:

- Linux/Solaris

Table 5.1 Include file and library path

<table>
<thead>
<tr>
<th>Option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>-I/fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>-L/fujitsuEnterprisePostgresClientInstallDir/lib</td>
</tr>
</tbody>
</table>

Table 5.2 C Library (libpq library)

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic library</td>
<td>libpq.so</td>
</tr>
<tr>
<td>Static library</td>
<td>libpq.a</td>
</tr>
</tbody>
</table>

Note

When creating a 64-bit application on Solaris, either -m64 or -xarch=v9 needs to be specified. When the compiler you are using is Oracle Solaris Studio 12.2 or later or Sun Studio 12, specify -m64. With Sun Studio 11, Sun Studio 10, or Sun Studio 9, specify -xarch=v9.

Solaris 64-bit:

Note that "<xy>" indicates the product version and level.

```
> cc -m64 -I/opt/fsepv<xy>client64/include -L/opt/fsepv<xy>client64/lib -lpq testproc.c -o testproc
```

Or

```
> cc -xarch=v9 -I/opt/fsepv<xy>client64/include -L/opt/fsepv<xy>client64/lib -lpq testproc.c -o testproc
```
If the include file and the library path have been set in the environment variable, there is no need to specify the options shown below for the compile.

<table>
<thead>
<tr>
<th>Option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td><code>fujitsuEnterprisePostgresClientInstallDir\include</code></td>
</tr>
<tr>
<td>Path of the library</td>
<td><code>fujitsuEnterprisePostgresClientInstallDir\lib</code></td>
</tr>
</tbody>
</table>

### Table 5.4 C Library (libpq library)

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library for links</td>
<td>libpq.lib</td>
</tr>
<tr>
<td>Dynamic library</td>
<td>libpq.dll</td>
</tr>
</tbody>
</table>

#### 5.4.2 Creating Applications during Cluster Operations

This section explains points to consider when creating applications during cluster operations.

See

Refer to the Cluster Operation Guide for information on cluster operations.

#### 5.4.2.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs during cluster operations, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or F U J I T S U Enterprise Postgres system failure</td>
<td>Failure occurs during access</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td></td>
<td>PGRES_FATAL_ERROR(*1)</td>
<td>57P01(*2) NULL(*2)</td>
</tr>
<tr>
<td></td>
<td>CONNECTION_BAD(*3)</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access</td>
<td>PGRES_FATAL_ERROR(*1) 57P01(*2) NULL(*2)</td>
</tr>
<tr>
<td></td>
<td>CONNECTION_BAD(*3)</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of PQresultStatus().

*2: Return value of PQresultErrorField() PG_DIAG_SQLSTATE.

*3: Return value of PQstatus().
Chapter 6 Embedded SQL in C

This chapter describes application development using embedded SQL in C.

6.1 Development Environment

Install the FUJITSU Enterprise Postgres Client package for the architecture to be developed and executed.

See

Refer to Installation and Setup Guide for Client for information on the C compiler required for C application development.

Note

C++ is not supported. Create a library by implementing embedded SQL in C, and call it from C++.

6.2 Setup

6.2.1 Environment Settings

When using embedded SQL in C, the same environment settings as when using the C library (libpq) are required. Refer to "5.2.1 Environment Settings" in "C Library (libpq)" for information on the environment settings for the library for C.

Additionally, set the following path for the precompiler ecpg:

- Linux/Solaris
  - fujitsuEnterprisePostgresClientInstallDir/bin
- Windows(R)
  - fujitsuEnterprisePostgresClientInstallDir\bin

6.2.2 Message Language and Encoding System Used by Applications Settings

The message language and the encoding System Settings Used by Applications settings are the same as when using the library for C.

However, in embedded SQL, the PQsetClientEncoding function cannot be used in the encoding system settings. In embedded SQL, use the SET command to specify the encoding system in client_encoding.

Refer to "5.2.2 Message Language and Encoding System Used by Applications Settings" in "C Library (libpq)" for information on the settings for the library for C.

6.2.3 Settings for Encrypting Communication Data

When encrypting the communication data, the same environment settings as when using the C library (libpq) are required. Refer to "5.2.3 Settings for Encrypting Communication Data" in "C Library (libpq)" for information on the environment settings for the C library.
6.3 Connecting with the Database

- It is recommended to use a connection service file to specify connection destinations. In the connection service file, a name (service name) is defined as a set, comprising information such as connection destination information and various types of tuning information set for connections. By using the service name defined in the connection service file when connecting to databases, it is no longer necessary to modify applications when the connection information changes. Refer to "The Connection Service File" in "Client Interfaces" in the PostgreSQL Documentation for information.

- If using a connection service file, perform either of the procedures below:
  - Set the service name as a string literal or host variable, as follows:
    
    tcp:postgresql://?service=my_service
  
  - Set the service name in the environment variable PGSERVICE, and use CONNECT TO DEFAULT

Use the CONNECT statement shown below to create a connection to the database server.

**Format**

```
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name];
```

target

Write in one of the following formats:

- dbname@host:port
- tcp:postgresql://host:port/dbname[?options]
- unix:postgresql://host[:port]/dbname[?options]  
  (Definition method when using the UNIX domain socket)
- SQL string literal containing one of the above formats
- Reference to a character variable containing one of the above formats
- DEFAULT

user-name

Write in one of the following formats:

- username
- username/password
- username IDENTIFIED BY password
- username USING password

**Description of the arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbname</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>host</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>port</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is “27500”.</td>
</tr>
<tr>
<td>connection-name</td>
<td>Specify connection names to identify connections when multiple connections are to be processed within a single program.</td>
</tr>
<tr>
<td>Argument</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>username</td>
<td>Specify the user that will connect with the database. If this is omitted, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>password</td>
<td>Specify a password when authentication is required.</td>
</tr>
<tr>
<td>options</td>
<td>Specify the following parameter when specifying a time for timeout. Connect parameters with &amp; when specifying more than one. The following shows the values specified for each parameter.</td>
</tr>
<tr>
<td></td>
<td>- connect_timeout</td>
</tr>
<tr>
<td></td>
<td>Specify the timeout for connections.</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 0 and 2147483647 (in seconds). There is no limit set if you set 0 or an invalid value. If &quot;1&quot; is specified, the behavior will be the same as when &quot;2&quot; was specified. An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>
<td></td>
<td>- keepalives</td>
</tr>
<tr>
<td></td>
<td>This enables keepalive.</td>
</tr>
<tr>
<td></td>
<td>Keepalive is disabled if 0 is specified. Keepalive is enabling when any other value is specified. The default is keepalive enabled. Keepalive causes an error to occur when it is determined that the connection with the database is disabled.</td>
</tr>
<tr>
<td></td>
<td>- keepalives_idle</td>
</tr>
<tr>
<td></td>
<td>Specify the time until the system starts sending keepalive messages when communication with the database is not being performed.</td>
</tr>
<tr>
<td></td>
<td>- Linux</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.</td>
</tr>
<tr>
<td></td>
<td>- Windows(R)</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 2147483647 (in seconds). 7200 will be set as default if a value outside this range is specified or if nothing is specified.</td>
</tr>
<tr>
<td></td>
<td>- Solaris</td>
</tr>
<tr>
<td></td>
<td>Cannot be specified.</td>
</tr>
<tr>
<td></td>
<td>- keepalives_interval</td>
</tr>
<tr>
<td></td>
<td>Specify the interval between resends when there is no response to keepalive messages.</td>
</tr>
<tr>
<td></td>
<td>- Linux</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.</td>
</tr>
<tr>
<td></td>
<td>- Windows(R)</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 2147483647 (in seconds). 1 will be set as default if a value outside this range is specified or if nothing is specified.</td>
</tr>
<tr>
<td></td>
<td>- Solaris</td>
</tr>
<tr>
<td></td>
<td>Cannot be specified.</td>
</tr>
<tr>
<td></td>
<td>- keepalives_count</td>
</tr>
<tr>
<td></td>
<td>Specify the number of resends for keepalive messages.</td>
</tr>
<tr>
<td></td>
<td>- Linux</td>
</tr>
<tr>
<td>Argument</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 127. The default value of the system is used if this is not specified.</td>
</tr>
<tr>
<td>Windows(R)</td>
<td>The system default value is used irrespective of what is specified for this parameter.</td>
</tr>
<tr>
<td>Solaris</td>
<td>Cannot be specified.</td>
</tr>
</tbody>
</table>

### Information

It is not possible to specify keepalives_idle, keepalives_interval, or keepalives_count in Solaris. However, the ndd command can be used to configure the following (this needs to be set considering the impact on the entire system):

- tcp_keepalive_interval
  - Interval (in milliseconds) between keepalive probes.

- tcp_ip_abort_interval
  - Retransmission timeout value for a TCP connection (in milliseconds).

In addition, the following can be configured in Solaris 11:

- tcp_keepalive_abort_interval
  - Default time threshold to abort a TCP connection after the keepalive probing mechanism has failed.

### Code examples for applications

```sql
EXEC SQL CONNECT TO tcp:postgresql://sv1:27500/mydb?
  connect_timeout=20&keepalives_idle=20&keepalives_interval=5&keepalives_count=2&keepalives_back
  1 USER myuser/myuser01;
```

### 6.4 Application Development

Refer to "ECPG - Embedded SQL in C" in "Client Interfaces" in the PostgreSQL Documentation for information on developing applications.

However, when using embedded SQL in C, there are the following differences to the embedded SQL (ECPG) in PostgreSQL C.

#### 6.4.1 Support for National Character Data Types

This section describes how to use the national character data types using the SQL embedded C preprocessor.

The following explains the C language variable types corresponding to the NCHAR type:

Specify the number of characters specified for the NCHAR type multiple by 4, plus 1 for the length of the host variable.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Host variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>NATIONAL CHARACTER(n)</td>
<td>NCHAR variable name [nx4+1]</td>
</tr>
<tr>
<td>NATIONAL CHARACTER VARYING(n)</td>
<td>NVARCHAR variable name [nx4+1]</td>
</tr>
</tbody>
</table>
See

Refer to "Handling Character Strings" in "Client Interfaces" in the PostgreSQL documentation for information on using character string types.

6.4.2 Compiling Applications

Append the extension "pgc" to the name of the source file for the embedded SQL in C.

When the pgc file is precompiled using the ecpg command, C source files will be created, so use the C compiler for the compile.

Precompiling example

```
ecpg testproc.pgc
```

If an optimizer hint block comment is specified for the SQL statement, specify the following option in the ecpg command:

```
--enable-hint
```

Enables the optimizer hint block comment (hereafter, referred to as the "hint clause"). If this option is not specified, the hint clause will be removed as a result of the ecpg precompile and be disabled.

The SQL statements that can be specified in the hint clause are SELECT, INSERT, UPDATE, and DELETE.

The locations in which the hint clause can be specified are immediately after one of the SELECT, INSERT, UPDATE, DELETE, or WITH keywords. A syntax error will occur if any other location is specified.

Example of specifying the hint clause

```
EXEC SQL SELECT /*+ IndexScan(prod_ix01) */ name_id INTO :name_id FROM prod WHERE id = 1;
```

Refer to "11.1.1 Optimizer Hints" for information on optimizer hints.

Note

Take the following points into account when using embedded SQL source files:

- Multibyte codes expressed in SJIS or UTF-16 cannot be included in statements or host variable declarations specified in EXEC SQL.
- Do not use UTF-8 with a byte order mark (BOM), because an error may occur during compilation if the BOM character is incorrectly recognized as the source code.
- Multibyte characters cannot be used in host variable names.
- It is not possible to use a TYPE name that contains multibyte characters, even though it can be defined.

Specify the following options when compiling a C application output with precompiling.

### Linux/Solaris

<table>
<thead>
<tr>
<th>Option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>-I/fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>-L/fujitsuEnterprisePostgresClientInstallDir/lib</td>
</tr>
</tbody>
</table>
Table 6.2 C Library

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic library</td>
<td>libecpg.so</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.so</td>
<td>When using the pgtypes library</td>
</tr>
<tr>
<td>Static library</td>
<td>libecpg.a</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.a</td>
<td>When using the pgtypes library</td>
</tr>
</tbody>
</table>

**Note**

When creating a 64-bit application on Solaris, either -m64 or -xarch=v9 needs to be specified. When the compiler you are using is Oracle Solaris Studio 12.2 or later or Sun Studio 12, specify -m64. With Sun Studio 11, Sun Studio10, or Sun Studio 9, specify -xarch=v9.

Solaris 64-bit:

Note that "<xy>" indicates the product version and level.

```plaintext
cc -m64 -I/opt/fsepv<xy>/client64/include -L/opt/fsepv<xy>/client64/lib -lecpg
testproc.c -o testproc
```

Or

```plaintext
cc -xarch=v9 -I/opt/fsepv<xy>/client64/include -L/opt/fsepv<xy>/client64/lib -lecpg
testproc.c -o testproc
```

Windows(R)

If the include file and the library path have been set in the environment variable, there is no need to specify the options shown below for the compile.

Table 6.3 Include file and library path

<table>
<thead>
<tr>
<th>Type of option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>fujitsuEnterprisePostgresClientInstallDir\include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>fujitsuEnterprisePostgresClientInstallDir\lib</td>
</tr>
</tbody>
</table>

Table 6.4 C Library

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library for links</td>
<td>libecpg.lib</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.lib</td>
<td>When using the pgtypes library</td>
</tr>
<tr>
<td>Dynamic library</td>
<td>libecpg.dll</td>
<td></td>
</tr>
<tr>
<td></td>
<td>libpgtypes.dll</td>
<td>When using the pgtypes library</td>
</tr>
</tbody>
</table>

**Note**

- The libecpg library in Windows(R) is created by "release" and "multithreaded" options. When using the ECPGdebug function included in this library, compile using the "release" and "multithreaded" flags in all programs that use this library. When you do this, use the "dynamic" flag if you are using libecpg.dll, and use the "static" flag if you are using libecpg.lib.

Refer to "Library Functions" in "Client Interfaces" in the PostgreSQL Documentation for information on the ECPGdebug function.
6.4.3 Bulk INSERT

Bulk INSERT can be used to input multiple rows of data into the table using a single ECPG statement that uses the newly introduced `FOR` clause.

This functionality allows the user to make use of the data stored in host array variables, resulting in 'C' client programs that are simpler and easier to maintain.

**Synopsis**

The syntax of the bulk INSERT statement is given below:

```
EXEC SQL [ AT conn ] [ FOR { numOfRows | ARRAY_SIZE } ]
    INSERT INTO tableName [ ( colName [, ...] ) ]
    {  VALUES ( { expr | DEFAULT } [, ...] ) [, ...] | query }
    [ RETURNING * | outputExpr [ AS outputName ] [, ...] ]
    INTO outputHostVar [ [ INDICATOR ] indicatorVar ] [, ...]
```

**FOR Clause**

Specify the insertion count using `numOfRows` or `ARRAY_SIZE` in the FOR clause. The FOR clause can be specified only in the INSERT statement, not in other update statements.

`numOfRows` and `ARRAY_SIZE`

Insertion processing will be executed only for the specified count. However, if the count is 1, it will be assumed that the FOR clause was omitted when the application is executed. In this case, proceed according to the INSERT specification in the PostgreSQL documentation.

Specify the FOR clause as an integer host variable or as a literal.

Specify `ARRAY_SIZE` to insert all elements of the array in the table. When specifying `ARRAY_SIZE`, specify at least one array in `expr`.

If two or more arrays were specified in `expr`, it will be assumed that `ARRAY_SIZE` is the minimum number of elements in the array.

`numOfRows` or `ARRAY_SIZE` must exceed the minimum number of elements in all arrays specified in `expr`, `outputHostVar`, and `indicatorVal`.

The following example shows how to specify the FOR clause.
```
int number_of_rows = 10;
int id[25];
char name[25][10];

EXEC SQL FOR :number_of_rows    /* will process 10 rows */
INSERT INTO prod (name, id) VALUES (:name, :id);

EXEC SQL FOR ARRAY_SIZE           /* will process 25 rows */
INSERT INTO prod (name, id) VALUES (:name, :id);
```

**expr**

Specify the value to be inserted in the table. Array host variables, host variable literals, strings, and pointer variables can be specified. Structure type arrays and pointer variable arrays cannot be specified.

Do not use pointer variables and ARRAY_SIZE at the same time. The reason for this is that the number of elements in the area represented by the pointer variable cannot be determined.

**query**

The number of rows returned by query must be 1. If two or more rows are returned, an error will occur. This cannot be used at the same time as ARRAY_SIZE.

**outputHostVar, indicatorVal**

These must be array host variables or pointer variables.

**Note**

- In bulk INSERT, subqueries cannot be specified using the WITH clause.
- If an error occurs, all bulk INSERT actions will be rolled back, therefore, no rows are inserted. However, if the RETURNING clause was used, and the error occurred while obtaining the rows after the insertion was successful, the insertion processing will not be rolled back.

**Error Messages**

Given below are the error messages that are output when bulk INSERT functionality is not used correctly.

**Invalid value for numOfRows**

ECPG error

invalid statement name "FOR value should be positive integer"

**Cause**

The value given for numOfRows is less than or equal to 0.

**Solution**

Specify a value that is more than or equal to 1 for numOfRows.

**Invalid input for ARRAY_SIZE**

ECPG error

invalid statement name "Host array variable is needed when using FOR ARRAY_SIZE"

**Cause**

A host array is not specified in the values clause when using the ARRAY_SIZE keyword.

**Solution**

At least one host array variable should be included in the values clause.
Too many rows from SELECT... INTO

ECPG error

SELECT...INTO returns too many rows

Cause

The number of rows returned by the 'SELECT ... INTO' query in the INSERT statement is more than one.

Solution

When the value of numOfRows is more than one, the maximum number of rows that can be returned by the 'SELECT ... INTO' query in the INSERT statement is one.

Limitations

The limitations when using bulk INSERT are given below.

- Array of structures should not be used as an input in the 'VALUES' clause. Attempted use will result in junk data being inserted into the table.
- Array of pointers should not be used as an input in the 'VALUES' clause. Attempted use will result in junk data being inserted into the table.
- ECPG supports the use of 'WITH' clause in single INSERT statements. 'WITH' clause cannot be used in bulk INSERT statements.
- ECPG does not calculate the size of the pointer variable. So when a pointer variable is used that includes multiple elements, numOfRows should be less than or equal to the number of elements in the pointer. Otherwise, junk data will be inserted into the table.

Samples

Given below are some sample usages of the bulk INSERT functionality.

Basic Bulk INSERT

```c
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:in_f1);
```

The number of rows to insert indicated by the FOR clause is 3, so the data in the first 3 elements of the host array variable are inserted into the table. The contents of the target table will be:

```
f1
----
1
2
3
(3 rows)
```

Also a host integer variable can be used to indicate the number of rows that will be inserted in FOR clause, which will produce the same result as above:

```c
int num = 3;
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR :num INSERT INTO target (f1) VALUES (:in_f1);
```

Inserting constant values

Constant values can also be bulk INSERTed into the table as follows:

```c
EXEC SQL FOR 3 INSERT INTO target (f1,f2) VALUES (DEFAULT,'hello');
```
Using ARRAY_SIZE

'FOR ARRAY_SIZE' can be used to insert the entire contents of a host array variable, without explicitly specifying the size, into the table.

```sql
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1) VALUES (:in_f1);
```

In the above example, four rows are inserted into the table.

**Note**

If there are multiple host array variables specified as input values, then the number of rows inserted is same as the smallest array size. The example given below demonstrates this usage.

```sql
int in_f1[4] = {1,2,3,4};
char in_f3[3][10] = {"one", "two", "three"};
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1,f3) VALUES (:in_f1,:in_f3);
```

In the above example, the array sizes are 3 and 4. Given that the smallest array size is 3, only three rows are inserted into the table. The table contents are given below.

<table>
<thead>
<tr>
<th>f1</th>
<th>f3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>one</td>
</tr>
<tr>
<td>2</td>
<td>two</td>
</tr>
<tr>
<td>3</td>
<td>three</td>
</tr>
</tbody>
</table>

(3 rows)

Using Pointers as Input

Pointers that contain multiple elements can be used in bulk INSERT.

```c
int *in_pf1 = NULL;
in_pf1 = (int*)malloc(4*sizeof(int));
in_pf1[0]=1;
in_pf1[1]=2;
in_pf1[2]=3;
in_pf1[3]=4;
...
EXEC SQL FOR 4 INSERT INTO target (f1) values (:in_pf1);
```

The above example will insert four rows into the target table.

Using SELECT query

When using bulk INSERT, the input values can be got from the results of a SELECT statement. For example,
EXEC SQL FOR 4 INSERT INTO target(f1) SELECT age FROM source WHERE name LIKE 'foo';

Assuming that the 'SELECT' query returns one row, the same row will be inserted into the target table four times.

---

**Note**

If the 'SELECT' query returns more than one row, the INSERT statement will throw an error.

EXEC SQL FOR 1 INSERT INTO target(f1) SELECT age FROM source;

In the above example, all the rows returned by the 'SELECT' statement will be inserted into the table. In this context '1' has the meaning of 'returned row equivalent'.

---

Using RETURNING clause

Bulk INSERT supports the same RETURNING clause syntax as normal INSERT. An example is given below.

```c
int out_f1[4];
int in_f1[4] = {1,2,3,4};
...
EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:in_f1) RETURNING f1 INTO :out_f1;
```

After the execution of the above INSERT statement, the 'out_f1' array will have 3 elements with the values of '1', '2' and '3'.

---

### 6.4.4 DECLARE STATEMENT

This section describes the DECLARE STATEMENT statement.

**Synopsis**

```sql
EXEC SQL [ AT connName] DECLARE statementName STATEMENT
```

**Description**

DECLARE STATEMENT declares SQL statement identifier. SQL statement identifier is associated with connection. DECLARE CURSOR with a SQL statement identifier can be written before PREPARE.

**Parameters**

- **connName**
  A database connection name established by the CONNECT command.

  If AT clause is omitted, a SQL statement identifier is associated with the DEFAULT connection.

- **statementName**
  An identifier for SQL statement identifier which is SQL identifier or host variable.

**Examples**

```sql
EXEC SQL CONNECT TO postgres AS con1
EXEC SQL AT con1 DECLARE sql_stmt STATEMENT
EXEC SQL DECLARE cursor_name CURSOR FOR sql_stmt
EXEC SQL PREPARE sql_stmt FROM :dyn_string
EXEC SQL OPEN cursor_name
EXEC SQL FETCH cursor_name INTO :column1
EXEC SQL CLOSE cursor_name
```
- An SQL statement with a SQL statement identifier must use a same connection as the connection that the SQL statement identifier is associated with.
- An SQL statement without a SQL statement identifier must not use AT clause.

### 6.4.5 Creating Applications during Cluster Operations

This section explains points to consider when creating applications during cluster operations.

---

#### 6.4.5.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs during cluster operations, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information ((^*1))</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access 57P01 57P02 YE000 26000 40001</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td></td>
<td>Accessed during node/system failure 08001</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access 57P01 57P02 YE000 26000 40001</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accessed during switch 08001</td>
<td></td>
</tr>
</tbody>
</table>

\(^*1\): Return value of SQLSTATE.

---

### 6.4.6 Notes

#### Notes on creating multithreaded applications

In embedded SQL in C, DISCONNECT ALL disconnects all connections within a process, and therefore it is not thread-safe in all operations that use connections. Do not use it in multithreaded applications.
Chapter 7 Embedded SQL in COBOL

This chapter describes application development using embedded SQL in COBOL.

7.1 Development Environment

Install the FUJITSU Enterprise Postgres Client package for the architecture to be developed and executed.

See

Refer to the Installation and Setup Guide for Client for information on the COBOL compiler required for COBOL application development.

7.2 Setup

7.2.1 Environment Settings

When using embedded SQL in COBOL, the same environment settings as when using the C library (libpq) are required. Refer to “5.2.1 Environment Settings” in “C Library (libpq)” for information on the environment settings for the library for C.

Additionally, set the following path for the precompiler ecobpg:

- **Linux/Solaris**
  ```plaintext
  fujitsuEnterprisePostgresClientInstallDir/bin
  ```

- **Windows(R)**
  ```plaintext
  fujitsuEnterprisePostgresClientInstallDir\bin
  ```

7.2.2 Message Language and Encoding System Used by Applications

The settings for the message language and the encoding system used by applications should be the same as those required when using the library for C.

However, in embedded SQL, the PQsetClientEncoding function cannot be used in the encoding system settings. In embedded SQL, use the SET command to specify the encoding system in client_encoding.

Refer to “5.2.2 Message Language and Encoding System Used by Applications Settings” in “C Library (libpq)” for information on the settings for the library for C.

7.2.3 Settings for Encrypting Communication Data

When encrypting the communication data, the same environment settings as when using the C library (libpq) are required.

Refer to “5.2.3 Settings for Encrypting Communication Data” in “C Library (libpq)” for information on the environment settings for the C library.

7.3 Connecting with the Database

Use the CONNECT statement shown below to create a connection to the database server.

**Format**

```sql
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name]END-EXEC.
```
target

Write in one of the following formats:
- dbname@host:port
- tcp:postgresql://host:port/dbname[?options]
- unix:postgresql://host[:port][/dbname][?options]
  (Definition method when using the UNIX domain socket)
- SQL string literal containing one of the above formats
- Reference to a character variable containing one of the above formats
- DEFAULT

user-name

Write in one of the following formats:
- username
- username/password
- username IDENTIFIED BY password
- username USING password

Description of the arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbname</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>host</td>
<td>Specify the host name for the connection destination.</td>
</tr>
<tr>
<td>port</td>
<td>Specify the port number for the database server.</td>
</tr>
<tr>
<td></td>
<td>The default is &quot;27500&quot;.</td>
</tr>
<tr>
<td>connection-name</td>
<td>Specify connection names to identify connections when multiple connections are to be processed within a single program.</td>
</tr>
<tr>
<td>username</td>
<td>Specify the user that will connect with the database.</td>
</tr>
<tr>
<td></td>
<td>If this is omitted, the name used will be that of the user on the operating system that is executing the application.</td>
</tr>
<tr>
<td>password</td>
<td>Specify a password when authentication is required.</td>
</tr>
<tr>
<td>options</td>
<td>Specify the following parameter when specifying a time for timeout. Connect parameters with &amp; when specifying more than one. The following shows the values specified for each parameter.</td>
</tr>
<tr>
<td></td>
<td>- connect_timeout</td>
</tr>
<tr>
<td></td>
<td>Specify the timeout for connections.</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 0 and 2147483647 (in seconds). There is no limit set if you set 0 or an invalid value. If &quot;1&quot; is specified, the behavior will be the same as when &quot;2&quot; was specified. An error occurs when a connection cannot be established within the specified time.</td>
</tr>
<tr>

<tr>
<td></td>
<td>Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.</td>
</tr>
<tr>
<td></td>
<td>- Windows(R)</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 2147483647 (in seconds). 7200 will be set as default if a value outside this range is specified or if nothing is specified.</td>
</tr>
<tr>
<td></td>
<td>- Solaris</td>
</tr>
<tr>
<td></td>
<td>Cannot be specified.</td>
</tr>
<tr>
<td>- keepalives_interval</td>
<td>Specify the interval between resends when there is no response to keepalive messages.</td>
</tr>
<tr>
<td></td>
<td>- Linux</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 32767 (in seconds). The default value of the system is used if this is not specified.</td>
</tr>
<tr>
<td></td>
<td>- Windows(R)</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 2147483647 (in seconds). 1 will be set as default if a value outside this range is specified or if nothing is specified.</td>
</tr>
<tr>
<td></td>
<td>- Solaris</td>
</tr>
<tr>
<td></td>
<td>Cannot be specified.</td>
</tr>
<tr>
<td>- keepalives_count</td>
<td>Specify the number of resends for keepalive messages.</td>
</tr>
<tr>
<td></td>
<td>- Linux</td>
</tr>
<tr>
<td></td>
<td>Specify a value between 1 and 127. The default value of the system is used if this is not specified.</td>
</tr>
<tr>
<td></td>
<td>- Windows(R)</td>
</tr>
<tr>
<td></td>
<td>The system default value is used irrespective of what is specified for this parameter.</td>
</tr>
<tr>
<td></td>
<td>- Solaris</td>
</tr>
<tr>
<td></td>
<td>Cannot be specified.</td>
</tr>
</tbody>
</table>

See

It is not possible to specify keepalives_idle, keepalives_interval, or keepalives_count in Solaris. However, the ndd command can be used to configure the following (this needs to be set considering the impact on the entire system):

- tcp_keepalive_interval
  
  Interval (in milliseconds) between keepalive probes.

- tcp_ip_abort_interval
  
  Retransmission timeout value for a TCP connection (in milliseconds).

In addition, the following can be configured in Solaris 11:
- tcp_keepalive_abort_interval

Default time threshold to abort a TCP connection after the keepalive probing mechanism has failed.

**Code examples for applications**

```sql
EXEC SQL CONNECT TO tcp:postgresql://sv1:27500/mydb?
    connect_timeout=20&keepalives_idle=20&keepalives_interval=5&keepalives_count=2&keepalives=1
USER myuser/myuser01 END-EXEC.
```

### 7.4 Application Development

Refer to “Appendix D ECOBPG - Embedded SQL in COBOL” for information on developing applications.

#### 7.4.1 Support for National Character Data Types

This section describes how to use the national character data types using the SQL embedded COBOL preprocessor.

The table below lists the COBOL variable types supporting the national character data types. The number of characters specified for the national character data type must be specified for the length of the host variable.

<table>
<thead>
<tr>
<th>National character data type</th>
<th>COBOL variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARACTER(n)</td>
<td>varName PIC N(n)</td>
</tr>
<tr>
<td>NATIONAL CHARACTER(n)</td>
<td></td>
</tr>
<tr>
<td>CHARACTER VARYING(n)</td>
<td>varName PIC N(n) VARYING</td>
</tr>
<tr>
<td>NATIONAL CHARACTER VARYING(n)</td>
<td></td>
</tr>
</tbody>
</table>

To use COBOL variable types that support national character data types, it is necessary to specify the ECOBPG_NCHAR environment variable.

- **Linux/Windows(R):**
  
  ECOBPG_NCHAR={ UTF16LE | UTF16BE | UTF32LE | UTF32BE | SJIS }

- **Solaris:**

  ECOBPG_NCHAR={ UTF16LE | UTF16BE | UTF32LE | UTF32BE | SJIS | COBOL_EUC }

In SQL embedded COBOL, specify the encoding of the COBOL variable types that support national character data types.

- UTF16LE: UTF-16 little-endian
- UTF16BE: UTF-16 big-endian
- UTF32LE: UTF-32 little-endian
- UTF32BE: UTF-32 big-endian
- SJIS: Shift JIS
- **COBOL_EUC:** NetCOBOL-proprietary 16-bit wide character

If this environment variable is omitted, the encoding will be determined according to the encoding system of the client.

- If UTF8 is used: UTF16 (endians will be encoded in accordance with endians of the client system)
- If SJIS is used: SJIS
- If EUC_JP is used: COBOL_EUC
**Note**

If COBOL_EUC is specified for the ECOBPG_NCHAR environment variable, the client encoding system requires EUC_JP.

If encoding is specified for the translation option when compiling with NetCOBOL, the encoding specified for the national character data types should be used for the environment variable ECOBPG_NCHAR.

The list below shows NetCOBOL translation options and their corresponding environment variable ECOBPG_NCHAR values.

<table>
<thead>
<tr>
<th>NetCOBOL translation options</th>
<th>Environment variable ECOBPG_NCHAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCODE (UTF-8,UTF16,LE) RCS (UTF-16,LE)</td>
<td>UTF-16LE</td>
</tr>
<tr>
<td>ENCODE (UTF-8,UTF-16,BE) RCS (UTF-16,BE)</td>
<td>UTF-16BE</td>
</tr>
<tr>
<td>ENCODE (UTF-8,UTF-32,LE)</td>
<td>UTF-32LE</td>
</tr>
<tr>
<td>ENCODE (UTF-8,UTF-32,BE)</td>
<td>UTF-32BE</td>
</tr>
<tr>
<td>ENCODE (SJIS,SJIS)</td>
<td>SJIS</td>
</tr>
<tr>
<td>Not specified</td>
<td>No need to specify</td>
</tr>
</tbody>
</table>

When compiling with NetCOBOL and when executing applications, ensure that the environment variable ECOBPG_NCHAR is set to the national character data type encoding supported by the language specified in the environment variable LANG.

The list below shows the values of the environment variable LANG and their corresponding environment variable ECOBPG_NCHAR values.

<table>
<thead>
<tr>
<th>Environment variable LANG</th>
<th>Environment variable ECOBPG_NCHAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>ja_JP.eucJP</td>
<td>COBOL_EUC</td>
</tr>
<tr>
<td>ja_JP.UTF-8</td>
<td>UTF16BE</td>
</tr>
<tr>
<td>ja_JP.PCK</td>
<td>SJIS</td>
</tr>
</tbody>
</table>

Also, if the post-compiling encoding for an application differs from the locale of the execution environment, then the client encoding must be used for the application.

The list below shows the values supported for the combinations of application encoding, locale of the execution environment, and client encodings.

<table>
<thead>
<tr>
<th>Application encoding</th>
<th>Locale used when executing an application</th>
<th>Client encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTF-8</td>
<td>UTF-8</td>
<td>UTF-8</td>
</tr>
<tr>
<td></td>
<td>SJIS</td>
<td>UTF-8</td>
</tr>
<tr>
<td>SJIS</td>
<td>UTF-8</td>
<td>SJIS</td>
</tr>
<tr>
<td></td>
<td>SJIS</td>
<td>SJIS</td>
</tr>
</tbody>
</table>

Solaris
Refer to "7.2.2 Message Language and Encoding System Used by Applications" for information on how to set client encoding systems.

The following example shows host variable declaration of a national character data type.

```
01 DATA1 PIC N(10).
01 DATA2 PIC N(10) VARYING.
```

**Note**

- Halfwidth characters should not be used for the national character data type COBOL variable.
- The national character data type column attribute obtained by applications should be the CHAR type.
- Encoding cannot be specified using the ENCODING clause, which is a feature of NetCOBOL.

### 7.4.2 Compiling Applications

Append the extension "pco" to the name of the source file for the embedded SQL in COBOL.

When the pco file is precompiled using the ecobpg command, COBOL source files will be created, so use the COBOL compiler for the compile.

**Precompiling example**

```
ecobpg testproc.pco
```

For COBOL code notation, "fixed" or "variable" format can be specified as an ecobpg command option. If not specified, "fixed" format is used.

Refer to "D.1 Precautions when Using Functions and Operators" and "D.12.1 ecobpg" for information on COBOL code notation and how to specify options for ecobpg.

If an optimizer hint block comment is specified for the SQL statement, specify the following option in the ecobpg command:

```
--enable-hint
```

Enables the optimizer hint block comment (hereafter, referred to as the "hint clause"). If this option is not specified, the hint clause will be removed as a result of the ecobpg precompile and be disabled.

The SQL statements that can be specified in the hint clause are SELECT, INSERT, UPDATE, and DELETE.

The locations in which the hint clause can be specified are immediately after one of the SELECT, INSERT, UPDATE, DELETE, or WITH keywords. A syntax error will occur if it is specified in any other location.

**Example of specifying the hint clause**

```
EXEC SQL SELECT /*+ IndexScan(prod ix01) */ name_id INTO :name_id FROM prod WHERE id = 1 END-EXEC.
```

Refer to "11.1.1 Optimizer Hints" for information on optimizer hints.

If the encoding used for embedded SQL source files differs from that of the locale when precompiling was executed, set the encoding for the embedded SQL source files by specifying the following option for ecobpg.

<table>
<thead>
<tr>
<th>Application encoding</th>
<th>Locale used when executing an application</th>
<th>Client encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTF8</td>
<td>UTF8</td>
<td>UTF8</td>
</tr>
<tr>
<td>SJIS</td>
<td>SJIS</td>
<td>SJIS</td>
</tr>
<tr>
<td>EUC</td>
<td>EUC</td>
<td>EUC_JP</td>
</tr>
</tbody>
</table>
Specify "UTF8", "SJIS", or "EUC_JP".
If this option is omitted, the encoding is processed based on the locale.

Specify the following options when compiling a COBOL application output with precompiling.

Table 7.1 Include file and library path

<table>
<thead>
<tr>
<th>Option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>-I/fujitsuEnterprisePostgresClientInstallDir/include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>-L/fujitsuEnterprisePostgresClientInstallDir/lib</td>
</tr>
</tbody>
</table>

Table 7.2 COBOL Library

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic library</td>
<td>libecpg.so</td>
</tr>
<tr>
<td>Static library</td>
<td>libecpg.a</td>
</tr>
</tbody>
</table>

Example

Each example below compiles an application and dynamically links it to a COBOL library.

Note that "<xy>" indicates the product version and level.

- Linux 64-bit application:

  ```bash
  cobol -M -o testproc -I/opt/fsepv<xy>client64/include -L/opt/fsepv<xy>client64/lib
  -lecpg testproc.cob
  ```

- Linux 32-bit application:

  ```bash
  cobol -M -o testproc -I/opt/fsepv<xy>client32/include -L/opt/fsepv<xy>client32/lib
  -lecpg testproc.cob
  ```

- Solaris 64-bit application:

  ```bash
  cobol -M -o testproc -I/opt/fsepv<xy>client64/include -L/opt/fsepv<xy>client64/lib
  -lecpg testproc.cob
  ```

- Solaris 32-bit application:

  ```bash
  cobol -M -o testproc -I/opt/fsepv<xy>client32/include -L/opt/fsepv<xy>client32/lib
  -lecpg testproc.cob
  ```

Windows(R)

If the include file and the library path have been set in the environment variable, there is no need to specify the options shown below for the compile.

Table 7.3 Include file and library path

<table>
<thead>
<tr>
<th>Option</th>
<th>How to specify the option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path of the include file</td>
<td>fujitsuEnterprisePostgresClientInstallDir\include</td>
</tr>
<tr>
<td>Path of the library</td>
<td>fujitsuEnterprisePostgresClientInstallDir\lib</td>
</tr>
</tbody>
</table>
Table 7.4 COBOL Library

<table>
<thead>
<tr>
<th>Type of library</th>
<th>Library name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library for links</td>
<td>libcpg.lib</td>
</tr>
<tr>
<td>Dynamic library</td>
<td>libcpg.dll</td>
</tr>
</tbody>
</table>

Example

Each example below compiles an application and dynamically links it to a COBOL library (a 64-bit operating system is used in each example)

Note that "<xy>" indicates the product version and level.

- 64-bit application:

```plaintext
> SET LIB=%ProgramFiles%\Fujitsu\fsepv<xy>\client64\lib;%LIB%
> SET INCLUDE=%ProgramFiles%\Fujitsu\fsepv<xy>\client64\include;%INCLUDE%
> cobol -I "%ProgramFiles%\Fujitsu\fsepv<xy>\client64\include" -M testproc.cob
> link testproc.obj F4AGCIMP.LIB LIBCMT.LIB LIBECPG.Lib /OUT:testproc.exe
```

- 32-bit application:

[NetCOBOL V10.5 or earlier]

```plaintext
> SET LIB=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\lib;%LIB%
> SET INCLUDE=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\include;%INCLUDE%
> cobol32 -I "%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\include" -M testproc.cob
> link testproc.obj LIBC.Lib F3BICIMP.Lib LIBECPG.Lib /OUT:testproc.exe
```

[NetCOBOL V11.0 or later]

```plaintext
> SET LIB=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\lib;%LIB%
> SET INCLUDE=%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\include;%INCLUDE%
> cobol32 -I "%ProgramFiles(x86)%\Fujitsu\fsepv<xy>\client32\include" -M testproc.cob
> link testproc.obj MSVCRT.Lib F3BICIMP.Lib LIBECPG.Lib /OUT:testproc.exe
```

7.4.3 Bulk INSERT

Bulk INSERT is a feature that inserts multiple rows of data in embedded SQL (ECOBPG) in bulk.

By specifying the array host variable that stored the data in the VALUES clause of the INSERT statement, the data for each element in the array can be inserted in bulk. This feature is used by specifying the insertion count in the FOR clause immediately before the INSERT statement.

Synopsis

```plaintext
EXEC SQL [ AT conn ] [ FOR {numOfRows|ARRAY_SIZE}]

    INSERT INTO tableName [ ( colName [, ...] ) ]

    { VALUES ( ( expr | DEFAULT ) [, ...] ) [, ...] | query }

    [ RETURNING * | outputExpr [ [ AS ] outputName ] [, ...] ]

    INTO outputHostVar [ [ INDICATOR ] indicatorVar ] [, ...] END-EXEC
```
FOR Clause

Specify the insertion count using `numOfRows` or `ARRAY_SIZE` in the FOR clause. The FOR clause can be specified only in the INSERT statement, not in other update statements.

`numOfRows` and `ARRAY_SIZE`

Insertion processing will be executed only for the specified count. However, if the count is 1, it will be assumed that the FOR clause was omitted when the application is executed. In this case, proceed according to the INSERT specification in the PostgreSQL documentation.

Specify the FOR clause as an integer host variable or as a literal.

Specify `ARRAY_SIZE` to insert all elements of the array in the table. When specifying `ARRAY_SIZE`, specify at least one array in `expr`.

If two or more arrays were specified in `expr`, it will be assumed that `ARRAY_SIZE` is the minimum number of elements in the array.

`numOfRows` or `ARRAY_SIZE` must exceed the minimum number of elements in all arrays specified in `expr`, `outputHostVar`, and `indicatorVal`.

The following example shows how to specify the FOR clause.

```sql
01 NUMBER-OF-ROWS PIC S9(9) COMP VALUE 10.
01 GROUP-ITEM.
  05 ID1 PIC S9(9) OCCURS 25.
  05 NAME PIC X(10) OCCURS 25.
* will process 10 rows
EXEC SQL FOR :NUMBER-OF-ROWS
  INSERT INTO prod (name, id) VALUES (:NAME, :ID1) END-EXEC
* will process 25 rows
EXEC SQL FOR ARRAY_SIZE
  INSERT INTO prod (name, id) VALUES (:NAME, :ID1) END-EXEC
```

`expr`

Specify the value to be inserted in the table. Array host variables, host variable literals, strings, and pointer variables can be specified. Structure type arrays and pointer variable arrays cannot be specified.

Do not use pointer variables and `ARRAY_SIZE` at the same time. The reason for this is that the number of elements in the area represented by the pointer variable cannot be determined.

`query`

The number of rows returned by `query` must be 1. If two or more rows are returned, an error will occur. This cannot be used at the same time as `ARRAY_SIZE`.

`outputHostVar` and `indicatorVal`

These must be array host variables or pointer variables.

**Note**

In bulk INSERT, subqueries cannot be specified using the WITH clause.

If an error occurs, all bulk INSERT actions will be rolled back, therefore, no rows are inserted. However, if the RETURNING clause was used, and the error occurred while obtaining the rows after the insertion was successful, the insertion processing will not be rolled back.

**Error Messages**

The messages below are output if an error occurs when the bulk INSERT is used.
Invalid value for `numOfRows`

**Error Messages**

The value for the FOR clause must be a positive integer.

**Cause**

The value given for `numOfRows` is less than or equal to 0.

**Solution**

Specify a value that is more than or equal to 1 for `numOfRows`.

Invalid input for `ARRAY_SIZE`

**Error Messages**

Array host variable is needed when using FOR `ARRAY_SIZE`.

**Cause**

An array host variable is not specified in the VALUES clause.

**Solution**

Specify more than one array host variable in the VALUES clause.

Too many rows from SELECT... INTO

**Error Messages**

The SELECT..INTO query returned too many rows in row number %d.

**Cause**

The "SELECT ... INTO" query in the INSERT statement returned more than one row.

**Solution**

If `numOfRows` is more than one, the maximum number of rows that can be returned in the "SELECT ... INTO" query in the INSERT statement is one.

**Limitations**

The limitations when using bulk INSERT are given below.

- Array of structures should not be used as an input in the 'VALUES' clause.
- Array of pointers should not be used as an input in the 'VALUES' clause.
- ECOBPG supports the use of 'WITH' clause in single INSERT statements. 'WITH' clause cannot be used in bulk INSERT statements.

**Samples**

Given below are some sample usages of the bulk INSERT functionality.

**Basic Bulk INSERT**

```plaintext
01 GROUP-ITEM.
  05 IN-F1 PIC 9(9) OCCURS 4.
  MOVE 1 TO IN-F1(1)
  MOVE 2 TO IN-F1(2)
  MOVE 3 TO IN-F1(3)
  MOVE 4 TO IN-F1(4)
  ...
  EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:IN-F1) END-EXEC
```

The number of rows to insert indicated by the FOR clause is 3, so the data in the first 3 elements of the host array variable are inserted into the table. The contents of the target table will be:
Also a host integer variable can be used to indicate the number of rows that will be inserted in FOR clause, which will produce the same result as above:

```
01 NUM PIC S9(9) COMP VALUE 3.
01 GROUP-ITEM.
05 IN-F1 PIC S9(9) OCCURS 4.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
MOVE 4 TO IN-F1(4)
...
EXEC SQL FOR :NUM INSERT INTO target (f1) VALUES (:IN-F1) END-EXEC
```

Inserting constant values

Constant values can also be bulk INSERTed into the table as follows:

```
EXEC SQL FOR 3 INSERT INTO target (f1,f2) VALUES (DEFAULT,'hello') END-EXEC
```

Assuming the 'DEFAULT' value for the 'f1' column is '0', the contents of the target table will be:

```
f1 | f2
---+-------
0  | hello
0  | hello
0  | hello
(3 rows)
```

Using ARRAY_SIZE

'FOR ARRAY_SIZE' can be used to insert the entire contents of a host array variable, without explicitly specifying the size, into the table.

```
01 GROUP-ITEM.
05 IN-F1 PIC S9(9) OCCURS 4.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
MOVE 4 TO IN-F1(4)
...
EXEC SQL FOR ARRAY_SIZE INSERT INTO target (f1) VALUES (:IN-F1) END-EXEC
```

**Note**

If there are multiple host array variables specified as input values, then the number of rows inserted is same as the smallest array size. The example given below demonstrates this usage.

```
01 GROUP-ITEM.
05 IN-F1 PIC S9(9) OCCURS 4.
05 IN-F3 PIC X(10) OCCURS 3.
MOVE 1 TO IN-F1(1)
MOVE 2 TO IN-F1(2)
MOVE 3 TO IN-F1(3)
```

- 74 -
In the above example, the array sizes are 3 and 4. Given that the smallest array size is 3, only three rows are inserted into the table. The table contents are given below.

<table>
<thead>
<tr>
<th>f1</th>
<th>f3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>one</td>
</tr>
<tr>
<td>2</td>
<td>two</td>
</tr>
<tr>
<td>3</td>
<td>three</td>
</tr>
</tbody>
</table>

Using SELECT query

The result of a SELECT query can be used to insert values.

```sql
EXEC SQL FOR 4 INSERT INTO target(f1) SELECT age FROM source WHERE name LIKE 'foo' END-EXEC
```

In the example above, assuming that the SELECT query returns one row, the same row will be inserted into the table four times.

**Note**

If "2" or more is specified for the FOR clause, the INSERT statement returns an error when two or more rows of query results are returned.

If "1" is specified for the FOR clause, all rows returned by the SELECT query will be inserted into the table.

```sql
EXEC SQL FOR 1 INSERT INTO target(f1) SELECT age FROM source END-EXEC
```

In the example above, "1" specified for the FOR clause indicates all returned rows.

Using RETURNING clause

Bulk INSERT supports the same RETURNING clause syntax as normal INSERT. An example is given below.

```sql
EXEC SQL FOR 3 INSERT INTO target (f1) VALUES (:IN-F1) RETURNING f1 INTO :OUT-F1 END-EXEC
```

After the execution of the above INSERT statement, the 'out_f1' array will have 3 elements with the values of '1', '2' and '3'.

7.4.4 DECLARE STATEMENT

Refer to "6.4.4 DECLARE STATEMENT" in "Embedded SQL in C".
7.4.5 Creating Applications during Cluster Operations

This section explains points to consider when creating applications during cluster operations.

See

Refer to the Cluster Operation Guide for information on cluster operations.

7.4.5.1 Errors when an Application Connection Switch Occurs and Corresponding Actions

If an application connection switch occurs during cluster operations, explicitly close the connection and then reestablish the connection or reexecute the application.

The table below shows errors that may occur during a switch, and the corresponding action to take.

<table>
<thead>
<tr>
<th>State</th>
<th>Error information (*1)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server failure or FUJITSU Enterprise Postgres system failure</td>
<td>Failure occurs during access 57P01 57P02 YE000 26000 40001</td>
<td>After the switch is complete, reestablish the connection, or reexecute the application.</td>
</tr>
<tr>
<td></td>
<td>Accessed during system failure 08001</td>
<td></td>
</tr>
<tr>
<td>Switch to the standby server</td>
<td>Switched during access 57P01 57P02 YE000 26000 40001</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accessed during switch 08001</td>
<td></td>
</tr>
</tbody>
</table>

*1: Return value of SQLSTATE.
Chapter 8 SQL References

This chapter explains the SQL statement features expanded by FUJITSU Enterprise Postgres.

8.1 Expanded Trigger Definition Feature

This section explains the expanded trigger definition feature.

8.1.1 CREATE TRIGGER

In addition to features of PostgreSQL, triggers can be created with OR REPLACE option and DO option.

Synopsis

```
CREATE [ OR REPLACE ] [ CONSTRAINT ] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [ OR ... ] }
ON table_name
[ FROM referenced_table_name ]
( NOT DEFERRABLE | [ DEFERRABLE ] { INITIALLY IMMEDIATE | INITIALLY DEFERRED } )
[ FOR [ EACH ] { ROW | STATEMENT } ]
[ WHEN ( condition ) ]
( EXECUTE PROCEDURE function_name ( arguments ) | DO [ LANGUAGE lang_name ] code )
```

Description

Refer to the PostgreSQL Documentation for information about CREATE TRIGGER. This section describes OR REPLACE option and DO option.

A trigger which is created with OR REPLACE option and DO option will be associated with the specified table or view and will execute the specified code by the specified procedural language of DO (unnamed code block) when certain events occur.

Parameters

**OR REPLACE**

- If the specified trigger is not defined in the table, it defines a new trigger.
- If the specified trigger is already defined in the table, the named trigger replaces existing trigger.

**code**

- When the certain events occur, it executes the code in a specified procedural language. The unnamed code block does not require a prior definition like a function. Syntax is same as procedural language.

**lang_name**

- The name of the language that the function is implemented in. Can be SQL, C, internal, or the name of a user-defined procedural language. The default is 'plpgsql'.

plpgsql is supported in CREATE TRIGGER.

Note

- A normal trigger cannot be replaced by a constraint trigger.
- A constraint trigger cannot be replaced by a normal trigger.
- A trigger defined with DO option cannot be replaced by a trigger defined with EXECUTE PROCEDURE option.
- A trigger defined with EXECUTE PROCEDURE option cannot be replaced by a trigger defined with DO option.
Examples

It executes the code block that is specified by DO before the table is updated.
(Example that LANGUAGE is plpgsql)

```sql
CREATE TRIGGER check_update
    BEFORE UPDATE ON accounts
    FOR EACH ROW
    DO $$BEGIN RETURN NEW; END;$$ ;
```

Information

When a trigger created with DO option, a new function is created internally. The name of function is "schema name"."on table name"."trigger name"_TRIGPROC(serial number).

8.1.2 How to Define Triggers in pgAdmin

The expanded features of the trigger definition can also be used in pgAdmin.

See

Refer to "pgAdmin Help" for information on how to define triggers using pgAdmin.
Chapter 9 Compatibility with Oracle Databases

This chapter describes the environment settings and functionality offered for features that are compatible with Oracle databases.

9.1 Overview

Features compatible with Oracle databases are provided. These features enable you to easily migrate to FUJITSU Enterprise Postgres and reduce the costs of reconfiguring applications.

The table below lists features compatible with Oracle databases.

<table>
<thead>
<tr>
<th>Category</th>
<th>Feature</th>
<th>Item</th>
<th>Overview</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL</td>
<td>Queries</td>
<td>Outer join operator (+)</td>
<td>Operator for outer joins</td>
</tr>
<tr>
<td>SQL</td>
<td></td>
<td>DUAL table</td>
<td>Table provided by the system</td>
</tr>
<tr>
<td>Functions</td>
<td>DECODE</td>
<td></td>
<td>Compares values, and if they match, returns a corresponding value</td>
</tr>
<tr>
<td>Functions</td>
<td>SUBSTR</td>
<td></td>
<td>Extracts part of a string using characters to specify position and length</td>
</tr>
<tr>
<td>Functions</td>
<td>NVL</td>
<td></td>
<td>Returns a substitute value when a value is NULL</td>
</tr>
<tr>
<td>Package</td>
<td>DBMS_OUTPUT</td>
<td></td>
<td>Sends messages to clients</td>
</tr>
<tr>
<td>Package</td>
<td>UTL_FILE</td>
<td></td>
<td>Enables text file operations</td>
</tr>
<tr>
<td>Package</td>
<td>DBMS_SQL</td>
<td></td>
<td>Enables dynamic SQL execution</td>
</tr>
</tbody>
</table>

See

In addition to the above, refer to the file below for information on the Oracle function.

- Linux/Solaris: `fujitsuEnterprisePostgresInstallDir/share/doc/extension/README.asciidoc`
- Windows(R): `fujitsuEnterprisePostgresInstallDir\doc\extension\README.asciidoc`

9.2 Precautions when Using the Features Compatible with Oracle Databases

To use the features compatible with Oracle databases, create a new instance and execute the following command for the "postgres" and "template1" databases:

```
CREATE EXTENSION oracle_compatible;
```

Features compatible with Oracle databases are defined as user-defined functions in the "public" schema created by default when database clusters are created, so they can be available for all users without the need for special settings.

For this reason, ensure that "public" (without the double quotation marks) is included in the list of schema search paths specified in the search_path parameter.

9.2.1 Notes on SUBSTR

SUBSTR is implemented in FUJITSU Enterprise Postgres and Oracle databases using different external specifications.
For this reason, when using SUBSTR, define which specification is to take precedence. In the default configuration of FUJITSU Enterprise Postgres, the specifications of FUJITSU Enterprise Postgres take precedence.

When using the SUBSTR function compatible with Oracle databases, set "oracle" and "pg_catalog" in the "search_path" parameter of postgresql.conf. You must specify "oracle" before "pg_catalog" when doing this.

```sql
search_path = '"$user", public, oracle, pg_catalog'
```

---

**Information**

- The `search_path` parameter specifies the order in which schemas are searched. The SUBSTR function in Oracle databases is defined in the oracle schema.
- Refer to "Server Administration" > "Client Connection Defaults" > "Statement Behavior" in the PostgreSQL Documentation for information on `search_path`.

---

### 9.2.2 Notes when Integrating with the Interface for Application Development

The SQL noted in "Table 9.1 Features compatible with Oracle databases" can be used in the interface for application development. However, outer join operators cannot be used when integrated with Visual Studio.

When integrated with Visual Studio or using the features compatible with Oracle databases from Fujitsu Npgsql .NET Data Provider, select one of the actions below for the `SearchPath` parameter, which is one of the pieces of information needed to connect to databases specified for individual connections.
- Do not specify the `SearchPath` parameter itself, or
- Specify both "public" and the schema name in the SQL statement.

Note that both "public" and the schema name in the SQL statement must be specified as the `SearchPath` parameter before "oracle" and "pg_catalog" when using the Oracle database-compatible feature SUBSTR.

---

### 9.3 Queries

The following queries are supported:

- **Outer Join Operator (+)**
- **DUAL Table**

#### 9.3.1 Outer Join Operator (+)

In the `WHERE` clause conditional expression, by adding the plus sign (+), which is the outer join operator, to the column of the table you want to add as a table join, it is possible to achieve an outer join that is the same as a joined table (OUTER JOIN).
Syntax

SELECT statement

Note

Here we are dealing only with the WHERE clause of the SELECT statement. Refer to "Reference" > "SQL Commands" in the PostgreSQL Documentation for information on the overall syntax of the SELECT statement.

General rules

WHERE clause

- The WHERE clause specifies search condition or join conditions for the tables that are derived.
- Search conditions are any expressions that return BOOLEAN types as the results of evaluation. Any rows that do not meet these conditions are excluded from the output. When the values of the actual rows are assigned to variables and if the expression returns TRUE, those rows are considered to have met the conditions.
- Join conditions are comparison conditions that specify outer join operators. Join conditions in a WHERE clause return a table that includes all the rows that meet the join conditions, including rows that do not meet all the join conditions.
- Join conditions take precedence over search conditions. For this reason, all rows returned by the join conditions are subject to the search conditions.
- The following rules and restrictions apply to queries that use outer join operators. It is therefore recommended to use FROM clause joined tables (OUTER JOIN) rather than outer join operators:
  - Outer join operators can only be specified in the WHERE clause.
  - Outer join operators can only be specified for base tables or views.
  - To perform outer joins using multiple join conditions, it is necessary to specify outer join operators for all join conditions.
  - When combining join conditions with constants, specify outer join operators in the corresponding column specification. When not specified, they will be treated as search conditions.
  - The results column of the outer join of table t1 is not returned if table t1 is joined with table t2 by specifying an outer join operator in the column of t1, then table t1 is joined with table t3 by using search conditions.
- It is not possible to specify columns in the same table as the left/right column specification of a join condition.

- It is not possible to specify an expression other than a column specification for outer join operators, but they may be specified for the columns that compose the expression.

There are the following limitations on the functionality of outer join operators when compared with joined tables (OUTER JOIN). To use functionality that is not available with outer join operators, use joined tables (OUTER JOIN).

**Table 9.2 Range of functionality with outer join operators**

<table>
<thead>
<tr>
<th>Functionality available with joined tables (OUTER JOIN)</th>
<th>Outer join operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outer joins of two tables</td>
<td>Y</td>
</tr>
<tr>
<td>Outer joins of three or more tables</td>
<td>Y (*1)</td>
</tr>
<tr>
<td>Used together with joined tables within the same query</td>
<td>N</td>
</tr>
<tr>
<td>Use of the OR logical operator to a join condition</td>
<td>N</td>
</tr>
<tr>
<td>Use of an IN predicate to a join condition</td>
<td>N</td>
</tr>
<tr>
<td>Use of subqueries to a join condition</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Available  
N: Not available

*1: The outer joins by outer join operators can return outer join results only for one other table. For this reason, to combine outer joins of table t1 and table t2 or table t2 and table t3, it is not possible to specify outer join operators simultaneously for table t2.

**Example**

Table configuration

t1

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>AAAAA</td>
<td>1000</td>
</tr>
<tr>
<td>1002</td>
<td>BBBBB</td>
<td>2000</td>
</tr>
<tr>
<td>1003</td>
<td>CCCCC</td>
<td>3000</td>
</tr>
</tbody>
</table>

t2

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>aaaaa</td>
</tr>
<tr>
<td>1002</td>
<td>bbbbbb</td>
</tr>
<tr>
<td>1004</td>
<td>dddddd</td>
</tr>
</tbody>
</table>

Example 1: Return all rows in table t2, including those that do not exist in table t1.

```
SELECT *
FROM t1, t2
WHERE t1.col1(+) = t2.col1;
```

<table>
<thead>
<tr>
<th>col1</th>
<th>col2</th>
<th>col3</th>
<th>col1</th>
<th>col2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>AAAAA</td>
<td>1000</td>
<td>1001</td>
<td>aaaaa</td>
</tr>
<tr>
<td>1002</td>
<td>BBBBB</td>
<td>2000</td>
<td>1002</td>
<td>bbbbbb</td>
</tr>
</tbody>
</table>
This is the same syntax as the joined table (OUTER JOIN) of the FROM clause shown next.

```
SELECT *
FROM t1 RIGHT OUTER JOIN t2
  ON t1.col1 = t2.col1;
```

Example 2: In the following example, the results are filtered to records above 2000 in t1.col3 by search conditions, and the records are those in table t2 that include ones that do not exist in table t1. After filtering with the join conditions, there is further filtering with the search conditions, so there will only be one record returned.

```
SELECT *
FROM t1, t2
WHERE t1.col1(+) = t2.col1
  AND t1.col3 >= 2000;
```

```
col1 |    col2    | col3 | col1 |    col2
------+------------+------+------+------------
1002 | BBBBB      | 2000 | 1002 | bbbbb
(1 row)
```

This is the same syntax as the joined table (OUTER JOIN) of the FROM clause shown next.

```
SELECT *
FROM t1 RIGHT OUTER JOIN t2
  ON t1.col1 = t2.col1
WHERE t1.col3 >= 2000;
```

9.3.2 DUAL Table

DUAL table is a virtual table provided by the system. Use when executing SQL where access to a base table is not required, such as when performing tests to get result expressions such as functions and operators.

Example

In the following example, the current system date is returned.

```
SELECT CURRENT_DATE  "date" FROM DUAL;
  date
------------
2013-05-14
(1 row)
```

9.4 SQL Function Reference

The following SQL functions are supported:

- DECODE
- SUBSTR
- NVL

9.4.1 DECODE

Description

Compares values and if they match, returns a corresponding value.
Syntax

```
| DECODE | { | expr | . | arch | . | result | default | } |
```

General rules

- DECODE compares values of the value expression to be converted and the search values one by one. If the values match, a corresponding result value is returned. If no values match, the default value is returned if it has been specified. A NULL value is returned if a default value has not been specified.

- If the same search value is specified more than once, then the result value returned is the one listed for the first occurrence of the search value.

- The following data types can be used in result values and in the default value:
  - CHAR
  - VARCHAR
  - NCHAR
  - NCHAR VARYING
  - TEXT
  - INTEGER
  - BIGINT
  - NUMERIC
  - DATE
  - TIME WITHOUT TIME ZONE
  - TIMESTAMP WITHOUT TIME ZONE
  - TIMESTAMP WITH TIME ZONE

- The same data type must be specified for the values to be converted and the search values. However, note that different data types may also be specified if a literal is specified in the search value, and the value expression to be converted contains data types that can be converted. When specifying literals, refer to "A.3 Implicit Data Type Conversions" > "Table A.1 Data type combinations that contain literals and can be converted implicitly" for information on the data types that can be specified.

- If the result values and default value are all literals, the data types for these values will be as shown below:
  - If all values are string literals, all will become character types.
  - If there is one or more numeric literal, all will become numeric types.
  - If there is one or more literal cast to the datetime/time types, all will become datetime/time types.

- If the result values and default value contain a mixture of literals and non-literals, the literals will be converted to the data types of the non-literals. When specifying literals, refer to "A.3 Implicit Data Type Conversions" > "Table A.1 Data type combinations that contain literals and can be converted implicitly" for information on the data types that can be converted.

- The same data type must be specified for all result values and for the default value. However, different data types can be specified if the data type of any of the result values or default value can be converted - these data types are listed below:
Table 9.3 Data type combinations that can be converted by DECODE (summary)

<table>
<thead>
<tr>
<th>Result value (any)</th>
<th>Numeric type</th>
<th>Character type</th>
<th>Date/time type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Y</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Character type</td>
<td>N</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>Date/time type</td>
<td>N</td>
<td>N</td>
<td>S (*1)</td>
</tr>
</tbody>
</table>

Y: Can be converted  
S: Some data types can be converted  
N: Cannot be converted  

*1: The data types that can be converted for date/time types are listed below:

Table 9.4 Result value and default value date/time data types that can be converted by DECODE

<table>
<thead>
<tr>
<th>Result value (any)</th>
<th>DATE</th>
<th>TIME WITHOUT TIME ZONE</th>
<th>TIMESTAMP WITHOUT TIME ZONE</th>
<th>TIMESTAMP WITH TIME ZONE</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATE</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>TIME WITHOUT TIME ZONE</td>
<td>N</td>
<td>Y</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>TIMESTAMP WITHOUT TIME ZONE</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be converted  
N: Cannot be converted

- The data type of the return value will be the data type within the result or default value that is longest and has the highest precision.

Example

In the following example, the value of col3 in table t1 is compared and converted to a different value. If the col3 value matches search value 1, the result value returned is "one". If the col3 value does not match any of search values 1, 2, or 3, the default value "other number" is returned.

```
SELECT col1,  
    DECODE(col3, 1, 'one',  
            2, 'two',  
            3, 'three',  
            'other number') "num-word"  
FROM t1;  
```

col1  | num-word  
------|----------  
1001 | one  
1002 | two  
1003 | three  
(3 rows)
9.4.2 SUBSTR

Description

Extracts part of a string using characters to specify position and length.

Syntax

![SUBSTR syntax diagram](image)

General rules

- SUBSTR extracts and returns a substring of string `str`, beginning at position `startPos`, for number of characters `len`.
- When `startPos` is positive, it will be the number of characters from the beginning of the string.
- When `startPos` is 0, it will be treated as 1.
- When `startPos` is negative, it will be the number of characters from the end of the string.
- When `len` is not specified, all characters to the end of the string are returned. NULL is returned when `len` is less than 1.
- For `startPos` and `len`, specify a SMALLINT or INTEGER type. When specifying literals, refer to "A.3 Implicit Data Type Conversions" > "Table A.1 Data type combinations that contain literals and can be converted implicitly" for information on the data types that can be specified.
- The data type of the return value is TEXT.

Note

- There are two types of SUBSTR. One that behaves as described above, and one that behaves the same as SUBSTRING. The search_path parameter must be modified for it to behave the same as the specification described above.
- It is recommended to set search_path in postgresql.conf. In this case, it will be effective for each instance. Refer to "9.2.1 Notes on SUBSTR" for information on how to configure postgresql.conf.
- The configuration of search_path can be done at the user level or at the database level. Setting examples are shown below.
  - Example of setting at the user level
    This can be set by executing an SQL command. In this example, user1 is used as the username.
    ```sql
    ALTER USER user1 SET search_path = "$user",public,oracle,pg_catalog;
    ```
  - Example of setting at the database level
    This can be set by executing an SQL command. In this example, db1 will be used as the database name.
    ```sql
    ALTER DATABASE db1 SET search_path = "$user",public,oracle,pg_catalog;
    ```
    You must specify "oracle" before "pg_catalog".
  - If the change has not been implemented, SUBSTR is the same as SUBSTRING.

See

Refer to "Reference" > "SQL Commands" in the PostgreSQL Documentation for information on ALTER USER and ALTER DATABASE.
The general rules for SUBSTRING are as follows:
- The start position will be from the beginning of the string, whether positive, 0, or negative.
- When \( \text{len} \) is not specified, all characters to the end of the string are returned.
- An empty string is returned if no string is extracted or \( \text{len} \) is less than 1.

See

Refer to "String Functions and Operators" under "The SQL Language" in the PostgreSQL Documentation for information on SUBSTRING.

Example

In the following example, part of the string "ABCDEFG" is extracted:

```sql
SELECT SUBSTR('ABCDEFG',3,4) "Substring" FROM DUAL;
```

<table>
<thead>
<tr>
<th>Substring</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDEF</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Substring</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDEF</td>
</tr>
</tbody>
</table>

9.4.3 NVL

Description

Returns a substitute value when a value is NULL.

Syntax

```
NVL ( expr1 , expr2 )
```

General rules

- NVL returns a substitute value when the specified value is NULL. When \( \text{expr1} \) is NULL, \( \text{expr2} \) is returned. When \( \text{expr1} \) is not NULL, \( \text{expr1} \) is returned.
- Specify the same data types for \( \text{expr1} \) and \( \text{expr2} \). However, if a constant is specified in \( \text{expr2} \), and the data type can also be converted by \( \text{expr1} \), different data types can be specified. When this happens, the conversion by \( \text{expr2} \) is done to suit the data type in \( \text{expr1} \), so the value of \( \text{expr2} \) returned when \( \text{expr1} \) is a NULL value will be the value converted in the data type of \( \text{expr1} \).
- When specifying literals, refer to "A.3 Implicit Data Type Conversions" > "Table A.1 Data type combinations that contain literals and can be converted implicitly" for information on the data types that can be converted.
Example

In the following example, "IS NULL" is returned if the value of col1 in table t1 is a NULL value.

```
SELECT col2, NVL(col1,'IS NULL') "nvl" FROM t1;
+----+-----------+
<table>
<thead>
<tr>
<th>col2</th>
<th>nvl</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa</td>
<td>IS NULL</td>
</tr>
</tbody>
</table>
(1 row)
```

9.5 Package Reference

A "package" is a group of features, brought together by schemas, that have a single functionality, and are used by calling from PL/pgSQL.

The following packages are supported:

- DBMS_OUTPUT
- UTL_FILE
- DBMS_SQL

To call the different functionalities from PL/pgSQL, use the PERFORM statement or SELECT statement, using the package name to qualify the name of the functionality. Refer to the explanations for each of the package functionalities for information on the format for calling.

9.5.1 DBMS_OUTPUT

Overview

Sends messages to clients such as psql from PL/pgSQL.

Features

<table>
<thead>
<tr>
<th>Features</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE</td>
<td>Enables features of this package.</td>
</tr>
<tr>
<td>DISABLE</td>
<td>Disables features of this package.</td>

<tr>
<td>SERVEROUTPUT</td>
<td>Controls whether messages are sent.</td>
</tr>
<tr>
<td>PUT</td>
<td>Sends messages.</td>
</tr>
<tr>
<td>PUT_LINE</td>
<td>Sends messages with a newline character appended.</td>
</tr>
<tr>
<td>NEW_LINE</td>
<td>Sends a newline character.</td>
</tr>
<tr>
<td>GET_LINE</td>
<td>Retrieves a line from the message buffer.</td>
</tr>
<tr>
<td>GET_LINES</td>
<td>Retrieves multiple lines from the message buffer.</td>
</tr>
</tbody>
</table>

- 88 -
9.5.1.1 Description
This section explains each feature of DBMS_OUTPUT.

ENABLE
- ENABLE enables the use of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES.
- With multiple executions of ENABLE, the value specified last is the buffer size (in bytes). Specify a buffer size from 2000 to 1000000.
- The default value of the buffer size is 20000. If NULL is specified as the buffer size, 1000000 will be used.
- If ENABLE has not been executed, PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES are ignored even if they are executed.

Example
```
PERFORM DBMS_OUTPUT.ENABLE(20000);
```

DISABLE
- DISABLE disables the use of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES.
- Remaining buffer information is discarded.

Example
```
PERFORM DBMS_OUTPUT.DISABLE();
```
SERVERTOUTPUT
- SERVEROUTPUT controls whether messages are sent.
- Specify TRUE or FALSE for sendMsgs.
- If TRUE is specified, when PUT, PUT_LINE, or NEW_LINE is executed, the message is sent to a client such as psql and not stored in the buffer.
- If FALSE is specified, when PUT, PUT_LINE, or NEW_LINE is executed, the message is stored in the buffer and not sent to a client such as psql.

See
Refer to "The SQL Language" > "Data Types" > "Boolean Type" in the PostgreSQL Documentation for information on boolean type (TRUE/FALSE) values.

Example
PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);

PUT
- PUT sets the message to be sent.
- The string is the message to be sent.
- When TRUE is specified for SERVEROUTPUT, the messages are sent to clients such as psql.
- When FALSE is specified for SERVEROUTPUT, the messages are retained in the buffer.
- PUT does not append a newline character. To append a newline character, execute NEW_LINE.
- If a string longer than the buffer size specified in ENABLE is sent, an error occurs.

Example
PERFORM DBMS_OUTPUT.PUT('abc');

PUT_LINE
- PUT_LINE sets the message to be sent appended with a newline character.
- The string is the message that is sent.
- When TRUE is specified for SERVEROUTPUT, the messages are sent to clients such as psql.
- When FALSE is specified for SERVEROUTPUT, the messages are retained in the buffer.
- PUT_LINE appends a newline character to the end of messages.
- If a string longer than the buffer size specified in ENABLE is sent, an error occurs.

Example
PERFORM DBMS_OUTPUT.PUT_LINE('abc');
NEW_LINE

- NEW_LINE appends a newline character to the message created with PUT.
- When TRUE is specified for SERVEROUTPUT, the messages are sent to clients such as psql.
- When FALSE is specified for SERVEROUTPUT, the messages are retained in the buffer.

**Example**

```sql
PERFORM DBMS_OUTPUT.NEW_LINE();
```

GET_LINE

- GET_LINE retrieves a line from the message buffer.
- Use a SELECT statement to obtain the retrieved line and status code returned by the operation, which are stored in the line and status columns.
- The line column stores the line retrieved from the buffer. The data type of line is TEXT.
- The status column stores the status code returned by the operation: 0-completed successfully; 1-failed because there are no more lines in the buffer. The data type of status is INTEGER.
- If GET_LINE or GET_LINES is executed and then PUT, PUT_LINE, or NEW_LINE is while messages that have not been retrieved from the buffer still exist, the messages not retrieved from the buffer will be discarded.

**Example**

```sql
DECLARE
  buff1 VARCHAR(20);
  stts1 INTEGER;
BEGIN
  SELECT line,status INTO buff1,stts1 FROM DBMS_OUTPUT.GET_LINE();
END;
```

GET_LINES

- GET_LINES retrieves multiple lines from the message buffer.
- Specify the number of lines to retrieve from the buffer.
- Use a SELECT statement to obtain the retrieved lines and the number of lines retrieved, which are stored in the lines and numlines columns.
- The lines column stores the lines retrieved from the buffer. The data type of lines is TEXT.
- The numlines column stores the number of lines retrieved from the buffer. If this number is less than the number of lines requested, then there are no more lines in the buffer. The data type of numlines is INTEGER.
- If GET_LINE or GET_LINES is executed and then PUT, PUT_LINE, or NEW_LINE is while messages that have not been retrieved from the buffer still exist, the messages not retrieved from the buffer will be discarded.

**Example**

```sql
DECLARE
  buff VARCHAR(20)[10];
  stts INTEGER := 10;
```

- 91 -
9.5.1.2 Example

A usage example of DBMS_OUTPUT is shown below.

```sql
CREATE FUNCTION dbms_output_exe() RETURNS VOID AS $$
DECLARE
    buff1    VARCHAR(20);
    buff2    VARCHAR(20);
    stts1    INTEGER;
    stts2    INTEGER;
BEGIN
    PERFORM DBMS_OUTPUT.DISABLE();
    PERFORM DBMS_OUTPUT.ENABLE();
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(FALSE);
    PERFORM DBMS_OUTPUT.PUT('DBMS_OUTPUT TEST 1');
    PERFORM DBMS_OUTPUT.NEW_LINE();
    PERFORM DBMS_OUTPUT.PUT_LINE('DBMS_OUTPUT TEST 2');
    SELECT line,status INTO buff1,stts1 FROM DBMS_OUTPUT.GET_LINE();
    SELECT line,status INTO buff2,stts2 FROM DBMS_OUTPUT.GET_LINE();
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
    PERFORM DBMS_OUTPUT.PUT_LINE(buff1);
    PERFORM DBMS_OUTPUT.PUT_LINE(buff2);
END;
$$ LANGUAGE plpgsql;
SELECT dbms_output_exe();
DROP FUNCTION dbms_output_exe();
```

9.5.2 UTL_FILE

Overview

Text files can be written and read using PL/pgSQL.

To perform these file operations, the directory for the operation target must be registered in the UTL_FILE.UTL_FILE_DIR table beforehand. Use the INSERT statement as the database administrator or a user who has INSERT privileges to register the directory. Also, if the directory is no longer necessary, delete it from the same table. Refer to "9.5.2.1 Registering and Deleting Directories" for information on the how to register and delete the directory.

Refer to "C.1 UTL_FILE.UTL_FILE_DIR" for information on the UTL_FILE.UTL_FILE_DIR table.

Declare the file handler explained hereafter as follows in PL/pgSQL:

```sql
DECLARE
    f UTL_FILE.FILE_TYPE;
```

Features

### Syntax

9.5.2.1 Registering and Deleting Directories

The examples in this sections are for Linux/Solaris. In Windows(R), use a forward slash (/) as the separator for the directory.

**Windows(R) example:** `c:/ fsep`
Registering the directory

1. Check if the directory is already registered (if it is, then step 2 is not necessary).

   ```sql
   SELECT * FROM UTL_FILE.UTL_FILE_DIR WHERE dir='/home/fsep';
   ```

2. Register the directory.

   ```sql
   INSERT INTO UTL_FILE.UTL_FILE_DIR VALUES('/home/fsep');
   ```

Deleting the directory

```sql
DELETE FROM UTL_FILE.UTL_FILE_DIR WHERE dir='/home/fsep';
```

9.5.2.2 Description

This section explains each feature of UTL_FILE.

**FCLOSE**

- **FCLOSE** closes a file that is open.
- Specify an open file handle.
- The value returned is a NULL value.

**Example**

```sql
f := UTL_FILE.FCLOSE(f);
```

**FCLOSE_ALL**

- **FCLOSE_ALL** closes all files open in a session.
- Files closed with **FCLOSE_ALL** can no longer be read or written.

**Example**

```sql
PERFORM UTL_FILE.FCLOSE_ALL();
```

**FCOPY**

- **FCOPY** copies a whole file or a contiguous portion thereof. The whole file is copied if `startLine` and `endLine` are not specified.
- Specify the directory location of the source file.
- Specify the source file.
- Specify the directory where the destination file will be created.
- Specify the file name of the destination file.
- Specify a slash (/) or a backslash (\) as a separator in the copy source directory name and the copy destination directory name.
- Specify the line number at which to begin copying. Specify a value greater than 0. If not specified, 1 is used.
- Specify the line number at which to stop copying. If not specified, the last line number of the file is used.
**Example**

**Linux/Solaris**

PERFORM UTL_FILE.FCOPY('/home/fsep', 'regress_fsep.txt', '/home/fsep', 'regress_fsep2.txt');

**Windows(R)**

PERFORM UTL_FILE.FCOPY('c:/fsep', 'regress_fsep.txt', 'c:/fsep', 'regress_fsep2.txt');

**FFLUSH**

- FFLUSH forcibly writes the buffer data to a file.
- Specify an open file handle.

**Example**

PERFORM UTL_FILE.FFLUSH(f);

**FGETATTR**

- FGETATTR retrieves file attributes: file existence, file size, and information about the block size of the file.
- Specify the directory where the file exists.
- Specify a slash (/) or a backslash (\) as a separator in the directory name.
- Specify the file name.
- Use a SELECT statement to obtain the file attributes, which are stored in the fexists, file_length, and blocksize columns.
- The fexists column stores a boolean (TRUE/FALSE) value. If the file exists, fexists is set to TRUE. If the file does not exist, fexists is set to FALSE. The data type of fexists is BOOLEAN.
- The file_length column stores the length of the file in bytes. If the file does not exist, file_length is NULL. The data type of file_length is INTEGER.
- The blocksize column stores the block size of the file in bytes. If the file does not exist, blocksize is NULL. The data type of blocksize is INTEGER.

**Example**

**Linux/Solaris**

SELECT fexists, file_length, blocksize INTO file_flag, file_len, size FROM UTL_FILE.FGETATTR('/home/fsep', 'regress_fsep.txt');

**Windows(R)**

SELECT fexists, file_length, blocksize INTO file_flag, file_len, size FROM UTL_FILE.FGETATTR('c:/fsep', 'regress_fsep.txt');
FOPEN

- FOPEN opens a file.
- Specify the directory where the file exists.
- Specify a slash (/) or a backslash (\) as a separator in the directory name.
- Specify the file name.
- Specify the mode for opening the file:
  r: Read
  w: Write
  a: Add
- Specify the maximum string length (in bytes) that can be processed with one operation. If omitted, the default is 1024. Specify a value from 1 to 32767.
- Up to 50 files per session can be open at the same time.

Example

<table>
<thead>
<tr>
<th>Linux/Solaris</th>
</tr>
</thead>
<tbody>
<tr>
<td>$f := UTL_FILE.FOPEN('/home/fsep','regress_fsep.txt','r',1024);</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Windows(R)</th>
</tr>
</thead>
<tbody>
<tr>
<td>$f := UTL_FILE.FOPEN('c:/fsep','regress_fsep.txt','r',1024);</td>
</tr>
</tbody>
</table>

FRENAME

- FRENAME renames a file.
- Specify the directory location of the source file.
- Specify the source file to be renamed.
- Specify the directory where the renamed file will be created.
- Specify the new name of the file.
- Specify a slash (/) or a backslash (\) as a separator in the directory name.
- Specify whether to overwrite a file if one exists with the same name and in the same location as the renamed file. If TRUE is specified, the existing file will be overwritten. If FALSE is specified, an error occurs. If omitted, FALSE is set.

See

Refer to "The SQL Language" > "Data Types" > "Boolean Type" in the PostgreSQL Documentation for information on boolean type (TRUE/FALSE) values.

Example

<table>
<thead>
<tr>
<th>Linux/Solaris</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
PERFORM UTL_FILE.FRENAME('/home/fsep', 'regress_fsep.txt', '/home/fsep', 'regress_fsep2.txt', TRUE);

PERFORM UTL_FILE.FRENAME('c:/fsep', 'regress_fsep.txt', 'c:/fsep', 'regress_fsep2.txt', TRUE);

GET_LINE
- GET_LINE reads one line from a file.
- Specify the file handle returned by FOPEN using the r (read) mode.
- Specify the number of bytes to read from the file. If not specified, the maximum string length specified at FOPEN will be used.
- The return value is the buffer that receives the line read from the file.
- Newline characters are not loaded to the buffer.
- An empty string is returned if a blank line is loaded.
- Specify the maximum length (in bytes) of the data to be read. Specify a value from 1 to 32767. If not specified, the maximum string length specified at FOPEN is set. If no maximum string length is specified at FOPEN, 1024 is set.
- If the line length is greater than the specified number of bytes to read, the remainder of the line is read on the next call.
- A **NO_DATA_FOUND** exception will occur when trying to read past the last line.

**Example**

```sql
buff := UTL_FILE.GET_LINE(f);
```

IS_OPEN
- **IS_OPEN** checks if a file is open.
- Specify the file handle.
- The return value is a **BOOLEAN** type. **TRUE** represents an open state and **FALSE** represents a closed state.

**See**

Refer to "The SQL Language" > "Data Types" > "Boolean Type" in the PostgreSQL Documentation for information on boolean type (TRUE/FALSE) values.

**Example**

```sql
IF UTL_FILE.IS_OPEN(f) THEN
    PERFORM UTL_FILE.FCLOSE(f);
END IF;
```
NEW_LINE
- NEW_LINE writes one or more newline characters.
- Specify an open file handle.
- Specify the number of newline characters to be written to the file. If omitted, "1" is used.

Example
PERFORM UTL_FILE.NEW_LINE(f, 2);

PUT
- PUT writes a string to a file.
- Specify the file handle that was opened with FOPEN using w (write) or a (append).
- Specify the string to be written to the file.
- The maximum length (in bytes) of the string to be written is the maximum string length specified at FOPEN.
- The return value is a TEXT type and is the buffer that receives the line loaded from the file.

Example
PERFORM UTL_FILE.PUT(f, 'ABC');

PUT_LINE
- PUT_LINE appends a newline character to a string and writes the string.
- Specify the file handle that was opened with FOPEN w (write) or a (append).
- Specify whether to forcibly write to the file. If TRUE is specified, file writing is forced. If FALSE is specified, file writing is asynchronous. If omitted, FALSE will be set.
- The maximum length of the string (in bytes) is the maximum string length specified at FOPEN.

Example
PERFORM UTL_FILE.PUT_LINE(f, 'ABC', TRUE);

PUTF
- PUTF writes a formatted string.
- Specify the file handle that was opened with FOPEN w (write) or a (append).
- Specify the format, which is a string that includes the formatting characters \n and %s.
- The \n in the format is code for a newline character.
- Specify the same number of input values as there are %s in the format. Up to a maximum of five input values can be specified. The %s in the format are replaced with the corresponding input characters. If an input value corresponding to %s is not specified, it is replaced with an empty string.
9.5.2.3 Example

The procedure when using UTL_FILE, and a usage example, are shown below.

1. Preparation

Before starting a new job that uses UTL_FILE, register the directory in the UTL_FILE.UTL_FILE_DIR table.

Refer to "9.5.2.1 Registering and Deleting Directories" for information on how to register the directory.

2. Performing a job

Perform a job that uses UTL_FILE. The example is shown below.

```
CREATE OR REPLACE FUNCTION gen_file(mydir TEXT, infile TEXT, outfile TEXT, copyfile TEXT) RETURNS void AS $$
DECLARE
    v1 VARCHAR(32767);
    inf UTL_FILE.FILE_TYPE;
    otf UTL_FILE.FILE_TYPE;
BEGIN
    inf := UTL_FILE.FOPEN(mydir, infile,'r',256);
    otf := UTL_FILE.FOPEN(mydir, outfile,'w');
    v1 := UTL_FILE.GET_LINE(inf,256);
    PERFORM UTL_FILE.PUT_LINE(otf,v1,TRUE);
    v1 := UTL_FILE.GET_LINE(inf,256);
    PERFORM UTL_FILE.PUTF(otf,'%s
',v1);
    v1 := UTL_FILE.GET_LINE(inf, 256);
    PERFORM UTL_FILE.PUT(otf,v1);
    PERFORM UTL_FILE.NEW_LINE(otf);
    PERFORM UTL_FILE.FFLUSH(otf);
    inf := UTL_FILE.FCLOSE(inf);
    otf := UTL_FILE.FCLOSE(otf);
    PERFORM UTL_FILE.FCOPY(mydir, outfile, mydir, copyfile, 2, 3);
    PERFORM UTL_FILE.FRENAME(mydir, outfile, mydir, 'rename.txt');
END;
$$ LANGUAGE plpgsql;
/* Linux/Solaris */
SELECT gen_file('/home/fsep', 'input.txt', 'output.txt', 'copyfile.txt');
/* Windows(R) */
SELECT gen_file('c:/fsep', 'input.txt', 'output.txt', 'copyfile.txt');
```

3. Post-processing

If you remove a job that uses UTL_FILE, delete the directory information from the UTL_FILE.UTL_FILE_DIR table. Ensure that the directory information is not being used by another job before deleting it.

Refer to "9.5.2.1 Registering and Deleting Directories" for information on how to delete the directory.
9.5.3 DBMS_SQL

Overview

Dynamic SQL can be executed from PL/pgSQL.

Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_VARIABLE</td>
<td>Sets values in the host variable within the SQL statement.</td>
</tr>
<tr>
<td>CLOSE_CURSOR</td>
<td>Closes the cursor.</td>
</tr>
<tr>
<td>COLUMN_VALUE</td>
<td>Retrieves the value of the column in the select list extracted with</td>
</tr>
<tr>
<td></td>
<td>FETCH_ROWS.</td>
</tr>
<tr>
<td>DEFINE_COLUMN</td>
<td>Defines the column from which values are extracted and the storage</td>
</tr>
<tr>
<td></td>
<td>destination.</td>
</tr>
<tr>
<td>EXECUTE</td>
<td>Executes SQL statements.</td>
</tr>
<tr>
<td>FETCH_ROWS</td>
<td>Positions the specified cursor at the next row and extracts values from</td>
</tr>
<tr>
<td></td>
<td>the row.</td>
</tr>
<tr>
<td>OPEN_CURSOR</td>
<td>Opens a new cursor.</td>
</tr>
<tr>
<td>PARSE</td>
<td>Parses SQL statements.</td>
</tr>
</tbody>
</table>

Note

- In DBMS_SQL, the data types supported in dynamic SQL are limited, and therefore the user must consider this. The supported data types are:
  - INTEGER
  - DECIMAL
  - NUMERIC
  - REAL
  - DOUBLE PRECISION
  - CHAR(*1)
  - VARCHAR(*1)
  - NCHAR(*1)
  - NCHAR VARYING(*1)
  - TEXT
  - DATE
  - TIMESTAMP WITHOUT TIME ZONE
  - TIMESTAMP WITH TIME ZONE
  - INTERVAL(*2)
  - SMALLINT
  - BIGINT

  *1: The host variables with CHAR, VARCHAR, NCHAR, and NCHAR VARYING data types are treated as TEXT, to match the string function arguments and return values. Refer to "The SQL Language" > "Functions and Operators" > "String Functions and Operators" in the PostgreSQL Documentation for information on string functions.
When specifying the arguments of the features compatible with Oracle databases NVL and/or DECODE, use CAST to convert the data types of the host variables to ensure that data types between arguments are the same.

*2: When using COLUMN_VALUE to obtain an INTERVAL type value specified in the select list, use an INTERVAL type variable with a wide range such as when no interval qualifier is specified, or with a range that matches that of the variable in the select list. If an interval qualifier variable with a narrow range is specified, then the value within the interval qualifier range will be obtained, but an error that the values outside the range have been truncated will not occur.

**Example**

This example illustrates where a value expression that returns an INTERVAL value is set in the select list and the result is received with COLUMN_VALUE. Note that the SQL statement operation result returns a value within the INTERVAL DAY TO SECOND range.

**[Bad example]**

Values of MINUTE, and those after MINUTE, are truncated, because the variable(v_interval) is INTERVAL DAY TO HOUR.

```
v_interval     INTERVAL DAY TO HOUR;
...
    PERFORM DBMS_SQL.PARSE(cursor, 'SELECT CURRENT_TIMESTAMP - ''2010-01-01'' FROM DUAL', 1);
...
    SELECT value INTO v_interval FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_interval);
result:1324 days 09:00:00
```

**[Good example]**

By ensuring that the variable(v_interval) is INTERVAL, the values are received correctly.

```
v_interval     INTERVAL;
...
    PERFORM DBMS_SQL.PARSE(cursor, 'SELECT CURRENT_TIMESTAMP - ''2010-01-01'' FROM DUAL', 1);
...
    SELECT value INTO v_interval FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_interval);
    result:1324 days 09:04:37.530623
```
9.5.3.1 Description

This section explains each feature of DBMS_SQL.

**BIND_VARIABLE**

- BIND_VARIABLE sets values in the host variable within the SQL statement.
- Specify the cursor number to be processed.
- Specify the name of the host variable within the SQL statement using a string for the host variable name.
- Specify the value set in the host variable. The data type of the host variable is the same as that of the value expression - it is implicitly converted in accordance with its position within the SQL statement. Refer to "A.3 Implicit Data Type Conversions" for information on implicit conversions.
- If the value is a character type, the string length is the number of characters. If the string length is not specified, the size is the total length of the string.
- It is necessary to place a colon at the beginning of the host variable in SQL statements to identify the host variable. The colon does not have to be added to the host variable names specified at BIND_VARIABLE. The following shows examples of host variable names specified with SQL statements and host variable names specified with BIND_VARIABLE:

```
PERFORM DBMS_SQL.PARSE(cursor, 'SELECT emp_name FROM emp WHERE sal > :x', 1);
```

In this example, BIND_VARIABLE will be as follows:

```
PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':x', 3500);
```

Or,

```
PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':x', 3500);
```

- The length of the host variable name can be up to 30 bytes (excluding colons).
- If the data type of the set value is string, specify the effective size of the column value as the fourth argument.
Example

If the data type of the value to be set is not a string:

PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':NO', 1);

If the data type of the value to be set is a string:

PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':NAME', h_memid, 5);

CLOSE_CURSOR
- CLOSE_CURSOR closes the cursor.
- Specify the cursor number to be processed.
- The value returned is a NULL value.

Example

cursor := DBMS_SQL.CLOSE_CURSOR(cursor);

COLUMN_VALUE
- COLUMN_VALUE retrieves the value of the column in the select list extracted with FETCH_ROWS.
- Specify the cursor number to be processed.
- Specify the position of the column of the select list in the SELECT statement. The position of the first column is 1.
- Specify the destination variable name.
- Use a SELECT statement to obtain the values of the value, column_error, and actual_length columns.
- The value column returns the value of the column specified at the column position. The data type of the variable name must match that of the column. If the data type of the column in the SELECT statement specified in PARSE is not compatible with DBMS_SQL, use CAST to convert to a compatible data type.
- The data type of the column_error column is NUMERIC. If the column value could not be set correctly in the value column, a value other than 0 will be returned:
  22001: The extracted string has been truncated
  22002: The extracted value contains a NULL value
- The data type of the actual_length column is INTEGER. If the extracted value is a character type, the number of characters will be returned (if the value was truncated, the number of characters prior to the truncation will be returned), otherwise, the number of bytes will be returned.

Example

When retrieving the value of the column, the error code, and the actual length of the column value:

SELECT value, column_error, actual_length INTO v_memid, v_col_err, v_act_len FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_memid);

When retrieving just the value of the column:

SELECT value INTO v_memid FROM DBMS_SQL.COLUMN_VALUE(cursor, 1, v_memid);
**DEFINE_COLUMN**
- DEFINE_COLUMN defines the column from which values are extracted and the storage destination.
- Specify the cursor number to be processed.
- Specify the position of the column in the select list in the SELECT statement. The position of the first column is 1.
- Specify the destination variable name. The data type should be match with the data type of the column from which the value is to be extracted. If the data type of the column in the SELECT statement specified in PARSE is not compatible with DBMS_SQL, use CAST to convert to a compatible data type.
- Specify the maximum number of characters of character type column values.
- If the data type of the column value is string, specify the effective size of the column value as the fourth argument.

**Example**

When the data type of the column value is not a string:

```sql
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 1, v_memid);
```

When the data type of the column value is a string:

```sql
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 1, v_memid, 10);
```

**EXECUTE**
- EXECUTE executes SQL statements.
- Specify the cursor number to be processed.
- The return value is an INTEGER type, is valid only with INSERT statement, UPDATE statement, and DELETE statement, and is the number of rows processed. Anything else is invalid.

**Example**

```sql
ret := DBMS_SQL.EXECUTE(cursor);
```

**FETCH_ROWS**
- FETCH_ROWS positions at the next row and extracts values from the row.
- Specify the cursor number to be processed.
- The return value is an INTEGER type and is the number of rows extracted. 0 is returned if all are extracted.
- The extracted information is retrieved with COLUMN_VALUE.

**Example**

```sql
LOOP
  IF DBMS_SQL.FETCH_ROWS(cursor) = 0 THEN
    EXIT;
  END IF;
  ...
```
OPEN_CURSOR

- OPEN_CURSOR opens a new cursor.
- The parameter is used for compatibility with Oracle databases only, and is ignored by FUJITSU Enterprise Postgres. An INTEGER type can be specified, but it will be ignored. If migrating from an Oracle database, specify 1.
- Close unnecessary cursors by executing CLOSE_CURSOR.
- The return value is an INTEGER type and is the cursor number.

Example

cursor := DBMS_SQL.OPEN_CURSOR();

PARSE

- PARSE analyzes dynamic SQL statements.
- Specify the cursor number to be processed.
- Specify the SQL statement to be parsed.
- Parameters 1, 2, 3, and 4 are used for compatibility with Oracle databases only, and are ignored by FUJITSU Enterprise Postgres. If you are specifying values anyway, specify the following:
  - Parameter 1 is an INTEGER type. Specify 1.
  - Parameters 2 and 3 are TEXT types. Specify NULL.
  - Parameter 4 is a BOOLEAN type. Specify TRUE.
    If migrating from an Oracle database, the specified values for parameters 2, 3, and 4 do not need to be changed.
- Add a colon to the beginning of host variables in SQL statements.
- The DDL statement is executed when PARSE is issued. EXECUTE is not required for the DDL statement.
- If PARSE is called again for opened cursors, the content in the data regions within the cursors is reset, and the SQL statement is parsed anew.

Example

PERFORM DBMS_SQL.PARSE(cursor, 'SELECT memid, memnm FROM member WHERE memid = :NO', 1);

9.5.3.2 Example

This section explains the flow of DBMS_SQL and provides an example.
Flow of DBMS_SQL

Example

CREATE FUNCTION smp_00()
RETURNS INTEGER
AS $$
DECLARE
    str_sql     VARCHAR(255);
    cursor      INTEGER;
    h_smpid     INTEGER;
    v_smpid     INTEGER;
    v_smpnm     VARCHAR(20);
    v_smpage    INTEGER;
    errcd       INTEGER;
$$
BEGIN
str_sql := 'SELECT smpid, smpnm, smpage FROM smp_tbl WHERE smpid < :H_SMPID ORDER BY smpid';
h_smpid := 3;
v_smpid := 0;
v_smpnm := '';
v_smpage := 0;
cursor := DBMS_SQL.OPEN_CURSOR();
PERFORM DBMS_SQL.PARSE(cursor, str_sql, 1);
PERFORM DBMS_SQL.BIND_VARIABLE(cursor, ':H_SMPID', h_smpid);
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 1, v_smpid);
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 2, v_smpnm, 10);
PERFORM DBMS_SQL.DEFINE_COLUMN(cursor, 3, v_smpage);
ret := DBMS_SQL.EXECUTE(cursor);
loop
  if DBMS_SQL.FETCH_ROWS(cursor) = 0 then
    EXIT;
  end if;
  SELECT value, column_error, actual_length INTO v_smpid, errcd, length FROM
  DBMS_SQL.COLUMN_VALUE(cursor, 1, v_smpid);
  RAISE NOTICE '-----------------------------------------------';
  RAISE NOTICE 'smpid       = %', v_smpid;
  RAISE NOTICE 'errcd       = %', errcd;
  RAISE NOTICE 'length      = %', length;
  SELECT value, column_error, actual_length INTO v_smpnm, errcd, length FROM
  DBMS_SQL.COLUMN_VALUE(cursor, 2, v_smpnm);
  RAISE NOTICE '-----------------------------------------------';
  RAISE NOTICE 'smpnm       = %', v_smpnm;
  RAISE NOTICE 'errcd       = %', errcd;
  RAISE NOTICE 'length      = %', length;
  select value, column_error, actual_length INTO v_smpage, errcd, length FROM
  DBMS_SQL.COLUMN_VALUE(cursor, 3, v_smpage);
  RAISE NOTICE '-----------------------------------------------';
  RAISE NOTICE 'smpage      = %', v_smpage;
  RAISE NOTICE 'errcd       = %', errcd;
  RAISE NOTICE 'length      = %', length;
end loop;
cursor := DBMS_SQL.CLOSE_CURSOR(cursor);
RETURN 0;
END;
$$ LANGUAGE plpgsql;
The application connection switch feature enables automatic connection to the target server when there are multiple servers with redundant configurations.

When using this feature, specify the primary server and secondary server as the connected servers in the application connection information.

If an application connection switch occurs, explicitly close the connection and then reestablish the connection or reexecute the application. Refer to “Errors when an Application Connection Switch Occurs and Corresponding Actions” of the relevant client interface for information on how to confirm the switch.

10.1 Connection Information for the Application Connection Switch Feature

To use the application connection switch feature, set the information shown below when connecting the database.

**IP address or host name**
Specify the IP address or host name that will be used to configure the database multiplexing system.

**Port number**
A port number used by each database server to listen for connections from applications.
In each client interface, multiple port numbers can be specified, however in the format shown below, for example, if only one port number is specified, it will be assumed that host1: 27500 (the default value) and host2:port2 were specified.
host1,host2:port2
Omit all port numbers, or specify only one per server.

**Target server**
From the specified connection destination server information, specify the selection sequence of the servers to which the application will connect. The values specified for the target server have the meanings shown below. If a value is omitted, “any” will be assumed if the JDBC driver is used, or “primary server” otherwise.

**Primary server**
The primary server is selected as the connection target from the specified “IP addresses or host names”. Specify this to perform tasks that can be performed only on the primary server, such as applications in line with updates, or management tasks such as REINDEX and VACUUM.

**Standby server (this value can be used only when the JDBC driver is used)**
The standby server is selected as the connection target from the specified “IP addresses or host names”. On standby server, the update will always fail. If the target server is not standby, the JDBC driver will throw an error stating that it is unable to find a server with the specified targetServerType.

**Priority given to a standby server**
The standby server is selected preferentially as the connection target from the specified “IP addresses or host names”. If there is no standby server, the application will connect to the primary server.

**Any (this value can be used only when the JDBC driver is used)**
This method is not recommended in database multiplexing systems. This is because, although the connection destination server is selected in the specified sequence from the specified “IP addresses or host names”, if the server that was successfully connected to first is the standby server, the update will always fail.

The table below shows the server selection order values to set for each driver:

<table>
<thead>
<tr>
<th>Server selection order</th>
<th>JDBC driver</th>
<th>Drivers other than JDBC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary server</td>
<td>&quot;master&quot;</td>
<td>&quot;primary&quot;</td>
</tr>
<tr>
<td>Standby server</td>
<td>&quot;slave&quot;</td>
<td>-</td>
</tr>
</tbody>
</table>
**Server selection order**

<table>
<thead>
<tr>
<th>Priority given to a standby server</th>
<th>JDBC driver</th>
<th>Drivers other than JDBC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefer Slave</td>
<td>&quot;preferSlave&quot;</td>
<td>&quot;prefer_standby&quot;</td>
</tr>
<tr>
<td>Any</td>
<td>&quot;any&quot;</td>
<td>-</td>
</tr>
</tbody>
</table>

**SSL server certificate Common Name (CN)**

To perform SSL authentication by creating the same server certificate for each server in a multiplexing system, specify the SSL server certificate Common Name (CN) in this parameter. Accordingly, SSL authentication using the CN can be performed without having to consider the names of the multiple servers contained in the multiplexing system.

## 10.2 Using the Application Connection Switch Feature

This section explains how to set the connection destination server using the application connection switch feature.

Of the parameters used as connection information for each client interface, only the parameters specific to the application connection switch feature are explained here. Refer to "Setup" and "Connecting to the Database" for information on the other parameters of each client interface.

### 10.2.1 Using the JDBC Driver

Set the following information in the connection string of the DriverManager class, or in the data source.

**Table 10.1 Information to be set**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1, host2</td>
<td>Specify the IP address or host name.</td>
</tr>
<tr>
<td>port1, port2</td>
<td>Specify the port number for the connection. The port number can be omitted.</td>
</tr>
<tr>
<td>database_name</td>
<td>Specify the database name.</td>
</tr>
<tr>
<td>targetServerType</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>sslmode</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows: disable: Connect without SSL require: Connect always with SSL verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1) verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>sslservercertcn</td>
<td>This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", the CA certificate file can be specified using connection string sslrootcert.

**When using Driver Manager**

Specify the following URL in the API of the DriverManager class:

```java
jdbc:postgresql://host1[:port1],host2[:port2]/dbName?[targetServerType={master | slave | preferSlave | any}][&sslmode=verify-full][&sslrootcert=CACertificateFile][&sslservercertcn=targetServerCertificateCN]
```
If the target server is omitted, the default value "any" is used.

- When using IPV6, specify the host in the "[host]" (with square brackets) format.

[Example]
```
jdbc:postgresql://[2001:Db8::1234]:27500,192.168.1.1:27500/
```

targetName

When using the data source

Specify the properties of the data source in the following format:
```
source.setServerName("host1[:port1], host2[:port2]");
source.setTargetServerType("master");
source.setSslmode("verify-full");
source.setSslrootcert("cACertificateFile");
source.setSsslservercertcn("targetServerCertificateCN");
```

- If the port number is omitted, the value specified in the portNumber property will be used. Also, if the portNumber property is omitted, the default is 27500.
- If the target server is omitted, the value will be "any".
- When using IPV6, specify the host in the "[host]" (with square brackets) format.

[Example]
```
source.setServerName("[2001:Db8::1234]:27500,192.168.1.1:27500");
```

Note

If using the connection parameter loginTimeout, the value will be applied for the time taken attempting to connect to all of the specified hosts.

10.2.2 Using the ODBC Driver

Set the following information in the connection string or data source.

Table 10.2 Information to be set

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Servername</td>
<td>Specify IP address 1 and IP address 2, or the host name, using a comma as the delimiter. Based on ODBC rules, it is recommended to enclose the whole string containing comma delimiters with {}. Format: {host1,host2}</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter. Based on ODBC rules, it is recommended to enclose the whole string containing comma delimiters with {}. Format: {port1,port2} Specify the port number corresponding to the IP address or host specified for the nth Servername as the nth Port. The port number can be omitted. If omitted, the default is 27500. If n server names are specified, the (n+1)th and later ports will be ignored.</td>
</tr>
<tr>
<td>TargetServer</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Explanation</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SSLMode</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for SSLMode are as follows:</td>
</tr>
<tr>
<td></td>
<td>disable: Connect without SSL</td>
</tr>
<tr>
<td></td>
<td>allow: Connect without SSL, and if it fails, connect with SSL</td>
</tr>
<tr>
<td></td>
<td>prefer: Connect with SSL, and if it fails, connect without SSL</td>
</tr>
<tr>
<td></td>
<td>require: Connect always with SSL</td>
</tr>
<tr>
<td></td>
<td>verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1)</td>
</tr>
<tr>
<td></td>
<td>verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>SSLServerCertCN</td>
<td>This parameter is enabled only to perform SSL authentication (SSLMode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in Servername.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT of your operating system to specify the CA certificate file as shown below.

Example)  
Variable name: PGSSLROOTCERT  
Variable value: cACertificateFile

When specifying a connection string  
Specify the following connection string:

```
...;Servername={host1,host2};Port={port1, port2};[TargetServer=\{primary | prefer_standby\}];[SSLMode=verify-full;SSLServerCertCN=targetServerCertificateCN]...
```

- When using IPV6, specify the host in the "host" format.

  `[Example]`

  ```
  Servername=(2001:Db8::1234,192.168.1.1);Port={27500,27500};
  ```

When using the data source  
Specify the properties of the data source in the following format:

```
Servername={host1,host2}  
Port={port1, port2}  
TargetServer={primary | prefer_standby}  
SSLMode=verify-full  
SSLServerCertCN=targetServerCertificateCN
```

- When using IPV6, specify the host in the "host" format.

  `[Example]`

  ```
  Servername=(2001:Db8::1234,192.168.1.1)  
  ```

Registering the data source using the ODBC Data Source Administrator  
Using the ODBC Data Source Administrator, specify the items within the red border below:
Note

If using the connection parameter login_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the login_timeout value elapses.

10.2.3 Using a .NET Data Provider

Set the following information in the connection string of NpgsqlConnection, or in the data source.

Table 10.3 Information to be set

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1</td>
<td>Specify the IP address or host name.</td>
</tr>
<tr>
<td>host2</td>
<td></td>
</tr>
<tr>
<td>port1</td>
<td>Specify the port number for the connection.</td>
</tr>
<tr>
<td>port2</td>
<td></td>
</tr>
<tr>
<td>targetServer</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
</tbody>
</table>

When specifying a connection string

Specify the following connection string:

```
host1[:port1],host2[:port2];[targetServer={primary | prefer_standby }];
```
- If the port number is omitted from the host string, the value specified for the Port keyword of the connection string will be used. Refer to "4.3.4 Connection String" for information on the Port keyword.

- If the target server is omitted, the value will be primary.

- When using IPV6, specify the host in the "[host]" (with square brackets) format.

  [Example]
  
  host=[2001:Db8::1234]:27500,192.168.1.1:27500;

When specifying the NpgsqlConnectionStringBuilder property, or adding a connection in TableAdapter

Specify the Host property of the data source in the following format:

host1[:port1],host2[:port2]

- If the port number is omitted from the host string, the value specified in the Port property will be used. Also, if the Port property is omitted, the default is 27500.

Specify the TargetServer property of the data source in the following format:

TargetServer.primary | TargetServer.prefer_standby

- If the target server is omitted, the value will be primary.

---

**Note**

If using the connection parameter Timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the Timeout value elapses.

### 10.2.4 Using a Connection Service File

Set the connection parameters as follows.

**Table 10.4 Information to be set**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Specify the host names, using a comma as the delimiter.</td>
</tr>
<tr>
<td>hostaddr</td>
<td>Specify IP address 1 and IP address 2, using a comma as the delimiter.</td>
</tr>
<tr>
<td>port</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter.</td>
</tr>
<tr>
<td></td>
<td>Specify the port number for the server specified for the nth host or hostaddr as the nth port.</td>
</tr>
<tr>
<td></td>
<td>The port number can be omitted. If omitted, the default is 27500.</td>
</tr>
<tr>
<td></td>
<td>If n server names are specified, the (n+1)th and later ports will be ignored.</td>
</tr>
<tr>
<td>target_server</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>sslmode</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows:</td>
</tr>
<tr>
<td></td>
<td>disable: Connect without SSL</td>
</tr>
<tr>
<td></td>
<td>allow: Connect without SSL, and if it fails, connect with SSL</td>
</tr>
<tr>
<td></td>
<td>prefer: Connect with SSL, and if it fails, connect without SSL</td>
</tr>
<tr>
<td>Parameter</td>
<td>Explanation</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>require:</td>
<td>Connect always with SSL</td>
</tr>
<tr>
<td>verify-ca:</td>
<td>Connect with SSL, using a certificate issued by a trusted CA (*1)</td>
</tr>
<tr>
<td>verify-full:</td>
<td>Connect with SSL, using a certificate issued by a trusted CA to verify if</td>
</tr>
<tr>
<td></td>
<td>the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>sslservercertcn</td>
<td>This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT (connection parameter sslrootcert) of your operating system to specify the CA certificate file as shown below.

Example)
Variable name: PGSSLROOTCERT
Variable value: cACertificateFile

---

**Note**

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

---

**Point**

If using the C Library, embedded SQL or psql commands (including other client commands that specify connection destinations), it is recommended to use a connection service file to specify connection destinations.

In the connection service file, a name (service name) is defined as a set, comprising information such as connection destination information and various types of tuning information set for connections. By using the service name defined in the connection service file when connecting to databases, it is no longer necessary to modify applications when the connection information changes.

---

### 10.2.5 Using the C Library (libpq)

It is recommended that you use a connection service file. Refer to "10.2.4 Using a Connection Service File" for details.

If a connection service file will not be used, set the following information for the database connection control functions (PQconnectdbParams, PQconnectdb, and so on) or environment variables.

**Table 10.5 Information to be set**

<table>
<thead>
<tr>
<th>Parameter (environment variable name)</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host(PGHOST)</td>
<td>Specify the host names, using a comma as the delimiter.</td>
</tr>
<tr>
<td>hostaddr(PGHOSTADDR)</td>
<td>Specify IP address 1 and IP address 2, using a comma as the delimiter.</td>
</tr>
<tr>
<td>port(PGPORT)</td>
<td>Specify the connection destination port numbers, using a comma as the</td>
</tr>
<tr>
<td></td>
<td>delimiter. Specify the port number for the server specified for the nth</td>
</tr>
<tr>
<td></td>
<td>host or hostaddr as the nth port.</td>
</tr>
<tr>
<td></td>
<td>The port number can be omitted. If omitted, the default is 27500.</td>
</tr>
<tr>
<td></td>
<td>If n server names are specified, the (n+1)th and later ports will be</td>
</tr>
<tr>
<td></td>
<td>ignored.</td>
</tr>
<tr>
<td>Parameter (environment variable name)</td>
<td>Explanation</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>target_server(PGXTARGETSERVER)</code></td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td><code>sslmode(PGSSLMODE)</code></td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows: disable: Connect without SSL allow: Connect without SSL, and if it fails, connect with SSL prefer: Connect with SSL, and if it fails, connect without SSL require: Connect always with SSL verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1) verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td><code>sslservercertcn(PGXSSLSERVERCERTCN)</code></td>
<td>This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT (connection parameter sslrootcert) of your operating system to specify the CA certificate file as shown below.

Example)
Variable name: PGSSLROOTCERT
Variable value: cACertificateFile

When using URI

```
postgresql://host1[:port1],host2[:port2],[...]/database_name
[?target_server={primary | prefer_standby}]
```

- When using IPV6, specify the host in the "[host]" (with square brackets) format.

  Example]

```
postgresql://postgres@[2001:Db8::1234]:27500,192.168.1.1:27500/database_name
```

When using key-value

```
host=host1[,host2] port=port1[,port2] user=user1 password=pwd1 dbname=mydb
[target_server={primary | prefer_standby}]
```

- When using IPV6, specify the host in the "host" format.

  Example]

```
host=2001:Db8::1234,192.168.1.1 port=27500,27500
```
Note

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

Information

If using a password file (.pgpass), describe the entries matching each server.

- Example 1:
  ```
  host1:port1:dbname:user:password
  host2:port2:dbname:user:password
  ```

- Example 2:
  ```
  *:port:dbname:user:password
  ```

10.2.6 Using Embedded SQL

It is recommended that you use a connection service file. Refer to "10.2.4 Using a Connection Service File" for details.

Point

If using a connection service file, either of the following methods is available:

- Set the service name as a string literal or host variable, as follows:
  ```
  tcp:postgresql://?service=my_service
  ```

- Set the service name in the environment variable PGSERVICE, and use CONNECT TO DEFAULT

If a connection service file will not be used, use a literal or variable to specify the connection destination server information for target in the SQL statement below:

```sql
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name];
```

Method used

```sql
dbname@host1,host2[:[port1][,port2]]
tcp:postgresql://host1,host2[:[port1][,port2]] [/dbname] [?target_server={primary | prefer_standby}] [sslmode=verify-full&sslservercertcn=targetServerCertificateCN]
```

- The above format cannot be specified directly without using a literal or variable.

Table 10.6 Information to be set

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1</td>
<td>Specify the IP address or host name. IPv6 format addresses cannot be specified.</td>
</tr>
<tr>
<td>host2</td>
<td></td>
</tr>
<tr>
<td>port1</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter. The port number can be omitted. If omitted, the default is 27500.</td>
</tr>
<tr>
<td>port2</td>
<td></td>
</tr>
<tr>
<td>dbname</td>
<td>Specify the database name.</td>
</tr>
</tbody>
</table>
**Argument**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_server</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
</tbody>
</table>
| sslmode | Specify this to encrypt communications. By default, this is disabled. The setting values for sslmode are as follows:  
- disable: Connect without SSL  
- allow: Connect without SSL, and if it fails, connect with SSL  
- prefer: Connect with SSL, and if it fails, connect without SSL  
- require: Connect always with SSL  
- verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1)  
- verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1) |
| sslservercertcn | This parameter is enabled only to perform SSL authentication (sslmode=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host. |

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT (connection parameter sslrootcert) of your operating system to specify the CA certificate file as shown below.

Example)  
Variable name: PGSSLROOTCERT  
Variable value: cACertificateFile

**Point**

Environment variables can also be used. Refer to "10.2.5 Using the C Library (libpq)" for information on environment variables.

**Note**

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

### 10.2.7 Using the psql Command

It is recommended that you use a connection service file. Refer to "10.2.4 Using a Connection Service File" for details.

If a connection service file will not be used, specify the following information in the psql command option/environment variable.

**Table 10.7 Information to be set**

<table>
<thead>
<tr>
<th>Option (environment variable)</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| -h/--host(PGHOST/PGHOSTADDR) | Specify IP address 1 and IP address 2, or the host name, using a comma as the delimiter.  
This can also be specified for the environment variable PGHOST or PGHOSTADDR. |
<table>
<thead>
<tr>
<th>Option (environment variable)</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>-p/--port(PGPORT)</td>
<td>Specify the connection destination port numbers, using a comma as the delimiter. This can also be specified for the environment variable PGPORT. Specify the port number corresponding to the IP address specified for the nth -h option as the nth -p option. The port number can be omitted. If omitted, the default is 27500. If n -h options are specified, the (n+1)th and later -p options will be ignored.</td>
</tr>
<tr>
<td>(PGXTARGETSERVER)</td>
<td>Specify the selection sequence of the servers to which the application will connect. Refer to &quot;Target server&quot; for details.</td>
</tr>
<tr>
<td>(PGSSLMODE)</td>
<td>Specify this to encrypt communications. By default, this is disabled. The setting values for PGSSLMODE are as follows: disable: Connect without SSL allow: Connect without SSL, and if it fails, connect with SSL prefer: Connect with SSL, and if it fails, connect without SSL require: Connect always with SSL verify-ca: Connect with SSL, using a certificate issued by a trusted CA (*1) verify-full: Connect with SSL, using a certificate issued by a trusted CA to verify if the server host name matches the certificate (*1)</td>
</tr>
<tr>
<td>(PGXSSLSERVERCERT CN)</td>
<td>This environment variable is enabled only to perform SSL authentication (PGSSLMODE=verify-full). Specify the server certificate CN. If this is omitted, the value will be null, and the server certificate CN will be authenticated using the host name specified in host.</td>
</tr>
</tbody>
</table>

*1: If specifying either "verify-ca" or "verify-full", use the system environment variable PGSSLROOTCERT (connection parameter sslrootcert) of your operating system to specify the CA certificate file as shown below.

Example)
Variable name: PGSSLROOTCERT
Variable value: cACertificateFile

Note

If using the connection parameter connect_timeout, this value is applied for connections to each of the specified hosts. If both multiplexed database servers have failed, the connection will time out when a time equal to double the connect_timeout value elapses.

Information

Use the same method as for psql commands to specify connection destination server information for other client commands used to specify connection destinations.
Chapter 11 Performance Tuning

This chapter explains how to tune application performance.

11.1 Enhanced Query Plan Stability

By stabilizing the SQL statement query plan so that it does not change, deterioration of the application performance is suppressed.

11.1.1 Optimizer Hints

This section explains the basic feature content of the optimizer hint (pg_hint_plan).

Refer to the open-source software webpage for information on pg_hint_plan.

In FUJITSU Enterprise Postgres, the optimizer hints can be specified in all application interfaces.

Description

You can specify a query plan in each SQL statement.

List of Features

The main query plans that can be specified using this feature are as follows:

- Query methods
- Join methods
- Join sequences

Query methods

Specify which method to use to query the specified table.

The main features are as follows:

- SeqScan (tableName)
- BitMapScan (tableName [indexName ... ])
- IndexScan (tableName [indexName ... ])
- IndexOnlyScan (tableName [indexName ... ])

Note

- If the specified index does not exist, or is not related to the search condition column specified in the WHERE clause, for example, SeqScan will be used.
- Even if IndexOnlyScan is specified, IndexScan may be used if it is necessary to access the table because a row was updated, for example.
- If multiple query methods were specified for the same table, the method specified last will be used.

Join methods

Specify the join method.

The main features are as follows:

- NestLoop (tableName tableName [tableName ... ])

- 119 -
Join sequences
The tables will be joined in the specified table sequence.
Specify the information using the following method:
- Leading ((table table))
  The method used to specify [table] is as follows:
  table = tableName or ( table table )

Note
If multiple sequences were specified for the same table combination, the sequence specified last will be used.

Usage method
The use of this feature is explained below.

Preparation
The following preparation is required to use this feature.
1. Run CREATE EXTENSION for the database that uses this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

   Example
   Postgres=# CREATE EXTENSION pg_hint_plan;
   CREATE EXTENSION

   Information
   Hereafter, also perform this preparatory task for the "template1" database when creating a new database, so that this feature can be used by default.
   2. Set the postgresql.conf file parameters.
      Add "pg_hint_plan" to the "shared_preload_libraries" parameter.
   3. Restart FUJITSU Enterprise Postgres.

Method used to define this feature
Define this feature by specifying the format (block comment) " /*+ ... */".
- To specify hint clauses in each SELECT statement, for example when there are multiple SELECT statements in the SQL statement, define all hint clauses in the first block comment.

**Example**

Specifying hint clauses for the emp table and the dept table

```
WITH /*+ IndexScan(emp emp_age_index) IndexScan(dept dept_deptno_index) */ age30
AS (SELECT * FROM emp WHERE age BETWEEN 30 AND 39)
SELECT * FROM age30, dept WHERE age30.deptno = dept.deptno;
```

- To specify separate hint clauses for the same object in the SQL statement, define aliases in each object, and then specify hint clauses for those aliases.

**Example**

Specifying separate hint clauses for the emp table

```
WITH /*+ SeqScan(ta) IndexScan(tb) */ over100
AS (SELECT empno FROM emp ta WHERE salary > 1000000)
SELECT * FROM emp tb, over100 WHERE tb.empno = over100.empno AND tb.age < 30
```

- When using embedded SQL in C, the locations in which the hint clause block comment is specified are restricted. Refer to "6.4.2 Compiling Applications" for details.

**Usage notes**

- If a hint clause was specified in multiple block comments in the SQL statement, the hint clause specified in the second block comment and thereafter will be ignored.

- If characters other than those listed below appear before the hint clause in the SQL statement, they will be invalid even for hint clause block comments.
  - Space, tab, line feed
  - Letter (uppercase and lowercase), number
  - Underscore, comma
  - Brackets ()

### 11.1.2 Locked Statistics

This section explains the basic feature content for locked statistics (pg_dbms_stats).

Refer to the open-source software webpage for information on pg_dbms_stats.

#### Description

Locks the statistics.

By using this feature to lock the statistics for performance obtained in job load testing in an environment that simulates a production environment, performance degradation caused by changes to the query plan after go-live can be suppressed.

Additionally, by using the export and import features, statistics that were checked in the test environment can also be reproduced in the production environment.

#### List of Features

The main features that can be specified using this feature are as follows.

[Features]
<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock/unlock of the statistics</td>
<td>Lock</td>
<td>Locks the statistics.</td>
</tr>
<tr>
<td></td>
<td>Unlock</td>
<td>Unlocks the statistics.</td>
</tr>
<tr>
<td>Backup/restore of the statistics</td>
<td>Backup</td>
<td>Backs up the current statistics.</td>
</tr>
<tr>
<td></td>
<td>Restore</td>
<td>Restores the statistics to the point when they were backed up, and then locks them.</td>
</tr>
<tr>
<td></td>
<td>Purge</td>
<td>Deletes backups that are no longer necessary.</td>
</tr>
<tr>
<td>Backup/restore using external files</td>
<td>Export</td>
<td>Exports the statistics (binary format).</td>
</tr>
<tr>
<td></td>
<td>Import</td>
<td>Imports the statistics, and then locks them.</td>
</tr>
</tbody>
</table>

### Target object

<table>
<thead>
<tr>
<th>Target resource</th>
<th>Range of feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>In the database</td>
</tr>
<tr>
<td>Schema</td>
<td>In the schema</td>
</tr>
<tr>
<td>Table</td>
<td>In the table</td>
</tr>
<tr>
<td>Column</td>
<td>ID column</td>
</tr>
</tbody>
</table>

### Usage method

The use of this feature is explained below.

#### Preparation

The following preparation is required to use this feature.

1. Run `CREATE EXTENSION` for the database that will use this feature.
   - The target database is described as "postgres" here.
   - Use the psql command to connect to the "postgres" database.

```
Example

Postgres=# CREATE EXTENSION pg_dbms_stats;
CREATE EXTENSION
```

#### Information

Hereafter, also perform this preparatory task for the "template1" database, so that this feature can be used by default when creating a new database.

2. Set the postgresql.conf file parameter.
   - Add "pg_dbms_stats" to the "shared_preload_libraries" parameter.
3. Restart FUJITSU Enterprise Postgres.

### Method used to specify this feature

Specify this feature as an SQL function.

The methods used to specify the main features are shown in the table below.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Object</th>
<th>Function specified</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Lock</strong></td>
<td>Database</td>
<td><code>dbms_stats.lock_database_stats()</code></td>
</tr>
<tr>
<td></td>
<td>Schema</td>
<td><code>dbms_stats.lock_schema_stats('schemaName')</code></td>
</tr>
<tr>
<td></td>
<td>Table</td>
<td><code>dbms_stats.lock_schema_stats('schemaName.tableName')</code></td>
</tr>
<tr>
<td><strong>Unlock</strong></td>
<td>Database</td>
<td><code>dbms_stats.unlock_database_stats()</code></td>
</tr>
<tr>
<td></td>
<td>Schema</td>
<td><code>dbms_stats.unlock_schema_stats('schemaName')</code></td>
</tr>
<tr>
<td></td>
<td>Table</td>
<td><code>dbms_stats.unlock_schema_stats('schemaName.tableName')</code></td>
</tr>
<tr>
<td><strong>Import</strong></td>
<td>Database</td>
<td><code>dbms_stats.import_database_stats('fullPathOfExportedFile')</code></td>
</tr>
<tr>
<td><strong>Backup</strong></td>
<td>Database</td>
<td><code>dbms_stats.backup_database_stats('commentUsedForIdentification')</code></td>
</tr>
</tbody>
</table>
| **Restore** | Database | `[Format 1]`<br>`dbms_stats.restore_database_stats('timestamp')`<br>**[Timestamp]**<br>Say in the same format as the time column of the backup history table. Backups earlier than the specified time will be restored.  
[Format 2]<br>`dbms_stats.restore_stats(backupId)`<br>**[Backup ID]**<br>Specify a value in the id column of the backup_history table. The specified backup will be restored. |
| **Purge** | Backup | `dbms_stats.purge_stats(backupId, flagUsedForDeletion)`<br>**[Backup ID]**<br>Specify a value in the id column of the backup_history table.  
**[Flag used for deletion]**
true: The target backup is forcibly deleted.  
false: The target backup is deleted only when there are also backups for the entire database. |

Remark 1: The export feature is executed using the COPY statement, not the SQL function.

---

**Example**

**Example 1: Locking the statistics of the entire database**

```sql
userdb=# SELECT dbms_stats.lock_database_stats();
lock_database_stats
-----------------------
tbl1
tbl1_pkey
```

Note that the locked information can be referenced as follows:

```sql
userdb=# select relname from dbms_stats.relation_stats_locked;
relname
-----------------------
tbl1
tbl1_pkey
```

**Example 2: Unlocking the statistics of the entire database**
Example 3: Backing up the statistics of the entire database

```
userdb=# SELECT dbms_stats.backup_database_stats('backup1');
backup_database_stats
-----------------------
 1                  
```

Note that the backed up statistics can be referenced as follows:

```
userdb=# select id,comment,time,unit from dbms_stats.backup_history;
id | comment  |             time              | unit
----+----------+-------------------------------+------
 1 | backup1  | 2014-03-04 11:08:40.315948+09 | d    
```

The ID:1 backup "backup1" is obtained for each database at "2014-03-04 11:08:40.315948+09".

[Meaning of unit] d: database s: schema t: table c: column

Example 4: Exporting the statistics of the entire database

```
$ psql -d userdb -f export.sql
BEGIN
COMMIT
```

`export.sql` is the file in which the COPY statement is defined.

Refer to "export_effective_stats-9.4.sql_sample" for information on the content of the COPY statement.

"export_effective_stats-9.4.sql_sample" is stored as follows:

`fujitsuEnterprisePostgresInstallDir/share/doc/extension`

Example 5: Importing the statistics of the entire database

```
$ psql -d userdb -c "SELECT dbms_stats.import_database_stats ('$PWD/export_stats.dmp')"
import_database_stats
-----------------------
(1 row)
```

Usage notes

- You must run the ANALYZE command once for the target tables of this feature. If the ANALYZE command is not run, the statistics cannot be locked.
  Refer to "SQL Commands" in "Reference" in the PostgreSQL Documentation for information on the ANALYZE command.

- To use this feature to delete an object that has locked the statistics, use the unlock feature to delete the object lock information first.

- This feature does not specify the statistics value directly. It reproduces the status that has actually occurred. For this reason, if the text format is specified in the COPY statement when the export occurs, restore will not be possible. Always use the binary format when performing the export.
This chapter describes scanning using a VCI.

**Note**

This feature can only be used in Advanced Edition.

### 12.1 Operating Conditions

Faster aggregation can be achieved by using a VCI defined for all columns to be referenced.

This section describes the conditions under which a scan can use a VCI.

Whether to use VCI is determined based on cost estimation in the same way as normal indexes. Therefore, another execution plan will be selected if it is cheaper than a VCI even if a VCI is available.

#### SQL statements that can use VCIs

In addition to general SELECT statements, VCIs can be used for the SQL statements below (as long as they do not specify any of the elements listed in "SQL statements that cannot use VCIs" below):

- SELECT INTO
- CREATE TABLE AS SELECT
- CREATE MATERIALIZED VIEW ... AS SELECT
- CREATE VIEW ... AS SELECT
- COPY (SELECT ...) TO

#### SQL statements that cannot use VCIs

VCIs cannot be used for SQL statements that specify any of the following:

- Subquery to reference the column in which the parent query is referencing is specified
- Lock clause (such as FOR UPDATE)
- Cursor declared with WITH HOLD or scrollable
- SERIALIZABLE transaction isolation level
- Function or operator listed in "Functions and operators that do not use a VCI"
- User-defined function

#### Table 12.1 Functions and operators that cannot use VCIs

<table>
<thead>
<tr>
<th>Classification</th>
<th>Function/operator</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

### 12.2 Usage

This section describes how to use a VCI in line with the following steps:

1. **Designing**
   - Determine execution multiplicity/number of parallel processes and parameters

2. **Checking**
   - Check the behavior of the target SQL statement

3. **Evaluating**
   - Tune (if necessary)
### 12.2.1 Designing

Design as follows before using a VCI.

- **Execution multiplicity and number of parallel processes**

**Parameters**

**Execution multiplicity and number of parallel processes**

Determine the maximum number of SQL statements that can be executed simultaneously and the number of parallel processes based on the number of CPU cores that can be allocated for scans that use VCI to perform aggregate processing. Design in advance the multiplicity of SQL statements for executing scans that use VCI and the number of parallel processes for scans that use VCI.

For example, if the number of CPUs that can be allocated is 32 cores, then the maximum number of SQL statements that can be executed simultaneously is 8 and the number of parallel processes is 4.

**Note**

A temporary file is created in /dev/shm as the dynamic shared memory for each SQL statement during a scan using a VCI. A temporary file is created in a directory under the data storage directory or in a directory specified for the vci.smc_directory parameter as the dynamic shared memory for each SQL statement during a scan using a VCI.

Ensure that this directory has sufficient space to meet the memory requirements estimated for the execution multiplicity and number of parallel processes of SQL statements (refer to "Memory used per scanning" in "VCI Memory Requirements" in the Installation and Setup Guide for Server for details). If it does not have sufficient space when a scan is performed, SQL statements will return errors due to the insufficient memory.

**Parameters**

The VCI parallel scan feature cannot be used for setting parameters immediately after creating an instance. Therefore, set the parameters below based on the values determined in "Execution multiplicity and number of parallel processes of SQL statements" above.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Default</th>
<th>Value index</th>
</tr>
</thead>
<tbody>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of VCI parallel processes (background processes) to be used per SQL statement.</td>
<td>0</td>
<td>Specify the number of parallel processes.</td>
</tr>
<tr>
<td>vci.smc_directory</td>
<td>Directory name in which a temporary file is created as the dynamic shared memory during a scan using a VCI.</td>
<td>A directory (dataStorageDir\base\pgsql_tmp) under the data storage directory</td>
<td>Specify a directory that has enough free space for the memory used for each query during the scan.</td>
</tr>
<tr>
<td>max_worker_processes</td>
<td>Maximum number of background processes that the system supports.</td>
<td>8</td>
<td>Add the value of the maximum number of SQL statements that can be executed simultaneously for scans that use VCI</td>
</tr>
</tbody>
</table>
### 12.2.2 Checking

Execute the SQL statement with "EXPLAIN ANALYZE" to check the following:

- If a VCI was used
  "Custom Scan (VCI...)" is displayed in the plan if a VCI was used.
- Number of parallel processes
  The number of parallel processes when the SQL statement is executed is displayed in "Allocated Workers". Check that it is running the designed number of parallel processes.
- Response
  Check if the execution time displayed in "Execution time" is as estimated.

The following shows an example of the output result of EXPLAIN ANALYZE:

```sql
EXPLAIN ANALYZE SELECT COUNT(*) FROM test WHERE x > 10000;
```

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Default</th>
<th>Value index</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>multiplied by vci.max_parallel_degree.</td>
</tr>
</tbody>
</table>

#### Note

A cost output by the execution plan that uses a VCI may be inaccurate. A VCI works if all or part of the best execution plan when the SQL statement was executed is replaced with an execution plan that uses a VCI. If the cost of the execution plan to be replaced is lower than a certain value (vci.cost_threshold parameter), it will not be replaced nor recalculated. Therefore, the cost of the original execution plan is output as is.

### 12.2.3 Evaluating

If the results in "12.2.2 Checking" is any of the following, tune accordingly:

If a VCI is not used
- Check if the "12.1 Operating Conditions" are met.
- Check if vci.enable is set to "off".
- A VCI may not be appropriately used when statistics are outdated, such as immediately after inserting a large amount of data. In such cases, execute the VACUUM ANALYZE statement or the ANALYZE statement.
A VCI is not used if there is insufficient memory for VCI scan. This may occur during time-consuming transactions involving tables for which VCIs were defined. Set vci.log_query to "on", and check if either "could not use VCI: local ROS size (%zu) exceeds limit (%zu)" or "out of memory during local ROS generation" is output. If it is, then increase the value of the vci.max_local_ros.

Response is not as expected
Tuning may improve response. Check the following:
- If vci.max_parallel_degree is not set or is set to 0, set an appropriate value according to "12.2.1 Designing".
- If there is a margin in the CPU usage, increase the value of vci.max_parallel_degree and check again. In addition, if the value that of max_worker_processes is lower than the maximum number of SQL statements that can be executed simultaneously for parallel scan multiplied by vci.max_parallel_degree, increase it and check again.

12.3 Usage Notes
This section provides notes on using VCI.
- Regardless of whether VCI is used, the content of the result does not change. However, records may be returned in a different order if the ORDER BY clause is not specified.
- To reduce resource consumption, edit postgresql.conf or use the SET statement to enable/disable vci.enable when you use this feature only for specific times or jobs (SQL applications).
- The optimizer hint (pg_hint_plan) cannot be specified for a VCI. The hint clause is ignored if it is specified.
- If a plan other than VCI is specified for the optimizer hint (pg_hint_plan), a VCI may be used. Therefore, if you specify a query plan with the hint clause, use the SET statement to set vci.enable to "off".
- The message below may be output when a scan that uses VCI is performed on the streaming replication standby server:

```
"LOG: recovery has paused"
"HINT: Execute pg_xlog_replay_resume() to continue."
```

This message is output because application of the WAL to the VCI temporarily pauses due to the scan being performed.
- Even if a scan is performed using a VCI, information in the idx_scan, idx_tup_read, and idx_tup_fetch columns of the collected statistics views, pg_stat_all_indexes and pg_stat_user_indexes, will not be updated.
Appendix A Precautions when Developing Applications

This appendix describes precautions when developing applications with FUJITSU Enterprise Postgres.

A.1 Precautions when Using Functions and Operators

This section describes notes for using functions and operators.

A.1.1 General rules of Functions and Operators

This section describes general rules for using functions and operators. Ensure the general rules are followed when using functions and operators to develop applications.

General rules

- Specify the stated numbers for arguments when specifying numbers for arguments in functions.
- Specify the stated data types when specifying data types for functions. If you use a data type other than the stated data types, use CAST to explicitly convert the data type.
- Specify data types that can be compared when specifying data types for operators. If you use a data type that cannot be compared, use CAST to explicitly convert the data type.

See

Refer to “Functions and Operators” under “The SQL Language” in the PostgreSQL Documentation for information on the functions and operators available with FUJITSU Enterprise Postgres.

A.1.2 Errors when Developing Applications that Use Functions and/or Operators

This section provides examples of problems that may occur when developing applications that use functions and/or operators, and describes how to deal with them.

The error "Function ***** does not exist" occurs when executing SQL

The following error will occur when executing an SQL statement that does not abide by the general rules for functions:

```
ERROR:  Function ***** does not exist
```

Note: "*****" denotes the function for which the error occurred, and the data type of its arguments.

The cause of the error will be one of the following:

- The specified function does not exist.
- The wrong number of arguments or wrong argument data type was specified

Corrective action

Check the following points and correct any errors:

- Check if there are any errors in the specified function name, number of arguments, or argument data type, and revise accordingly.
- Check the argument data type of the function displayed in the message. If an unintended data type is displayed, use a function such as CAST to convert it.
The error "Operator does not exist" occurs when executing SQL

The following error will occur when executing an SQL statement that specifies a data type in the operator that cannot be compared:

```
ERROR:  Operator does not exist: *****
```

Note: "*****" denotes the operator for which the error occurred, and the data type of the specified value.

Corrective action

Ensure the data type of the expressions specified on the left and right sides of the operator can be compared. If required, revise to ensure these data types can be compared by using a function such as CAST to explicitly convert them.

A.2 Notes when Using Temporary Tables

In standard SQL, a temporary table can be defined in advance to enable an empty temporary table to be created automatically when the application connects to the database. However, in FUJITSU Enterprise Postgres, a temporary table must be created when the application connects to the database by explicitly using the CREATE TABLE statement.

If the same temporary table is repeatedly created and deleted during the same session, the system table might expand, and memory usage might increase. To prevent this, specify the CREATE TABLE statement to ensure the temporary table is reused.

For example, in cases where a temporary table would be created and deleted for repeatedly executed transactions, specify the CREATE TABLE statement as shown below:

- Specify "IF NOT EXISTS" to create a temporary table only if none exists when the transaction starts.
- Specify "ON COMMIT DELETE ROWS" to ensure all rows are deleted when the transaction ends.

See

Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on the CREATE TABLE statement.

Examples of SQL using a temporary table are shown below:

**Example of bad use (creating and deleting a temporary table)**

```
BEGIN;
CREATE TEMPORARY TABLE mytable(col1 CHAR(4), col2 INTEGER) ON COMMIT DROP;
    (mytable processes)
COMMIT;
```

**Example of good use (reusing a temporary table)**

```
BEGIN;
CREATE TEMPORARY TABLE IF NOT EXISTS mytable(col1 CHAR(4), col2 INTEGER) ON COMMIT
DELETE ROWS;
    (mytable processes)
COMMIT;
```

A.3 Implicit Data Type Conversions

An implicit data type conversion refers to a data type conversion performed automatically by FUJITSU Enterprise Postgres, without the need to explicitly specify the data type to convert to.
The combination of possible data type conversions differs, depending on whether the expression in the conversion source is a literal.

For non-literals, data types can only be converted to other types within the same range.

For literals, character string literal types can be converted to the target data type. Numeric literals are implicitly converted to specific numeric types. These implicitly converted numeric literals can then have their types converted to match the conversion target data type within the numeric type range. For bit character string literals, only the bit column data type can be specified. The following shows the range of type conversions for literals.

Table A.1 Data type combinations that contain literals and can be converted implicitly

<table>
<thead>
<tr>
<th>Conversion target</th>
<th>Character literal (*1)</th>
<th>Numeric literal(*2)</th>
<th>Bit character string literal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td>SMALLINT</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td></td>
<td>INTEGER</td>
<td>Y</td>
<td>Y (*3)</td>
</tr>
<tr>

Y: Can be converted  
N: Cannot be converted

*1: Only strings that can be converted to the data type of the conversion target can be specified (such as "1" if the conversion target is a numeric type)

*2: "Y" indicates specific numeric types that are converted first.

*3: Integers that can be expressed as INTEGER types can be specified

*4: Integers that cannot be expressed as INTEGER types, but can be expressed as BIGINT types, can be specified

*5: Integers that cannot be expressed as INTEGER or BIGINT types, but that can be expressed as NUMERIC types, or numeric literals that contain a decimal point or the exponent symbol (e), can be specified

Implicit data type conversions can be used when comparing or storing data.
The conversion rules differ, depending on the reason for converting. Purpose-specific explanations are provided below.

**A.3.1 Function Argument**

Value expressions specified in a function argument will be converted to the data type of that function argument.

**See**

Refer to "Functions and Operators" under "The SQL Language" in the PostgreSQL Documentation for information on data types that can be specified in function arguments.

**A.3.2 Operators**

Comparison operators, BETWEEN, IN

Combinations of data types that can be compared using comparison operators, BETWEEN, or IN are shown below.
Table A.2 Combinations of comparable data type

<table>
<thead>
<tr>
<th>Left side</th>
<th>Right side</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Numeric type</td>
</tr>
<tr>
<td>Numeric type</td>
<td>Y</td>
</tr>
<tr>
<td>Character type</td>
<td>N</td>
</tr>
<tr>
<td>Date/time type</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be compared
N: Cannot be compared

When strings with different lengths are compared, the shorter one is padded with spaces to make the lengths match.

When numeric values with different precisions are compared, data will be converted to the type with the higher precision.

Set operation and CASE also follow the same rules.

Other operators

Value expressions specified in operators will be converted to data types that are valid for that operator.

See

Refer to "Functions and Operators" under "The SQL Language" in the PostgreSQL Documentation for information on data types that can be specified in operators.

A.3.3 Storing Values

Value expressions specified in the VALUES clause of the INSERT statement or the SET clause of the UPDATE statement will be converted to the data type of the column in which they will be stored.

A.4 Notes on Using Index

This section explains the notes on using the following indexes:

- Hash index
- SP-GiST index

A.4.1 Hash Index

Update operations for the hash index are not recorded in the WAL.

Therefore, if the database server fails, the hash index needs to be rebuilt with REINDEX to recover the database server.

Also, after obtaining the first backup, queries that use the hash index would return incorrect results, since index updates are not reflected in streaming replication and file-based replication. For these reasons, use of the hash index is not recommended.

A.4.2 SP-GiST Index

If more than 2 concurrent updates are performed on a table in which the SP-GiST index is defined, applications may stop responding. When this occur, all system processes including the Check Pointer process will also be in the state of no response. For these reasons, use of the SP-GiST index is not recommended.
A.5 Notes on Using the psql Commands

This section explains the notes on using the psql commands.

A.5.1 Entering Multibyte Characters

Multibyte characters cannot be entered from the psql command prompt.

Multibyte characters can be entered from a file by specifying the -f option.
If using this option, the target file encoding system must be explicitly specified as the client encoding system.

See

Refer to "Character Set Support" in "Server Administration" in the PostgreSQL Documentation for information on how to configure the client encoding system.

A.6 Notes on Using Multibyte Characters in Definition Names

Do not use multibyte characters in database names or user names if using a Windows database server.

Multibyte characters must not be used in database names or user names on non-Windows database servers, because certain conditions may apply or it may not be possible to connect to some clients.

Related notes and constraints are described below.

1) Configuring the client encoding system

The client encoding system must be configured when the names are created.

See

Refer to "Character Set Support" in "Server Administration" in the PostgreSQL Documentation for information on how to configure the client encoding system.

2) Encoding system of names used for connection

Ensure that the encoding system of names used for connection is the same as that of the database that was connected when these names were created.

The reasons for this are as follows:

- Storage system for names in FUJITSU Enterprise Postgres
  The system catalog saves encoded names by using the encoding system of the database at the time the names were created.

- Encoding conversion policy when connected
  When connected, names sent from the client are matched with names in the system catalog without performing encoding conversion.

Accordingly, if the database that was connected when the names were defined uses the EUC_JP encoding system, but the database name is specified using UTF-8 encoding, then the database will be considered to be non-existent.

3) Connection constraints

The table below shows the connection constraints for each client type, based on the following assumptions:

- The conditions described in 1) and 2) above are satisfied.
- The database name and user names use the same encoding system.

<table>
<thead>
<tr>
<th>Client type</th>
<th>Client operating system</th>
<th>Windows(R)</th>
<th>Linux/Solaris</th>

</tbody>
</table>
Appendix B Conversion Procedures Required due to Differences from Oracle Database

This appendix explains how to convert from an Oracle database to FUJITSU Enterprise Postgres, within the scope noted in "Chapter 9 Compatibility with Oracle Databases" from the following perspectives:

- Feature differences
- Specification differences

This document assumes that the version of the Oracle database to be converted is 7-10.2g.

B.1 Outer Join Operator (Perform Outer Join)

Features

In the WHERE clause conditional expression, by adding the plus sign (+), which is the outer join operator, to the column of the table you want to add as a table join, it is possible to achieve an outer join that is the same as a joined table (OUTER JOIN).

B.1.1 Comparing with the ^= Comparison Operator

Oracle database

```sql
SELECT *
FROM t1, t2
WHERE t1.col1(+) ^= t2.col1;
```

* col1 is assumed to be CHAR(4) type

FUJITSU Enterprise Postgres

```sql
SELECT *
FROM t1, t2
WHERE t1.col1(+) != t2.col1;
```

* col1 is assumed to be CHAR(4) type

Feature differences

Oracle database

The ^= comparison operator can be specified.

FUJITSU Enterprise Postgres

The ^= comparison operator cannot be specified.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "^=" is used.
2. Ensure that the keyword, "(+)", is either on the right or left-hand side.
3. Change "^=" to " != ".

- 137 -
B.2 DECODE (Compare Values and Return Corresponding Results)

Features

DECODE compares values of the conversion target value expression and the search values one by one, and if the values of the conversion target value expression and the search values match, a corresponding result value is returned.

B.2.1 Comparing Numeric Data of Character String Types and Numeric Characters

Oracle database

```
SELECT DECODE(
coll,
    1000, 'ITEM-A',
    2000, 'ITEM-B',
    'ITEM-C')
FROM t1;
```

* coll is assumed to be CHAR(4) type

FUJITSU Enterprise Postgres

```
SELECT DECODE( CAST(coll AS INTEGER),
    1000, 'ITEM-A',
    2000, 'ITEM-B',
    'ITEM-C')
FROM t1;
```

* coll is assumed to be CHAR(4) type

Feature differences

Oracle database

When the value expression is a string and the search value is a numeric, the string value will be converted to the data type of the comparison target numeric, so that they can be compared.

FUJITSU Enterprise Postgres

If the conversion target value expression is a string value, then no search value can be specified with numbers.

Conversion procedure

Since the data type that can be specified for the conversion target value expression is unknown, use CAST to explicitly convert the conversion target value expression (coll in the example) to a numeric (INTEGER type in the example).

B.2.2 Obtaining Comparison Result from more than 50 Conditional Expressions

Oracle database

```
SELECT DECODE(coll,
    1, 'A',
    2, 'B',
    ... 
    78, 'BZ',
    NULL, 'UNKNOWN',
    'OTHER')
FROM t1;
```
FUJITSU Enterprise Postgres

```sql
SELECT CASE
    WHEN col1 = 1 THEN 'A'
    WHEN col1 = 2 THEN 'B'
    ... 
    WHEN col1 = 78 THEN 'BZ'
    WHEN col1 IS NULL THEN 'UNKNOWN'
    ELSE 'OTHER'
END
FROM t1;
```

Feature differences

**Oracle database**
Search value with a maximum of 127 items (up to 255 arguments in total) can be specified.

**FUJITSU Enterprise Postgres**
Search value with a maximum of 49 items (up to 100 arguments in total) only can be specified.

Conversion procedure
Convert to the CASE expression using the following procedure:

1. Specify the DECODE conversion target value expression (col1 in the first argument, in the example) and the search value (1 in the second argument, in the example) for the CASE expression search condition. Specify the DECODE result value ('A' in the third argument, in the example) for the CASE expression THEN (WHEN col1 = 1 THEN 'A', in the example). Note that if the search value is NULL, specify "IS NULL" for the search condition for the CASE expression.

2. If the DECODE default value ('OTHER' in the last argument, in the example) is specified, specify the default value for the CASE expression ELSE (ELSE 'OTHER', in the example).

### B.2.3 Obtaining Comparison Result from Values with Different Data Types

**Oracle database**

```sql
SELECT DECODE( col1,
    '1000', 'A',
    '2000', 1,
    'OTHER')
FROM t1;
```

* col1 is assumed to be CHAR(4) type

**FUJITSU Enterprise Postgres**

```sql
SELECT DECODE( col1,
    '1000', 'A',
    '2000', 1,
    'OTHER')
FROM t1;
```

* col1 is assumed to be CHAR(4) type
Feature differences

Oracle database

The data types of all result values are converted to the data type of the first result value.

FUJITSU Enterprise Postgres

Results in an error.

Conversion procedure

Convert using the following procedure:

1. Check the literal data type for the first result value specified.
2. Change the literals specified for each result value to the literal data type checked in the step 1.

B.3 SUBSTR (Extract a String of the Specified Length from Another String)

Features

SUBSTR returns the number of characters specified in the third argument (starting from the position specified in the second argument) from the string specified in the first argument.

Refer to "9.2.1 Notes on SUBSTR" for details on precautions when using SUBSTR.

B.3.1 Specifying a Value Expression with a Data Type Different from the One that can be Specified for Function Arguments

Oracle database

```
SELECT SUBSTR( col1, 1, col2 )
FROM DUAL;
```

* col1 and col2 are assumed to be CHAR type

FUJITSU Enterprise Postgres

```
CREATE CAST (CHAR AS INTEGER) WITH INOUT AS IMPLICIT;

SELECT SUBSTR( col1, 1, col2 )
FROM DUAL;
# No changes to SELECT statement;
```

* col1 and col2 are assumed to be CHAR type

Feature differences

Oracle database

If the type can be converted to a data type that can be specified for function arguments, conversion is performed implicitly.

FUJITSU Enterprise Postgres

If the data types are different from each other, or if loss of significance occurs, implicit conversion is not performed.
Conversion procedure

Since the data type of the string length is clear, first execute the following CREATE CAST only once so that the CHAR type value (col2 in the example) specified for the string length is implicitly converted to INTEGER type.

```
CREATE CAST (CHAR AS INTEGER) WITH INOUT AS IMPLICIT;
```

B.3.2 Extracting a String with the Specified Format from a Datetime Type Value

**Oracle database**

```
SELECT SUBSTR( CURRENT_TIMESTAMP, 1, 8)
FROM DUAL;
```

**FUJITSU Enterprise Postgres**

```
SELECT SUBSTR( TO_CHAR(CURRENT_TIMESTAMP, 'DD–MON–YY HH.MI.SS.US PM'), 1, 8)
FROM DUAL;
```

Feature differences

**Oracle database**

A datetime value such as CURRENT_TIMESTAMP can be specified for character value expressions.

**FUJITSU Enterprise Postgres**

A datetime value such as CURRENT_TIMESTAMP cannot be specified for character value expressions.

Conversion procedure

First, specify TO_CHAR for the SUBSTR character value expression.
Specify datetime type (CURRENT_TIMESTAMP, in the example) in firstArg of TO_CHAR, and specify the format template pattern (DD–MON–YY HH.MI.SS.US PM, in the example) for secondArg to match with the result of SUBSTR before conversion.

TO_CHAR specification format: TO_CHAR(firstArg, secondArg)

**Information**

Refer to “Data Type Formatting Functions” in the PostgreSQL Documentation for information on format template patterns that can be specified for TO_CHAR in FUJITSU Enterprise Postgres.

B.3.3 Concatenating a String Value with a NULL value

**Oracle database**

```
SELECT SUBSTR( col1 || col2, 2, 5)
FROM t1;
```

* col1 and col2 are assumed to be character string type, and col2 may contain NULL
Feature differences

Oracle database

NULL is handled as an empty string, and strings are joined.

FUJITSU Enterprise Postgres

NULL is not handled as an empty string, and the result of joining the strings becomes NULL.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "||" is used.
2. Check if any of the value expressions can contain NULL - if they can, then execute step 3.
3. Modify to NVL(valExpr,"").

B.4 NVL (Replace NULL)

Features

NVL converts NULL values.

B.4.1 Obtaining Result from Arguments with Different Data Types

Oracle database

```
SELECT NVL( col1, 
           col2 )
FROM t1;
```

* col1 is assumed to be VARCHAR(100) type, and col2 is assumed to be CHAR(100) type

FUJITSU Enterprise Postgres

```
SELECT NVL( col1, 
           CAST(col2 AS VARCHAR(100)) )
FROM t1;
```

* col1 is assumed to be VARCHAR(100) type, and col2 is assumed to be CHAR(100) type

Feature differences

Oracle database

Value expressions with different data types can be specified. If the first argument is a string value, then VARCHAR2 is returned, and if it is a numeric, then a numeric type with greater range is returned.

FUJITSU Enterprise Postgres

Value expressions with different data types cannot be specified.
Conversion procedure

Since the data types that can be specified for the expressions in the two arguments are unknown, use the following steps to convert:

1. Check the data types specified for each of the two expressions.
2. Using the data type that is to be received as a result, explicitly convert the other argument with CAST.

B.4.2 Operating on Datetime/Numeric, Including Adding Number of Days to a Particular Day

Oracle database

```
SELECT NVL( col1 + 10, CURRENT_DATE)
FROM t1;
```

* col1 is assumed to be TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type

FUJITSU Enterprise Postgres

```
SELECT NVL( CAST(col1 AS DATE) + 10, CURRENT_DATE)
FROM t1;
```

* col1 is assumed to be TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type

Feature differences

Oracle database

Numbers can be operated (added to or subtracted from) with either TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type. Operation result will be DATE type.

FUJITSU Enterprise Postgres

Numbers cannot be operated (added to or subtracted from) with neither TIMESTAMP WITHOUT TIME ZONE type nor TIMESTAMP WITH TIME ZONE type. However, numbers can be operated (added to or subtracted from) with DATE type.

Conversion procedure

Convert using the following procedure:

1. Search locations where the keyword "+" or "-" is used in addition or subtraction, and check if these operations are between numbers and TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type.
2. If they are, use CAST to explicitly convert TIMESTAMP WITHOUT TIME ZONE type or TIMESTAMP WITH TIME ZONE type to DATE type.

B.4.3 Calculating INTERVAL Values, Including Adding Periods to a Date

Oracle database

```
SELECT NVL( CURRENT_DATE + (col1 * 1.5), col2)
FROM t1;
```

* col1 and col2 are assumed to be INTERVAL YEAR TO MONTH types

FUJITSU Enterprise Postgres

```
SELECT NVL( CURRENT_DATE +
            CAST(col1 * 1.5 AS
```
* col1 and col2 are assumed to be INTERVAL YEAR TO MONTH types

**Feature differences**

**Oracle database**

INTERVAL YEAR TO MONTH type multiplication and division result in INTERVAL YEAR TO MONTH type and any fraction (number of days) will be truncated.

**FUJITSU Enterprise Postgres**

INTERVAL YEAR TO MONTH type multiplication and division result in INTERVAL type and fractions (number of days) will not be truncated.

**Conversion procedure**

Convert using the following procedure:

1. Search locations where the keywords "*" or "//" are used in multiplication or division, and check if the specified value is INTERVAL YEAR TO MONTH type.
2. If the value is INTERVAL YEAR TO MONTH type, use CAST to explicitly convert the operation result to INTERVAL YEAR TO MONTH type.

## B.5 DBMS_OUTPUT (Output Messages)

**Features**

DBMS_OUTPUT sends messages to clients such as psql from PL/pgSQL.

### B.5.1 Outputting Messages Such As Process Progress Status

**Oracle database**

```sql
set serveroutput on;...(1)

DECLARE
  v_col1    CHAR(20);
  v_col2    INTEGER;
CURSOR c1 IS
  SELECT col1, col2 FROM t1;
BEGIN
  DBMS_OUTPUT.PUT_LINE('-- BATCH_001 Start --');
  OPEN c1;
  DBMS_OUTPUT.PUT_LINE('-- LOOP Start --');
  LOOP
    FETCH c1 INTO v_col1, v_col2;
    EXIT WHEN c1%NOTFOUND;
    DBMS_OUTPUT.PUT(' .');
  END LOOP;
  DBMS_OUTPUT.NEW_LINE; ...(2)
  DBMS_OUTPUT.PUT_LINE('-- LOOP End --');
  CLOSE c1;
  DBMS_OUTPUT.PUT_LINE('-- BATCH_001 End --');

EXCEPTION
  WHEN OTHERS THEN
    DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
    DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
```

- 144 -
FUJITSU Enterprise Postgres

```
DO $$
DECLARE
  v_col1   CHAR(20);
  v_col2   INTEGER;
  c1 CURSOR FOR
    SELECT col1, col2 FROM t1;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE); ...(1)
  PERFORM DBMS_OUTPUT.ENABLE(NULL); ... (1)

  PERFORM DBMS_OUTPUT.PUT_LINE('-- BATCH_001 Start --');

  OPEN c1;
  PERFORM DBMS_OUTPUT.PUT_LINE('-- LOOP Start --');
  LOOP
    FETCH c1 INTO v_col1, v_col2;
    EXIT WHEN FOUND = false;
    PERFORM DBMS_OUTPUT.PUT('.');
  END LOOP;
  PERFORM DBMS_OUTPUT.NEW_LINE(); ...(2)

  PERFORM DBMS_OUTPUT.PUT_LINE('-- LOOP End --');
  CLOSE c1;

  PERFORM DBMS_OUTPUT.PUT_LINE('-- BATCH_001 End --');

EXCEPTION
  WHEN OTHERS THEN
    PERFORM DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
    PERFORM DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
END;
$$ ;
```

(1) SERVEROUTPUT/ENABLE

Specification differences

Oracle database

- Use SET statement and specify SERVEROUTPUT ON.

FUJITSU Enterprise Postgres

- Specify DBMS_SQL.SERVEROUTPUT(TRUE).

Conversion procedure

Convert using the following procedure:

1. Check if a SET SERVEROUTPUT statement is specified before the PL/SQL block of a stored procedure.

2. If a SET SERVEROUTPUT statement is specified, specify DBMS_SQL.SERVEROUTPUT straight after BEGIN of PL/pgSQL. If ON is specified to have messages output to a window, then specify TRUE. If OFF is specified, then specify FALSE.

3. Specify DBMS_SQL.ENABLE only if SET SERVEROUTPUT is ON. The values to be specified for the argument are as follows:
   - If SIZE is specified for the SET SERVEROUTPUT statement, specify this size for the argument.
- If SIZE is not specified for the SET SERVEROUTPUT statement, then specify 2000 for Oracle 10.1g or earlier, NULL for Oracle 10.2g or later.

If DBMS_SQL.ENABLE is specified for the PL/SQL block of the stored procedure, specify the same value as that argument.

(2) NEW_LINE

Specification differences
Oracle database

If there is no argument for packageName.featureName, parenthesis can be omitted.

FUJITSU Enterprise Postgres

Even if there is no argument for packageName.featureName, parenthesis cannot be omitted.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_OUTPUT.NEW_LINE" is used in the stored procedure.
2. If there is no parenthesis after packageName.featureName, add the parenthesis.

B.5.2 Receiving a Return Value from a Procedure (PL/SQL) Block (For GET_LINES)

**Oracle database**

```sql
set serveroutput off;

DECLARE
    v_num        INTEGER;
BEGIN
    DBMS_OUTPUT.DISABLE; ...(3)
    DBMS_OUTPUT.ENABLE(20000); ...(4)
    DBMS_OUTPUT.PUT_LINE('-- ITEM CHECK --');

    SELECT count(*) INTO v_num FROM t1;
    IF v_num = 0 THEN
        DBMS_OUTPUT.PUT_LINE('-- NO ITEM --');
    ELSE
        DBMS_OUTPUT.PUT_LINE('-- IN ITEM(' || v_num || ') --');
    END IF;
END;
/
set serveroutput on;

DECLARE
    v_buffs      DBMS_OUTPUT_LINESARRAY; ...(5)
    v_num        INTEGER := 10;
BEGIN
    DBMS_OUTPUT.GET_LINES(v_buffs, v_num); ...(5)
    FOR i IN 1..v_num LOOP
        DBMS_OUTPUT.PUT_LINE('LOG : ' || v_buffs(i)); ...(5)
    END LOOP;
```

- 146 -
DO $$
DECLARE
  v_num        INTEGER;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(FALSE);
  PERFORM DBMS_OUTPUT.DISABLE(); ...(3)
  PERFORM DBMS_OUTPUT.ENABLE(20000); ...(4)
  PERFORM DBMS_OUTPUT.PUT_LINE('-- ITEM CHECK --');
  SELECT count(*) INTO v_num FROM t1;
  IF v_num = 0 THEN
    PERFORM DBMS_OUTPUT.PUT_LINE('-- NO ITEM --');
  ELSE
    PERFORM DBMS_OUTPUT.PUT_LINE('-- IN ITEM(' || v_num || ') --');
  END IF;
END;
$$;

DO $$
DECLARE
  v_buffs      VARCHAR[]; ...(5)
  v_num        INTEGER := 10;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
  SELECT lines, numlines INTO v_buffs, v_num FROM DBMS_OUTPUT.GET_LINES(v_num); ...(5)
  FOR i IN 1..v_num LOOP
    PERFORM DBMS_OUTPUT.PUT_LINE('LOG : ' || v_buffs[i]); ...(5)
  END LOOP;
END;
$$;

(3) DISABLE
Same as the NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE for information on specification differences and conversion procedures associated with specification differences.

(4) ENABLE
Same as NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE for information on specification differences and conversion procedures associated with specification differences.

(5) GET_LINES
Specification format for Oracle database

DBMS_OUTPUT.GET_LINES(firstArg, secondArg)

Specification differences
Oracle database
  Obtained values are received with variables specified for arguments.
FUJITSU Enterprise Postgres

Since obtained values are the search results for DBMS_OUTPUT.GET_LINES, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_OUTPUT.GET_LINES" is used in the stored procedure.

2. Change the data type (DBMS_OUTPUT_LINESARRAY in the example) of the variable (v_buffs in the example) specified as firstArg of DBMS_OUTPUT.GET_LINES into a VARCHAR type array (VARCHAR[] in the example).

3. Replace the DBMS_OUTPUT.GET_LINES location called with a SELECT INTO statement.
   - Use the literal "lines, numlines" in the select list.
   - Specify firstArg (v_buffs in the example) and secondArg (v_num in the example) configured in DBMS_OUTPUT.GET_LINES, in the INTO clause.
   - Use DBMS_OUTPUT.GET_LINES in the FROM clause. Specify only secondArg (v_num in the example) before modification.

4. Identify the location that references firstArg (v_buffs in the example), and change it to the PL/pgSQL array reference format (v_buffs[i] in the example).

B.5.3 Receiving a Return Value from a Procedure (PL/SQL) Block
(For GET_LINE)

Oracle database

```sql
set serveroutput on;

DECLARE
  v_buff1       VARCHAR2(100);
  v_buff2       VARCHAR2(1000);
  v_num        INTEGER;
BEGIN
  v_buff2 := '';
  LOOP
    DBMS_OUTPUT.GET_LINE(v_buff1, v_num); ...(6)
    EXIT WHEN v_num = 1;
    v_buff2 := v_buff2 || v_buff1;
  END LOOP;
  DBMS_OUTPUT.PUT_LINE(v_buff2);
END;
/
```

* Only the process to obtain a value is stated

FUJITSU Enterprise Postgres

```sql
DO $$
DECLARE
  v_buff1       VARCHAR(100);
  v_buff2       VARCHAR(1000);
  v_num        INTEGER;
BEGIN
  PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
  v_buff2 := '';
  LOOP
```
SELECT line, status INTO v_buff1, v_num FROM DBMS_OUTPUT.GET_LINE(); ...(6)
EXIT WHEN v_num = 1;
v_buff2 := v_buff2 || v_buff1;
END LOOP;
PERFORM DBMS_OUTPUT.PUT_LINE(v_buff2);
END;
$$

* Only the process to obtain a value is stated

(6) GET_LINE
Specification format for Oracle database

DBMS_OUTPUT.GET_LINE(firstArg, secondArg)

Specification differences
Oracle database
Obtained values are received with variables specified for arguments.
FUJITSU Enterprise Postgres
Since obtained values are the search results for DBMS_OUTPUT.GET_LINES, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure
Convert using the following procedure:
1. Locate the places where the keyword "DBMS_OUTPUT.GET_LINE" is used in the stored procedure.
2. Replace the DBMS_OUTPUT.GET_LINE location called with a SELECT INTO statement.
   - Use the literal "line, status" in the select list.
   - Specify firstArg (v_buff1 in the example) and secondArg (v_num in the example) configured in DBMS_OUTPUT.GET_LINE, in the INTO clause.
   - Use DBMS_OUTPUT.GET_LINE in the FROM clause. Although arguments are not specified, parenthesis must be specified.

B.6 UTL_FILE (Perform File Operation)

Features
UTL_FILE reads and writes text files from PL/pgSQL.

B.6.1 Registering a Directory to Load and Write Text Files

Oracle database

[Oracle9i or earlier]
Configure the following with initialization parameter
   UTL_FILE_DIR='/home/fsep' ...(1)

[Oracle9.2i or later]
Configure the following with CREATE DIRECTORY statement
   CREATE DIRECTORY DIR AS '/home/fsep'; ...(1)
(1) UTL_FILE_DIR/CREATE DIRECTORY

Feature differences

Oracle database

Configure the directory to be operated, using the CREATE DIRECTORY statement or the initialization parameter UTL_FILE_DIR.

FUJITSU Enterprise Postgres

The directory to be operated cannot be configured using the CREATE DIRECTORY statement or the initialization parameter UTL_FILE_DIR.

Conversion procedure

Configure the target directory information in the UTL_FILE.UTL_FILE_DIR table using the INSERT statement. Note that this conversion procedure should be performed only once before executing the PL/pgSQL function.

- When using the initialization parameter UTL_FILE_DIR:
  1. Check the initialization parameter UTL_FILE_DIR value ('/home/fsep' in the example).
  2. Using the INSERT statement, specify and execute the directory name checked in step 1.
     - Specify UTL_FILE.UTL_FILE_DIR(dir) for the INTO clause.
     - Using the character string literal ('/home/fsep' in the example), specify the target directory name for the VALUES clause.
     - If multiple directories are specified, execute the INSERT statement for each directory.

- When using the CREATE DIRECTORY statement:
  1. Check the directory name ('/home/fsep' in the example) registered with the CREATE DIRECTORY statement. To check, log in SQL*Plus as a user with DBA privileges, and execute "show ALL_DIRECTORIES;".
  2. Using the INSERT statement, specify and execute the directory name checked in step 1. Same steps are used to specify the INSERT statement as when using the initialization parameter UTL_FILE_DIR.

B.6.2 Checking File Information

Oracle database

```
CREATE PROCEDURE read_file(fname VARCHAR2) AS

  v_file      UTL_FILE.FILE_TYPE;
  v_exists    BOOLEAN;
  v_length    NUMBER;
  v_bsize     INTEGER;
  v_rbuff     VARCHAR2(1024);
BEGIN
  UTL_FILE.FGETATTR('DIR', fname, v_exists, v_length, v_bsize); ...(2)

  IF v_exists <> true THEN
    DBMS_OUTPUT.PUT_LINE('-- FILE NOT FOUND --');
    RETURN;
  END IF;
END;
```
CREATE FUNCTION read_file(fname VARCHAR) RETURNS void AS $$
DECLARE
    v_file      UTL_FILE.FILE_TYPE;
    v_exists    BOOLEAN;
    v_length    NUMERIC;
    v_bsize     INTEGER;
    v_rbuff     VARCHAR(1024);
BEGIN
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);

    SELECT fexists, file_length, blocksize
    INTO v_exists, v_length, v_bsize
    FROM UTL_FILE.FGETATTR('/home/fsep', fname); ...(2)
    IF v_exists <> true THEN
        PERFORM DBMS_OUTPUT.PUT_LINE('-- FILE NOT FOUND --');
        RETURN;
    END IF;

    PERFORM DBMS_OUTPUT.PUT_LINE(' -- FILE DATA -- ');
    v_file := UTL_FILE.FOPEN('/home/fsep', fname, 'w', 1024); ...(3)
    FOR i IN 1..3 LOOP
        v_rbuff := UTL_FILE.GET_LINE(v_file, 1024); ...(4)
        PERFORM DBMS_OUTPUT.PUT_LINE(v_rbuff);
    END LOOP;
    PERFORM DBMS_OUTPUT.PUT_LINE('... more');
    PERFORM DBMS_OUTPUT.PUT_LINE(' -- READ END -- ');

    UTL_FILE.FCLOSE(v_file); ...(5)
    RETURN;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        PERFORM DBMS_OUTPUT.PUT_LINE(' -- FILE END -- ');
        UTL_FILE.FCLOSE(v_file);
        RETURN;
    WHEN OTHERS THEN
        PERFORM DBMS_OUTPUT.PUT_LINE(' -- SQL Error -- ');
        PERFORM DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
        UTL_FILE.FCLOSE_ALL; ...(6)
        RETURN;
END;
$$;

(2) FGETATTR

Specification format for Oracle database

UTL_FILE.FGETATTR(firstArg, secondArg, thirdArg, fourthArg, fifthArg)

Feature differences

Oracle database

If using a CREATE DIRECTORY statement (Oracle9.2i or later), specify a directory object name for the directory name.

FUJITSU Enterprise Postgres

A directory object name cannot be specified for the directory name.

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the search results for UTL_FILE.FGETATTR, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure. Refer to UTL_FILE_DIR/CREATE DIRECTORY for information on how to check if the directory object name corresponds to the actual directory name.

1. Locate the places where the keyword "UTL_FILE.FOPEN" is used in the stored procedure.
2. Check the actual directory name ('/home/fsep' in the example) that corresponds to the directory object name ('DIR' in the example).
3. Replace the directory object name ('DIR' in the example) in firstArg with the actual directory name ('/home/fsep' in the example) verified in step 2.
4. Replace the UTL_FILE.FGETATTR location called with a SELECT INTO statement.
   - Use the literal "fexists, file_length, blocksize" in the select list.
   - Specify thirdArg, fourthArg, and fifthArg (v_exists, v_length, v_bsize, in the example) specified for UTL_FILE.FGETATTR to the INTO clause in the same order as that of the arguments.
   - Use UTL_FILE.FGETATTR in the FROM clause. Specify only the actual directory name for firstArg ('/home/fsep' in the example) and secondArg (fname in the example) before modification for the arguments.
(3) FOPEN
Specification format for Oracle

UTL_FILE.FOPEN(firstArg, secondArg, thirdArg, fourthArg, fifthArg)

Feature differences

Oracle database

If using a CREATE DIRECTORY statement (Oracle9.2i or later), specify a directory object name for the directory name.

FUJITSU Enterprise Postgres

A directory object name cannot be specified for the directory name.

Conversion procedure

Convert using the following procedure. Refer to UTL_FILE_DIR/CREATE DIRECTORY for information on how to check if the directory object name corresponds to the actual directory name.

1. Locate the places where the keyword "UTL_FILE.FOPEN" is used in the stored procedure.
2. Check the actual directory name ('/home/fsep' in the example) that corresponds to the directory object name ('DIR' in the example).
3. Replace the directory object name ('DIR' in the example) in firstArg with the actual directory name ('/home/fsep' in the example) checked in step 1.

(4) GET_LINE
Specification format for Oracle database

UTL_FILE.GET_LINE(firstArg, secondArg, thirdArg, fourthArg)

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the returned value of UTL_FILE.GET_LINE, they are received with variables specified for substitution statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "UTL_FILE.GET_LINE" is used in the stored procedure.
2. Replace the UTL_FILE.GET_LINE location called with a value assignment (=).
   - On the left-hand side, specify secondArg (v_rbuff in the example) specified for UTL_FILE.GET_LINE.
   - Use UTL_FILE.GET_LINE in the right-hand side. Specify only firstArg (v_file in the example) and thirdArg (1024 in the example) before modification.

(5) FCLOSE
Specification format for Oracle database

UTL_FILE.FCLOSE(firstArg)

Specification differences

Oracle database

After closing, the file handler specified for the argument becomes NULL.
FUJITSU Enterprise Postgres

After closing, set the file handler to NULL by assigning the return value of UTL_FILE.FCLOSE to it.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "UTL_FILE.FCLOSE" is used in the stored procedure.
2. Replace the UTL_FILE.FCLOSE location called with a value assignment (:=) so that the file handler (v_file in the example) becomes NULL.
   - On the left-hand side, specify the argument (v_file in the example) specified for UTL_FILE.FCLOSE.
   - Use UTL_FILE.FCLOSE in the right-hand side. For the argument, specify the same value (v_file in the example) as before modification.

(6) FCLOSE_ALL

Same as NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE in the DBMS_OUTPUT for information on specification differences and conversion procedures associated with specification differences.

B.6.3 Copying Files

Oracle database

```
CREATE PROCEDURE copy_file(fromname VARCHAR2, toname VARCHAR2) AS
BEGIN
    UTL_FILE.FCOPY('DIR1', fromname, 'DIR2', toname, 1, NULL); ...(7)
    RETURN;
EXCEPTION
    WHEN OTHERS THEN
        DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
        DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
    RETURN;
END;
/
```

```
set serveroutput on
call copy_file('file01.txt','file01_bk.txt');
```

```
CREATE FUNCTION copy_file(fromname VARCHAR, toname VARCHAR) RETURNS void AS $$
BEGIN
    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
    
    PERFORM UTL_FILE.FCOPY('/home/fsep', fromname, '/home/backup', toname, 1, NULL); ...(7)
    RETURN;
EXCEPTION
    WHEN OTHERS THEN
        PERFORM DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
        PERFORM DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
    RETURN;
END;
$$
```

FUJITSU Enterprise Postgres
(7) FCOPY

Specification format for Oracle database

UTL_FILE.FCOPY(firstArg, secondArg, thirdArg, fourthArg, fifthArg, sixthArg)

Feature differences

Oracle database

If using a CREATE DIRECTORY statement (Oracle9.2i or later), specify a directory object name for the directory name.

FUJITSU Enterprise Postgres

A directory object name cannot be specified for the directory name.

Conversion procedure

Convert using the following procedure. Refer to UTL_FILE_DIR/CREATE DIRECTORY for information on how to check if the directory object name corresponds to the actual directory name.

1. Locate the places where the keyword "UTL_FILE.FCOPY" is used in the stored procedure.
2. Check the actual directory names ('/home/fsep' and '/home/backup', in the example) that correspond to the directory object names ('DIR1' and 'DIR2', in the example) of firstArg and thirdArg argument.
3. Replace the directory object name ('DIR1' and 'DIR2', in the example) with the actual directory names ('/home/fsep' in the example) checked in step 1.

B.6.4 Moving/Renaming Files

Oracle database

CREATE PROCEDURE move_file(fromname VARCHAR2, toname VARCHAR2) AS
BEGIN

    UTL_FILE.FRENAME('DIR1', fromname, 'DIR2', toname, FALSE); ...(8)
    RETURN;

EXCEPTION

    WHEN OTHERS THEN
        DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
        DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
        RETURN;

END;
/

set serveroutput on

call move_file('file01.txt','file02.txt');

FUJITSU Enterprise Postgres

CREATE FUNCTION move_file(fromname VARCHAR, toname VARCHAR) RETURNS void AS $$
BEGIN

    PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);

    $$
PERFORM UTL_FILE.FRENAME('/home/fsep', fromname, '/home/backup', toname, FALSE); ...(8)
RETURN;

EXCEPTION
WHEN OTHERS THEN
    PERFORM DBMS_OUTPUT.PUT_LINE('-- SQL Error --');
    PERFORM DBMS_OUTPUT.PUT_LINE('ERROR : ' || SQLERRM);
RETURN;
END;
$$
LANGUAGE plpgsql;

SELECT move_file('file01.txt','file02.txt');

(8) FRENAME

Same as FCOPY for the UTL_FILE package. Refer to FCOPY in the UTL_FILE package for information on specification differences and conversion procedures associated with specification differences.

B.7 DBMS_SQL (Execute Dynamic SQL)

Features

For DBMS_SQL, dynamic SQL can be executed from PL/pgSQL.

B.7.1 Searching Using a Cursor

Oracle database

CREATE PROCEDURE search_test(h_where CLOB) AS

    str_sql     CLOB;
    v_cnt       INTEGER;
    v_array     DBMS_SQL.VARCHAR2A;
    v_cur       INTEGER;
    v_smpid     INTEGER;
    v_smpnm     VARCHAR2(20);
    v_addbuff   VARCHAR2(20);
    v_smpage    INTEGER;
    errcd       INTEGER;
    length      INTEGER;
    ret         INTEGER;
BEGIN

    str_sql     := 'SELECT smpid, smpnm FROM smp_tbl WHERE ' || h_where || ' ORDER BY smpid';
    v_smpid     := 0;
    v_smpnm     := '';
    v_smpage    := 0;

    v_cur      := DBMS_SQL.OPEN_CURSOR; ...(1)

    v_cnt      := CEIL(DBMS_LOB.GETLENGTH(str_sql)/1000);
    FOR idx IN 1 .. v_cnt LOOP
        v_array(idx) :=
            DBMS_LOB.SUBSTR(str_sql, 1000,
            (idx-1)*1000+1);

    END LOOP;

    DBMS_SQL.PREPARE(v_cur, str_sql);
    DBMS_SQL.FETCHFIRST(v_cur, 1000, v_smpid, v_smpnm, v_smpage, errcd, length, ret);

END;
$$
LANGUAGE plpgsql;
```
END LOOP;
DBMS_SQL.PARSE(v_cur, v_array, 1, v_cnt, FALSE, DBMS_SQL.NATIVE); ...(2)
DBMS_SQL.DEFINE_COLUMN(v_cur, 1, v_smpid);
DBMS_SQL.DEFINE_COLUMN(v_cur, 2, v_smpnm, 10);

ret := DBMS_SQL.EXECUTE(v_cur);
LOOP
  v_addbuff := '';
  IF DBMS_SQL.FETCH_ROWS(v_cur) = 0 THEN
    EXIT;
  END IF;
  DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
  DBMS_SQL.COLUMN_VALUE(v_cur, 1, v_smpid, errcd, length); ...(3)
  IF errcd = 1405 THEN ...(3)
    DBMS_OUTPUT.PUT_LINE('smpid       = (NULL)');
  ELSE
    DBMS_OUTPUT.PUT_LINE('smpid       = ' || v_smpid);
  END IF;
  DBMS_SQL.COLUMN_VALUE(v_cur, 2, v_smpnm, errcd, length);
  IF errcd = 1406 THEN
    v_addbuff := '... [len=' || length || ']';
  END IF;
  IF errcd = 1405 THEN
    DBMS_OUTPUT.PUT_LINE('v_smpnm     = (NULL)');
  ELSE
    DBMS_OUTPUT.PUT_LINE('v_smpnm     = ' || v_smpnm || v_addbuff);
  END IF;
  DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
  DBMS_OUTPUT.NEW_LINE;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(v_cur); ...(4)
RETURN;
END;
/

Set serveroutput on

call search_test('smpid < 100');
```

FUJITSU Enterprise Postgres

```
CREATE FUNCTION search_test(h_where text) RETURNS void AS $$
DECLARE
  str_sql     text;
  v_cur       INTEGER;
```
v_smpid    INTEGER;
v_smpnm    VARCHAR(20);
v_addbuff  VARCHAR(20);
v_smpage   INTEGER;
errcd      INTEGER;
length     INTEGER;
ret        INTEGER;
BEGIN
PERFORM DBMS_OUTPUT.SERVEROUTPUT(TRUE);
str_sql := 'SELECT smpid, smpnm FROM smp_tbl WHERE ' || h_where || ' ORDER BY smpid';
v_smpid := 0;
v_smpnm := '';
v_smpage := 0;

v_cur := DBMS_SQL.OPEN_CURSOR(); ...(1)
PERFORM DBMS_SQL.PARSE(v_cur, str_sql, 1); ...(2)
PERFORM DBMS_SQL.DEFINE_COLUMN(v_cur, 1, v_smpid);
PERFORM DBMS_SQL.DEFINE_COLUMN(v_cur, 2, v_smpnm, 10);
ret := DBMS_SQL.EXECUTE(v_cur);
LOOP
v_addbuff := '';
IF DBMS_SQL.FETCH_ROWS(v_cur) = 0 THEN
EXIT;
END IF;
PERFORM DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
SELECT value, column_error, actual_length
INTO v_smpid, errcd, length
FROM DBMS_SQL.COLUMN_VALUE(v_cur, 1, v_smpid); ...(3)
IF errcd = 22002 THEN ...(3)
PERFORM DBMS_OUTPUT.PUT_LINE('smpid       = (NULL)');
ELSE
PERFORM DBMS_OUTPUT.PUT_LINE('smpid       = ' || v_smpid);
END IF;
SELECT value, column_error, actual_length INTO v_smpnm, errcd, length FROM DBMS_SQL.COLUMN_VALUE(v_cur, 2, v_smpnm);
IF errcd = 22001 THEN
v_addbuff := '... [len=' || length || '];'
END IF;
IF errcd = 22002 THEN
PERFORM DBMS_OUTPUT.PUT_LINE('v_smpnm     = (NULL)');
ELSE
PERFORM DBMS_OUTPUT.PUT_LINE('v_smpnm     = ' || v_smpnm || v_addbuff);
END IF;
PERFORM DBMS_OUTPUT.PUT_LINE('--------------------------------------------------------');
PERFORM DBMS_OUTPUT.NEW_LINE();
END LOOP;

v_cur := DBMS_SQL.CLOSE_CURSOR(v_cur); ...(4)
RETURN;
END;
$$
LANGUAGE plpgsql;
(1) OPEN_CURSOR

Same as NEW_LINE in the DBMS_OUTPUT package. Refer to NEW_LINE in the DBMS_OUTPUT package for information on specification differences and conversion procedures associated with specification differences.

(2) PARSE

Specification format for Oracle database

DBMS_SQL.PARSE(firstArg, secondArg, thirdArg, fourthArg, fifthArg)

Feature differences

Oracle database

SQL statements can be specified with string table types (VARCHAR2A type, VARCHAR2S type). Specify this for secondArg.

DBMS_SQL.NATIVE, DBMS_SQL.V6, DBMS_SQL.V7 can be specified for processing SQL statements.

FUJITSU Enterprise Postgres

SQL statements cannot be specified with string table types.

DBMS_SQL.NATIVE, DBMS_SQL.V6, DBMS_SQL.V7 cannot be specified for processing SQL statements.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_SQL.PARSE" is used in the stored procedure.
2. Check the data type of the SQL statement specified for secondArg (v_array in the example).
   - If the data type is either DBMS_SQL.VARCHAR2A type or DBMS_SQL.VARCHAR2S type, then it is a table type specification. Execute step 3 and continue the conversion process.
   - If the data type is neither DBMS_SQL.VARCHAR2A type nor DBMS_SQL.VARCHAR2S type, then it is a string specification. Execute step 7 and continue the conversion process.
3. Check the SQL statement (str_sql in the example) before it was divided into DBMS_SQL.VARCHAR2A type and DBMS_SQL.VARCHAR2S type.
4. Delete the sequence of the processes (processes near FOR idx in the example) where SQL is divided into DBMS_SQL.VARCHAR2A type and DBMS_SQL.VARCHAR2S type.
5. Replace secondArg with the SQL statement (str_sql in the example) before it is divided, that was checked in step 2.
6. Delete thirdArg, fourthArg, and fifthArg (v_cnt, FALSE, DBMS_SQL.NATIVE, in the example).
7. If DBMS_SQL.NATIVE, DBMS_SQL.V6, and DBMS_SQL.V7 are specified, then replace thirdArg with a numeric literal 1.
   - If either DBMS_SQL.VARCHAR2A type or DBMS_SQL.VARCHAR2S type is used, then sixthArg becomes relevant.
   - If neither DBMS_SQL.VARCHAR2A type nor DBMS_SQL.VARCHAR2S type is used, then thirdArg becomes relevant.

(3) COLUMN_VALUE

Specification format for Oracle database

DBMS_SQL.COLUMN_VALUE(firstArg, secondArg, thirdArg, fourthArg, fifthArg)
Feature differences

Oracle database

The following error codes are returned for column_error.

- 1406: fetched column value was truncated
- 1405: fetched column value is NULL

FUJITSU Enterprise Postgres

The following error codes are returned for column_error.

- 22001: string_data_right_truncation
- 22002: null_value_no_indicator_parameter

Specification differences

Oracle database

Obtained values are received with variables specified for arguments.

FUJITSU Enterprise Postgres

Since obtained values are the search results for DBMS_SQL.COLUMN_VALUE, they are received with variables specified for the INTO clause of the SELECT statement.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword "DBMS_SQL.COLUMN_VALUE" is used in the stored procedure.

2. Replace the DBMS_SQL.COLUMN_VALUE location called with a SELECT INTO statement.

   - Check the number of arguments (v_smpid, errcd, and length in the example) specified after secondArg (1 in the example) of DBMS_SQL.COLUMN_VALUE.
   - Specify "value", "column_error", and "actual_length" in the select list, according to the number of arguments checked in the previous step (for example, if only thirdArg is specified, then specify "value" only.)
   - Specify thirdArg, fourthArg, and fifthArg (v_smpid, errcd, length in the example) configured for DBMS_SQL.COLUMN_VALUE, for the INTO clause.
   - Use DBMS_SQL.COLUMN_VALUE in the FROM clause. Specify firstArg, secondArg, and thirdArg (v_cur, 1, v_smpid, in the example) before modification.

3. If the fourthArg (column_error value in the example) is used, then check the location of the target variable (errcd in the example).

4. If a decision process is performed in the location checked, then modify the values used in the decision process as below:

   - 1406 to 22001
   - 1405 to 22002

(4) CLOSE_CURSOR

Specification format for Oracle database

DBMS_SQL.CLOSE_CURSOR(firstArg)

Specification differences

Oracle database

After closing, the cursor specified in firstArg becomes NULL.
After closing, set the cursor to NULL by assigning the return value of DBMS_SQL.CLOSE_CURSOR to it.

Conversion procedure

Convert using the following procedure:

1. Locate the places where the keyword “DBMS_SQL.CLOSE_CURSOR” is used in the stored procedure.

2. Set the cursor to NULL by assigning (=) the return value of DBMS_SQL.CLOSE_CURSOR to it.
   - On the left-hand side, specify the argument (v_cur in the example) specified for DBMS_SQL.CLOSE_CURSOR.
   - Use DBMS_SQL.CLOSE_CURSOR in the right-hand side. For the argument, specify the same value (v_cur in the example) as before modification.
## C.1 UTL_FILE.UTL_FILE_DIR

Register the directory handled by the UTL_FILE package in the UTL_FILE.UTL_FILE_DIR table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>text</td>
<td>Name of the directory handled by the UTL_FILE package</td>
</tr>
</tbody>
</table>
Appendix D ECOBPG - Embedded SQL in COBOL

This appendix describes application development using embedded SQL in COBOL.

D.1 Precautions when Using Functions and Operators

An embedded SQL program consists of code written in an ordinary programming language, in this case COBOL, mixed with SQL commands in specially marked sections. To build the program, the source code (*.pco) is first passed through the embedded SQL preprocessor, which converts it to an ordinary COBOL program (*.cob), and afterwards it can be processed by a COBOL compiler. (For details about the compiling and linking see "D.9 Processing Embedded SQL Programs"). Converted ECOBPG applications call functions in the libpq library through the embedded SQL library (ecpglib), and communicate with the PostgreSQL server using the normal frontend-backend protocol.

Embedded SQL has advantages over other methods for handling SQL commands from COBOL code. First, it takes care of the tedious passing of information to and from variables in your C program. Second, the SQL code in the program is checked at build time for syntactical correctness. Third, embedded SQL in COBOL is specified in the SQL standard and supported by many other SQL database systems. The PostgreSQL implementation is designed to match this standard as much as possible, and it is usually possible to port embedded SQL programs written for other SQL databases to PostgreSQL with relative ease.

As already stated, programs written for the embedded SQL interface are normal COBOL programs with special code inserted to perform database-related actions. This special code always has the form:

```cobol
EXEC SQL ... END-EXEC
```

These statements syntactically take the place of a COBOL statement. Depending on the particular statement, they can appear at the data division or at the procedure division. Actual executable SQLs need to be placed at the procedure division, and host variable declarations need to be placed at data division. However, the precompiler does not validate their placements. Embedded SQL statements follow the case-sensitivity rules of normal SQL code, and not those of COBOL.

For COBOL code notation, "fixed" or "variable" can be used. In each line, columns 1 to 6 constitute the line number area, and column 7 is the indicator area. Embedded SQL programs also should be placed in area B (column 12 and beyond).

Note that sample code in this document omits indents for each area.

ECOBPG processes or outputs programs according to the COBOL code notation. COBOL code notation is specified using the ecobpg command. Note, however, that the following restrictions apply:

- For "fixed" notation, area B is from columns 12 to 72. Characters in column 73 and beyond are deleted in the precompiled source.
- For "variable" notation, area B is from column 12 to the last column of that record (up to column 251). Characters in column 252 and beyond are deleted in the precompiled source.

ECOBPG accepts as many COBOL statements as possible. Note, however, that the following restrictions apply:

- In declaring host variable section, you can't use debug line.
- Outside of declaring host variable section, you can use debug line, but you can't contain any SQL in debug lines.
- In declaring host variable section, you can't use commas or semicolons as separator. Use space instead.
- EXEC SQL VAR command, it can be used in ECPG, is not available in ECOBPG. Use REDEFINE clause of COBOL instead.

The following sections explain all the embedded SQL statements.
D.2 Managing Database Connections

This section describes how to open, close, and switch database connections.

D.2.1 Connecting to the Database Server

One connects to a database using the following statement:

```
EXEC SQL CONNECT TO target [AS connection-name] [USER user-name] END-EXEC.
```

The target can be specified in the following ways:
- `dbname[@hostname][:port]`
- `tcp:postgresql://hostname[:port][/dbname][?options]`
- `unix:postgresql://hostname[:port][/dbname][?options]`
- an SQL string literal containing one of the above forms
- a reference to a character variable containing one of the above forms (see examples)
- `DEFAULT`

If you specify the connection target literally (that is, not through a variable reference) and you don't quote the value, then the case-insensitivity rules of normal SQL are applied. In that case you can also double-quote the individual parameters separately as needed. In practice, it is probably less error-prone to use a (single-quoted) string literal or a variable reference. The connection target `DEFAULT` initiates a connection to the default database under the default user name. No separate user name or connection name can be specified in that case.

There are also different ways to specify the user name:
- `username`
- `username/password`
- `username IDENTIFIED BY password`
- `username USING password`

As above, the parameters `username` and `password` can be an SQL identifier, an SQL string literal, or a reference to a character variable.

The connection-name is used to handle multiple connections in one program. It can be omitted if a program uses only one connection. The most recently opened connection becomes the current connection, which is used by default when an SQL statement is to be executed (see later in this chapter).

Here are some examples of CONNECT statements:

```
EXEC SQL CONNECT TO mydb@sql.mydomain.com END-EXEC.

EXEC SQL CONNECT TO tcp:postgresql://sql.mydomain.com/mydb AS myconnection USER john END-EXEC.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 TARGET PIC X(25).
01 USER PIC X(5).
EXEC SQL END DECLARE SECTION END-EXEC.

... MOVE "mydb@sql.mydomain.com" TO TARGET.
MOVE "john" TO USER.
EXEC SQL CONNECT TO :TARGET USER :USER END-EXEC.
```
The last form makes use of the variant referred to above as character variable reference. For this purpose, only fixed-length string (no VARYING) variable can be used. Trailing spaces are ignored. You will see in later sections how COBOL variables can be used in SQL statements when you prefix them with a colon.

Be advised that the format of the connection target is not specified in the SQL standard. So if you want to develop portable applications, you might want to use something based on the last example above to encapsulate the connection target string somewhere.

D.2.2 Choosing a Connection

SQL statements in embedded SQL programs are by default executed on the current connection, that is, the most recently opened one. If an application needs to manage multiple connections, then there are two ways to handle this.

The first option is to explicitly choose a connection for each SQL statement, for example:

```
EXEC SQL AT connection-name SELECT ... END-EXEC.
```

This option is particularly suitable if the application needs to use several connections in mixed order.

If your application uses multiple threads of execution, they cannot share a connection concurrently. You must either explicitly control access to the connection (using mutexes) or use a connection for each thread. If each thread uses its own connection, you will need to use the AT clause to specify which connection the thread will use.

The second option is to execute a statement to switch the current connection. That statement is:

```
EXEC SQL SET CONNECTION connection-name END-EXEC.
```

This option is particularly convenient if many statements are to be executed on the same connection. It is not thread-aware.

Here is an example program managing multiple database connections:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 DBNAME PIC X(7).
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL CONNECT TO testdb1 AS con1 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb2 AS con2 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb3 AS con3 USER testuser END-EXEC.
*   This query would be executed in the last opened database "testdb3".
  EXEC SQL SELECT current_database() INTO :DBNAME END-EXEC.
  DISPLAY "current=" DBNAME " (should be testdb3)".
*   Using "AT" to run a query in "testdb2"
  EXEC SQL AT con2 SELECT current_database() INTO :DBNAME END-EXEC.
  DISPLAY "current=" DBNAME " (should be testdb2)".
*   Switch the current connection to "testdb1".
  EXEC SQL SET CONNECTION con1 END-EXEC.
  EXEC SQL SELECT current_database() INTO :DBNAME END-EXEC.
  DISPLAY "current=" DBNAME " (should be testdb1)".
  EXEC SQL DISCONNECT ALL END-EXEC.
```

This example would produce this output:

```
current=testdb3 (should be testdb3)
current=testdb2 (should be testdb2)
current=testdb1 (should be testdb1)
```
D.2.3 Closing a Connection

To close a connection, use the following statement:

```
EXEC SQL DISCONNECT [connection] END-EXEC.
```

The connection can be specified in the following ways:
- connection-name
- DEFAULT
- CURRENT
- ALL

If no connection name is specified, the current connection is closed.

It is good style that an application always explicitly disconnect from every connection it opened.

D.3 Running SQL Commands

Any SQL command can be run from within an embedded SQL application. Below are some examples of how to do that.

D.3.1 Executing SQL Statements

Creating a table:
```
EXEC SQL CREATE TABLE foo (number integer, ascii char(16)) END-EXEC.
EXEC SQL CREATE UNIQUE INDEX num1 ON foo(number) END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

Inserting rows:
```
EXEC SQL INSERT INTO foo (number, ascii) VALUES (9999, 'doodad') END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

Deleting rows:
```
EXEC SQL DELETE FROM foo WHERE number = 9999 END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

Updates:
```
EXEC SQL UPDATE foo
SET ascii = 'foobar'
WHERE number = 9999 END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

SELECT statements that return a single result row can also be executed using EXEC SQL directly. To handle result sets with multiple rows, an application has to use a cursor; see “D.3.2 Using Cursors” below. (As a special case, an application can fetch multiple rows at once into an array host variable; see “Arrays”.)

Single-row select:
```
EXEC SQL SELECT foo INTO :FooBar FROM table1 WHERE ascii = 'doodad' END-EXEC.
```

Also, a configuration parameter can be retrieved with the SHOW command:
```
EXEC SQL SHOW search_path INTO :var END-EXEC.
```

The tokens of the form :something are host variables, that is, they refer to variables in the COBOL program. They are explained in “D.4 Using Host Variables”.

- 166 -
D.3.2 Using Cursors

To retrieve a result set holding multiple rows, an application has to declare a cursor and fetch each row from the cursor. The steps to use a cursor are the following: declare a cursor, open it, fetch a row from the cursor, repeat, and finally close it.

Select using cursors:

```sql
EXEC SQL DECLARE foo_bar CURSOR FOR
    SELECT number, ascii FROM foo
    ORDER BY ascii END-EXEC.
EXEC SQL OPEN foo_bar END-EXEC.
EXEC SQL FETCH foo_bar INTO :FooBar, :DooDad END-EXEC.
...
EXEC SQL CLOSE foo_bar END-EXEC.
EXEC SQL COMMIT END-EXEC.
```

For more details about declaration of the cursor, see "D.11.4 DECLARE", and refer to “SQL Commands” in “Reference” in the PostgreSQL Documentation for information on FETCH command.

Note: The ECOBPG DECLARE command does not actually cause a statement to be sent to the PostgreSQL backend. The cursor is opened in the backend (using the backend's DECLARE command) at the point when the OPEN command is executed.

D.3.3 Managing Transactions

In the default mode, statements are committed only when EXEC SQL COMMIT is issued. The embedded SQL interface also supports autocommit of transactions (similar to libpq behavior) via the -t command-line option to ecobpg or via the EXEC SQL SET AUTOCOMMIT TO ON statement. In autocommit mode, each command is automatically committed unless it is inside an explicit transaction block. This mode can be explicitly turned off using EXEC SQL SET AUTOCOMMIT TO OFF.

See Refer to “ecpg” in “PostgreSQL Client Applications” in the PostgreSQL Documentation for information on -t command-line option to ecobpg.

The following transaction management commands are available:

- EXEC SQL COMMIT END-EXEC Commit an in-progress transaction.
- EXEC SQL ROLLBACK END-EXEC Roll back an in-progress transaction.
- EXEC SQL SET AUTOCOMMIT TO ON END-EXEC Enable autocommit mode.
- EXEC SQL SET AUTOCOMMIT TO OFF END-EXEC Disable autocommit mode. This is the default.

D.3.4 Prepared Statements

When the values to be passed to an SQL statement are not known at compile time, or the same statement is going to be used many times, then prepared statements can be useful.

The statement is prepared using the command PREPARE. For the values that are not known yet, use the placeholder "?":

```sql
EXEC SQL PREPARE stmt1 FROM "SELECT oid, datname FROM pg_database WHERE oid = ?" END-EXEC.
```

If a statement returns a single row, the application can call EXECUTE after PREPARE to execute the statement, supplying the actual values for the placeholders with a USING clause:
EXEC SQL EXECUTE stmt1 INTO :dboid, :dbname USING 1 END-EXEC.

If a statement returns multiple rows, the application can use a cursor declared based on the prepared statement. To bind input parameters, the cursor must be opened with a USING clause:

EXEC SQL PREPARE stmt1 FROM "SELECT oid,datname FROM pg_database WHERE oid > ?" END-EXEC.
EXEC SQL DECLARE foo_bar CURSOR FOR stmt1 END-EXEC.

* when end of result set reached, break out of while loop
EXEC SQL WHENEVER NOT FOUND GOTO FETCH-END END-EXEC.

EXEC SQL OPEN foo_bar USING 100 END-EXEC.
...
PERFORM NO LIMIT
EXEC SQL FETCH NEXT FROM foo_bar INTO :dboid, :dbname END-EXEC
END-PERFORM.
FETCH-END.
EXEC SQL CLOSE foo_bar END-EXEC.

When you don't need the prepared statement anymore, you should deallocate it:

EXEC SQL DEALLOCATE PREPARE name END-EXEC.

For more details about PREPARE, see "D.11.10 PREPARE". Also see "D.5 Dynamic SQL" for more details about using placeholders and input parameters.

D.4 Using Host Variables

In "D.3 Running SQL Commands" you saw how you can execute SQL statements from an embedded SQL program. Some of those statements only used fixed values and did not provide a way to insert user-supplied values into statements or have the program process the values returned by the query. Those kinds of statements are not really useful in real applications. This section explains in detail how you can pass data between your COBOL program and the embedded SQL statements using a simple mechanism called host variables. In an embedded SQL program we consider the SQL statements to be guests in the COBOL program code which is the host language. Therefore the variables of the COBOL program are called host variables.

Another way to exchange values between PostgreSQL backends and ECOBPG applications is the use of SQL descriptors, described in "D.6 Using Descriptor Areas".

D.4.1 Overview

Passing data between the COBOL program and the SQL statements is particularly simple in embedded SQL. Instead of having the program paste the data into the statement, which entails various complications, such as properly quoting the value, you can simply write the name of a COBOL variable into the SQL statement, prefixed by a colon. For example:

EXEC SQL INSERT INTO sometable VALUES (:v1, 'foo', :v2) END-EXEC.

This statements refers to two COBOL variables named v1 and v2 and also uses a regular SQL string literal, to illustrate that you are not restricted to use one kind of data or the other.

This style of inserting COBOL variables in SQL statements works anywhere a value expression is expected in an SQL statement.

D.4.2 Declare Sections

To pass data from the program to the database, for example as parameters in a query, or to pass data from the database back to the program, the COBOL variables that are intended to contain this data need to be declared in specially marked sections, so the embedded SQL preprocessor is made aware of them.

This section starts with:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
D.4.3 Retrieving Query Results

Now you should be able to pass data generated by your program into an SQL command. But how do you retrieve the results of a query? For that purpose, embedded SQL provides special variants of the usual commands SELECT and FETCH. These commands have a special INTO clause that specifies which host variables the retrieved values are to be stored in. SELECT is used for a query that returns only single row, and FETCH is used for a query that returns multiple rows, using a cursor.

Here is an example:

```cobol
* assume this table:
* CREATE TABLE test (a int, b varchar(50));
*
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 V1 PIC S9(9).
01 V2 PIC X(50) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL SELECT a, b INTO :V1, :V2 FROM test END-EXEC.
```

So the INTO clause appears between the select list and the FROM clause. The number of elements in the select list and the list after INTO (also called the target list) must be equal.

Here is an example using the command FETCH:

```cobol
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 V1 PIC S9(9).
01 V2 PIC X(50) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE foo CURSOR FOR SELECT a, b FROM test END-EXEC.

EXEC SQL FETCH NEXT FROM foo INTO :V1, :V2 END-EXEC
```

As you can see, you can optionally assign an initial value to the variable. The variable's scope is determined by the location of its declaring section within the program.

You can have as many declare sections in a program as you like.

The declarations are also echoed to the output file as normal COBOL variables, so there's no need to declare them again.

Variables that are not intended to be used in SQL commands can be declared normally outside these special sections.

The definition of a group item also must be listed inside a DECLARE section. Otherwise the preprocessor cannot handle these types since it does not know the definition.
Here the INTO clause appears after all the normal clauses.

D.4.4 Type Mapping

When ECOBPG applications exchange values between the PostgreSQL server and the COBOL application, such as when retrieving query results from the server or executing SQL statements with input parameters, the values need to be converted between PostgreSQL data types and host language variable types (COBOL language data types, concretely). One of the main points of ECOBPG is that it takes care of this automatically in most cases.

In this respect, there are two kinds of data types: Some simple PostgreSQL data types, such as integer and text, can be read and written by the application directly. Other PostgreSQL data types, such as timestamp and date can only be accessed through character strings. special library functions does not exist in ecobpg. (pgtypes, exists in ECPG, for COBOL is not implemented yet)

"Table D.1 Mapping Between PostgreSQL Data Types and COBOL Variable Types" shows which PostgreSQL data types correspond to which COBOL data types. When you wish to send or receive a value of a given PostgreSQL data type, you should declare a COBOL variable of the corresponding COBOL data type in the declare section.

Table D.1 Mapping Between PostgreSQL Data Types and COBOL Variable Types

<table>
<thead>
<tr>
<th>PostgreSQL data type</th>
<th>COBOL Host variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>smallint</td>
<td>PIC S9((1-4)) {BINARY</td>
</tr>
<tr>
<td>integer</td>
<td>PIC S9((5-9)) {BINARY</td>
</tr>
<tr>
<td>bigint</td>
<td>PIC S9((10-18)) {BINARY</td>
</tr>
<tr>
<td>decimal</td>
<td>PIC S9(m)V9(n) PACKED-DECIMAL</td>
</tr>
<tr>
<td></td>
<td>PIC 9(m)V9(n) DISPLAY (*1)</td>
</tr>
<tr>
<td></td>
<td>PIC S9(m)V9(n) DISPLAY SIGN TRAILING [SEPARATE]</td>
</tr>
<tr>
<td></td>
<td>PIC S9(m)V9(n) DISPLAY SIGN LEADING [SEPARATE]</td>
</tr>
<tr>
<td>numeric</td>
<td>(same with decimal)</td>
</tr>
<tr>
<td>real</td>
<td>COMP-1</td>
</tr>
<tr>
<td>double precision</td>
<td>COMP-2</td>
</tr>
<tr>
<td>small serial</td>
<td>PIC S9((1-4)) {BINARY</td>
</tr>
<tr>
<td>serial</td>
<td>PIC S9((1-9)) {BINARY</td>
</tr>
<tr>
<td>bigserial</td>
<td>PIC S9((10-18)) {BINARY</td>
</tr>
<tr>
<td>oid</td>
<td>PIC 9(9) {BINARY</td>
</tr>
<tr>
<td>character(n), varchar(n), text</td>
<td>PIC X(n), PIC X(n) VARYING</td>
</tr>
<tr>
<td>name</td>
<td>PIC X(NAMEDATALEN)</td>
</tr>
<tr>
<td>boolean</td>
<td>BOOL(*2)</td>
</tr>
<tr>
<td>other types(e.g. timestamp)</td>
<td>PIC X(n), PIC X(n) VARYING</td>
</tr>
</tbody>
</table>

*1: If no USAGE is specified, host variable is regarded as DISPLAY.
*2: Type definition is added automatically on pre-compiling.
Body of BOOL is PIC X(1). '1' for true and '0' for false.

You can use some pattern of digits for integer(see table), but if database sends big number with more digits than specified, behavior is undefined.
### Handling Character Strings

To handle SQL character string data types, such as varchar and text, there is a possible way to declare the host variables.

The way is using the PIC X(n) VARYING type (we call it VARCHAR type from now on), which is a special type provided by ECOBPG. The definition on type VARCHAR is converted into a group item consists of named variables. A declaration like:

```
01 VAR PIC X(180) VARYING.
```

is converted into:

```
01 VAR.
   49 LEN PIC S9(4) COMP-5.
   49 ARR PIC X(180).
```

if --varchar-with-named-member option is used, it is converted into:

```
01 VAR.
   49 VAR-LEN PIC S9(4) COMP-5.
   49 VAR-ARR PIC X(180).
```

You can use level 1 to 48 for VARCHAR. Don't use level 49 variable right after VARCHAR variable. To use a VARCHAR host variable as an input for SQL statement, LEN must be set the length of the string included in ARR.

To use a VARCHAR host variable as an output of SQL statement, the variable must be declared in a sufficient length. If the length is insufficient, it can cause a buffer overrun.

PIC X(n) and VARCHAR host variables can also hold values of other SQL types, which will be stored in their string forms.

### Accessing Special Data Types

ECOBPG doesn't have special support for date, timestamp, and interval types.

(ECPG has pgtypes, but ECOBPG doesn't.)

You can use PIC X(n) or VARCHAR for DB I/O with these types. See "Data Types" section in PostgreSQL’s document.

### Host Variables with Nonprimitve Types

As a host variable you can also use arrays, typedefs, and group items.

#### Arrays

To create and use array variables, OCCURENCE syntax is provided by COBOL.

The typical use case is to retrieve multiple rows from a query result without using a cursor. Without an array, to process a query result consisting of multiple rows, it is required to use a cursor and the FETCH command. But with array host variables, multiple rows can be received at once. The length of the array has to be defined to be able to accommodate all rows, otherwise a buffer overrun will likely occur.

Following example scans the pg_database system table and shows all OIDs and names of the available databases:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
   05 DBID PIC S9(9) COMP OCCURS 8.
   05 DBNAME PIC X(16) OCCURS 8.
01 I PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL CONNECT TO testdb END-EXEC.
```
You can use member of array as simple host variable by specifying subscript of array. For specifying subscript, use C-style "][1]\" , not COBOL-style "(1)\". But subscript starts with 1, according to COBOL syntax.

Group Item

A group item whose subordinate item names match the column names of a query result, can be used to retrieve multiple columns at once. The group item enables handling multiple column values in a single host variable.

The following example retrieves OIDs, names, and sizes of the available databases from the pg_database system table by using the pg_database_size() function. In this example, a group item variable dbinfo_t with members whose names match each column in the SELECT result is used to retrieve one result row without putting multiple host variables in the FETCH statement.

---

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 DBINFO-T TYPEDEF.
  02 OID PIC S9(9) COMP.
  02 DATNAME PIC X(65).
  02 DBSIZE PIC S9(18) COMP.
01 DBVAL TYPE DBINFO-T.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cursor CURSOR FOR SELECT oid, datname, pg_database_size(oid) AS size FROM pg_database END-EXEC.
EXEC SQL OPEN cursor END-EXEC.

* when end of result set reached, break out of loop
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
  * Fetch multiple columns into one structure.
  EXEC SQL FETCH FROM cursor INTO :DBVAL END-EXEC

  * Print members of the structure.
  DISPLAY "oid=" OID ", datname=" DATNAME ", size=" DBSIZE END-PERFORM.
```
group item host variables "absorb" as many columns as the group item as subordinate items. Additional columns can be assigned to other host variables. For example, the above program could also be restructured like this, with the size variable outside the group item:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 DBINFO-T TYPEDEF.
    02 OID PIC S9(9) COMP.
    02 DATNAME PIC X(65).
  01 DBVAL TYPE DBINFO-T.
  01 DBSIZE PIC S9(18) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT oid, datname, pg_database_size(oid) AS size
FROM pg_database END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.

*   when end of result set reached, break out of loop
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
  *   Fetch multiple columns into one structure.
    EXEC SQL FETCH FROM cur1 INTO :DBVAL, :DBSIZE END-EXEC

  *   Print members of the structure.
    DISPLAY "oid=" OID ", datname=" DATNAME ", size=" DBSIZE
END-PERFORM

FETCH-END.
EXEC SQL CLOSE cur1 END-EXEC.
```

You can use only non-nested group items for host variable of SQL statement. Declaration of nested group items are OK, but you must specify non-nested part of group items for SQL. (VARCHAR, is translated to group item on pre-compilation, is not considered as offense of this rule.) When using inner item of group item in SQL, use C-struct like period separated syntax(not COBOL’s A OF B). Here is example.

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 NESTED-GROUP.
    02 CHILD1.
      03 A PIC X(10).
      03 B PIC S9(9) COMP.
    02 CHILD2.
      03 A PIC X(10).
      03 B PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

* This SQL is valid. CHILD1 has no nested group items.
EXEC SQL SELECT * INTO :NESTED-GROUP.CHILD1 FROM TABLE1 END-EXEC.
```

For specifying basic item of group items, full specification is not needed if the specification is enough for identifying the item. This is from COBOL syntax. For more detail, see resources of COBOL syntax.

**TYPEDEF**

Use the typedef keyword to map new types to already existing types.
D.4.5 Handling Nonprimitive SQL Data Types

This section contains information on how to handle nonscalar and user-defined SQL-level data types in ECOBPG applications. Note that this is distinct from the handling of host variables of nonprimitive types, described in the previous section.

Arrays

SQL-level arrays are not directly supported in ECOBPG. It is not possible to simply map an SQL array into a COBOL array host variable. This will result in undefined behavior. Some workarounds exist, however.

If a query accesses elements of an array separately, then this avoids the use of arrays in ECOBPG. Then, a host variable with a type that can be mapped to the element type should be used. For example, if a column type is array of integer, a host variable of type PIC S9(9) COMP can be used. Also if the element type is varchar or text, a host variable of type VARCHAR can be used.

Here is an example. Assume the following table:

```sql
CREATE TABLE t3 (
    ii integer[]
);
```

```
ptestdb=> SELECT * FROM t3;
    ii
------------
{1,2,3,4,5}
(1 row)
```

The following example program retrieves the 4th element of the array and stores it into a host variable of type PIC S9(9) COMP-5:

```cobol
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 II PIC S9(9) COMP.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL DECLARE cur1 CURSOR FOR SELECT ii[4] FROM t3 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.
PERFORM NO LIMIT
   EXEC SQL FETCH FROM cur1 INTO :II END-EXEC
   DISPLAY "ii=" II
END-PERFORM.
```
To map multiple array elements to the multiple elements in an array type host variables each element of array column and each element of the host variable array have to be managed separately, for example:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
  05 II_A PIC S9(9) COMP OCCURS 8.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT ii[1], ii[2], ii[3], ii[4] FROM t3 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.
PERFORM NO LIMIT
... END-PERFORM.
```

Note again that:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
  05 II_A PIC S9(9) COMP OCCURS 8.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT ii FROM t3 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.
PERFORM NO LIMIT
  * WRONG
  EXEC SQL FETCH FROM cur1 INTO :II_A END-EXEC
... END-PERFORM.
```

would not work correctly in this case, because you cannot map an array type column to an array host variable directly.

Another workaround is to store arrays in their external string representation in host variables of type VARCHAR. For more details about this representation.

See Refer to “Arrays” in “Tutorial” in the PostgreSQL Documentation for information more details about this representation.

Note that this means that the array cannot be accessed naturally as an array in the host program (without further processing that parses the text representation).

**Composite Types**

Composite types are not directly supported in ECOBPG, but an easy workaround is possible. The available workarounds are similar to the ones described for arrays above: Either access each attribute separately or use the external string representation.

For the following examples, assume the following type and table:

```sql
CREATE TYPE comp_t AS (intval integer, textval varchar(32));
CREATE TABLE t4 (compval comp_t);
INSERT INTO t4 VALUES ( (256, 'PostgreSQL') );
```
The most obvious solution is to access each attribute separately. The following program retrieves data from the example table by selecting each attribute of the type comp_t separately:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 INTVAL PIC S9(9) COMP.
  01 TEXTVAL PIC X(33) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.

* Put each element of the composite type column in the SELECT list.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT (compval).intval, (compval).textval FROM t4 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
  * Fetch each element of the composite type column into host variables.
    EXEC SQL FETCH FROM cur1 INTO :INTVAL, :TEXTVAL END-EXEC
    DISPLAY "intval=" INTVAL ", textval=" ARR OF TEXTVAL
END-PERFORM.
END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.
```

To enhance this example, the host variables to store values in the FETCH command can be gathered into one group item. For more details about the host variable in the group item form, see "Group Item". To switch to the group item, the example can be modified as below. The two host variables, intval and textval, become subordinate items of the comp_t group item, and the group item is specified on the FETCH command.

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 COMP-T TYPEDEF.
    02 INTVAL PIC S9(9) COMP.
    02 TEXTVAL PIC X(33) VARYING.
  01 COMPVAL TYPE COMP-T.
EXEC SQL END DECLARE SECTION END-EXEC.

* Put each element of the composite type column in the SELECT list.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT (compval).intval, (compval).textval FROM t4 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.

PERFORM NO LIMIT
  * Put all values in the SELECT list into one structure.
    EXEC SQL FETCH FROM cur1 INTO :COMPVAL END-EXEC
    DISPLAY "intval=" INTVAL ", textval=" ARR OF TEXTVAL
END-PERFORM.
END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.
```

Although a group item is used in the FETCH command, the attribute names in the SELECT clause are specified one by one. This can be enhanced by using a * to ask for all attributes of the composite type value.

```sql
...
EXEC SQL DECLARE cur1 CURSOR FOR SELECT (compval).* FROM t4 END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.
PERFORM NO LIMIT
```
Put all values in the SELECT list into one structure.
EXEC SQL FETCH FROM cur1 INTO :COMPVAL END-EXEC
DISPLAY "intval=" INTVAL ", textval=" ARR OF TEXTVAL
END-PERFORM.

This way, composite types can be mapped into structures almost seamlessly, even though ECOBPG does not understand the composite type itself.

Finally, it is also possible to store composite type values in their external string representation in host variables of type VARCHAR. But that way, it is not easily possible to access the fields of the value from the host program.

**User-defined Base Types**

New user-defined base types are not directly supported by ECOBPG. You can use the external string representation and host variables of type VARCHAR, and this solution is indeed appropriate and sufficient for many types.

Here is an example using the data type complex.

---

Refer to "User-defined Types" in "Server Programming" in the PostgreSQL Documentation for information on the data type complex.

---

The external string representation of that type is (%lf,%lf), which is defined in the functions complex_in() and complex_out() functions. The following example inserts the complex type values (1,1) and (3,3) into the columns a and b, and select them from the table after that.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 A PIC X(64) VARYING.
01 B PIC X(64) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL INSERT INTO test_complex VALUES ('(1,1)', '(3,3)') END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT a, b FROM test_complex END-EXEC.
EXEC SQL OPEN cur1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO END-FETCH END-EXEC.
PERFORM NO LIMIT
EXEC SQL FETCH FROM cur1 INTO :A, :B END-EXEC
DISPLAY "a=" ARR OF A ", b=" ARR OF B
END-PERFORM.
END-FETCH.
EXEC SQL CLOSE cur1 END-EXEC.

Another workaround is avoiding the direct use of the user-defined types in ECOBPG and instead create a function or cast that converts between the user-defined type and a primitive type that ECOBPG can handle. Note, however, that type casts, especially implicit ones, should be introduced into the type system very carefully.

For example:

CREATE FUNCTION create_complex(r double precision, i double precision) RETURNS complex
LANGUAGE SQL
IMMUTABLE
AS $$ SELECT $1 * complex '(1,0)' + $2 * complex '(0,1)' $$;

After this definition, the following:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 A COMP-2.
D.4.6 Indicators

The examples above do not handle null values. In fact, the retrieval examples will raise an error if they fetch a null value from the database. To be able to pass null values to the database or retrieve null values from the database, you need to append a second host variable specification to each host variable that contains data. This second host variable is called the indicator and contains a flag that tells whether the datum is null, in which case the value of the real host variable is ignored. Here is an example that handles the retrieval of null values correctly:

```cobol
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 VAL PIC X(50) VARYING.
01 VAL_IND PIC S9(9) COMP-5.
EXEC SQL END DECLARE SECTION END-EXEC.

... 
EXEC SQL SELECT b INTO :VAL :VAL_IND FROM test1 END-EXEC.
```

The indicator variable val_ind will be zero if the value was not null, and it will be negative if the value was null.

The indicator has another function: if the indicator value is positive, it means that the value is not null, but it was truncated when it was stored in the host variable.

D.5 Dynamic SQL

In many cases, the particular SQL statements that an application has to execute are known at the time the application is written. In some cases, however, the SQL statements are composed at run time or provided by an external source. In these cases you cannot embed the SQL statements directly into the COBOL source code, but there is a facility that allows you to call arbitrary SQL statements that you provide in a string variable.

D.5.1 Executing Statements without a Result Set

The simplest way to execute an arbitrary SQL statement is to use the command EXECUTE IMMEDIATE. For example:

```cobol
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 STMT PIC X(30) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.

MOVE "CREATE TABLE test1 (...);" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL EXECUTE IMMEDIATE :STMT END-EXEC.
```

EXECUTE IMMEDIATE can be used for SQL statements that do not return a result set (e.g., DDL, INSERT, UPDATE, DELETE). You cannot execute statements that retrieve data (e.g., SELECT) this way. The next section describes how to do that.
D.5.2 Executing a Statement with Input Parameters

A more powerful way to execute arbitrary SQL statements is to prepare them once and execute the prepared statement as often as you like. It is also possible to prepare a generalized version of a statement and then execute specific versions of it by substituting parameters. When preparing the statement, write question marks where you want to substitute parameters later. For example:

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 STMT PIC X(40) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "INSERT INTO test1 VALUES(?, ?);" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL PREPARE MYSTMT FROM :STMT END-EXEC.
...
EXEC SQL EXECUTE MYSTMT USING 42, 'foobar' END-EXEC.
```

When you don't need the prepared statement anymore, you should deallocate it:

```
EXEC SQL DEALLOCATE PREPARE name END-EXEC.
```

D.5.3 Executing a Statement with a Result Set

To execute an SQL statement with a single result row, EXECUTE can be used. To save the result, add an INTO clause.

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 STMT PIC X(50) VARYING.
01 V1 PIC S9(9) COMP.
01 V2 PIC S9(9) COMP.
01 V3 PIC X(50) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "SELECT a, b, c FROM test1 WHERE a > ?" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL PREPARE MYSTMT FROM :STMT END-EXEC.
...
EXEC SQL EXECUTE MYSTMT INTO :V1, :V2, :V3 USING 37 END-EXEC.
```

An EXECUTE command can have an INTO clause, a USING clause, both, or neither.

If a query is expected to return more than one result row, a cursor should be used, as in the following example. (See "D.3.2 Using Cursors" for more details about the cursor.)

```
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 DBANAME PIC X(128) VARYING.
01 DATNAME PIC X(128) VARYING.
01 STMT PIC X(200) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "SELECT u.usename as dbaname, d.datname
    FROM pg_database d, pg_user u
    WHERE d.datdba = u.usesysid" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL PREPARE STMT1 FROM :STMT END-EXEC.
EXEC SQL DECLARE cursor1 CURSOR FOR STMT1 END-EXEC.
EXEC SQL OPEN cursor1 END-EXEC.
EXEC SQL WHENEVER NOT FOUND GOTO FETCH-END END-EXEC.
```
D.6 Using Descriptor Areas

An SQL descriptor area is a more sophisticated method for processing the result of a SELECT, FETCH or a DESCRIBE statement. An SQL descriptor area groups the data of one row of data together with metadata items into one data group item. The metadata is particularly useful when executing dynamic SQL statements, where the nature of the result columns might not be known ahead of time. PostgreSQL provides a way to use Descriptor Areas: the named SQL Descriptor Areas.

D.6.1 Named SQL Descriptor Areas

A named SQL descriptor area consists of a header, which contains information concerning the entire descriptor, and one or more item descriptor areas, which basically each describe one column in the result row.

Before you can use an SQL descriptor area, you need to allocate one:

```sql
EXEC SQL ALLOCATE DESCRIPTOR identifier END-EXEC.
```

The identifier serves as the "variable name" of the descriptor area. When you don't need the descriptor anymore, you should deallocate it:

```sql
EXEC SQL DEALLOCATE DESCRIPTOR identifier END-EXEC.
```

To use a descriptor area, specify it as the storage target in an INTO clause, instead of listing host variables:

```sql
EXEC SQL FETCH NEXT FROM mycursor INTO SQL DESCRIPTOR mydesc END-EXEC.
```

If the result set is empty, the Descriptor Area will still contain the metadata from the query, i.e. the field names.

For not yet executed prepared queries, the DESCRIBE statement can be used to get the metadata of the result set:

```sql
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 SQL-STMT PIC X(30) VARYING.
EXEC SQL END DECLARE SECTION END-EXEC.
MOVE "SELECT * FROM table1" TO ARR OF SQL-STMT.
COMPUTE LEN OF SQL-STMT = FUNCTION STORED-CHAR-LENGTH ( ARR OF SQL-STMT ) .
EXEC SQL PREPARE STMT1 FROM :SQL-STMT END-EXEC.
EXEC SQL DESCRIBE STMT1 INTO SQL DESCRIPTOR MYDESC END-EXEC.
```

Before PostgreSQL 9.0, the SQL keyword was optional, so using DESCRIPTOR and SQL DESCRIPTOR produced named SQL Descriptor Areas. Now it is mandatory, omitting the SQL keyword is regarded as the syntax that produces SQLDA Descriptor Areas. However, ecobpg does not support SQLDA and it causes an error.

In DESCRIBE and FETCH statements, the INTO and USING keywords can be used to similarly: they produce the result set and the metadata in a Descriptor Area.

Now how do you get the data out of the descriptor area? You can think of the descriptor area as a group item with named fields. To retrieve the value of a field from the header and store it into a host variable, use the following command:

```sql
EXEC SQL GET DESCRIPTOR name :hostvar = field END-EXEC.
```
Currently, there is only one header field defined: COUNT, which tells how many item descriptor areas exist (that is, how many columns are contained in the result). The host variable needs to be of an integer type as PIC S9(9) COMP-5. To get a field from the item descriptor area, use the following command:

```sql
EXEC SQL GET DESCRIPTOR name VALUE num :hostvar = field END-EXEC.
```

num can be a host variable containing an integer as PIC S9(9) COMP-5.
hostvar must be PIC S9(9) COMP-5 if type of the field is integer. Possible fields are:

**CARDINALITY (integer)**
- number of rows in the result set

**DATA**
- actual data item (therefore, the data type of this field depends on the query)

**DATETIME_INTERVAL_CODE (integer)**
- When TYPE is 9, DATETIME_INTERVAL_CODE will have a value of 1 for DATE, 2 for TIME, 3 for TIMESTAMP, 4 for TIME WITH TIME ZONE, or 5 for TIMESTAMP WITH TIME ZONE.

**DATETIME_INTERVAL_PRECISION (integer)**
- not implemented

**INDICATOR (integer)**
- the indicator (indicating a null value or a value truncation)

**KEY_MEMBER (integer)**
- not implemented

**LENGTH (integer)**
- length of the datum in characters

**NAME (string)**
- name of the column

**NULLABLE (integer)**
- not implemented

**OCTET_LENGTH (integer)**
- length of the character representation of the datum in bytes

**PRECISION (integer)**
- precision (for type numeric)

**RETURNED_LENGTH (integer)**
- length of the datum in characters

**RETURNED_OCTET_LENGTH (integer)**
- length of the character representation of the datum in bytes

**SCALE (integer)**
- scale (for type numeric)

**TYPE (integer)**
- numeric code of the data type of the column

In EXECUTE, DECLARE and OPEN statements, the effect of the INTO and USING keywords are different. A Descriptor Area can also be manually built to provide the input parameters for a query or a cursor and USING SQL DESCRIPTOR name is the way to pass the input parameters into a parametrized query. The statement to build a named SQL Descriptor Area is below:
EXEC SQL SET DESCRIPTOR name VALUE num field = :hostvar END-EXEC.

PostgreSQL supports retrieving more than one record in one FETCH statement and storing the data in host variables in this case assumes that the variable is an array. E.g.:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
01 GROUP-ITEM.
  05 IDNUM PIC S9(9) COMP OCCURS 5.
EXEC SQL END DECLARE SECTION END-EXEC.
EXEC SQL FETCH 5 FROM mycursor INTO SQL DESCRIPTOR mydesc END-EXEC.
EXEC SQL GET DESCRIPTOR mydesc VALUE 1 :IDNUM = DATA END-EXEC.

D.7 Error Handling

This section describes how you can handle exceptional conditions and warnings in an embedded SQL program. There are two nonexclusive facilities for this.

- Callbacks can be configured to handle warning and error conditions using the WHENEVER command.
- Detailed information about the error or warning can be obtained from the sqlca variable.

D.7.1 Setting Callbacks

One simple method to catch errors and warnings is to set a specific action to be executed whenever a particular condition occurs. In general:

EXEC SQL WHENEVER condition action END-EXEC.

condition can be one of the following:

SQLERROR
The specified action is called whenever an error occurs during the execution of an SQL statement.

SQLWARNING
The specified action is called whenever a warning occurs during the execution of an SQL statement.

NOT FOUND
The specified action is called whenever an SQL statement retrieves or affects zero rows. (This condition is not an error, but you might be interested in handling it specially.)

action can be one of the following:

CONTINUE
This effectively means that the condition is ignored. This is the default.

GOTO label
GO TO label
Jump to the specified label (using a COBOL goto statement).

SQLPRINT
Print a message to standard error. This is useful for simple programs or during prototyping. The details of the message cannot be configured.

STOP
Call STOP, which will terminate the program.
CALL name usingargs
DO name usingargs

Call the specified functions with the following characters including arguments. Thus, syntaxes (including compiler depending) are able to be placed as well as the arguments. Though, there are some limitation as following:

- You can't use RETURNING, ON EXCEPTION or OVER FLOW clauses.
- In the called subprogram, you must specify CONTINUE for every action with WHENEVER statement.

The SQL standard only provides for the actions CONTINUE and GOTO (and GO TO).

Here is an example that you might want to use in a simple program. It prints a simple message when a warning occurs and aborts the program when an error happens:

```sql
EXEC SQL WHENEVER SQLWARNING SQLPRINT END-EXEC.
EXEC SQL WHENEVER SQLERROR STOP END-EXEC.
```

The statement EXEC SQL WHENEVER is a directive of the SQL preprocessor, not a COBOL statement. The error or warning actions that it sets apply to all embedded SQL statements that appear below the point where the handler is set, unless a different action was set for the same condition between the first EXEC SQL WHENEVER and the SQL statement causing the condition, regardless of the flow of control in the COBOL program. So neither of the two following COBOL program excerpts will have the desired effect:

```sql
* * WRONG
* ...
  IF VERBOSE = 1 THEN
    EXEC SQL WHENEVER SQLWARNING SQLPRINT SQLPRINT END-EXEC END-IF.
  ...
  EXEC SQL SELECT ... END-EXEC.
  ...
*  * WRONG
* ...
  CALL SET-ERROR-HANDLER.
*        (and execute "EXEC SQL WHENEVER SQLERROR STOP" in SET-ERROR-HANDLER)
  ...
  EXEC SQL SELECT ... END-EXEC.
  ...
```

D.7.2 sqlca

For more powerful error handling, the embedded SQL interface provides a global variable with the name sqlca (SQL communication area) that has the following group item:

```sql
01 sqlca_t.
  10 sqlcaid PIC X(8).
  10 sqlabcc PIC S9(9) COMP-5.
  10 sqlcode PIC S9(9) COMP-5.
  10 sqlerrm.
    20 sqlerrml PIC S9(9) COMP-5.
    20 sqlerrmc PIC X(150).
  10 sqlerrp PIC X(8).
  10 sqlerrd PIC S9(9) COMP-5 OCCURS 6.
  10 sqlwarn PIC X(8).
  10 sqlstate PIC X(5).
```
(In a multithreaded program, every thread automatically gets its own copy of sqlca. This works similarly to the handling of the standard C global variable errno.)

sqlca covers both warnings and errors. If multiple warnings or errors occur during the execution of a statement, then sqlca will only contain information about the last one.

If no error occurred in the last SQL statement, SQLCODE will be 0 and SQLSTATE will be "00000". If a warning or error occurred, then SQLCODE will be negative and SQLSTATE will be different from "00000". A positive SQLCODE indicates a harmless condition, such as that the last query returned zero rows. SQLCODE and SQLSTATE are two different error code schemes; details appear below.

If the last SQL statement was successful, then SQLERRD(2) contains the OID of the processed row, if applicable, and SQLERRD(3) contains the number of processed or returned rows, if applicable to the command.

In case of an error or warning, SQLERRMC will contain a string that describes the error. The field SQLERRML contains the length of the error message that is stored in SQLERRMC (the result of FUNCTION STORED-CHAR-LENGTH). Note that some messages are too long to fit in the fixed-size sqlerrmc array; they will be truncated.

In case of a warning, the 3rd character of SQLWARN is set to W. (In all other cases, it is set to something different from W.) If the 2nd character of SQLWARN is set to W, then a value was truncated when it was stored in a host variable. The 1st character of SQLWARN is set to W if any of the other elements are set to indicate a warning.

The fields sqlcaid, sqlcabc, sqlerrp, and the remaining elements of sqlerrd and sqlwarn currently contain no useful information.

The structure sqlca is not defined in the SQL standard, but is implemented in several other SQL database systems. The definitions are similar at the core, but if you want to write portable applications, then you should investigate the different implementations carefully.

Here is one example that combines the use of WHENEVER and sqlca, printing out the contents of sqlca when an error occurs. This is perhaps useful for debugging or prototyping applications, before installing a more "user-friendly" error handler.

EXEC SQL WHENEVER SQLERROR GOTO PRINT_SQLCA END-EXEC.

PRINT_SQLCA.
  DISPLAY "==== sqlca ====".
  DISPLAY "SQLCODE: " SQLCODE.
  DISPLAY "SQLERRML: " SQLERRML.
  DISPLAY "SQLERRMC: " SQLERRMC.
  DISPLAY "SQLERRD: " SQLERRD(1) " " SQLERRD(2) " " SQLERRD(3) " " SQLERRD(4) " " SQLERRD(5) " " SQLERRD(6).
  DISPLAY "SQLSTATE: " SQLSTATE.
  DISPLAY "".

The result could look as follows (here an error due to a misspelled table name):

==== sqlca ====
sqlcode: -000000400
SQLERRML: +000000064
SQLERRMC: relation "pg_databasep" does not exist (10292) on line 93
sqlerrd: +000000000 +000000000 +000000000 +000000000 +000000000 +000000000
sqlstate: 42P01

D.7.3 SQLSTATE vs. SQLCODE

The fields SQLSTATE and SQLCODE are two different schemes that provide error codes. Both are derived from the SQL standard, but SQLCODE has been marked deprecated in the SQL-92 edition of the standard and has been dropped in later editions. Therefore, new applications are strongly encouraged to use SQLSTATE.

SQLSTATE is a five-character array. The five characters contain digits or upper-case letters that represent codes of various error and warning conditions. SQLSTATE has a hierarchical scheme: the first two characters indicate the general class of the condition, the last three characters indicate a subclass of the general condition. A successful state is indicated by the code 00000. The SQLSTATE codes are for the most part defined in the SQL standard. The PostgreSQL server natively supports
SQLSTATE error codes; therefore a high degree of consistency can be achieved by using this error code scheme throughout all applications.

See

Refer to "PostgreSQL Error Codes" in "Appendixes" in the PostgreSQL Documentation for further information.

SQLCODE, the deprecated error code scheme, is a simple integer. A value of 0 indicates success, a positive value indicates success with additional information, and a negative value indicates an error. The SQL standard only defines the positive value +100, which indicates that the last command returned or affected zero rows, and no specific negative values. Therefore, this scheme can only achieve poor portability and does not have a hierarchical code assignment. Historically, the embedded SQL processor for PostgreSQL has assigned some specific SQLCODE values for its use, which are listed below with their numeric value and their symbolic name. Remember that these are not portable to other SQL implementations. To simplify the porting of applications to the SQLSTATE scheme, the corresponding SQLSTATE is also listed. There is, however, no one-to-one or one-to-many mapping between the two schemes (indeed it is many-to-many), so you should consult the global SQLSTATE in each case.

See

Refer to "PostgreSQL Error Codes" in "Appendixes" in the PostgreSQL Documentation.

These are the assigned SQLCODE values:

0
Indicates no error. (SQLSTATE 00000)

100
This is a harmless condition indicating that the last command retrieved or processed zero rows, or that you are at the end of the cursor. (SQLSTATE 02000)

When processing a cursor in a loop, you could use this code as a way to detect when to abort the loop, like this:

```
PERFORM NO LIMIT
   EXEC SQL FETCH ... END-EXEC
   IF SQLCODE = 100 THEN
      GO TO FETCH-END
   END-IF
END-PERFORM.
```

But WHENEVER NOT FOUND GOTO ... effectively does this internally, so there is usually no advantage in writing this out explicitly.

-12
Indicates that your virtual memory is exhausted. The numeric value is defined as -ENOMEM. (SQLSTATE YE001)

-200
Indicates the preprocessor has generated something that the library does not know about. Perhaps you are running incompatible versions of the preprocessor and the library. (SQLSTATE YE002)

-201
This means that the command specified more host variables than the command expected. (SQLSTATE 07001 or 07002)

-202
This means that the command specified fewer host variables than the command expected. (SQLSTATE 07001 or 07002)

-203
This means a query has returned multiple rows but the statement was only prepared to store one result row (for example, because the specified variables are not arrays). (SQLSTATE 21000)

-185 -
The host variable is of type signed int and the datum in the database is of a different type and contains a value that cannot be interpreted as a signed int. The library uses strtol() for this conversion. (SQLSTATE 42804)

The host variable is of type unsigned int and the datum in the database is of a different type and contains a value that cannot be interpreted as an unsigned int. The library uses strtoul() for this conversion. (SQLSTATE 42804)

The host variable is of type float and the datum in the database is of another type and contains a value that cannot be interpreted as a float. The library uses strtod() for this conversion. (SQLSTATE 42804)

The host variable is of type DECIMAL and the datum in the database is of another type and contains a value that cannot be interpreted as a DECIMAL or DISPLAY value. For the case of DISPLAY, this error happens if values in the database is too large for converting to DISPLAY value. (SQLSTATE 42804)

The host variable is of type interval and the datum in the database is of another type and contains a value that cannot be interpreted as an interval value. (SQLSTATE 42804)

The host variable is of type date and the datum in the database is of another type and contains a value that cannot be interpreted as a date value. (SQLSTATE 42804)

The host variable is of type timestamp and the datum in the database is of another type and contains a value that cannot be interpreted as a timestamp value. (SQLSTATE 42804)

This means the host variable is of type bool and the datum in the database is neither 'Y' nor 'T'. (SQLSTATE 42804)

The statement sent to the PostgreSQL server was empty. (This cannot normally happen in an embedded SQL program, so it might point to an internal error.) (SQLSTATE YE002)

A null value was returned and no null indicator variable was supplied. (SQLSTATE 22002)

An ordinary variable was used in a place that requires an array. (SQLSTATE 42804)

The database returned an ordinary variable in a place that requires array value. (SQLSTATE 42804)

The program tried to access a connection that does not exist. (SQLSTATE 08003)

The program tried to access a connection that does exist but is not open. (This is an internal error.) (SQLSTATE YE002)

The statement you are trying to use has not been prepared. (SQLSTATE 26000)

The descriptor specified was not found. The statement you are trying to use has not been prepared. (SQLSTATE 33000)

The descriptor index specified was out of range. (SQLSTATE 07009)
An invalid descriptor item was requested. (This is an internal error.) (SQLSTATE YE002)

During the execution of a dynamic statement, the database returned a numeric value and the host variable was not numeric. (SQLSTATE 07006)

During the execution of a dynamic statement, the database returned a non-numeric value and the host variable was numeric. (SQLSTATE 07006)

Some error caused by the PostgreSQL server. The message contains the error message from the PostgreSQL server.

The PostgreSQL server signaled that we cannot start, commit, or rollback the transaction. (SQLSTATE 08007)

The connection attempt to the database did not succeed. (SQLSTATE 08001)

Duplicate key error, violation of unique constraint. (SQLSTATE 23505)

A result for the subquery is not single row. (SQLSTATE 21000)

An invalid cursor name was specified. (SQLSTATE 34000)

Transaction is in progress. (SQLSTATE 25001)

There is no active (in-progress) transaction. (SQLSTATE 25P01)

An existing cursor name was specified. (SQLSTATE 42P03)

D.8 Preprocessor Directives

Several preprocessor directives are available that modify how the ecobpg preprocessor parses and processes a file.

D.8.1 Including Files

To include an external file into your embedded SQL program, use:

```
EXEC SQL INCLUDE filename END-EXEC.
EXEC SQL INCLUDE <filename> END-EXEC.
EXEC SQL INCLUDE "filename" END-EXEC.
```

The embedded SQL preprocessor will look for a file named filename.pco, preprocess it, and include it in the resulting COBOL output. Thus, embedded SQL statements in the included file are handled correctly.

By default, the ecobpg preprocessor will search a file at the current directory. This behavior can be changed by the ecobpg commandline option.

First, the preprocessor tries to locate a file by specified file name at the current directory. If it fails and the file name does not end with .pco, the preprocessor also tries to locate a file with the suffix at the same directory.
The difference between EXEC SQL INCLUDE and COPY statement is whether precompiler processes embedded SQLs in the file, or not. If the file contains embedded SQLs, use EXEC SQL INCLUDE.

**Note**

The include file name is case-sensitive, even though the rest of the EXEC SQL INCLUDE command follows the normal SQL case-sensitivity rules.

### D.8.2 The define and undef Directives

Similar to the directive `#define` that is known from C, embedded SQL has a similar concept:

```sql
EXEC SQL DEFINE name END-EXEC.
EXEC SQL DEFINE name value END-EXEC.
```

So you can define a name:

```sql
EXEC SQL DEFINE HAVE_FEATURE END-EXEC.
```

And you can also define constants:

```sql
EXEC SQL DEFINE MYNUMBER 12 END-EXEC.
EXEC SQL DEFINE MYSTRING 'abc' END-EXEC.
```

Use `undef` to remove a previous definition:

```sql
EXEC SQL UNDEF MYNUMBER END-EXEC.
```

Note that a constant in the SQL statement is only replaced by EXEC SQL DEFINE. The replacement may change the number of characters in a line, but ecobpg does not validate it after the replacement. Pay attention to the limitation of the number of characters in a line.

### D.8.3 ifdef, ifndef, else, elif, and endif Directives

You can use the following directives to compile code sections conditionally:

```sql
EXEC SQL ifdef name END-EXEC.
```

Checks a name and processes subsequent lines if name has been created with EXEC SQL define name.

```sql
EXEC SQL ifndef name END-EXEC.
```

Checks a name and processes subsequent lines if name has not been created with EXEC SQL define name.

```sql
EXEC SQL else END-EXEC.
```

Starts processing an alternative section to a section introduced by either EXEC SQL ifdef name or EXEC SQL ifndef name.

```sql
EXEC SQL elif name END-EXEC.
```

Checks name and starts an alternative section if name has been created with EXEC SQL define name.

```sql
EXEC SQL endif END-EXEC.
```

Ends an alternative section.

**Example:**

```sql
EXEC SQL ifdef TZVAR END-EXEC.
EXEC SQL SET TIMEZONE TO 'GMT' END-EXEC.
EXEC SQL elif TZNAME END-EXEC.
```
D.9 Processing Embedded SQL Programs

Now that you have an idea how to form embedded SQL COBOL programs, you probably want to know how to compile them. Before compiling you run the file through the embedded SQL COBOL preprocessor, which converts the SQL statements you used to special function calls. After compiling, you must link with a special library that contains the needed functions. These functions fetch information from the arguments, perform the SQL command using the libpq interface, and put the result in the arguments specified for output.

The preprocessor program is called ecobpg and is included in a normal PostgreSQL installation. Embedded SQL programs are typically named with an extension .pco. If you have a program file called prog1.pco, you can preprocess it by simply calling:

```
ecobpg prog1.pco
```

This will create a file called prog1.cob. If your input files do not follow the suggested naming pattern, you can specify the output file explicitly using the -o option.

The preprocessed file can be compiled normally, following the usage of the compiler.

The generated COBOL source files include library files from the PostgreSQL installation, so if you installed PostgreSQL in a location that is not searched by default, you have to add an option such as -I/usr/local/pgsql/include to the compilation command line.

To link an embedded SQL program, you need to include the libecpg library.

Again, you might have to add an option for library search like -L/usr/local/pgsql/lib to that command line.

If you manage the build process of a larger project using make, it might be convenient to include the following implicit rule to your makefiles:

```
ECOBPG = ecobpg
%.cob: %.pco
  $(ECOBPG) $<
```

The complete syntax of the ecobpg command is detailed in "D.12.1 ecobpg".

Currently, ecobpg does not support multi threading.

D.10 Large Objects

Large objects are not supported by ECOBPG.

If you need to access large objects, use large objects interfaces of libpq instead.

D.11 Embedded SQL Commands

This section describes all SQL commands that are specific to embedded SQL.

<table>

---

**See**

Refer to the SQL commands listed in "SQL Commands" under "Reference" in the PostgreSQL Documentation, which can also be used in embedded SQL, unless stated otherwise.

---

**D.11.1 ALLOCATE DESCRIPTOR**

**Name**

ALLOCATE DESCRIPTOR -- allocate an SQL descriptor area

**Synopsis**

ALLOCATE DESCRIPTOR name

**Description**

ALLOCATE DESCRIPTOR allocates a new named SQL descriptor area, which can be used to exchange data between the PostgreSQL server and the host program.

Descriptor areas should be freed after use using the DEALLOCATE DESCRIPTOR command.

**Parameters**

name

A name of SQL descriptor. This can be an SQL identifier or a host variable.

**Examples**

```
EXEC SQL ALLOCATE DESCRIPTOR mydesc END-EXEC.
```

**Compatibility**

ALLOCATE DESCRIPTOR is specified in the SQL standard.
D.11.2 CONNECT

Name

CONNECT -- establish a database connection

Synopsis

CONNECT TO connection_target [ AS connection_name ] [ USER connection_user_name ]
CONNECT TO DEFAULT
CONNECT connection_user_name
DATABASE connection_target

Description

The CONNECT command establishes a connection between the client and the PostgreSQL server.

Parameters

collection_target

connection_target specifies the target server of the connection on one of several forms.

[ database_name ] [ @host ] [ :port ]

Connect over TCP/IP

database:postgresql://host [ :port ] / [ database_name ] [ ?connection_option ]

Connect over Unix-domain sockets

tcp:postgresql://host [ :port ] / [ database_name ] [ ?connection_option ]

Connect over TCP/IP

SQL string constant

containing a value in one of the above forms

host variable

host variable of fixed-length string (trailing spaces are ignored) containing a value in one of the above forms

connection_name

An optional identifier for the connection, so that it can be referred to in other commands. This can be an SQL identifier or a host variable.

connection_user_name

The user name for the database connection.

This parameter can also specify user name and password, using one the forms user_name/password, user_name IDENTIFIED BY password, or user_name USING password.

User name and password can be SQL identifiers, string constants, or host variables (fixed-length string, trailing spaces are ignored).

DEFAULT

Use all default connection parameters, as defined by libpq.
Examples

Here are several variants for specifying connection parameters:

EXEC SQL CONNECT TO "connectdb" AS main END-EXEC.
EXEC SQL CONNECT TO "connectdb" AS second END-EXEC.
EXEC SQL CONNECT TO "unix:postgresql://localhost/connectdb" AS main USER connectuser END-EXEC.
EXEC SQL CONNECT TO 'connectdb' AS main END-EXEC.
EXEC SQL CONNECT TO 'unix:postgresql://localhost/connectdb' AS main USER :user END-EXEC.
EXEC SQL CONNECT TO :dbn AS :idt END-EXEC.
EXEC SQL CONNECT TO :dbn USER connectuser USING :pw END-EXEC.
EXEC SQL CONNECT TO :localhost AS main USER connectdb END-EXEC.
EXEC SQL CONNECT TO REGRESSDB1 as main END-EXEC.
EXEC SQL CONNECT TO connectdb AS :idt END-EXEC.
EXEC SQL CONNECT TO connectdb AS main USER connectuser/connectdb END-EXEC.
EXEC SQL CONNECT TO connectdb@localhost AS main END-EXEC.
EXEC SQL CONNECT TO tcp:postgresql://localhost/ USER connectdb END-EXEC.
EXEC SQL CONNECT TO tcp:postgresql://localhost/connectdb USER connectuser IDENTIFIED BY connectpw END-EXEC.
EXEC SQL CONNECT TO tcp:postgresql://localhost:20/connectdb USER connectuser IDENTIFIED BY connectpw END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/ AS main USER connectdb END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb AS main USER connectuser END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb USER connectuser IDENTIFIED BY "connectpw" END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb USER connectuser USING "connectpw" END-EXEC.
EXEC SQL CONNECT TO unix:postgresql://localhost/connectdb?connect_timeout=14 USER connectuser END-EXEC.

Here is an example program that illustrates the use of host variables to specify connection parameters:

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
   * database name
   01 DBNAME PIC X(6).
   * connection user name
   01 USER PIC X(8).
   * connection string
   01 CONNECTION PIC X(38).
   01 VER PIC X(256).
EXEC SQL END DECLARE SECTION END-EXEC.

MOVE "testdb" TO DBNAME.
MOVE "testuser" TO USER.
MOVE "tcp:postgresql://localhost:5432/testdb" TO CONNECTION.

EXEC SQL CONNECT TO :DBNAME USER :USER END-EXEC.
EXEC SQL SELECT version() INTO :VER END-EXEC.
EXEC SQL DISCONNECT END-EXEC.

DISPLAY "version: " :VER.
EXEC SQL CONNECT TO :CONNECTION USER :USER END-EXEC.
EXEC SQL SELECT version() INTO :VER END-EXEC.
EXEC SQL DISCONNECT END-EXEC.

DISPLAY "version: " :VER.
Compatibility

CONNECT is specified in the SQL standard, but the format of the connection parameters is implementation-specific.

See Also

DISCONNECT, SET CONNECTION

D.11.3 DEALLOCATE DESCRIPTOR

Name

DEALLOCATE DESCRIPTOR -- deallocate an SQL descriptor area

Synopsis

DEALLOCATE DESCRIPTOR name

Description

DEALLOCATE DESCRIPTOR deallocates a named SQL descriptor area.

Parameters

name

The name of the descriptor which is going to be deallocated. This can be an SQL identifier or a host variable.

Examples

EXEC SQL DEALLOCATE DESCRIPTOR mydesc END-EXEC.

Compatibility

DEALLOCATE DESCRIPTOR is specified in the SQL standard.

See Also

ALLOCATE DESCRIPTOR, GET DESCRIPTOR, SET DESCRIPTOR

D.11.4 DECLARE

Name

DECLARE -- define a cursor

Synopsis

DECLARE cursor_name [ BINARY ] [ INSENSITIVE ] [ [ NO ] SCROLL ] CURSOR [ ( WITH | WITHOUT ) HOLD ] FOR prepared_name

DECLARE cursor_name [ BINARY ] [ INSENSITIVE ] [ [ NO ] SCROLL ] CURSOR [ ( WITH | WITHOUT ) HOLD ] FOR query

Description

DECLARE declares a cursor for iterating over the result set of a prepared statement. This command has slightly different semantics from the direct SQL command DECLARE: Whereas the latter executes a query and prepares the result set for retrieval, this embedded SQL command merely declares a name as a "loop variable" for iterating over the result set of a query; the actual execution happens when the cursor is opened with the OPEN command.
Parameters

cursor_name

A cursor name. This can be an SQL identifier or a host variable.

prepared_name

The name of a prepared query, either as an SQL identifier or a host variable.

query

A SELECT or VALUES command which will provide the rows to be returned by the cursor.

For the meaning of the cursor options, see DECLARE.

See

Refer to “SQL Commands” in “Reference” in the PostgreSQL Documentation for information on the SELECT, VALUES and DECLARE command.

Examples

Examples declaring a cursor for a query:

EXEC SQL DECLARE C CURSOR FOR SELECT * FROM My_Table END-EXEC.
EXEC SQL DECLARE C CURSOR FOR SELECT Item1 FROM T END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR SELECT version() END-EXEC.

An example declaring a cursor for a prepared statement:

EXEC SQL PREPARE stmt1 AS SELECT version() END-EXEC.
EXEC SQL DECLARE cur1 CURSOR FOR stmt1 END-EXEC.

Compatibility

DECLARE is specified in the SQL standard.

See Also

OPEN, CLOSE, DECLARE

See

Refer to “SQL Commands” in “Reference” in the PostgreSQL Documentation for information on the CLOSE and DECLARE command.

D.11.5 DESCRIBE

Name

DESCRIBE -- obtain information about a prepared statement or result set

Synopsis

DESCRIBE [ OUTPUT ] prepared_name USING SQL DESCRIPTOR descriptor_name

DESCRIBE [ OUTPUT ] prepared_name INTO SQL DESCRIPTOR descriptor_name
**Description**

DESCRIBE retrieves metadata information about the result columns contained in a prepared statement, without actually fetching a row.

**Parameters**

`prepared_name`

The name of a prepared statement. This can be an SQL identifier or a host variable.

`descriptor_name`

A descriptor name. It can be an SQL identifier or a host variable.

**Examples**

```sql
EXEC SQL ALLOCATE DESCRIPTR mydesc END-EXEC.
EXEC SQL PREPARE stmt1 FROM :sql_stmt END-EXEC.
EXEC SQL DESCRIBE stmt1 INTO SQL DESCRIPTR mydesc END-EXEC.
EXEC SQL GET DESCRIPTR mydesc VALUE 1 :charvar = NAME END-EXEC.
EXEC SQL DEALLOCATE DESCRIPTR mydesc END-EXEC.
```

**Compatibility**

DESCRIBE is specified in the SQL standard.

**See Also**

ALLOCATE DESCRIPTOR, GET DESCRIPTOR

**D.11.6 DISCONNECT**

**Name**

DISCONNECT -- terminate a database connection

**Synopsis**

```sql
DISCONNECT connection_name
DISCONNECT [ CURRENT ]
DISCONNECT DEFAULT
DISCONNECT ALL
```

**Description**

DISCONNECT closes a connection (or all connections) to the database.

**Parameters**

`connection_name`

A database connection name established by the CONNECT command.

**CURRENT**

Close the "current" connection, which is either the most recently opened connection, or the connection set by the SET CONNECTION command. This is also the default if no argument is given to the DISCONNECT command.

**DEFAULT**

Close the default connection.
Close all open connections.

**Examples**

```sql
EXEC SQL CONNECT TO testdb AS DEFAULT USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb AS con1 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb AS con2 USER testuser END-EXEC.
EXEC SQL CONNECT TO testdb AS con3 USER testuser END-EXEC.
*   close con3
EXEC SQL DISCONNECT CURRENT END-EXEC.
*   close DEFAULT
EXEC SQL DISCONNECT DEFAULT END-EXEC.
*   close con2 and con1
EXEC SQL DISCONNECT ALL END-EXEC.
```

**Compatibility**

DISCONNECT is specified in the SQL standard.

**See Also**

CONNECT, SET CONNECTION

---

**D.11.7 EXECUTE IMMEDIATE**

**Name**

EXECUTE IMMEDIATE -- dynamically prepare and execute a statement

**Synopsis**

EXECUTE IMMEDIATE string

**Description**

EXECUTE IMMEDIATE immediately prepares and executes a dynamically specified SQL statement, without retrieving result rows.

**Parameters**

`string`

A literal string or a host variable containing the SQL statement to be executed.

**Examples**

Here is an example that executes an INSERT statement using EXECUTE IMMEDIATE and a host variable named command:

```sql
MOVE "INSERT INTO test (name, amount, letter) VALUES ('db: 'r1''', 1, 'f')" TO ARR OF cmd.
COMPUTE LEN OF cmd = FUNCTION STORED-CHAR-LENGTH(ARR OF cmd).
EXEC SQL EXECUTE IMMEDIATE :cmd END-EXEC.
```

**Compatibility**

EXECUTE IMMEDIATE is specified in the SQL standard.

---

**D.11.8 GET DESCRIPTOR**
Name
GET DESCRIPTOR -- get information from an SQL descriptor area

Synopsis
GET DESCRIPTOR descriptor_name :hostvariable = descriptor_header_item [, ... ]
GET DESCRIPTOR descriptor_name VALUE column_number :hostvariable = descriptor_item [, ... ]

Description
GET DESCRIPTOR retrieves information about a query result set from an SQL descriptor area and stores it into host variables. A descriptor area is typically populated using FETCH or SELECT before using this command to transfer the information into host language variables.

This command has two forms: The first form retrieves descriptor "header" items, which apply to the result set in its entirety. One example is the row count. The second form, which requires the column number as additional parameter, retrieves information about a particular column. Examples are the column name and the actual column value.

Parameters

descriptor_name
A descriptor name.

descriptor_header_item
A token identifying which header information item to retrieve. Only COUNT, to get the number of columns in the result set, is currently supported.

column_number
The number of the column about which information is to be retrieved. The count starts at 1.

descriptor_item
A token identifying which item of information about a column to retrieve. See Section 33.7.1 for a list of supported items.

hostvariable
A host variable that will receive the data retrieved from the descriptor area.

Examples
An example to retrieve the number of columns in a result set:
EXEC SQL GET DESCRIPTOR d :d_count = COUNT END-EXEC.

An example to retrieve a data length in the first column:
EXEC SQL GET DESCRIPTOR d VALUE 1 :d_returned_octet_length = RETURNED_OCTET_LENGTH END-EXEC.

An example to retrieve the data body of the second column as a string:
EXEC SQL GET DESCRIPTOR d VALUE 2 :d_data = DATA END-EXEC.

Here is an example for a whole procedure of executing SELECT current_database(); and showing the number of columns, the column data length, and the column data:
EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 D-COUNT PIC S9(9) COMP-5.
  01 D-DATA PIC X(1024).
When the example is executed, the result will look like this:

<table>
<thead>
<tr>
<th>d_count</th>
<th>+000000001</th>
</tr>
</thead>
<tbody>
<tr>
<td>d_returned_octet_length</td>
<td>+000000006</td>
</tr>
<tr>
<td>d_data</td>
<td>testdb</td>
</tr>
</tbody>
</table>

**Compatibility**

GET DESCRIPTOR is specified in the SQL standard.

**See Also**

ALLOCATE DESCRIPTOR, SET DESCRIPTOR

---

### D.11.9 OPEN

**Name**

OPEN -- open a dynamic cursor

**Synopsis**

```
OPEN cursor_name

OPEN cursor_name USING value [, ... ]

OPEN cursor_name USING SQL DESCRIPTOR descriptor_name
```
Description

OPEN opens a cursor and optionally binds actual values to the placeholders in the cursor’s declaration. The cursor must previously have been declared with the DECLARE command. The execution of OPEN causes the query to start executing on the server.

Parameters

cursor_name

The name of the cursor to be opened. This can be an SQL identifier or a host variable.

value

A value to be bound to a placeholder in the cursor. This can be an SQL constant, a host variable, or a host variable with indicator.

descriptor_name

The name of a descriptor containing values to be bound to the placeholders in the cursor. This can be an SQL identifier or a host variable.

Examples

EXEC SQL OPEN a END-EXEC.
EXEC SQL OPEN d USING 1, 'test' END-EXEC.
EXEC SQL OPEN cl USING SQL DESCRIPTOR mydesc END-EXEC.
EXEC SQL OPEN :curname1 END-EXEC.

Compatibility

OPEN is specified in the SQL standard.

See Also

DECLARE, CLOSE

See

Refer to “SQL Commands” in “Reference” in the PostgreSQL Documentation for information on the CLOSE command.

D.11.10 PREPARE

Name

PREPARE -- prepare a statement for execution

Synopsis

PREPARE name FROM string

Description

PREPARE prepares a statement dynamically specified as a string for execution. This is different from the direct SQL statement PREPARE, which can also be used in embedded programs. The EXECUTE command is used to execute either kind of prepared statement.

Parameters

prepared_name

An identifier for the prepared query.
**string**

A literal string or a host variable containing a preparable statement, one of the SELECT, INSERT, UPDATE, or DELETE.

**Examples**

```sql
MOVE "SELECT * FROM test1 WHERE a = ? AND b = ?" TO ARR OF STMT.
COMPUTE LEN OF STMT = FUNCTION STORED-CHAR-LENGTH (ARR OF STMT).
EXEC SQL ALLOCATE DESCRIPTOR indesc END-EXEC.
EXEC SQL ALLOCATE DESCRIPTOR outdesc END-EXEC.
EXEC SQL PREPARE foo FROM :STMT END-EXEC.
EXEC SQL EXECUTE foo USING SQL DESCRIPTOR indesc INTO SQL DESCRIPTOR outdesc END-EXEC.
```

**Compatibility**

PREPARE is specified in the SQL standard.

**See Also**

EXECUTE

---

### D.11.11 SET AUTOCOMMIT

**Name**

SET AUTOCOMMIT -- set the autocommit behavior of the current session

**Synopsis**

```sql
SET AUTOCOMMIT { = | TO } { ON | OFF }
```

**Description**

SET AUTOCOMMIT sets the autocommit behavior of the current database session. By default, embedded SQL programs are not in autocommit mode, so COMMIT needs to be issued explicitly when desired. This command can change the session to autocommit mode, where each individual statement is committed implicitly.

**Compatibility**

SET AUTOCOMMIT is an extension of PostgreSQL ECOBPG.

### D.11.12 SET CONNECTION

**Name**

SET CONNECTION -- select a database connection

**Synopsis**

```sql
SET CONNECTION [ TO | = ] connection_name
```

**Description**

SET CONNECTION sets the "current" database connection, which is the one that all commands use unless overridden.
Parameters

connection_name

A database connection name established by the CONNECT command.

DEFAULT

Set the connection to the default connection.

Examples

```
EXEC SQL SET CONNECTION TO con2 END-EXEC.
EXEC SQL SET CONNECTION = con1 END-EXEC.
```

Compatibility

SET CONNECTION is specified in the SQL standard.

See Also

CONNECT, DISCONNECT

D.11.13 SET DESCRIPTOR

Name

SET DESCRIPTOR -- set information in an SQL descriptor area

Synopsis

```
SET DESCRIPTOR descriptor_name descriptor_header_item = value [, ... ]
SET DESCRIPTOR descriptor_name VALUE number descriptor_item = value [, ...]
```

Description

SET DESCRIPTOR populates an SQL descriptor area with values. The descriptor area is then typically used to bind parameters in a prepared query execution.

This command has two forms: The first form applies to the descriptor "header", which is independent of a particular datum. The second form assigns values to particular datums, identified by number.

Parameters

```
descriptor_name

A descriptor name.

descriptor_header_item

A token identifying which header information item to set. Only COUNT, to set the number of descriptor items, is currently supported.

number

The number of the descriptor item to set. The count starts at 1.

descriptor_item

A token identifying which item of information to set in the descriptor. See Section 33.7.1 for a list of supported items.

value

A value to store into the descriptor item. This can be an SQL constant or a host variable.
```
Examples

```
EXEC SQL SET DESCRIPTOR indesc COUNT = 1 END-EXEC.
EXEC SQL SET DESCRIPTOR indesc VALUE 1 DATA = 2 END-EXEC.
EXEC SQL SET DESCRIPTOR indesc VALUE 1 DATA = :val1 END-EXEC.
EXEC SQL SET DESCRIPTOR indesc VALUE 2 DATA = 'some string', INDICATOR = :val1 END-EXEC.
EXEC SQL SET DESCRIPTOR indesc VALUE 2 INDICATOR = :val2null, DATA = :val2 END-EXEC.
```

Compatibility

SET DESCRIPTOR is specified in the SQL standard.

See Also

ALLOCATE DESCRIPTOR, GET DESCRIPTOR

D.11.14 TYPE

Name

TYPE -- define a new data type

Synopsis

```
TYPE type_name IS ctype
```

Description

The TYPE command defines a new COBOL type. It is equivalent to putting a typedef into a declare section.

This command is only recognized when ecobpgpg is run with the -c option.

A level number of 01 is automatically added to type_name item. Thus, the level number must not to be specified externally.

To define a group item, a level number needs to be specified to the each subordinate items.

For reasons of internal implementation, "TYPE" must be placed just after "EXEC SQL", without containing newline. For other place, you can use newline.

Parameters

```
type_name

The name for the new type. It must be a valid COBOL type name.
```

```
ctype

A COBOL type specification (including expression format specification).
```

Examples

```
EXEC SQL TYPE CUSTOMER IS
    02  NAME PIC X(50) VARYING.
    02  PHONE PIC S9(9) COMP. END-EXEC.

EXEC SQL TYPE CUST-IND IS
    02  NAME_IND PIC S9(4) COMP.
    02  PHONE_IND PIC S9(4) COMP. END-EXEC.

EXEC SQL TYPE INTARRAY IS
    02  INT PIC S9(9) OCCURS 20. END-EXEC.

EXEC SQL TYPE STR IS PIC X(50) VARYING. END-EXEC.

EXEC SQL TYPE STRING IS PIC X(10). END-EXEC.
```
Here is an example program that uses EXEC SQL TYPE:

```
EXEC SQL TYPE TT IS
  02 V PIC X(256) VARYING.
  02 I PIC S9(9) COMP. END-EXEC.

EXEC SQL TYPE TT-IND IS
  02 V-IND PIC S9(4) COMP.
  02 I-IND PIC S9(4) COMP. END-EXEC.

EXEC SQL BEGIN DECLARE SECTION END-EXEC.
  01 T TYPE TT.
  01 T-IND TYPE TT-IND.
EXEC SQL END DECLARE SECTION END-EXEC.

EXEC SQL CONNECT TO testdb AS con1 END-EXEC.

EXEC SQL SELECT current_database(), 256 INTO :T :T-IND LIMIT 1 END-EXEC.

DISPLAY "t.v = " ARR OF V OF T.
DISPLAY "t.i = " I OF T.

DISPLAY "t_ind.v_ind = " V-IND OF T-IND.
DISPLAY "t_ind.i_ind = " I-IND OF T-IND.

EXEC SQL DISCONNECT con1 END-EXEC.
```

Compatibility
The TYPE command is a PostgreSQL extension.

### D.11.15 VAR

**Name**
VAR—define a variable

**Synopsis**

```
VAR varname IS ctype
```

**Description**
The VAR command defines a host variable. It is equivalent to an ordinary COBOL variable definition inside a declare section. When translating, a level number 01 is added. Thus, the level number must not to be specified externally.

To define a group item, a level number needs to be specified to the each subordinate items.

For reasons of internal implementation, "VAR" must be placed just after "EXEC SQL", without containing newline. For other place, you can use newline.

**Parameters**

- varname
  A COBOL variable name.

- ctype
  A COBOL type specification.
Examples

EXEC SQL VAR VC IS PIC X(10) VARYING. END-EXEC.
EXEC SQL VAR BOOL-VAR IS BOOL. END-EXEC.

Compatibility

The VAR command is a PostgreSQL extension.

D.11.16 WHENEVER

Name

WHENEVER -- specify the action to be taken when an SQL statement causes a specific class condition to be raised

Synopsis

WHENEVER { NOT FOUND | SQLERROR | SQLWARNING } action

Description

Define a behavior which is called on the special cases (Rows not found, SQL warnings or errors) in the result of SQL execution.

Parameters

See Section "D.7.1 Setting Callbacks" or a description of the parameters.

Examples

EXEC SQL WHENEVER NOT FOUND CONTINUE END-EXEC.
EXEC SQL WHENEVER SQLWARNING SQLPRINT END-EXEC.
EXEC SQL WHENEVER SQLWARNING DO "warn" END-EXEC.
EXEC SQL WHENEVER SQLERROR sqlprint END-EXEC.
EXEC SQL WHENEVER SQLERROR CALL "print2" END-EXEC.
EXEC SQL WHENEVER SQLERROR DO handle_error USING "select" END-EXEC.
EXEC SQL WHENEVER SQLERROR DO sqlnotice USING 0 1 END-EXEC.
EXEC SQL WHENEVER SQLERROR DO "sqlprint" END-EXEC.
EXEC SQL WHENEVER SQLERROR GOTO error_label END-EXEC.
EXEC SQL WHENEVER SQLERROR STOP END-EXEC.

A typical application is the use of WHENEVER NOT FOUND GOTO to handle looping through result sets:

EXEC SQL CONNECT TO testdb AS con1 END-EXEC.
EXEC SQL ALLOCATE DESCRIPTOR d END-EXEC.
EXEC SQL DECLARE cur CURSOR FOR SELECT current_database(), 'hoge', 256 END-EXEC.
EXEC SQL OPEN cur END-EXEC.

* when end of result set reached, break out of while loop
EXEC SQL WHENEVER NOT FOUND GOTO NOTFOUND END-EXEC.

PERFORM NO LIMIT
    EXEC SQL FETCH NEXT FROM cur INTO SQL DESCRIPTOR d END-EXEC
    ...
END-PERFORM.

NOTFOUND.
EXEC SQL CLOSE cur END-EXEC.
EXEC SQL COMMIT END-EXEC.
Compatibility

WHENEVER is specified in the SQL standard, but most of the actions are PostgreSQL extensions.

D.12 PostgreSQL Client Applications

This part contains reference information for PostgreSQL client applications and utilities. Not all of these commands are of general utility; some might require special privileges. The common feature of these applications is that they can be run on any host, independent of where the database server resides.

When specified on the command line, user and database names have their case preserved — the presence of spaces or special characters might require quoting. Table names and other identifiers do not have their case preserved, except where documented, and might require quoting.

D.12.1 ecobpg

Name

ecobpg -- embedded SQL COBOL preprocessor

Synopsis

ecobpg [option...] file...

Description

ecobpg is the embedded SQL preprocessor for COBOL programs. It converts COBOL programs with embedded SQL statements to normal COBOL code by replacing the SQL invocations with special function calls. The output files can then be processed with any COBOL compiler tool chain.

ecobpg will convert each input file given on the command line to the corresponding COBOL output file. Input files preferably have the extension .pco, in which case the extension will be replaced by .cob to determine the output file name. If the extension of the input file is not .pco, then the output file name is computed by appending .cob to the full file name. The output file name can also be overridden using the -o option.

Options

ecobpg accepts the following command-line arguments:

- -c
    Automatically generate certain COBOL code from SQL code. Currently, this works for EXEC SQL TYPE.

- -I directory
    Specify an additional include path, used to find files included via EXEC SQL INCLUDE. Defaults are: (current directory), /usr/local/include, the PostgreSQL include directory which is defined at compile time (default: /usr/local/pgsql/include), and /usr/include, in that order.

- -o filename
    Specifies that ecobpg should write all its output to the given filename.

- -f format
    Specifies the COBOL code notation. For "format", specify either of the following. If omitted, "fixed" is used.
    fixed
        Specifies fixed format notation. Up to 72 columns can be specified for area B. Characters in column 73 and beyond are deleted in the precompiled source.
variable

Specifies variable format notation. Up to 251 columns can be specified for area B. Characters in column 252 and beyond are deleted in the precompiled source.

-r option

Selects run-time behavior. Option can be one of the following:

prepare

Prepare all statements before using them. Libecpg will keep a cache of prepared statements and reuse a statement if it gets executed again. If the cache runs full, libecpg will free the least used statement.

questionmarks

Allow question mark as placeholder for compatibility reasons. This used to be the default long ago.

-t

Turn on autocommit of transactions. In this mode, each SQL command is automatically committed unless it is inside an explicit transaction block. In the default mode, commands are committed only when EXEC SQL COMMIT is issued.

--varchar-with-named-member

When converting VARCHAR host variable, adding name of the variable to members as prefix. Instead of LEN and ARR, (varname)-ARR and (varname)-LEN will be used.

-E encode

Specify the COBOL source encoding: "UTF8", "SJIS", or "EUC_JP".

If this option is omitted, the encoding is processed based on the locale.

-v

Print additional information including the version and the "include" path.

--version

Print the ecobpg version and exit.

-?

--help

Show help about ecobpg command line arguments, and exit.

Notes

When compiling the preprocessed COBOL code files, the compiler needs to be able to find the ECOBPG library text files in the PostgreSQL include directory. Therefore, you might have to use the -I option when invoking the compiler.

Programs using COBOL code with embedded SQL have to be linked against the libecpg library, for example using the linker options.

The value of either of these directories that is appropriate for the installation can be found out using pg_config.

See

Refer to "pg_config" in "Reference" in the PostgreSQL Documentation.

Examples

If you have an embedded SQL COBOL source file named prog1.pco, you can create an executable program using the following command:

ecobpg prog1.pco
# Appendix E Quantitative Limits

This appendix lists the quantitative limits of FUJITSU Enterprise Postgres.

## Table E.1 Length of identifier

<table>
<thead>
<tr>
<th>Item</th>

<tr>
<td>Number of large objects</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of rows in tables defined by WITH OIDS</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
<tr>
<td>Number of index access methods</td>
<td>Less than 4,294,967,296 (+1)</td>
</tr>
</tbody>
</table>

*1: The total number of all database objects must be less than 4,294,967,296.

Table E.3 Schema element

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns that can be defined in one table</td>
<td>From 250 to 1600 (according to the data type)</td>
</tr>
<tr>
<td>Table row length</td>
<td>Up to 400 gigabytes</td>
</tr>
<tr>
<td>Number of columns comprising a unique constraint</td>
<td>Up to 32 columns</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>------</td>
<td>-------</td>
</tr>
<tr>
<td>Data length comprising a unique constraint</td>
<td>Less than 2,000 bytes (*1) (*2)</td>
</tr>
<tr>
<td>Table size</td>
<td>Up to one terabyte</td>
</tr>
<tr>
<td>Search condition character string length in a trigger definition statement</td>
<td>Up to 800 megabytes (*1) (*2)</td>
</tr>
<tr>
<td>Item size</td>
<td>Up to 1 gigabyte</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.
*2: This is the character string byte length when converted by the server character set character code.

### Table E.4 Index

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns comprising a key (including VCI)</td>
<td>Up to 32 columns</td>
</tr>
<tr>
<td>Key length (other than VCI)</td>
<td>Less than 2,000 bytes (*1)</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

### Table E.5 Data types and attributes that can be handled

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td>Data length</td>
</tr>
<tr>
<td>Specification length (n)</td>
<td>Up to 10,485,760 characters (*1)</td>
</tr>
<tr>
<td>Numeric</td>
<td>External decimal expression</td>
</tr>
<tr>
<td>Internal binary expression</td>
<td>2 bytes</td>
</tr>
<tr>
<td>4 bytes</td>
<td>From -2,147,483,648 to 2,147,483,647</td>
</tr>
<tr>
<td>8 bytes</td>
<td>From -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807</td>
</tr>
<tr>
<td>Internal decimal expression</td>
<td>Up to 13,1072 digits before the decimal point, and up to 16,383 digits after the decimal point</td>
</tr>
<tr>
<td>Floating point expression</td>
<td>4 bytes</td>
</tr>
<tr>
<td>8 bytes</td>
<td>From -1.7E+308 to -2.5E-324, 0, or from 2.5E-324 to 1.7E+308</td>
</tr>
<tr>
<td>bytea</td>
<td>Up to one gigabyte minus 53 bytes</td>
</tr>
<tr>
<td>Large object</td>
<td>Up to two gigabytes</td>
</tr>
</tbody>
</table>

*1: This is the character string byte length when converted by the server character set character code.

### Table E.6 Function definition

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of arguments that can be specified</td>
<td>Up to 100</td>
</tr>
<tr>
<td>Number of variable names that can be specified in the declarations section</td>
<td>No limit</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Number of SQL statements or control statements that can be specified in a function processing implementation</td>
<td>No limit</td>
</tr>
</tbody>
</table>

**Table E.7 Data operation statement**

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of connections for one process in an application (remote access)</td>
<td>4,000 connections</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a selection list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of tables that can be specified in a FROM clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of unique expressions that can be specified in a selection list/DISTINCT clause/ORDER BY clause/GROUP BY clause within one SELECT statement</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a GROUP BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an ORDER BY clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of SELECT statements that can be specified in a UNION clause/INTERSECT clause/EXCEPT clause</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of nestings in joined tables that can be specified in one view</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of functions or operator expressions that can be specified in one expression</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row constructor</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in an UPDATE statement SET clause</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in one row of a VALUES list</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a RETURNING clause</td>
<td>Up to 1,664</td>
</tr>
<tr>
<td>Total expression length that can be specified in the argument list of one function specification</td>
<td>Up to 800 megabytes (*2)</td>
</tr>
<tr>
<td>Number of cursors that can be processed simultaneously by one session</td>
<td>No limit</td>
</tr>
<tr>
<td>Character string length of one SQL statement</td>
<td>Up to 800 megabytes (*1) (*3)</td>
</tr>
<tr>
<td>Number of input parameter specifications that can be specified in one dynamic SQL statement</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of tokens that can be specified in one SQL statement</td>
<td>Up to 10,000</td>
</tr>
<tr>
<td>Number of values that can be specified as a list in a WHERE clause IN syntax</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of expressions that can be specified in a USING clause</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of JOINs that can be specified in a joined table</td>
<td>Up to 4,000 (*1)</td>
</tr>
<tr>
<td>Number of expressions that can be specified in COALESCE</td>
<td>No limit</td>
</tr>
<tr>
<td>Number of WHEN clauses that can be specified for CASE in a simple format or a searched format</td>
<td>No limit</td>
</tr>
<tr>
<td>Item</td>
<td>Limit</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>Data size per record that can be updated or inserted by one SQL statement</td>
<td>Up to one gigabyte minus 53 bytes</td>
</tr>
<tr>
<td>Number of objects that can share a lock simultaneously</td>
<td>Up to 256,000 (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.

*2: The total number of all database objects must be less than 4,294,967,296.

*3: This is the character string byte length when converted by the server character set character code.

**Table E.8 Data sizes**

<table>
<thead>
<tr>
<th>Item</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data size per record for input data files (COPY statement, psql command 'copy meta command)</td>
<td>Up to 800 megabytes (*1)</td>
</tr>
<tr>
<td>Data size per record for output data files (COPY statement, psql command 'copy meta command)</td>
<td>Up to 800 megabytes (*1)</td>
</tr>
</tbody>
</table>

*1: Operation might proceed correctly even if operations are performed with a quantity outside the limits.

There are the following two ways to develop applications using Fujitsu Npgsql.NET Data Provider:

- Use the Fujitsu Npgsql.NET Data Provider API (classes and methods) directly.

  Fujitsu Npgsql.NET Data Provider is created based on the open source software Npgsql. Refer to the "Npgsql - .Net Data Provider for Postgresql" for information on the APIs:

  See

  Refer to the Installation and Setup Guide for Client for the version of Npgsql that Fujitsu Npgsql.NET Data Provider is based on.

- Use the API of the .NET System.Data.Common namespace

  It is possible to create applications that do not rely on a provider when you use the System.Data.Common namespace. Refer to the "Writing Provider-Independent Code in ADO.NET" in MSDN Library for information.

The following table indicates whether the System.Data.Common namespace API is supported. Note that API marked "Npgsql extension API" do not exist in the System.Data.Common namespace, but rather are API extended by Npgsql.

### F.4 C Library (libpq)

Refer to "libpq - C Library" in “Client Interfaces” in the PostgreSQL Documentation.

### F.5 Embedded SQL in C

Refer to “ECPG - Embedded SQL in C” in “Client Interfaces” in the PostgreSQL Documentation.
FUJITSU Enterprise Postgres 9.6

Operation Guide (Linux)
Preface

Purpose of this document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Linux platform.
This document is the FUJITSU Enterprise Postgres Operation Guide.

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres.
Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Linux

Structure of this document
This document is structured as follows:

Chapter 1 Operating FUJITSU Enterprise Postgres
Describes how to operate FUJITSU Enterprise Postgres.

Chapter 2 Starting an Instance and Creating a Database
Describes how to start a FUJITSU Enterprise Postgres instance, and how to create a database.

Chapter 3 Backing Up the Database
Describes how to back up the database.

Chapter 4 Configuring Secure Communication Using Secure Sockets Layer
Describes communication data encryption between the client and the server.

Chapter 5 Protecting Storage Data Using Transparent Data Encryption
Describes how to encrypt the data to be stored in the database.

Chapter 6 Data Masking
Describes the data masking feature.

Chapter 7 Periodic Operations
Describes the periodic database operations that must be performed on FUJITSU Enterprise Postgres.

Chapter 8 Streaming Replication Using WebAdmin
Describes how to create a streaming replication cluster using WebAdmin.

Chapter 9 Installing and Operating the In-memory Feature
Describes how to install and operate the in-memory feature.

Chapter 10 Actions when an Error Occurs
Describes how to perform recovery when disk failure or data corruption occurs.

Appendix A Parameters
Describes the FUJITSU Enterprise Postgres parameters.

Appendix B System Administration Functions
Describes the system administration functions of FUJITSU Enterprise Postgres.

Appendix C System Views
Describes how to use the system view in FUJITSU Enterprise Postgres.
Appendix D Tables Used by Data Masking
Describes the tables used by the data masking feature.

Appendix E Activating and Stopping the Web Server Feature of WebAdmin
Describes how to activate and stop WebAdmin (Web server feature).

Appendix F WebAdmin Wallet
Describes how to use the Wallet feature of WebAdmin.

Appendix G Collecting Failure Investigation Data
Describes how to collect information for initial investigation.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

5.10.2 Database Multiplexing Mode .................................................................................. 39
5.11 Security-Related Notes .................................................................................................. 40
Chapter 1 Operating FUJITSU Enterprise Postgres

This chapter describes how to operate FUJITSU Enterprise Postgres.

1.1 Operating Methods

There are two methods of managing FUJITSU Enterprise Postgres operations:

- Operation management using GUI tools
- Operation management using commands

Before performing switchover or failover operation using database multiplexing, refer to “Database Multiplexing Mode” in the Cluster Operation Guide.

Operation management using GUI tools

This involves managing operations using the WebAdmin and pgAdmin GUI tools.

- Management using WebAdmin
  
  This removes the requirement for complex environment settings and operational design for backup and recovery that is usually required for running a database. It enables you to easily and reliably monitor the state of the database, create a streaming replication cluster, back up the database, and restore it even if you do not have expert knowledge of databases.

- Management using pgAdmin
  
  When developing applications and maintaining the database, you can use pgAdmin to perform simple operations on database objects, such as:
  
  - Rebuild indexes and update statistics
  - Create, delete, and update database objects

  In addition, from pgAdmin of FUJITSU Enterprise Postgres, you can use the expanded features provided by FUJITSU Enterprise Postgres on the PostgreSQL SQL commands.

Refer to pgAdmin Help for information on the expanded features of pgAdmin provided by FUJITSU Enterprise Postgres.

Operation management using commands

You can use commands for configuring and operating the database and managing operations.

Note

You cannot combine WebAdmin and server commands to perform the following operations:

- Use commands to operate an instance created using WebAdmin.
- Use WebAdmin to recover a database backed up using commands.

For instances created with WebAdmin, however, backup can be obtained with the pgx_dmpall command. Also, WebAdmin can perform recovery by using the backup obtained with the pgx_dmpall command.

- To operate an instance created using the initdb command in WebAdmin, the instance needs to be imported using WebAdmin.
You can perform backup and restoration in pgAdmin, but the backup data obtained with WebAdmin and pgx_dmpall is not compatible with the backup data obtained with pgAdmin.

Refer to pgAdmin Help for other notes on pgAdmin.

### Features used in each phase

The following table lists the features used in each phase for GUI-based operations and command-based operations.

<table>
<thead>
<tr>
<th>Operation</th>
<th>GUI-based operation</th>
<th>Command-based operation</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

*1: Operations can be monitored using operation management middleware (such as Systemwalker Centric Manager).

*2: A warning is displayed when disk usage reaches 80%.

*3: This command searches for pg_stat_activity in the standard statistics views and monitors the state.

### 1.2 Activating WebAdmin

This section describes how to activate and log in to WebAdmin.

#### 1.2.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

### User environment

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build 38)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.
Activation URL for WebAdmin

In the browser address bar, type the activation URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- `hostNameOrIpAddress`: The host name or IP address of the server where WebAdmin is installed.
- `portNumber`: The port number of WebAdmin. The default port number is 27515.

**Example**

For a server with IP address "192.0.2.0" and port number "27515"

```
http://192.0.2.0:27515/
```

The activation URL window shown below is displayed. From this window you can launch WebAdmin or access the product documentation.

---

**Note**

- You must activate the Web server feature of WebAdmin before using WebAdmin.
- Refer to "Appendix E Activating and Stopping the Web Server Feature of WebAdmin" for information on how to activate the Web server feature of WebAdmin.

---

Log in to WebAdmin

Click [Launch WebAdmin] in the activation URL window to activate WebAdmin and display the login window.
To log in, specify the following values:
- [User ID]: User ID (OS user account) of the instance administrator
- [Password]: Password corresponding to the user ID

Point

Use the OS user account as the user ID of the instance administrator. Refer to “Creating an Instance Administrator” in the Installation and Setup Guide for Server for details.

1.3 Starting pgAdmin

This section describes how to start pgAdmin, how to add an instance required for managing a database, and how to connect to and disconnect from the instance.

You can use pgAdmin on the Windows client.

1.3.1 Starting pgAdmin

This section explains how to start pgAdmin if you are using it from the product "FUJITSU Enterprise Postgres Client (AAbit) x.y SPz" (where AA is "32" or "64", x.y and z are the version numbers (x.y SPz)).

Windows Server(R) 2012
From the [Start] screen, start [pgAdmin III (AAbit) (x.y SPz)].

Windows(R) 8.1 or Windows Server(R) 2012 R2
From the [Apps] view, start [pgAdmin III (AAbit) (x.y SPz)].

Windows(R) 10 or Windows Server(R) 2016
Click [Start] >> [All apps] >> [FUJITSU Enterprise Postgres Client(AAbit)] and start [pgAdmin III (AAbit) (x.y SPz)].

Other operating systems
Click [Start] >> [All Programs] >> [FUJITSU Enterprise Postgres Client(AAbit) x,y SPz] and start [pgAdmin III (AAbit) (x.y SPz)].
The following window is displayed when pgAdmin starts.

1.3.2 Adding an Instance

This section describes how to add an instance to be connected to.

1. From the [File] menu in pgAdmin, click [Add Server].
2. In the [New Server Registration] window, specify a value for each item.

<table>
<thead>
<tr>
<th>Properties</th>
<th>SSL</th>
<th>SSH Tunnel</th>
<th>Advanced</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>db01</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Host</td>
<td>sv1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Port</td>
<td>27500</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Service</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Maintenance DB</td>
<td>postgres</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Username</td>
<td>fsopuser</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Password</td>
<td>**********</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Store password</td>
<td>no</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Colour</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Group</td>
<td>Servers</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

([Properties] tab)
- [Name]: Name of the instance to be managed
- [Host]: Host name or IP address of the server where FUJITSU Enterprise Postgres is installed
- [Port]: Port number of the instance
- [Username]: User name of the instance administrator
- [Password]: Password for the user name specified in [Username]

When you add an instance using pgAdmin, the instance is automatically connected to immediately after the addition is completed.

**Note**

If you select [Store password], a file storing the FUJITSU Enterprise Postgres connection password is created in the following location. Set the appropriate access permissions for the password file to protect it from unauthorized access.
- `%APPDATA%\postgresql\pgpass.conf`

### 1.3.3 Connecting/Disconnecting an Instance

This section describes how to connect pgAdmin to an instance, and how to disconnect it.
To connect to an instance created using WebAdmin, you must first configure the settings in the [Client Authentication] window of WebAdmin to permit connection from pgAdmin.

**Connecting to an instance**

Starting pgAdmin does not connect it to any instance.

To connect to an instance, right-click the instance in [Object browser] and select [Connect].

If a password was not saved when the instance was added, the following password entry window is displayed.
Disconnecting from an instance

To disconnect from an instance, right-click the server in [Object browser] in the pgAdmin window and select [Disconnect server].

1.4 Operations Using Commands

You can operate and manage the database using the following commands:

- **Server commands**
  
  This group of commands includes commands for creating a database cluster and controlling the database. You can run these commands on the server where the database is operating.

  To use these commands, you must configure the environment variables.

  **See**

  - Refer to "PostgreSQL Server Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on server commands.

  - Refer to "Configure the environment variables" under the procedure for creating an instance in "Using the initdb Command" in the Installation and Setup Guide for Server for information on the values to be set in the environment variables.

- **Client commands**

  This group of commands includes the psql command and commands for extracting the database cluster to a script file. These commands can be executed on the client that can connect to the database, or on the server on which the database is running.

  To use these commands, you need to configure the environment variables.

  **See**

  - Refer to "PostgreSQL Client Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on client commands.

  - Refer to "Configuring Environment Variables" in the Installation and Setup Guide for Client for information on the values to be set in the environment variables.

1.5 Operating Environment of FUJITSU Enterprise Postgres

This section describes the operating environment and the file composition of FUJITSU Enterprise Postgres.
### 1.5.1 Operating Environment

The following figure shows the configuration of the FUJITSU Enterprise Postgres operating environment. The tables given below list the roles of the OS resources and FUJITSU Enterprise Postgres resources.

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.

#### Table 1.1 OS resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared memory</td>
<td>Used when a database process exchanges information with an external process.</td>
</tr>
<tr>
<td>Semaphore</td>
<td></td>
</tr>
</tbody>
</table>

#### Table 1.2 FUJITSU Enterprise Postgres client resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection service file</td>
<td>Specifies information, such as the host name, user name, and password, for connecting to FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>Password file</td>
<td>Securely manages the password for connecting to FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>CA certificate file</td>
<td>CA (certificate authority) certificate used for server authentication when encrypting communication data</td>
</tr>
</tbody>
</table>
### Table 1.3 Server resources of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>Database storage area on the database storage disk. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>System catalog</td>
<td>Contains information required for the system to run, including the database definition information and the operation information created by the user</td>
</tr>
<tr>
<td>Default tablespace</td>
<td>Contains table files and index files stored by default</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Contains log information in case of a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
<tr>
<td>Work file</td>
<td>Work file used when executing applications or commands</td>
</tr>
<tr>
<td>postgresql.conf</td>
<td>Contains information that defines the operating environment of FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>pg_hba.conf</td>
<td>FUJITSU Enterprise Postgres uses this file to authenticate individual client hosts</td>
</tr>
<tr>
<td>Server certificate file</td>
<td>Contains information about the server certificate to be used when encrypting communication data and authenticating a server</td>
</tr>
<tr>
<td>Server private key file</td>
<td>Contains information about the server private key to be used when encrypting communication data and authenticating a server</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster</td>
</tr>
<tr>
<td>Backup</td>
<td>Stores the data required for recovering the database when an error, such as disk failure, occurs</td>
</tr>
<tr>
<td>Database backup</td>
<td>Contains the backup data for the database</td>
</tr>
<tr>
<td>Archive log</td>
<td>Contains the log information for recovery.</td>
</tr>
<tr>
<td>Core file</td>
<td>FUJITSU Enterprise Postgres process core file that is output when an error occurs during an FUJITSU Enterprise Postgres process</td>
</tr>
<tr>
<td>Key management server or key management storage</td>
<td>Server or storage where the master encryption key file is located</td>
</tr>
<tr>
<td>Master encryption key file</td>
<td>Contains the master encryption key to be used when encrypting storage data. The master encryption key file is managed on the key management server or key management storage.</td>
</tr>
</tbody>
</table>

### 1.5.2 File Composition

FUJITSU Enterprise Postgres consists of the following files for controlling and storing the database. The table below shows the relationship between the number of such files and their location within a single instance.

#### Table 1.4 Number of files within a single instance and how to specify their location

<table>
<thead>
<tr>
<th>File type</th>
<th>Required</th>
<th>Quantity</th>
<th>How to specify the location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program files</td>
<td>Y</td>
<td>Multiple</td>
<td>Note that &quot;&lt;xy&gt;&quot; indicates the product version and level. /opt/fsepv&lt;xy&gt;server64</td>
</tr>
<tr>
<td>Database cluster</td>
<td>Y</td>
<td>1</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using pgAdmin or the DDL statement.</td>
</tr>
<tr>
<td>Backup</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Core file</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin, server commands, or postgresql.conf</td>
</tr>
<tr>
<td>Server certificate file (+1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>File type</td>
<td>Required</td>
<td>Quantity</td>
<td>How to specify the location</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>----------</td>
<td>----------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Server private key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Master encryption key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify the directory created as the key store using postgresql.conf.</td>
</tr>
<tr>
<td>Connection service file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>Password file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>CA certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
</tbody>
</table>

Y: Mandatory  
N: Optional

*1: Set manually when using the applicable feature.

---

**Note**

- Do not use an NFS for UNIX-type files used in FUJITSU Enterprise Postgres except when creating a database space in a storage device on a network.
- If anti-virus software is used, set scan exception settings for directories so that none of the files that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the files that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop FUJITSU Enterprise Postgres and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

---

1.6 **Notes on Compatibility of Applications Used for Operations**

When you upgrade FUJITSU Enterprise Postgres to a newer version, there may be some affect on applications due to improvements or enhancements in functionality.

Take this into account when creating applications so that you can maintain compatibility after upgrading to a newer version of FUJITSU Enterprise Postgres.

**See**

Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

---

1.7 **Notes on Upgrading Database Instances**

When upgrading FUJITSU Enterprise Postgres 9.4 or newer database instances to 9.6 using pg_upgrade, there are certain steps you need to follow.

Before using pg_upgrade, remove the following extensions from all databases in the instance, except "template0":

- pg_stat_statements
- pgx_io
- pgx_paging
- pgx_network
- pgx_network_err
- pgx_cpu
- pgx_memory
- pgx_swap
- pgx_disk
- pgx_process
- pgx_log
- oracle_compatible

For all databases except "template0", execute the following command to remove these extensions:

```
DROP EXTENSION extensionName;
```

Once the pg_upgrade operation is complete, for all databases except "template0", execute the following command to re-create these extensions as required:

```
CREATE EXTENSION extensionName;
```

**Note**

- It is strongly recommended to back up the database using pg_dump before performing pg_upgrade or using "DROP EXTENSION".
- If there are any columns created in the user tables using a data type from these extensions, then the "DROP EXTENSION" command will also drop these columns. Therefore, it is essential that alternate upgrade mechanisms are considered instead of pg_upgrade, in such scenarios. These may include pg_dump/pg_restore.
Chapter 2 Starting an Instance and Creating a Database

This chapter describes basic operations, from starting an instance to creating a database.

2.1 Starting and Stopping an Instance

This section describes how to start and stop an instance.

- 2.1.1 Using WebAdmin
- 2.1.2 Using Server Commands

Point

To automatically start or stop an instance when the operating system on the database server is started or stopped, refer to “Configuring Automatic Start and Stop of an Instance” in the Installation and Setup Guide for Server and configure the settings.

Note

The collected statistics are initialized if an instance is stopped in the “Immediate” mode or if it is abnormally terminated. To prepare for such initialization of statistics, consider regular collection of the statistics by using the SELECT statement. Refer to “The Statistics Collector” in “Server Administration” in the PostgreSQL Documentation for information on the statistics.

2.1.1 Using WebAdmin

WebAdmin enables you to start or stop an instance and check its operating status.

Starting an instance

Start an instance by using the [Instances] tab in WebAdmin.

is displayed when an instance is stopped.

To start a stopped instance, click .

Stopping an instance

Stop an instance by using the [Instances] tab in WebAdmin.

is displayed when an instance is active.

To stop an active instance, click .

Stop mode

Select the mode in which to stop the instance. The following describes the operations of the modes:

<table>
<thead>
<tr>
<th>Stop mode</th>
<th>Connected clients</th>
<th>Backup being executed using the command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart mode (*1)</td>
<td>Waits for all connected clients to be disconnected.</td>
<td>Waits for backups being executed using the command to finish.</td>
</tr>
<tr>
<td>Fast mode</td>
<td>Rolls back all transactions being executed and forcibly disconnects clients.</td>
<td>Terminates backups being executed using the command.</td>
</tr>
<tr>
<td>Immediate mode</td>
<td>All server processes are terminated immediately. Crash recovery is executed the next time the instance is started.</td>
<td></td>
</tr>
</tbody>
</table>
*1: When the processing to stop the instance in the Smart mode has started and you want to stop immediately, use the following procedure:

1. Restart the Web server feature of WebAdmin.
2. In the [Instances] tab, click .
3. In the [Instances] tab, click , and select the Immediate mode to stop the instance.

**Checking the operating status of an instance**

You can check the operating status of an instance by using the [Instances] tab. The following indicators are used to show the status of a resource.

<table>
<thead>
<tr>
<th>Status indicator</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Status indicator" /></td>
<td>The resource is operating normally.</td>
</tr>
<tr>
<td><img src="image" alt="Status indicator" /></td>
<td>The resource is stopped.</td>
</tr>
<tr>
<td><img src="image" alt="Status indicator" /></td>
<td>There is an error in the resource.</td>
</tr>
<tr>
<td><img src="image" alt="Status indicator" /></td>
<td>An operation is in progress on this resource or the status is being checked.</td>
</tr>
<tr>
<td><img src="image" alt="Status indicator" /></td>
<td>The resource is not operating optimally and needs intervention.</td>
</tr>
</tbody>
</table>

If an instance stops abnormally, remove the cause of the stoppage and start the instance by using WebAdmin.

**Figure 2.1 Status when an instance is active**
- When operating WebAdmin, click to update the status. WebAdmin will reflect the latest status of the operation or the instance resources from the server.

- If an error occurs while communicating with the server, there may be no response from WebAdmin. When this happens, close the browser and then log in again. If this does not resolve the issue, check the system log of the server and confirm whether a communication error has occurred.

### 2.1.2 Using Server Commands

Server commands enable you to start or stop an instance and check its operating status.

To use server commands, configure the environment variables.

Refer to “Configure the environment variables” in the procedure to create instances in “Using the initdb Command” in the Installation and Setup Guide for Server for information on configuring the environment variables.

### Starting an instance

Use the pg_ctl command to start an instance.
Specify the following values in the pg_ctl command:

- Specify "start" as the mode.

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- It is recommended to specify the -w option, which causes the command to return after waiting for the instance to start. If the -w option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

If an application, command, or process tries to connect to the database while the instance is starting up, the message "FATAL: the database system is starting up(11189)" is output. However, this message may also be output if the instance is started with the -w option specified.

This message is output by the pg_ctl command to check if the instance has started successfully. Therefore, ignore this message if there are no other applications, commands, or processes that connect to the database.

Example

> pg_ctl start -w -D /database/inst1

Stopping an instance

Use the pg_ctl command to stop an instance.

Specify the following values in the pg_ctl command:

- Specify "stop" as the mode.

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

> pg_ctl stop -D /database/inst1

Checking the operating status of an instance

Use the pg_ctl command to check the operating status of an instance.

Specify the following values in the pg_ctl command:

- Specify "status" as the mode.

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

When the instance is active:

> pg_ctl status -D /database/inst1
pg_ctl: server is running (PID: 1234)

When the instance is inactive:

> pg_ctl status -D /database/inst1
pg_ctl: no server running.
2.2 Creating a Database

This section explains how to create a database.

- 2.2.1 Using pgAdmin
- 2.2.2 Using Client Commands

2.2.1 Using pgAdmin

Follow the procedure below to define a database using pgAdmin.

1. In the pgAdmin window, right-click [Database] in [Object browser], and then click [New Database] to display a new database window.
2. Specify appropriate values for the following items in the new database window.

   - [Properties] tab

   The following example illustrates creation of the database "db01".

   ![New Database Window]

   - [Name]: Name of the database to be managed

3. Click [OK] to create the database.

### 2.2.2 Using Client Commands

Follow the procedure below to define a database using client commands.

An example of operations on the server is shown below.

1. Use psql command to connect to the postgres database.
   
   Execute `psql postgres`.

   ```
   > psql postgres
   psql (9.6.2)
   Type "help" for help.
   ```

2. Create the database.
   
   To create the database, execute the `CREATE DATABASE databaseName;` statement.

   ```
   postgres=# CREATE DATABASE db01;
   CREATE DATABASE
   ```
3. Confirm that the database is created.
   Execute the \l+ command, and confirm that the name of the database created in step 2 is displayed.

   ```
   postgres=# \l+
   ```

4. Disconnect from the postgres database.
   Execute \q to terminate the psql command.

   ```
   postgres=# \q
   ```

You can create a database using the createdb command.

See

Refer to "Creating a Database" in "Tutorial" in the PostgreSQL Documentation for information on creating a database using the createdb command.
Chapter 3 Backing Up the Database

This chapter describes how to back up the database.

Backup methods

The following backup methods enable you to recover data to a backup point or to the state immediately preceding disk physical breakdown or data logical failure.

- Backup using WebAdmin
  This method enables you to back up data through intuitive window operations using the GUI.
  WebAdmin is used for recovery.

- Backup using the pgx_dmpall command
  Execute the pgx_dmpall command with a script to perform automatic backup.
  To back up data automatically, you must register the process in the automation software of the operating system. Follow the procedure given in the documentation for your operating system.
  The pgx_rcvall command is used for recovery.

Approximate backup time

The formula for deriving the approximate backup time when you use WebAdmin or the pgx_dmpall command is as follows:

\[
\text{backupTime} = \frac{\text{dataStorageDestinationUsage}}{\text{diskWritePerformance}} \times 1.5
\]

- \(\text{dataStorageDestinationUsage}\): Disk usage at the data storage destination
- \(\text{diskWritePerformance}\): Maximum data volume (bytes/second) that can be written per second in the system environment where operation is performed
- 1.5: Coefficient to factor in tasks other than disk write (which is the most time-consuming step)

\(\text{Note}\)

- Backup operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.
- Use the selected backup method continuously.

There are several differences, such as the data format, across the backup methods. For this reason, the following restrictions apply:

- It is not possible to use one method for backup and another for recovery.
- It is not possible to convert one type of backup data to a different type of backup data.

- There are several considerations for the backup of the keystore and backup of the database in case the data stored in the database is encrypted. Refer to the following for details:
  - 5.6.4 Backing Up and Recovering the Keystore
  - 5.7 Backing Up and Restoring/Recovering the Database

- If you have defined a tablespace, back it up. If you do not back it up, directories for the tablespace are not created during recovery, which may cause the recovery to fail. If the recovery fails, refer to the system log, create the tablespace, and then perform the recovery process again.

\(\text{Information}\)

The following methods can also be used to perform backup. Performing a backup using these methods allows you to restore to the point when the backup was performed.
- Backup using an SQL-based dump
  Dump the data by using SQL. This backup method also enables data migration.
- File system level backup
  This backup method requires you to stop the instance and use OS commands to backup database resources as files.
- Backup by continuous archiving
  This is the standard backup method for PostgreSQL.

Refer to "Backup and Restore" in "Server Administration" in the PostgreSQL Documentation for information on these backup methods.

### 3.1 Periodic Backup

It is recommended that you perform backup periodically.

Backing up data periodically using WebAdmin or the `pgx_dmpall` command has the following advantages:

- This method reduces disk usage, because obsolete archive logs (transaction logs copied to the backup data storage destination) are deleted. It also minimizes the recovery time when an error occurs.

#### Backup cycle

The time interval when backup is performed periodically is called the backup cycle. For example, if backup is performed every morning, the backup cycle is 1 day.

The backup cycle depends on the jobs being run, but on FUJITSU Enterprise Postgres it is recommended that operations are run with a backup cycle of at least once per day.

### 3.2 Backup Methods

This section describes the methods for backing up the database.

- 3.2.1 Using WebAdmin
- 3.2.2 Using Server Commands

#### 3.2.1 Using WebAdmin

You can use WebAdmin to perform backup and check the backup status.

#### Note

- If backup is disabled for an instance, you will not be able to back up or restore the instance. Refer to "Creating an Instance" > "[Backup]" in the Installation and Setup Guide for Server for details.
- If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.
- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.
- It is recommended to set the `wal_level` parameter of `postgresql.conf` to "replica" prior to enabling the backup.

#### Backup operation

Follow the procedure below to back up the database.

1. Select the database to back up

   In the [Instances] tab, select the instance to be backed up and click 🗑.
2. Back up the database

   The [Backup] dialog box is displayed. To perform backup, click [Yes].
   An instance is automatically started when backup is performed.

Backup status

If an error occurs and backup fails, [Error] is displayed adjacent to [Data storage status] or [Backup storage status] in the [Instances] tab. An error message is also displayed in the message list.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, [Solution] appears to the right of the error message. Clicking this button displays information explaining how to resolve the cause of the error. Remove the cause of failure, and perform backup again.

---

Note

If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.

3.2.2 Using Server Commands

Use the pgx_dmpall command and pgx_rcvall command to perform backup and check the backup result.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Follow the procedure below.
1. Prepare the backup data storage disk
   For backup, prepare a separate disk unit from the database storage disk and mount it using the operating system commands.

2. Create a directory where the backup data will be stored
   Create an empty directory.
   Set appropriate permissions so that only the instance administrator can access the directory.
   **Example**
   ```bash
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```

3. Specify the settings required for backup
   Stop the instance, and set the following parameters in the postgresql.conf file.
   Start the instance after editing the postgresql.conf file.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| backup_destination | Name of the directory where the backup data will be stored | Specify the name of the directory where the backup data will be stored.  
|                    |                                                     | Appropriate privileges that allow only the instance administrator to access the directory must already be set.  
|                    |                                                     | Place the backup data storage destination directory outside the data storage destination directory, the tablespace directory, and the transaction log storage destination directory.  |
| wal_level          | minimal, replica (+1), or logical                   | Specify the output level for the transaction log.  
|                    |                                                     | +1: replica is a setting for streaming replication.  |
| archive_mode       | on                                                  | Specify the archive log mode.  
|                    |                                                     | Specify [on] (execute).  |
| archive_command    | ‘installationDirectory/bin/pgx_xlogcopy.cmd “%p” “backupDataStorageDestinationDirectory/archived_xlog/%f”’ | Specify the path name of the command that will save the transaction log and the storage destination.  |

Refer to "Appendix A Parameters" and "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

**Backup operation**

Use the pgx_dmpall command to perform backup. You can even embed the pgx_dmpall command in OS automation software to perform backup.
The backup data is stored in the directory specified in the backup_destination parameter of postgresql.conf. Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pgx_dmpall -D /database/inst1
```

Note

Backup stores the data obtained during the backup and the backup data of the data obtained during previous backup. If the data to be stored in the database is encrypted, refer to the following and back up the keystore:

- 5.6.4 Backing Up and Recovering the Keystore

Backup status

Use the pgx_rcvall command to check the backup status.

Specify the following values in the pgx_rcvall command:

- The -l option indicates backup data information.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

```
> pgx_rcvall -l -D /database/inst1
Date                    Status          Dir
```

If an error occurs and backup fails, a message is output to the system log. In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, remove the cause of failure and perform backup again.

See

Refer to "pgx_dmpall" and "pgx_rcvall" in the Reference for information on the pgx_dmpall command and pgx_rcvall command.

Setting a restore point

In case you want to recover your database to a certain point in time, you can name this particular point in time, which is referred to as the restore point, by using the psql command.

By setting a restore point before executing an application, it becomes easy to identify up to which point in time the data will be reverted. A restore point can be set to any point in time after a backup is executed. However, if a restore point is set before a backup is executed, the database cannot be recovered to that point in time. This is because restore points are recorded in the archive logs, and the archive logs are discarded when backups are executed.

Example

The following example uses the psql command to connect to the database and execute the SQL statement to set a restore point.

However, when considering continued compatibility of applications, do not use functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.
Refer to "10.3.2 Using the pgx_revall Command" for information on using a restore point to recover the database.

**Note**

- Name restore points so that they are unique within the database. Add the date and time of setting a restore point to distinguish it from other restore points, as shown below:
  - YYMMDD_HHMMSS
    - YYMMDD: Indicates the date
    - HHMMSS: Indicates the time
  - There is no way to check restore points you have set. Keep a record in, for example, a file.

**See**

Refer to "System Administration Functions" under "Functions and Operators" in the PostgreSQL Documentation for information on pg_create_restore_point.
Chapter 4 Configuring Secure Communication Using Secure Sockets Layer

If communication data transferred between a client and a server contains confidential information, encrypting the communication data can protect it against threats, such as eavesdropping on the network.

4.1 Configuring Communication Data Encryption

To encrypt communication data transferred between a client and a server, configure communication data encryption as described below. Communication data encryption not only protects the communication content, but it also guards against man-in-the-middle (MITM) attacks (for example, data and password theft through server impersonation).

Table 4.1 Configuration procedure

<table>
<thead>
<tr>
<th>Configuration procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Issue a certificate</td>
</tr>
<tr>
<td>2) Deploy a server certificate file and a server private key file</td>
</tr>
<tr>
<td>3) Distribute a CA certificate file to the client</td>
</tr>
<tr>
<td>4) Configure the operating environment for the database server</td>
</tr>
<tr>
<td>5) Configure the operating environment for the client</td>
</tr>
</tbody>
</table>

The following figure illustrates the environment for communication data encryption.

Figure 4.1 Environment for communication data encryption
4.1.1 Issuing a Certificate

For authenticating servers, you must acquire a certificate issued by the certificate authority (CA). FUJITSU Enterprise Postgres supports X.509 standard PEM format files. If the certificate authority issues a file in DER format, use a tool such as the openssl command to convert the DER format file to PEM format.

The following provides an overview of the procedure. Refer to the procedure published by the public or independent certificate authority (CA) that provides the certificate file for details.

a. Create a server private key file
b. Disable the passphrase for the server private key file
c. Create a CSR (signing request for obtaining a server certificate) from the server private key file
d. Apply to the certificate authority (CA) for a server certificate
e. Obtain a server certificate file and a CA certificate file from the certificate authority (CA)
f. Store the server certificate file and the CA certificate file

Note: If you lose or destroy the certificates, you will need to have them re-issued.

The above procedure enables you to prepare the following files:
- Server private key file
- Server certificate file
- CA certificate file

4.1.2 Deploying a Server Certificate File and a Server Private Key File

Create a directory on the local disk of the database server and store the server certificate file and the server private key file in it. Use the operating system features to set access privileges for the server certificate file and the server private key file so that only the database administrator has load privileges. Back up the server certificate file and the server private key file in the event that data corruption occurs and store them securely.

4.1.3 Distributing a CA Certificate File to the Client

Create a directory on the local disk of the client and place the distributed CA certificate file there. Use the operating system features to set load privileges to protect the CA certificate file against accidental deletion.

4.1.4 Configuring the Operating Environment for the Database Server

Refer to "Secure TCP/IP Connections with SSL" under "Server Administration" in the PostgreSQL Documentation for details.

4.1.5 Configuring the Operating Environment for the Client

Refer to the following sections in the Application Development Guide for details, depending on your application development environment:
- "Settings for Encrypting Communication Data" under "Setup" in "JDBC Driver"
- "Settings for Encrypting Communication Data" under "Setup" in "C Library (libpq)"
- "Settings for Encrypting Communication Data" under "Setup" in "Embedded SQL in C"
4.1.6 Performing Database Multiplexing

When you perform communication that uses database multiplexing and a Secure Socket Layer server certificate, certificates with the same "Common Name" must be used. To ensure this, take one of the following actions:

- Create one server certificate, replicate it, and place a copy on each server used for database multiplexing.
- Create a server certificate with the same "Common Name" for each server used for database multiplexing.

Refer to "Using the Application Connection Switch Feature" in the Application Development Guide for information on how to specify applications on the client.
Chapter 5 Protecting Storage Data Using Transparent Data Encryption

This chapter describes how to encrypt data to be stored in the database.

5.1 Protecting Data Using Encryption

With PostgreSQL, data in a database is protected from access by unauthorized database users through the use of authentication and access controls. However, the OS file is not protected from attackers who bypass the database server's authentication and access controls.

With FUJITSU Enterprise Postgres, data inside the OS file is encrypted, so valuable information is protected even if the file or disk is stolen.

Data to be stored in a database is encrypted when it is written to the data file, and decrypted when it is read.

This is performed automatically by the instance, so the user and the application need not be aware of key management and encryption or decryption. This process is called TDE (Transparent Data Encryption).

The characteristics of TDE are described below.

Encryption mechanisms

Two-layer encryption key and the keystore

In each tablespace, there is a tablespace encryption key that encrypts and decrypts all the data within. The tablespace encryption key is encrypted by the master encryption key and saved.

Only one master encryption key exists in a database cluster. It is encrypted based on a passphrase specified by the user and stored in a keystore. FUJITSU Enterprise Postgres provides a file-based keystore. Attackers who do not know the passphrase cannot read the master encryption key from the keystore.

Strong encryption algorithms

TDE uses the Advanced Encryption Standard (AES) as its encryption algorithm. AES was adopted as a standard in 2002 by the United States Federal Government, and is used throughout the world.

Faster encryption and decryption based on hardware

TDE minimizes the overhead of encryption and decryption by using the AES-NI (Advanced Encryption Standard New Instructions) built into Intel(R) Xeon(R) processors since the 5600 series. This means that even in situations where previously the minimum encryption target was selected as a tradeoff between performance and security, it is now possible to encrypt all the data of an application.

You can reference a list of processors equipped with AES-NI on the following page at Intel Corporation's website:

http://ark.intel.com/search/advanced/?s=t&AESTech=true

Zero overhead storage areas

Encryption does not change the size of data stored in tables, indexes, or WAL. There is, therefore, no need for additional estimates or disks.

Scope of encryption

All user data within the specified tablespace

The tablespace is the unit for specifying encryption. All tables, indexes, temporary tables, and temporary indexes created in the encrypted tablespace are encrypted. There is no need for the user to consider which tables and strings to encrypt.

Backup data

The pgx_dmpall command and pg_basebackup command create backup data by copying the OS file. Backups of the encrypted data are, therefore, also encrypted. Information is protected from leakage even if the backup medium is stolen.

WAL and temporary files

WAL, which is created by updating encrypted tables and indexes, is encrypted with the same security strength as the update target. When large merges and sorts are performed, the encrypted data is written to a temporary file in encrypted format.
Streaming replication support

You can combine streaming replication and transparent data encryption. The data and WAL encrypted on the primary server is transferred to the standby server in its encrypted format and stored.

Note

The following are not encrypted:
- pg_dump and pg_dumpall output files
- Files output by the COPY command
- Notification event payloads that communicate using the LISTEN or NOTIFY command

5.2 Setting the Master Encryption Key

To use transparent data encryption, you must create a keystore and set the master encryption key.

1. In the keystore_location parameter of postgresql.conf, specify the directory to store the keystore.
   Specify a different location for each database cluster.
   
   keystore_location = '/key/store/location'

   Refer to "Appendix A Parameters" for information on postgresql.conf.
   After editing the postgresql.conf file, either start or restart the instance.
   
   - Using WebAdmin
     Refer to "2.1.1 Using WebAdmin", and restart the instance.
   
   - Using the pg_ctl command
     Specify the following in the pg_ctl command:
     - Specify "restart" as the mode.
     - Specify the data storage destination directory in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
     - Specify the -w option. This means that the command returns after waiting for the instance to start. If the -w option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

   Example

   > pg_ctl restart -w -D /database/inst1

2. Execute an SQL function, such as the one below, to set the master encryption key. This must be performed by the superuser. Execute it as the database superuser.

   SELECT pgx_set_master_key('passphrase');

   The value "passphrase" is the passphrase that will be used to open the keystore. The master encryption key is protected by this passphrase, so avoid specifying a short simple string that is easy to guess.

   Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.

Note

Note that if you forget the passphrase, you will not be able to access the encrypted data. There is no method to retrieve a forgotten passphrase and decrypt data. Do not, under any circumstances, forget the passphrase.
The pgx_set_master_key function creates a file with the name keystore.ks in the keystore storage destination. It also creates a master encryption key from random bit strings, encrypts it with the specified passphrase, and stores it in keystore.ks. At this point, the keystore is open.

---

### 5.3 Opening the Keystore

To create encrypted tablespaces and access the encrypted data, you must first open the keystore. When you open the keystore, the master encryption key is loaded into the database server memory and becomes usable for encryption and decryption.

You need to open the keystore each time you start the instance. To open the keystore, the database superuser must execute the following SQL function.

```sql
SELECT pgx_open_keystore('passphrase');
```

The value “passphrase” is the passphrase specified during creation of the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_open_keystore function.

Note that, in the following cases, the passphrase must be entered when starting the instance, because the encrypted WAL must be decrypted for recovery. In this case, the above-mentioned pgx_open_keystore function cannot be executed.

- If performing crash recovery at the time of starting the instance
- If performing recovery using continuous archiving

For the above cases, specify the --keystore-passphrase option in the pg_ctl command, and then start the instance. This will display the prompt for the passphrase to be entered, as shown below.

```bash
> pg_ctl --keystore-passphrase start
Enter the passphrase:
The server is starting
>
```

**Point**

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the database server starts. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.

---

### 5.4 Encrypting a Tablespace

The keystore must be open before you can create an encrypted tablespace.

When creating a tablespace that will be encrypted, configure the encryption algorithm in the runtime parameters. For example, to create a tablespace with the name secure_tablespace using AES with a key length of 256 bits as the encryption algorithm, configure as shown below.

```sql
-- Specify the encryption algorithm for the tablespace to be created below
SET tablespace_encryption_algorithm = 'AES256';
CREATE TABLESPACE secure_tablespace LOCATION '/My/Data/Dir';
-- Specify that the tablespace to be created below is not to be encrypted
SET tablespace_encryption_algorithm = 'none';
```

Or

```sql
CREATE TABLESPACE secure_tablespace LOCATION '/My/Data/Dir' WITH (tablespace_encryption_algorithm = 'AES256');
```

You can use AES with a key length of 128 bits or 256 bits as the encryption algorithm. It is recommended that you use 256-bit AES. Refer to "Appendix A Parameters" for information on how to specify the runtime parameters.

If user provides both GUC and command line options while creating the tablespace, the preference is given to the command line option.

The pg_default and pg_global tablespaces cannot be encrypted.
Create tables and indexes in the encrypted tablespace that you created. Relations created in the encrypted tablespace are automatically encrypted.

**Example**

**Example 1: Specifying an encrypted tablespace when creating it**

```sql
CREATE TABLE my_table (...)
    TABLESPACE secure_tablespace;
```

**Example 2: Not explicitly specifying a tablespace when creating it and instead using the default tablespace**

```sql
SET default_tablespace = 'secure_tablespace';
CREATE TABLE my_table (...);
```

The process is the same for encrypting temporary tables and temporary indexes. In other words, either explicitly specify the TABLESPACE clause or list encrypted tablespaces in the temp_tablespaces parameter, and then execute CREATE TEMPORARY TABLE or CREATE INDEX.

If you specify an encrypted tablespace in the TABLESPACE clause of the CREATE DATABASE statement when creating a database, relations that you create in the database without explicitly specifying a tablespace will be encrypted. Furthermore, the system catalog is also encrypted, so the source code of user-defined functions is also protected.

**Note**

An encrypted tablespace cannot be created from the window used for creating the pgAdmin tablespace, or from the query tool. To create an encrypted tablespace, click [PSQL Console] from the [Plugins] menu and create an encrypted tablespace in the psql console window.

### 5.5 Checking an Encrypted Tablespace

The `pgx_tablespaces` system view displays information about whether each tablespace has been encrypted, and about the encryption algorithm. Refer to "C.1 pgx_tablespaces" for information on strings.

You can discover which tablespaces have been encrypted by executing the following SQL statements.

However, when considering continued compatibility of applications, do not reference system catalogs (pg_tablespace) directly in SQL statements.

```sql
SELECT spcname, spcencalgo
FROM pg_tablespace ts, pgx_tablespaces tsx
WHERE ts.oid = tsx.spctablespace;
```

**Example**

```
postgres=# SELECT spcname, spcencalgo FROM pg_tablespace ts, pgx_tablespaces tsx WHERE ts.oid =
   tsx.spctablespace;

    spcname   | spcencalgo
---------------+------------
     pg_default | none       
     pg_global  | none       
 secure_tablespace | AES256
(3 rows)
```
5.6 Managing the Keystore

This section describes how to manage the keystore and the master encryption key to guard against the threat of theft.

5.6.1 Changing the Master Encryption Key

Using the same encryption key for an extended period gives attackers an opportunity to decipher the encrypted data. It is recommended that you change the key at regular intervals, or whenever the key is exposed to risk.

Adhere to the industry's best practices for encryption algorithms and key management when considering how often the key should be changed. For example, the NIST in the United States has published "NIST Special Publication 800-57". The PCI DSS also refers to this publication. This publication recommends changing the master encryption key once a year.

To change the master encryption key, execute the pgx_set_master_key function, which is the same function used for configuring the key. Refer to "5.2 Setting the Master Encryption Key" for details.

After changing the master encryption key, you must immediately back up the keystore.

5.6.2 Changing the Keystore Passphrase

In security policies for organizations, it is usually a requirement that the passphrase be changed whenever a security administrator who knows the passphrase is removed from duties due to transfer or retirement. It is also recommended that the passphrase be changed if it is ever exposed to risks due to deception such as social engineering.

To change the keystore passphrase, execute the following SQL function as a superuser.

```sql
SELECT pgx_set_keystore_passphrase('oldPassphrase', 'newPassphrase');
```

After changing the passphrase, you must immediately back up the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_keystore_passphrase function.

5.6.3 Enabling Automatic Opening of the Keystore

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the instance starts. Execute the pgx_keystore command to enable automatic opening of the keystore.

```bash
> pgx_keystore --enable-auto-open /key/store/location/keystore.ks
Enter the passphrase:
Automatic opening of the keystore is now enabled
```

Refer to "pgx_keystore" in the Reference for information on pgx_keystore command.

When automatic opening is enabled, an automatically opening keystore is created in the same directory as the original keystore. The file name of the automatically opening keystore is keystore.aks. The file keystore.aks is an obfuscated copy of the decrypted content of the keystore.ks file. As long as this file exists, there is no need to enter the passphrase to open the keystore when starting the instance.

Do not delete the original keystore file, keystore.ks. It is required for changing the master encryption key and the passphrase. When you change the master encryption key and the passphrase, keystore.aks is recreated from the original keystore file, keystore.ks.

Protect keystore.ks, keystore.aks, and the directory that stores the keystore so that only the user who starts the instance can access them.
Configure the permission of the files so that only the user who starts the instance can access the SQL functions and commands that create these files. Accordingly, manually configure the same permission mode if the files are restored.

```
# chown -R fsepuser:fsepuser /key/store/location
# chmod 700 /key/store/location
# chmod 600 /key/store/location/keystore.ks
# chmod 600 /key/store/location/keystore.aks
```

An automatically opening keystore will only open on the computer where it was created.

To disable automatic opening of the keystore, delete keystore.aks.

**Note**
- To use WebAdmin for recovery, you must enable automatic opening of the keystore.
- Refer to "5.7 Backing Up and Restoring/Recovering the Database" after enabling or reconfiguring encryption to back up the database.
- Specify a different directory from those below as the keystore storage destination:
  - Data storage destination
  - Tablespace storage destination
  - Transaction log storage destination
  - Backup data storage destination

### 5.6.4 Backing Up and Recovering the Keystore

Back up the keystore at the following times in case it is corrupted or lost. Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen. A passphrase is not required to open an automatically opening keystore, so store this type of keystore in a safe location.

- When the master encryption key is first configured
- When the master encryption key is changed
- When the database is backed up
- When the keystore passphrase is changed

**Point**
Do not overwrite an old keystore when backing up a keystore. This is because during database recovery, you must restore the keystore to its state at the time of database backup. When the backup data of the database is no longer required, delete the corresponding keystore.

**Example**

- Back up the database and the keystore on May 1, 2015.

```
> pgx_dmpall -D /database/inst1
> cp -p /key/store/location/keystore.ks /keybackup/keystore_20150501.ks
```

Specify the following in the pgx_dmpall command:
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Change the master encryption key, and back up the keystore on May 5, 2015.

```plaintext
> psql -c "SELECT pgx_set_master_key('passphrase')" postgres
> cp -p /key/store/location/keystore.ks /keybackup/keystore_20150505.ks
```

Specify the following in the `psql` command:

- Specify the SQL function that sets the master encryption key in the `-c` option.
- Specify the name of the database to be connected to as the argument.

If the keystore is corrupted or lost, restore the keystore containing the latest master encryption key. If there is no keystore containing the latest master encryption key, restore the keystore to its state at the time of database backup, and recover the database from the database backup. This action recovers the keystore to its latest state.

---

**Example**

- Restore the keystore containing the latest master encryption key as of May 5, 2015.

```plaintext
> cp -p /keybackup/keystore_20150505.ks /key/store/location/keystore.ks
```

- If there is no backup of the keystore containing the latest master encryption key, recover the keystore by restoring the keystore that was backed up along with the database on 1 May 2015.

```plaintext
> cp -p /keybackup/keystore_20150501.ks /key/store/location/keystore.ks
> pgx_rcvall -B /backup/inst1 -D /database/inst1 --keystore-passphrase
```

Specify the following in the `pgx_rcvall` command:

- Specify the data storage directory in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage directory in the `-B` option.
- The `--keystore-passphrase` option prompts you to enter the passphrase to open the keystore.

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

It is recommended that you do not back up the automatically opening keystore file, keystore.aks. If the database backup medium and the backup medium storing the automatically opening keystore are both stolen, the attacker will be able to read the data even without knowing the passphrase.

If the automatically opening keystore is corrupted or lost, you must again enable automatic opening. The keystore.aks file will be recreated from keystore.ks at this time.

---

See

Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the `pgx_rcvall` and `pgx_dmpall` commands.

Refer to "psql" under "Reference" in the PostgreSQL Documentation for information on the `psql` command.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the `pgx_set_master_key` function.

Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

---

### 5.7 Backing Up and Restoring/Recovering the Database

FUJITSU Enterprise Postgres enables you to use the five backup and recovery methods described below. Regardless of the method you use, you must back up the keystore at the same time.
Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen.

**Backup and recovery using WebAdmin**

- **Backup**
  
  WebAdmin backs up encrypted data.
  
  Back up the key store after backing up the database.

- **Recovery**
  
  Restore the keystore to its state at the time of database backup. Refer to "5.6.4 Backing Up and Recovering the Keystore" for details.
  
  Enable automatic opening of the keystore in accordance with the procedure described in "5.6.3 Enabling Automatic Opening of the Keystore". Then, use WebAdmin to recover the database.

**Backup and recovery using the pgx_dmpall and pgx_rcvall commands**

- **Backup**
  
  The pgx_dmpall command backs up the encrypted data.
  
  Back up the key store after backing up the database.

- **Recovery**
  
  Restore the keystore to its state at the time of the database backup.
  
  Configure automatic opening of the key store as necessary.
  
  If automatic opening of the keystore is not enabled, execute the pgx_rcvall command with the --keystore-passphrase option specified. This will display the prompt for the passphrase to be entered.

### Example

- **Back up the database and the keystore on May 1, 2015.**

  ```
  > pgx_dmpall -D /database/inst1
  > cp -p /key/store/location/keystore.ks /keybackup/keystore_20150501.ks
  ```

  Specify the following in the pgx_dmpall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- **Recover the database and the keystore from the backup taken on May 1, 2015.**

  ```
  > cp -p /keybackup/keystore_20150501.ks /key/store/location/keystore.ks
  > pgx_keystore --enable-auto-open /key/store/location/keystore.ks  (Execute only when enabling automatic opening)
  > pgx_rcvall -B /backup/inst1 -D /database/inst1 --keystore-passphrase
  ```

  Specify the following in the pgx_rcvall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
  
  - Specify the backup data storage directory in the -B option.
  
  - The --keystore-passphrase option prompts you to enter the passphrase to open the keystore.

- 36 -
Dump and restore using SQL

- **Backup**
  
  The files output by the `pg_dump` and `pg_dumpall` commands are not encrypted. You should, therefore, encrypt the files using OpenSSL commands or other means before saving them, as described in “5.8 Importing and Exporting the Database” below.

  Back up the key store after backing up the database.

- **Restore**
  
  If the backup data has been encrypted using, for example OpenSSL commands, decrypt that data.

  The data generated by the `pg_dumpall` command includes a specification to encrypt tablespaces by For this reason, the `pg_restore` command encrypts tablespaces during restoration.

File system level backup and restore

- **Backup**
  
  Stop the instance and backup the data directory and the tablespace directory using the file copy command of the operating system. The files of encrypted tablespaces are backed up in the encrypted state.

  Back up the key store after performing the backup.

- **Restore**
  
  Restore the keystore to its state at the time of the database backup.

  Stop the instance and restore the data directory and the tablespace directory using the file copy command of the operating system.

Continuous archiving and point-in-time recovery

- **Backup**
  
  The `pg_basebackup` command backs up the encrypted data as is.

  Back up the key store after performing the backup.

- **Recovery**
  
  Restore the keystore to its state at the time of the database backup.

  Configure automatic opening of the key store as necessary.

  If automatic opening of the keystore is not enabled, execute the `pg_ctl` command to start the instance with the `--keystore-passphrase` option specified. This will display the prompt for the passphrase to be entered.

See

- Refer to "pg_ctl" under "Reference" in the PostgreSQL Documentation for information on the `pg_ctl` command.
- Refer to "Reference" in the PostgreSQL Documentation for information on the following commands:
  
  - `psql`
  - `pg_dump`
  - `pg_restore`
  - `pg_basebackup`
- Refer to the Reference for information on the following commands:
  
  - `pgx_rcvall`
  - `pgx_dmpall`
  - `pg_dumpall`
If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

### 5.8 Importing and Exporting the Database

The files output by the COPY TO command are not encrypted. Therefore, when transferring files to other systems, you should encrypt files using OpenSSL commands or other means and use scp or sftp to encrypt the data being transferred.

Use a safe method to delete obsolete plain text files.

You can use the following methods to safely delete files:

- `shred` command

```
Example

# Export the contents of the table my_table to a CSV file.
> psql -c "COPY my_table TO '/tmp/my_table.csv' (FORMAT CSV)" postgres

# Encrypt the exported file.
> openssl enc -e -aes256 -in my_table.csv -out my_table.csv.enc
(The user is prompted to enter the passphrase to be used for encryption)

# Safely delete plain text files.
> shred -u -x my_table.csv
(Transfer encrypted files to other systems)

# Decrypt the encrypted files on other systems.
> openssl enc -d -aes256 -in my_table.csv.enc -out my_table.csv
(The user is prompted to enter the passphrase to be used for decryption)
```

If you use COPY FROM to import data to tables and indexes in an encrypted tablespace, the imported data is automatically encrypted before being stored.

### 5.9 Encrypting Existing Data

You cannot encrypt existing unencrypted tablespaces. In addition, you cannot change encrypted tablespaces so that they do not encrypt. As an alternative, transfer the tables and indexes to other tablespaces. You can use the following SQL commands for this:

```
ALTER TABLE table_name SET TABLESPACE new_tablespace;
ALTER INDEX index_name SET TABLESPACE new_tablespace;
ALTER DATABASE database_name SET TABLESPACE new_tablespace;
```

Refer to “SQL Commands” under “Reference” in the PostgreSQL Documentation for information on SQL commands.

### 5.10 Operations in Cluster Systems

This section describes how to use transparent data encryption on cluster systems such as high-availability systems, streaming replication, and database multiplexing.
5.10.1 HA Clusters that do not Use Database Multiplexing

Take the following points into account when using transparent data encryption in an HA cluster environment that does not use database multiplexing.

**Placement and automatic opening of the keystore file**

There are two alternatives for placing the keystore file:

- Sharing the keystore file
- Placing a copy of the keystore file

**Sharing the keystore file**

This involves using the same keystore file on the primary server and the standby server.

As the standby server is not active while the primary server is running, this file would not be accessed simultaneously, and therefore, it can be shared.

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location.

Enable the automatic opening of the keystore on both the primary and standby servers.

**Placing a copy of the keystore file**

This involves placing a copy of the primary server keystore file on the standby server.

You can do this if you cannot prepare a shared server or disk device that can be accessed from both the primary and standby servers.

However, if you change the master encryption key and the passphrase on the primary server, you must copy the keystore file to the standby server again.

To manage the keystore file in a more secure manner, prepare the key management server or the key management storage isolated in a secure location for both the primary and standby servers, and place the keystore files there.

Enable the automatic opening of the keystore on both the primary and standby servers. Note that copying the automatically opening keystore file (keystore.akx) to the standby server does not enable the automatic opening of the keystore.

---

**See**

Refer to the Cluster Operation Guide for information on building a cluster system environment using failover operation.

---

5.10.2 Database Multiplexing Mode

Note the following when using transparent data encryption in environments that use streaming replication, or database multiplexing with streaming replication.

**Placing the keystore file**

Place a copy of the primary server keystore file on the standby server.

This is required as the keystore file cannot be shared, and both servers may need to access it simultaneously.

---

**Point**

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location. A keystore used by both the primary and standby servers can be managed on the same key management server or key management storage.

However, create different directories for the keystores to be used by the primary server and the standby server. Then copy the keystore for the primary server to the directory used on the standby server.
Automatically opening the keystore

You must enable automatic opening of the keystore.

To do this, enable automatic opening of the keystore in all servers that make up database multiplexing. The settings for automatic opening of the keystore include information unique to each server, so simply copying the file does not enable it.

Changing the passphrase

Changes to the passphrase are reflected in all servers that make up database multiplexing, so no special operation is required.

Building and starting a standby server

Before using the pg_basebackup command or pgx_rcvall command to build a standby server, copy the keystore file from the primary server to the standby server. When using an automatically opening keystore, use the copied keystore file to enable automatic opening on the standby server.

Open the keystore each time you start the standby server. This step is necessary for decrypting and restoring encrypted WAL received from the primary server. To open the keystore, specify the --keystore-passphrase option in the pg_ctl command or pgx_rcvall command and enter the passphrase, or use an automatically opening keystore.

Changing the master encryption key and the passphrase

Change the master encryption key and the passphrase on the primary server. You need not copy the keystore from the primary server to the standby server. You need not even restart the standby server or reopen the keystore. Changes to the master encryption key and the passphrase are reflected in the keystore on the standby server.

See

Refer to "pgx_rcvall " in the Reference for information on pgx_rcvall command.

Refer to "pg_ctl" under "Reference" in the PostgreSQL Documentation for information on pg_ctl command.

Refer to "pg_basebackup" under "Reference" in the PostgreSQL Documentation for information on pg_basebackup command.

Refer to "High Availability, Load Balancing, and Replication" under "Server Administration" in the PostgreSQL Documentation for information on how to set up streaming replication.

5.11 Security-Related Notes

- stored in a core file, which is a process memory dump. You should, therefore, safely delete the memory dump.

You can safely delete files by using the following command:

- shred command

- Unencrypted data may be written from the database server memory to the operating system's swap area. To prevent leakage of information from the swap area, consider either disabling the use of swap area or encrypting the swap area using a full-disk encryption product.

- The content of the server log file is not encrypted. Therefore, in some cases the value of a constant specified in a SQL statement is output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement.

- When executing an SQL function that opens the keystore and modifies the master encryption key, ensure that the SQL statement containing the passphrase is not output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement. If you are executing this type of SQL function on a different computer from the database server, encrypt the communication between the client and the database server with SSL.

5.12 Tips for Installing Built Applications

With transparent data encryption, you can easily encrypt all the data in an application without modifying the application. Database administrators install built applications in the following manner. However, this procedure stores data to the default tablespace, so take necessary action if processing differs from the original design.
1. (Normal procedure) Create an owner and a database for the built application.

   ```sql
   CREATE USER crm_admin ...;
   CREATE DATABASE crm_db ...;
   ```

2. (Procedure for encryption) Create an encrypted tablespace to store the data for the built application.

   ```sql
   SET tablespace_encryption_algorithm = 'AES256';
   CREATE TABLESPACE crm_tablespace LOCATION '/crm/data';
   ```

3. (Procedure for encryption) Configure an encrypted tablespace as the default tablespace for the owner of the built application.

   ```sql
   ALTER USER crm_admin SET default_tablespace = 'crm_tablespace';
   ALTER USER crm_admin SET temp_tablespaces = 'crm_tablespace';
   ```

4. (Normal procedure) Install the built application. The application installer prompts you to enter the host name and the port number of the database server, the user name, and the database name. The installer uses the entered information to connect to the database server and execute the SQL script. For applications that do not have an installer, the database administrator must manually execute the SQL script.

   Normally, the application’s SQL script includes logic definition SQL statements, such as CREATE TABLE, CREATE INDEX, and GRANT or REVOKE, converted from the entity-relationship diagram. It does not include SQL statements that create databases, users, and tablespaces. Configuring the default tablespace of the users who will execute the SQL script deploys the objects generated by the SQL script to the tablespace.
Data masking is a feature that can change the returned data for queries generated by applications, so that it can be referenced by users. For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

**Note**
When using this feature, it is recommended that the changed data be transferred to another medium for users to reference. This is because, if users directly access the database to extract the masked data, there is a possibility that they can deduce the original data by analyzing the masking policy or query result to the masking target column.

### 6.1 Masking Policy

Masking policy is a method of changing data under specific conditions when it is returned for a query from an application. One masking policy can be created per table. You can configure masking target, masking type, masking condition and masking format in a masking policy.

**Figure 6.1 Masking policy**

When a masking policy is defined, the search performance for the corresponding table may deteriorate.
6.1.1 Masking Target

Masking target refers to a column to which a masking policy will be applied. When referring to a masking target or a function that includes a masking target, the execution result will be changed and obtained.

The following commands can change the execution result:

- SELECT
- COPY
- pg_dump
- pg_dumpall

Note

- If a masking target is specified to INSERT...SELECT target columns, processing will be performed using data before change.
- If a masking target other than SELECT target columns is specified, processing will be performed using data before change.
- If a masking target is specified in a function where the data type will be converted, an error will occur.

6.1.2 Masking Type

Masking type is a method to change column data that is returned from queries. Specify the masking type in the function_type parameter. The following masking types can be specified and selected depending on the masking target data type.

Full masking

All the data in the specified column is changed. The changed value returned to the application that made the query varies depending on the column data type.
For example, 0 is used for a numeric type column and a space is used for a character type column.

Partial masking

The data in the specified column is partially changed.
For example, digits except the last four digits of an employee number can be changed to ":-".

Regular expression masking

The data in the specified column is changed via a search that uses a regular expression.
For example, for strings such as email address that can have variable length, ":-" can be used to change characters preceding ":@" by using a regular expression. Regular expression masking can only be used for character type data.

Note

- If multiple valid masking targets are specified for a function, the masking type for the left-most masking target will be applied.
  For example, if "SELECT GREATEST(c1, c2) FROM t1" is executed for numeric type masking target c1 and c2, the masking type for c1 will be applied.
- When masking the data that includes multibyte characters, do not specify partial masking for masking type. The result may not be as expected.

6.1.3 Masking Condition

Masking condition refers to the conditions configured to perform masking. Specify the masking condition in the expression parameter. Changed or actual data can be displayed for different users by defining masking condition. An expression that returns a boolean type result needs to be specified in masking condition and masking is performed only when TRUE is returned. Refer to "Value Expressions" in the PostgreSQL Documentation for information on the expressions that can be specified. Note that expressions that include a column cannot
be specified. For example, when masking data only for "postgres" users, specify `current_user = "postgres"` in the masking condition.

**Information**

Specify `1=1` so the masking condition is always evaluated to be TRUE and masking is performed all the time.

### 6.1.4 Masking Format

Masking format is a combination of change method and displayed characters when the masking condition is met. Masking format varies depending on the masking type. The following describes the masking format.

**Full masking**

With full masking, all characters are changed to values as determined by the database. Changed characters can be referenced in the `pgx_confidential_values` table. Also, replacement characters can be changed using the `pgx_update_confidential_values` system management function.

**See**

Refer to "6.3 Data Types for Masking" for information on the data types for which data masking can be performed.

**Partial masking**

With partial masking, data is changed according to the content in the `function_parameters` parameter. The method of specifying `function_parameters` varies depending on the data type.

<table>
<thead>
<tr>
<th>Category</th>
<th>Method of specifying function_parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td><code>'replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify the number to display. Specify a value from 0 to 9.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the start position of masking. Specify a positive integer.</td>
</tr>
<tr>
<td></td>
<td>- <code>endPosition</code>: Specify the end position of masking. Specify a positive integer that is greater than <code>startPosition</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong></td>
</tr>
<tr>
<td></td>
<td>Specify as below to change the values from the 1st to 5th digits to 9.</td>
</tr>
<tr>
<td></td>
<td><code>function_parameters := '9, 1, 5'</code></td>
</tr>
<tr>
<td></td>
<td>In this example, if the original data is &quot;123456789&quot;, it will be changed to &quot;999996789&quot;.</td>
</tr>
<tr>
<td>Character type</td>
<td><code>'inputFormat, outputFormat, replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>inputFormat</code>: Specify the current format of the data. Specify &quot;V&quot; for characters that will potentially be masked, and specify &quot;F&quot; for values such as spaces or hyphens that will not be masked.</td>
</tr>
<tr>
<td></td>
<td>- <code>outputFormat</code>: Define the method to format the displayed data. Specify &quot;V&quot; for characters that will potentially be masked. Any character to be output can be specified for each character &quot;F&quot; in <code>inputFormat</code>. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify any single character. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the position of &quot;V&quot; as the start position of masking. For example, to specify the position of the 4th &quot;V&quot; from the left, specify 4. Specify a positive integer.</td>
</tr>
</tbody>
</table>
### Category: Method of specifying function_parameters

- **endPosition**: Specify the position of "V" as an end position of masking. When working out the end position, do not include positions of "F". For example, to specify the position of the 11th "V" from the left, specify 11. Specify a positive integer that is greater than `startPosition`.

**Example**

Specify as below to mask a telephone number other than the first three digits using *.

```plaintext
function_parameters := 'VVVFVVVVFVVV, VVV-VVVV-VVVV, *, 4, 11'
```

In this example, if the original data is "012-3156-7890", it will be changed to "012-****-****".

### Date/timestamp type: 'MDYHMS'

- **M**: Masks month. To mask month, enter the month from 1 to 12 after a lowercase letter m. Specify an uppercase letter M to not mask month.
- **D**: Masks date. To mask date, enter the date from 1 to 31 after a lowercase letter d. If a value bigger than the last day of the month is entered, the last day of the month will be displayed. Specify an uppercase letter D to not mask date.
- **Y**: Masks year. To mask year, enter the year from 1 to 9999 after a lowercase letter y. Specify an uppercase letter Y to not mask year.
- **H**: Masks hour. To mask hour, enter the hour from 0 to 23 after a lowercase letter h. Specify an uppercase letter H to not mask hour.
- **M**: Masks minute. To mask minute, enter the minute from 0 to 59 after a lowercase letter m. Specify an uppercase letter M to not mask minute.
- **S**: Masks second. To mask second, enter the second from 0 to 59 after a lowercase letter s. Specify an uppercase letter S to not mask second.

**Example**

Specify as below to mask hour, minute, and second and display 00:00:00.

```plaintext
function_parameters := 'MDYh0m0s0'
```

In this example, if the original data is "2010-10-10 10:10:10", it will be changed to "2010-10-10 00:00:00".

### See

- Refer to "B.3.2 pgx_create_confidential_policy" for information on function_parameters.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

### Regular expression masking

With regular expression masking, data is changed according to the content of the regexp_pattern, regexp_replacement and regexp_flags parameters. For regexp_pattern, specify the search pattern using a regular expression. For regexp_replacement, specify the replacement character to use when data matches the search pattern. For regexp_flags, specify the regular expression flags.

**Example**

Specify as below to change all three characters starting from b to X.

```plaintext
regexp_pattern := 'b..'
```
regexp_replacement := 'X'
regexp_flags := 'g'

In this example, if the original data is "foobarbaz", it will be changed to "fooXX".

---

See

- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

---

Note

- When column data type is character(n) or char(n) and if the string length after change exceeds n, the extra characters will be truncated and only characters up to the nth character will be displayed.
- When column data type is character varying(n) or varchar(n) and if the string length after change exceeds the length before the change, the extra characters will be truncated and only characters up to the length before change will be displayed.

---

6.2 Usage Method

Preparation

The following preparation is required to use this feature.

1. Set the postgresql.conf file parameters.
   Prepend "pgx_datamasking" to the shared_preload_libraries parameter.
2. Restart the instance.
3. Run CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

   **Example**

   ```
   postgres=# CREATE EXTENSION pgx_datamasking;
   CREATE EXTENSION
   ```

   **Note**

   You must always prepend "pgx_datamasking" to the "shared_preload_libraries" parameter.

   **Information**

   - Specify "false" for pgx_datamasking.enable to not use this feature. Data will not be masked even if a masking policy is configured. This feature becomes available again once "true" is specified for pgx_datamasking.enable. This setting can be made
by specifying a SET statement or specifying a parameter in the postgresql.conf file.
Example

```
postgres=# SET pgx_datamasking.enable=false;
```

- Hereafter, also perform this preparatory task for the "template1" database, so that this feature can be used by default when creating a new database.

### Usage

To perform masking, a masking policy needs to be configured. The masking policy can be created, changed, confirmed, enabled, disabled or deleted during operation.
The procedures to perform these tasks are explained below with examples.

1. Creating a masking policy
2. Changing a masking policy
3. Confirming a masking policy
4. Enabling and disabling a masking policy
5. Deleting a masking policy

#### Note

Only database superusers can configure masking policies.

### 6.2.1 Creating a Masking Policy

An example of the operation on the server is shown below.

1. Create a masking policy
   Execute the `pgx_create_confidential_policy` system management function to create a masking policy.
   The following values are configured in this example.
   - Masking target: Numeric type c1
   - Masking type: FULL
   - Masking condition: '1=1'

   ```
   postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
   expression := '1=1', column_name := 'c1', function_type := 'FULL');
   pgx_create_confidential_policy
   ----------------------------
   t
   (1 row)
   ```

2. Confirm the displayed data
   Confirm that the masking target data (column c1) has been correctly changed.

   ```
   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
   0 | 012-3456-7890
   0 | 012-3456-7891
   0 | 012-3456-7892
   (3 row)
   ```

#### See

- Refer to "B.3.2 pgx_create_confidential_policy" for information on the `pgx_create_confidential_policy` system management function.
Note

- Only one masking policy can be created per table.
- All users can view the masking policy created, so do not grant the login privilege of the database where this feature is set to the users who refer to the changed data. Masking policies are defined in the "pgx_confidential_columns", "pgx_confidential_policies" and "pgx_confidential_values" tables.

6.2.2 Changing a Masking Policy

1. An example of the operation on the server is shown below.

2. Change a masking policy

   Execute the pgx_alter_confidential_policy system management function to change a masking policy.

   The following values are changed in this example.
   - Content of change: Add a masking target
   - Masking target: Character type c2
   - Masking type: PARTIAL
   - Masking condition: 'VVVFVVVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11'

   ```
   postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1',
   action := 'ADD_COLUMN', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
   'VVVFVVVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11');
   pgx_alter_confidential_policy
   --------------------------------
   t
   (1 row)
   ```

3. Confirm the displayed data

   Confirm that the masking target data has been correctly changed.

   ```
   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
   0 | 012-****-****
   0 | 012-****-****
   0 | 012-****-****
   (3 row)
   ```

See

- Refer to "B.3.1 pgx_alter_confidential_policy" for information on the pgx_alter_confidential_policy system management function.

6.2.3 Confirming a Masking Policy

An example of the operation on the server is shown below.

1. Confirm information about a masking target where a masking policy is set

   Refer to the pgx_confidential_columns table to confirm the masking target where the masking policy is set.

   ```
   postgres=# select * from pgx_confidential_columns;
   schema_name | table_name | policy_name | column_name | function_type |
   function_parameters | regexp_pattern | regexp_replacement | regexp_flags |
   column_description
   +------------------------+------------+-------------+-------------+---------------
   | public | t1 | pl | c1 | FULL |
   | | | | | |
   ```
2. Confirm information about the masking policy content
   Refer to pgx_confidential_policies to confirm the masking policy content.

   | schema_name | table_name | policy_name | expression | enable | policy_description |
   |-------------+------------+-------------+------------+--------+-------------------|
   | public      | t1         | p1          | 1=1        | t      |                   |

   See
   - Refer to "D.1 pgx_confidential_columns" for information on the pgx_confidential_columns table.
   - Refer to "D.2 pgx_confidential_policies" for information on the pgx_confidential_policies table.

6.2.4 Enabling and Disabling a Masking Policy

An example of the operation on the server is shown below.

1. Disable a masking policy
   Execute the pgx_enable_confidential_policy system management function to disable a masking policy.

   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 'f');
   pgx_enable_confidential_policy
   -----------------------------
   t
   (1 row)

2. Confirm the displayed data
   Confirm that the original data is displayed by disabling the masking policy.

   postgres=# select * from t1;
   c1  | c2
   ----|---------------
   1   | 012-3456-7890
   2   | 012-3456-7891
   3   | 012-3456-7892
   (3 row)

3. Enable a masking policy
   Execute the pgx_enable_confidential_policy system management function to enable a masking policy.

   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');
   pgx_enable_confidential_policy
   -----------------------------
   t
   (1 row)

4. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   postgres=# select * from t1;
   c1  | c2
   ----|---------------
   0   | 012-****-****
   0   | 012-****-****
6.2.5 Deleting a Masking Policy

An example of the operation on the server is shown below.

1. Delete a masking policy
   Execute the pgx_drop_confidential_policy system management function to delete a masking policy.

```
postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
pgx_drop_confidential_policy
-------------------------------
t
(1 row)
```

2. Confirm the displayed data
   Confirm that the original data is displayed by deleting the masking policy.

```
postgres=# select * from t1;
c1 |      c2
----+---------------
 1 | 012-3456-7890
 2 | 012-3456-7891
 3 | 012-3456-7892
(3 row)
```

6.3 Data Types for Masking

The data types for which data masking can be performed are shown below.

<table>
<thead>
<tr>
<th>Category</th>
<th>Data type</th>
<th>Masking type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Full masking</td>
</tr>
<tr>
<td>Numeric type</td>
<td>smallint</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>integer</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>bigint</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>decimal</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>numeric</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>float</td>
<td>Y</td>
</tr>
<tr>
<td></td>
<td>real</td>

</tbody>
</table>
Chapter 7 Periodic Operations

This chapter describes the operations that must be performed periodically when running daily database jobs.

7.1 Configuring and Monitoring the Log

FUJITSU Enterprise Postgres enables you to output database errors and warnings to a log file. This information is useful for identifying if errors have occurred and the causes of those errors.

By default, this information is output to the system log. It is recommended that you configure FUJITSU Enterprise Postgres to collect logs from its log files (for example, log_destination) before operating FUJITSU Enterprise Postgres.

Periodically monitor the log files to check if any errors have occurred.

See

- Refer to "Error Reporting and Logging" under "Server Administration" in the PostgreSQL Documentation for information on logs.
- Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on log settings when operating with WebAdmin.

7.2 Monitoring Disk Usage and Securing Free Space

When a database is used for an extended period, free space on the disk is continuously consumed and in some cases the disk space runs out. When this happens, database jobs may stop and no longer run.

You should, therefore, periodically monitor the usage of disk space, and delete obsolete files located in the disk.

Monitor the disk usage of the disk where the following directories are located:
- Data storage destination directory
- Transaction log storage destination (if the transaction log is stored in a different directory from the data storage destination directory)
- Backup data storage destination directory
- Tablespace storage destination directory

7.2.1 Monitoring Disk Usage

To check the disk usage, use the following operating system commands:
- df command

You can even use SQL statements to check tables and indexes individually.

Refer to "Determining Disk Usage" under "Server Administration" in the PostgreSQL Documentation for information on this method.

Information

If you are using WebAdmin for operations, a warning is displayed when disk usage reaches 80%.

7.2.2 Securing Free Disk Space

Secure free disk space by using the following operating system commands to delete unnecessary files, other than the database, from the same disk unit.
- rm command

You can also secure disk space by performing the following tasks periodically:
- To secure space on the data storage destination disk:
  Execute the REINDEX statement. Refer to "7.5 Reorganizing Indexes" for details.
- To secure space on the backup data storage destination disk:
  Execute backup using WebAdmin or the pgx_dmpall command.

### 7.3 Automatically Closing Connections

If an application stops responding and abnormally terminates for any reason, the connection from the application may remain active on the database server. If this situation continues for an extended period, other applications attempting to connect to the database server may encounter an error, or an error indicating that the tables are unavailable may occur.

It is, therefore, recommended that idle connections be closed automatically at regular intervals.

Set the following parameters in the postgresql.conf file to indicate the time permitted to elapse before a connection is closed.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp_keepalives_idle</td>
<td>Time until keepalive is sent (seconds)</td>
<td>Sends keepalive to an idle connection at the specified interval in seconds. If 0, the default value of the system is used. It is recommended to specify 30 seconds.</td>
</tr>
<tr>
<td>tcp_keepalives_interval</td>
<td>keepalive send interval (seconds)</td>
<td>Sends keepalive at the specified interval. If 0, the default value of the system is used. It is recommended to specify 10 seconds.</td>
</tr>
</tbody>
</table>

See

Refer to "Connection Settings" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

### 7.4 Monitoring the Connection State of an Application

FUJITSU Enterprise Postgres does not immediately delete the updated or deleted data. If the VACUUM determines there are no transactions that reference the database, FUJITSU Enterprise Postgres collects obsolete data. However, obsolete data is not collected if there are connections that have remained active for an extended period or connections occupying resources. In this case the database may expand, causing performance degradation.

See

Refer to "Routine Vacuuming" under "Server Administration" in the PostgreSQL Documentation for information on the VACUUM command.

In such cases, you can minimize performance degradation of the database by monitoring problematic connections.

The following two methods are supported for monitoring connections that have been in the waiting status for an extended period:

- 7.4.1 Using the View (pg_stat_activity)
- 7.4.2 Using pgAdmin

### 7.4.1 Using the View (pg_stat_activity)

Use the view (pg_stat_activity) to identify and monitor connections where the client has been in the waiting status for an extended period.

Example

The example below shows connections where the client has been in the waiting status for at least 60 minutes.
However, when considering continued compatibility of applications, do not reference system catalogs directly in the following SQL statements.

```
postgres=# select * from pg_stat_activity where state='idle in transaction' and current_timestamp >
   cast(query_start + interval '60 minutes' as timestamp);
- [ RECORD 1 ]-----------------------------
  datid   | 13003
  datname | db01
  pid     | 4638
  usesysid   | 10
  usename    | fsep
  application_name | apl01
  client_addr   | 192.33.44.15
  client_hostname |
  client_port | 27500
  backend_start | 2015-04-24 09:09:21.730641+09
  xact_start | 2015-04-24 09:09:23.858727+09
  query_start | 2015-04-24 09:09:23.858727+09
  state_change | 2015-04-24 09:09:23.858834+09
  waiting  | f
  state    | idle in transaction
  backend_xid |
  backend_xmin |
  query    | begin;
```

**See**

- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.
- Refer to "The Statistics Collector" under "Server Administration" in the PostgreSQL Documentation for information on `pg_stat_activity`.

### 7.4.2 Using pgAdmin

This section describes the procedure for monitoring connections using [Server Status] in pgAdmin.
1. From the [Tools] menu in pgAdmin, click [Server Status].
2. Identify client connections that have been in the waiting state for an extended period.

From the transaction start time displayed under [TX Start], identify connections that have been in the waiting state for an extended period.

![Confirmation as for the transaction initiating time.]

7.5 Reorganizing Indexes

Normally, a database defines indexes in tables, but if data is frequently updated, indexes can no longer use free space in the disk efficiently. This situation can also cause a gradual decline in database access performance.

To rearrange used space on the disk and prevent the database access performance from declining, it is recommended that you periodically execute the `REINDEX` command to reorganize indexes.

Check the disk usage of the data storage destination using the method described in "7.2 Monitoring Disk Usage and Securing Free Space".

---

Refer to "Routine Reindexing" under "Server Administration" in the PostgreSQL Documentation for information on reorganizing indexes by periodically executing the `REINDEX` command.
Typically, reorganize indexes once a month at a suitable time such as when conducting database maintenance. Use SQL statements to check index usage. If this usage is increasing on a daily basis, adjust the frequency of recreating the index as compared to the free disk space.

The following example shows the SQL statements and the output.

However, when considering continued compatibility of applications, do not reference system catalogs and functions directly in the following SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

[SQL statements]

```sql
SELECT
    nspname AS schema_name,
    relname AS index_name,
    round(100 * pg_relation_size(indexrelid) / pg_relation_size(indrelid)) / 100 AS index_ratio,
    pg_size_pretty(pg_relation_size(indexrelid)) AS index_size,
    pg_size_pretty(pg_relation_size(indrelid)) AS table_size
FROM pg_index I
LEFT JOIN pg_class C ON (C.oid = I.indexrelid)
LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE
    C.relkind = 'i' AND
    pg_relation_size(indrelid) > 0
ORDER BY pg_relation_size(indexrelid) DESC, index_ratio DESC;
```

[Output]

<table>
<thead>
<tr>
<th>schema_name</th>
<th>index_name</th>
<th>index_ratio</th>
<th>index_size</th>
<th>table_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>

See

Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

7.6 Monitoring Database Activity

FUJITSU Enterprise Postgres enables you to collect information related to database activity. By monitoring this information, you can check changes in the database status.

This information includes wait information for resources such as internal locks, and is useful for detecting performance bottlenecks. Furthermore, you should collect this information in case you need to request Fujitsu technical support for an investigation.
1. Collect statistics at fixed intervals during work hours.
   Accumulate the collected information into a file.
   Wherever possible, collect data from the various statistics views using a single transaction, because it enables you to take a snapshot of system performance at a given moment.
   Refer to “7.6 Monitoring Database Activity” for information on the system views that can be collected.

2. Reset statistics after work hours, that is, after jobs have finished.
   Refer to “7.6.3 Information Reset” for information on how to reset statistics.

3. Save the file with collected information.
   Keep the file with collected information for at least two days, in order to check daily changes in performance and to ensure that the information is not deleted until you have sent a query to Fujitsu technical support.

Where jobs run 24 hours a day, reset statistics and save the file with collected information when the workload is low, for example, at night.

---

**Note**

Statistics cumulatively add the daily database value, so if you do not reset them, the values will exceed the upper limit, and therefore will not provide accurate information.

---

The subsections below explain the following:

- Information that can be collected
- Collection configuration
- Information reset

### 7.6.1 Information that can be Collected

Information that can be collected is categorized into the following two types:

- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

**Information common to PostgreSQL**
Information added by FUJITSU Enterprise Postgres

You can collect the following information added by FUJITSU Enterprise Postgres.

Table 7.1 Information added by FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>View name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>Displays statistic related to lightweight lock, with each type of content displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.2 pgx_stat_lwlock&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>Displays statistics related latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.3 pgx_stat_latch&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_walwriter</td>
<td>Displays statistics related to WAL writing, in a single line. Refer to &quot;C.4 pgx_stat_walwriter&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_sql</td>
<td>Displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line. Refer to &quot;C.5 pgx_stat_sql&quot; for details.</td>
</tr>
</tbody>
</table>

7.6.2 Collection Configuration

The procedure for configuring collection depends on the information content.

- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

Information common to PostgreSQL

See

Refer to "The Statistics Collector" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on information common to PostgreSQL.

Information added by FUJITSU Enterprise Postgres

Information added by FUJITSU Enterprise Postgres is collected by default.

To enable or disable information collection, change the configuration parameters in postgresql.conf. The following table lists the views for which you can enable or disable information collection, and the configuration parameters.

<table>
<thead>
<tr>
<th>View name</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>track_waits (*1)</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>track_sql</td>
</tr>
</tbody>
</table>

Remarks: You cannot change the collection status for pgx_stat_walwriter.
When executing the SQL statement with EXPLAIN ANALYZE, processing time may increase because of this information collection. It is recommended to set this parameter to "off" when executing EXPLAIN ANALYZE to check the processing time. Refer to "Appendix A Parameters" for information on the parameters.

7.6.3 Information Reset

This section describes how to reset information.

Information added by FUJITSU Enterprise Postgres

You can reset information added by FUJITSU Enterprise Postgres by using the pg_stat_reset_shared function in the same way as for information common to PostgreSQL.

Configure the following parameters in the pg_stat_reset_shared function:

<table>
<thead>
<tr>
<th>Function</th>
<th>Type of return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pg_stat_reset_shared(text)</td>
<td>void</td>
<td>Reset some cluster-wide statistics counters to zero, depending on the argument (requires superuser privileges). Calling pg_stat_reset_shared('lwlock') will zero all counters shown in pgx_stat_lwlock. Similarly, in the following cases, all values of the pertinent statistics counter are reset:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If pg_stat_reset_shared('latch') is called: All values displayed in pgx_stat_latch</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If pg_stat_reset_shared('walwriter') is called: All values displayed in pgx_stat_walwriter</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- If pg_stat_reset_shared('sql') is called: All values displayed in pgx_stat_sql</td>
</tr>
</tbody>
</table>

See "Statistics Functions" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on other parameters of the pg_stat_reset_shared function.
Chapter 8 Streaming Replication Using WebAdmin

This chapter describes how to create a streaming replication cluster using WebAdmin.

8.1 Streaming Replication

Streaming replication allows the creation of one or more standby instances, which connect to the master instances and replicate the data using WAL records. The standby instance can be used for read-only operations.

WebAdmin can be used to create a streaming replication cluster. WebAdmin allows the creation of a cluster in the following configurations:

- Master-Standby Configuration: This configuration creates a master and standby instance together.
- Standby Only Configuration: This configuration creates a standby instance from an already existing instance.

Point

- A standby instance can be created from a standalone instance, a master instance, or even from another standby instance.
- If a streaming replication cluster is created using WebAdmin, the network with the host name (or IP address) specified in [Host name] will be used across sessions of WebAdmin, and also used as the log transfer network.
- To use a network other than the job network as the log transfer network, specify the host name other than the job network one in [Host name].

See

When a standby instance is created from an existing instance, it is necessary to set the values for the replication-related variables before a standby instance can be created. Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for details.

8.1.1 Creating a Standby Instance

Follow the procedure below to create a standby instance.

1. In the [Instances] tab, select the instance from which a standby instance is to be created.
2. Click 

- 61 -
3. Enter the information for the standby instance to be created. In the example below, a standby instance is created from instance “inst1”. The instance name, host address and port of the selected instance are already displayed for easy reference.

Enter the following items:

- [Location]: Whether to create the instance in the server that the current user is logged in to, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.

- [Replication credential]: The user name and password required for the standby instance to connect to the master instance. The user name and password can be entered or selected from the Wallet. Refer to "Appendix F WebAdmin Wallet" for information on creating wallet entries.

- [Instance name]: Name of the standby database instance to create. The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- [Instance port]: Port number of the standby database instance.

- [Host IP address]: The IP address of the server machine where the standby instance is to be created. This information is needed to configure the standby instance to be connected to the master.
- [Data storage path]: Directory where the database data will be stored
- [Backup storage path]: Directory where the database backup will be stored
- [Transaction log path]: Directory where the transaction log will be stored
- [Encoding]: Database encoding system
- [Replication mode]: Replication mode of the standby instance to be created ("Asynchronous" or "Synchronous")
- [Application name]: The reference name of the standby instance used to identify it to the master instance.

4. Click 📂 to create the standby instance.

5. Once the standby instance is created successfully, select “inst1s” in the [Instances] tab. The following page will be displayed:

![Image of the Fujitsu Enterprise Postgres interface showing the Inst1s instance with the Inst1s file system and backup file system paths]

**Note**

- Backups are not possible for standby instances in WebAdmin. As a result, 📡 and 📁 are disabled and no value is shown for [Backup storage status] and [Backup time].
- If using WebAdmin to manage Mirroring Controller, the message below may be output to the server log or system log in the standby instance. No action is required, as the instance is running normally.

```
ERROR: pgx_rcvall failed (16491)
ERROR: pgx_rcvall: backup of the database has not yet been performed, or an incorrect backup storage directory was specified
```

### 8.1.2 Promoting a Standby Instance

Streaming replication between a master and standby instance can be discontinued using WebAdmin.

Follow the procedure below to promote a standby instance to a standalone instance, thereby discontinuing the streaming replication.
1. In the [Instances] tab, select the standby instance that needs to be promoted.

2. Click 📝.

3. Click [Yes] from the confirmation dialog box.

The standby instance will be promoted and will become a standalone instance, which is not part of a streaming replication cluster.

Once the standby instance is promoted to become a standalone instance, the backup storage status will be "Error". This is because no backups are available when the instance is newly promoted to a standalone instance. The status will be reset if a new backup is performed by clicking [Solution] or 🔄.

8.1.3 Converting an Asynchronous Replication to Synchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert an Asynchronous standby instance to Synchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.

2. Click 📝.

3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Add the "Application name" of the standby instance you want to be in Synchronous mode.

4. Click 📝.

5. Select the master instance and click 📝.

6. Select the standby instance. [Instance type] will now show the updated status.

**Note**

- Converting an Asynchronous standby instance to Synchronous can cause the master instance to queue the incoming transactions until the standby instance is ready. For this reason, it is recommended that this operation be performed during a scheduled maintenance period.

- When adding a synchronous standby instance, FUJITSU Enterprise Postgres will only keep the first entry in [Synchronous standby names] in synchronous state.

- To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.

8.1.4 Converting a Synchronous Replication to Asynchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous Mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert a Synchronous standby instance to Asynchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.

2. Click 📝.

3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Remove the "Application name" of the standby instance you want to be in Asynchronous mode.

4. Click 📝.

5. Select the master instance and click 📝.

6. Select the standby instance. [Instance type] will now show the updated status.
To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.
Chapter 9 Installing and Operating the In-memory Feature

The in-memory feature enables fast aggregation using Vertical Clustered Index (VCI) and memory-resident feature. VCI has a data structure suitable for aggregation, and features parallel scan and disk compression, which enable faster aggregation through reduced disk I/O.

The memory-resident feature reduces disk I/O that occurs during aggregation. It consists of the preload feature that reads VCI data to memory in advance, and the stable buffer feature that suppresses VCI data eviction from memory. The stable buffer feature secures the proportion specified by parameter in the shared memory for VCI.

This chapter describes how to install and operate the in-memory feature.

Note
This feature can only be used in Advanced Edition.

9.1 Installing Vertical Clustered Index (VCI)

This section describes the installation of VCI.

1. Evaluating whether to Install VCI
2. Estimating Resources
3. Setting up

9.1.1 Evaluating whether to Install VCI

VCI uses available resources within the server to increase scan performance. It speeds up processing in many situations, and can be more effective in the following situations:

- Single table processing
- Processing that handles many rows in the table
- Processing that handles some columns in the table
- Processing that performs very heavy aggregation such as simultaneous aggregation of sum and average

VCI will not be used in the following cases, so it is necessary to determine its effectiveness in advance:

- The data type of the target table or column contains VCI restrictions.
- The SQL statement does not meet the VCI operating conditions
- VCI is determined to be slower based on cost estimation

Note
If performing operations that use VCI, the full_page_writes parameter setting in postgresql.conf must be enabled (on). For this reason, if this parameter is disabled (off), operations that use VCI return an error. In addition, to perform operations for tables that do not create a VCI when the full_page_writes parameter setting is temporarily disabled (off), do not create a VCI or perform operations to tables that created a VCI during that time.

See
- Refer to "9.1.4 Data that can Use VCI" for information on VCI restrictions.
9.1.2 Estimating Resources

Estimate resources before setting up VCI.

Select the aggregation that you want to speed up and identify the required column data. The additional resources below are required according to the number of columns.

- **Memory**
  Secure additional capacity required for the disk space for the column for which VCI is to be created.

- **Disk**
  Secure additional disks based on the disk space required for the column for which VCI is to be created, as VCI stores column data as well as existing table data on the disk. It is recommended to provide a separate disk in addition to the existing one, and specify it as the tablespace to avoid impact on any other jobs caused by I/O.

**Information**

The operations on VCI can continue even if the memory configured for VCI is insufficient by using VCI data on the disk.

**See**

9.1.3 Setting up

This section describes how to set up VCI.

**Setup flow**

1. Setting Parameters
2. Installing the Extensions
3. Creating VCI
4. Confirming that VCI has been Created

9.1.3.1 Setting Parameters

Edit postgresql.conf to set the required parameters for VCI. After that, start or restart the instance.

The following table lists the parameters that need or are recommended to be configured in advance:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at server start.</td>
<td>Y</td>
</tr>
<tr>
<td>session_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at connection start.</td>
<td>Y</td>
</tr>
<tr>
<td>reserve_buffer_ratio</td>
<td>Percentage of shared memory to be used for stable buffer table</td>
<td>Proportion of shared memory to be used for a stable buffer table.</td>
<td>N</td>
</tr>
</tbody>
</table>
### Parameter names

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>vci.control_max_workers</td>
<td>Number of background workers that manage VCI.</td>
<td>Number of background workers that manage VCI. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of background workers used for parallel scan.</td>
<td>Maximum number of background workers used for parallel scan. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
</tbody>
</table>

### Example

```sql
shared_preload_libraries = 'vci, pg_prewarm'
session_preload_libraries = 'vci, pg_prewarm'
reserve_buffer_ratio = 20
vci.control_max_workers = 8
vci.max_parallel_degree = 4
max_worker_processes = 18 # Example: If the initial value was 6, 6 + 8 + 4 = 18
```

### Note

An error occurs if you use VCI to start instances when procfs is not mounted. Ensure that procfs is mounted before starting instances.

### See

- Refer to "Appendix A Parameters" for information on all parameters for VCI. Refer also to default value for each parameter and details such as specification range in the same chapter. Refer to "Server Configuration" under "Server Administration" in the PostgreSQL documentation for information on shared_preload_libraries, session_preload_libraries, and max_worker_processes.

#### 9.1.3.2 Installing the Extensions

Execute the CREATE EXTENSION statement to install the VCI and pg_prewarm extensions. Both extensions need to be installed for each database.

- Installing VCI

```
db01=# CREATE EXTENSION vci;
```

- Installing pg_prewarm

```
db01=# CREATE EXTENSION pg_prewarm;
```

### Note

- Only superusers can install VCI extensions.
- VCI extensions can only be installed in public schema.
- Some operations cannot be performed for VCI extensions. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.

#### 9.1.3.3 Creating a VCI

Execute the CREATE INDEX statement with the "USING vci" clause to create a VCI for the desired columns and the "WITH (stable_buffer=true)" clause to enable the stable buffer feature.
To use a separate disk for the VCI, specify the TABLESPACE clause.

```
dbo1=# CREATE INDEX idx_vci ON table01 USING vci (col01, col02) WITH (stable_buffer=true);
```

**Note**

- Some table types cannot be specified on the ON clause of CREATE INDEX. Refer to "9.1.4.1 Relation Types" for details.
- Some data types cannot be specified on the column specification of CREATE INDEX. Refer to "9.1.4.2 Data Types" for details.
- Some operations cannot be performed for VCI. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
- The same column cannot be specified more than once on the column specification of CREATE INDEX.
- VCI cannot be created for table columns that belong to the template database.
- CREATE INDEX creates multiple views named vci_10digitRelOid_5digitRelAttr_1charRelType alongside VCI itself. These are called VCI internal relations. Do not update or delete them as they are used for VCI aggregation.
- All data for the specified column will be replaced in columnar format when VCI is created, so executing CREATE INDEX on an existing table with data inserted takes more time compared with a general index (B-tree). Jobs can continue while CREATE INDEX is running.

### 9.1.3.4 Confirming that the VCI has been Created

Execute the SELECT statement to reference the pg_indexes catalog, and confirm that the VCI was created for the target columns.

**Example**

```
dbo1=# SELECT indexdef FROM pg_indexes WHERE indexdef LIKE '%vci%';
indexdef
---------------------------------------------
CREATE INDEX idx_vci ON table01 USING vci (col01, col02)
(1 row)
```

### 9.1.4 Data that can Use VCI

This section describes on which relation types and for which data types VCIs can be created.

#### 9.1.4.1 Relation Types

VCIs cannot be created on some relation types. The ON clause of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify relations on which VCIs cannot be created.

- Relations on which VCIs can be created
  - Normal tables
  - UNLOGGED TABLEs
- Relations on which VCIs cannot be created
  - Materialized views
  - Temporary tables
  - Views
  - Temporary views
  - Foreign tables
## 9.1.4.2 Data Types

VCIs cannot be created for some data types.

The column specification of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify a column with data type on which VCIs cannot be created.

<table>
<thead>
<tr>

### 9.2 Operating VCI

This section describes how to operate VCI.

#### 9.2.1 Commands that cannot be Used for VCI

Some operations cannot be performed for VCI extensions and VCI itself.

This section describes SQL commands that cannot be executed for the VCI extensions and VCI itself, and client application commands.

**SQL commands**

- Operations that cannot be performed for the VCI extension

<table>
<thead>
<tr>
<th>Command</th>
<th>Subcommand</th>

</thead>
<tbody>
<tr>
<td>clusterdb</td>
<td>Clustering cannot be performed for tables that contain a VCI.</td>
</tr>
<tr>
<td>reindexdb</td>
<td>VCIs cannot be specified on the --index option.</td>
</tr>
</tbody>
</table>

### 9.2.2 Data Preload Feature

The first aggregation using VCI immediately after an instance is started may take time, because the VCI data has not been loaded to buffer. Therefore, use the preload feature to load the VCI data to buffer in advance when performing VCI aggregation after an instance is started.

When using the preload feature, execute the function `pgx_prewarm_vci` to each VCI created with CREATE INDEX.

```sql
db01=# SELECT pgx_prewarm_vci('idx_vci');
```
Refer to "B.4 VCI Data Load Control Function" for information on pgx_prewarm_vci.
Chapter 10 Actions when an Error Occurs

This chapter describes the actions to take when an error occurs in the database or an application, while FUJITSU Enterprise Postgres is operating.

Depending on the type of error, it may be necessary to recover the database cluster. The recovery process recovers the following resources:

- Data storage destination
- Transaction log storage destination (if the transaction log is stored in a separate disk from the data storage destination)
- Backup data storage destination

Note

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output. The recovery actions differ for these error messages.

Check the status of the disk, and select one of the following actions:

- If the disk is defective
  Refer to "10.1 Recovering from Disk Failure (Hardware)", and take actions accordingly.
- If the disk is not defective
  Refer to "10.14 I/O Errors Other than Disk Failure", and take actions accordingly.

A few examples of errors generated even if the disk is not defective include:

- Network error with an external disk
- Errors caused by power failure or mounting issues

Determining the cause of an error

If an error occurs, refer to the WebAdmin message and the server log, and determine the cause of the error.

See

Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on server logs.

Approximate recovery time

The formulas for deriving the approximate recovery time of resources in each directory are given below.

- Data storage destination or transaction log storage destination

\[
\text{Recovery time} = \frac{(\text{usageByTheDataStorageDestination} + \text{usageByTheTransactionLogStorageDestination})}{\text{diskWritePerformance}} \times 1.5
\]

- \text{usageByTheDataStorageDestination}: Disk space used by the database cluster
- \text{usageByTheTransactionLogStorageDestination}: Disk space used by the transaction log stored outside the database cluster
- \text{diskWritePerformance}: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

- Backup data storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheBackupDataStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]

- \text{usageByTheBackupDataStorageDestination}: Disk space used by the backup data
- `diskWritePerformance`: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

## 10.1 Recovering from Disk Failure (Hardware)

This section describes how to recover database clusters to a point immediately before failure, if a hardware failure occurs in the data storage disk or the backup data storage disk.

There are two methods of recovery:

- 10.1.1 Using WebAdmin
- 10.8.1.2 Using Server Commands

----

### 10.1.1 Using WebAdmin

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

-----

#### Point

Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

-----

#### 10.1.1 Using WebAdmin

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

-----

#### Note

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

-----

### If failure occurred in the data storage disk or the transaction log storage disk

Follow the procedure below to recover the data storage disk or the transaction log storage disk.

1. **Stop applications**
   - Stop applications that are using the database.

2. **Stop the instance**
   - Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.

3. **Recover the failed disk**
   - Replace the disk, and then recover the volume configuration information.

4. **Create a tablesapce directory**
   - If a tablespace was defined after backup, create a directory for it.

5. **Recover the keystore, and enable automatic opening of the keystore**
   - Do the following if the data in the database has been encrypted:
     - Restore the keystore to its state at the time of the database backup.
     - Enable automatic opening of the keystore.
6. Recover the database cluster

Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

7. Run recovery

In the [Restore Instance] dialog box, click [Yes].

Instance restore is performed. An instance is automatically started when recovery is successful.

**Note**

WebAdmin does not support recovery of hash index. If you are using a hash index, then after recovery, execute the REINDEX command to rebuild it. Use of hash indexes is not recommended.

8. Resume applications

Resume applications that are using the database.

**Point**

WebAdmin may be unable to detect disk errors, depending on how the error occurred.

If this happens, refer to "10.10.3 Other Errors" to perform recovery.
If failure occurred on the backup data storage disk

Follow the procedure below to recover the backup data storage disk.

1. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

2. Recover the backup data
   Log in to WebAdmin, and in the [Instance] tab, click [Solution] for the error message.

3. Run backup
   Perform backup to enable recovery of the backup data. In the [Backup] dialog box, click [Yes]. The backup is performed. An instance is automatically started when backup is performed.

Point

If you click [Recheck the status], the resources in the data storage destination and the backup data storage destination are reconfirmed. As a result, the following occurs:

- If an error is not detected
   The status of the data storage destination and the backup data storage destination returns to normal, and it is possible to perform operations as usual.
If an error is detected

An error message is displayed in the message list again. Click [Solution], and resolve the problem by following the resolution for the cause of the error displayed in the dialog box.

---

10.1.2 Using Server Command

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

**If failure occurred on the data storage disk or the transaction log storage directory**

Follow the procedure below to recover the data storage disk or the transaction log storage directory.

1. **Stop applications**
   Stop applications that are using the database.

2. **Stop the instance**
   Stop the instance, refer to "2.1.2 Using Server Commands" for details.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. **Recover the failed disk**
   Replace the disk, and then recover the volume configuration information.

4. **Create a storage destination directory**
   - **If failure occurred on the data storage disk**
     - Create a data storage destination directory. If a tablespace was defined, also create a directory for it.
   - **If failure occurred on the transaction log storage disk**
     - Create a transaction log storage destination directory.

**Example**

To create a data storage destination directory:

```bash
$ mkdir /database/inst1
$ chown fsepuser:fsepuser /database/inst1
$ chmod 700 /database/inst1
```

**See**

Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on how to create a storage directory.

5. **Recover the keystore, and enable automatic opening of the keystore**
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

6. **Recover the database cluster**
   Recover the database cluster using the backup data.
   Specify the following in the `pgx_rcvall` command:
   - Specify the data storage location in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
   - Specify the backup data storage location in the `-B` option.
Example

> pgx_rcvall -D /database/inst1 -B /backup/inst1

Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

7. Start the instance
   Start the instance.
   Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

8. Resume applications
   Resume applications that are using the database.

If failure occurred on the backup data storage disk

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Recover the failed disk</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Create a backup data storage destination directory</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Resume output of archive logs</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Resume transaction log mirroring</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>Start the instance</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>Run backup</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>Resume applications</td>
<td></td>
</tr>
</tbody>
</table>

- 80 -
The procedure is as follows:

If an instance has not been stopped

1. Confirm that transaction log mirroring has stopped

   Use the following SQL function to confirm that transaction log mirroring has stopped.

   ```sql
   postgres=# SELECT pgx_is_wal_multiplexing_paused();
   pgx_is_wal_multiplexing_paused
   -------------------
   t
   (1 row)
   ```

   If transaction log mirroring has not stopped, then stop it using the following SQL function.

   ```sql
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   --------------------------
   (1 row)
   ```

2. Stop output of archive logs

   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

   To prevent this, use the following methods to stop output of archive logs.

   - Changing archive_command
     Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.

     If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

   - Reload the configuration file
     Execute the pg_ctl reload command or the pg_reload_conf SQL function to reload the configuration file.

     If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string (""") in archive_command and reload the configuration file.

3. Recover the failed disk

   Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

   Create a backup data storage destination.

   **Example**

   ```bash
   $ mkdir /database/inst1
   $ chown fsepuser:fsepuser /database/inst1
   $ chmod 700 /database/inst1
   ```

   Refer to "3.2.2 Using Server Commands" for information on how to create a backup data storage destination.

5. Resume output of archive logs

   Return the archive_command setting to its original value, and reload the configuration file.

6. Resume transaction log mirroring

   Execute the pgx_resume_wal_multiplexing SQL function.
Example

```sql
SELECT pgx_resume_wal_multiplexing()
```

7. Run backup

Use the `pgx_dmpall` command to back up the database cluster.

Specify the following value in the `pgx_dmpall` command:

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

Example

```bash
> pgx_dmpall -D /database/inst1
```

If an instance has been stopped

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to “2.1.2 Using Server Commands” for details.

If the instance fails to stop, refer to “10.11 Actions in Response to Failure to Stop an Instance”.

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

Create a backup data storage destination.

Example

```
# mkdir /backup/inst1
# chown fsepuser:fsepuser /backup/inst1
# chmod 700 /backup/inst1
```

Refer to “3.2.2 Using Server Commands” for details.

5. Start the instance

Start the instance. Refer to “2.1.2 Using Server Commands” for information on how to start an instance.

6. Run backup

Use the `pgx_dmpall` command to back up the database cluster.

Specify the following value in the `pgx_dmpall` command:

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

Example

```bash
> pgx_dmpall -D /database/inst1
```

7. Resume applications

Resume applications that are using the database.

See

- Refer to “pgx_rcvall” and “pgx_dmpall” in the Reference for information on the `pgx_rcvall` command and `pgx_dmpall` command.
10.2 Recovering from Data Corruption

If data in a disk is logically corrupted and the database does not operate properly, you can recover the database cluster to its state at the time of backup.

There are two methods of recovery:

- 10.2.1 Using WebAdmin
- 10.2.2 Using the pgx_rcvall Command

Note

- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.
- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.

10.2.1 Using WebAdmin

If using WebAdmin, recover the data to the point immediately prior to data corruption by using the backup data.

Refer to "10.1.1 Using WebAdmin" for details.

10.2.2 Using the pgx_rcvall Command

Recover the database cluster by specifying in the pgx_rcvall command the date and time of the backup you want to read from. Then re-execute the transaction as required to recover the data.

Follow the procedure below to recover the data storage disk.

1. Stop applications
   Stop applications that are using the database.
2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".
3. Confirm the backup date and time
   Execute the pgx_rcvall command to confirm the backup data saved in the backup data storage destination, and determine a date and time prior to data corruption.
   Specify the following values in the pg_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup storage directory in the -B option.
   - The -l option displays the backup data information.
4. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster

Use the pgx_rcvall command to recover the database cluster.

Specify the following values in the pgx_rcvall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup storage directory in the -B option.
- Specify the recovery date and time in the -e option.

**Example**

In the following examples, "May 20, 2015 10:00:00" is specified as the recovery time.

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1 -e '2015-05-20 10:00:00'
```

**Note**

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

6. Start the instance

Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

If necessary, re-execute transaction processing from the specified recovery time, and then resume database operations.

**Note**

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

7. Resume applications

Resume applications that are using the database.

**See**

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.
10.3 Recovering from an Incorrect User Operation

This section describes how to recover database clusters when data has been corrupted due to erroneous user operations.

There are two methods of recovery:

- 10.3.1 Using WebAdmin
- 10.3.2 Using the pgx_rcvall Command

**Note**

- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.
- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.
- An effective restore point is one created on a time series for which you have made a backup. That is, if you recover data to a point in the past, you cannot use any restore points set after that recovery point. Therefore, once you manage to recover your target past data, make a backup.

10.3.1 Using WebAdmin

You can use WebAdmin to recover data to a backup point.

**Note**

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

Follow the procedure below to recover the data in the data storage disk.

1. Stop applications
   Stop applications that are using the database.
2. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.
3. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.
4. Recover the database cluster
   Log in to WebAdmin, and in the [Instances] tab, select the instance to be recovered and click 🔄.
5. Recover to the backup point
   In the [Restore Instance] dialog box, click [Yes].
   Recovery is performed. An instance is automatically started when recovery is successful.
WebAdmin cannot accurately recover a hash index. If you are using a hash index, then after recovery, execute the REINDEX command for the appropriate index.

6. Resume database operations

If necessary, re-execute transaction processing from the backup point to when an erroneous operation was performed, and then resume database operations.

10.3.2 Using the pgx_rcvall Command

The pgx_rcvall command recovers database clusters to the restore point created with the server command. Refer to "Setting a restore point" in "3.2.2 Using Server Commands" for information on how to create a restore point.

Follow the procedure below to recover the data in the data storage disk.

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.

If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the restore point

Execute the pgx_rcvall command to confirm the backup data saved in the backup data storage destination, and use a restore point recorded in an arbitrary file, as explained in "3.2.2 Using Server Commands", to determine a restore point prior to the erroneous operation.

Specify the following values in the pg_rcvall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Specify the backup data storage destination in the -B option.

- The -l option displays the backup data information.

Example

```bash
> pgx_rcvall -D /database/inst1 -B /backup/inst1 -l
```

<table>
<thead>
<tr>
<th>Date</th>
<th>Status</th>
<th>Dir</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015-05-01 10:00:00</td>
<td>COMPLETE</td>
<td>/backup/inst1/2015-05-01_10-00-00</td>
</tr>
</tbody>
</table>

4. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster

Use the pgx_rcvall command to recover the database cluster.

Specify the following values in the pg_rcvall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Specify the backup data storage destination in the -B option.

- The -n option recovers the data to the specified restore point.

Example

The following example executes the pgx_rcvall command with the restore point "batch_20150503_1".
If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

6. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

```
Note
```

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

7. Restart operation of the database

If necessary, re-execute transaction processing from the specified recovery time to the point when an erroneous operation was performed, and then resume database operations.

```
See
```

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

### 10.4 Actions in Response to an Application Error

If there is a connection from a client that has been in the waiting state for an extended period, you can minimize performance degradation of the database by closing the problematic connection.

The following methods are available for identifying a connection to be closed:

- view(pg_stat_activity) (refer to "10.4.1 When using the view (pg_stat_activity)"
- ps command (refer to "10.4.2 Using the ps Command")
- pgAdmin (refer to "10.4.3 Using pgAdmin")

Use the system management function (pg_terminate_backend) to disconnect connections.

#### 10.4.1 When using the view (pg_stat_activity)

When using the view (pg_stat_activity), follow the procedure below to close a connection.

1. Use psql command to connect to the postgres database.

```
> psql postgres
psql (9.6.2)
Type "help" for help.
```
2. Close connections from clients that have been in the waiting state for an extended period.

Use `pg_terminate_backend()` to close connections that have been trying to connect for an extended period.

However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

Example

The following example closes connections where the client has been in the waiting state for at least 60 minutes.

```sql
select pid, usename, application_name, client_hostname, pg_terminate_backend(pid) from pg_stat_activity where state='idle in transaction' and current_timestamp > cast(query_start + interval '60 minutes' as timestamp);
```

- RECORD 1 |---------------
pid | 4684
usename | fsepuser
application_name | apl1
client_hostname | 192.11.11.1
pg_terminate_backend | t

See

- Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on `pg_terminate_backend`.
- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on how to maintain application compatibility.

### 10.4.2 Using the ps Command

Follow the procedure below to close a connection using a standard Unix tool (ps command).

1. Execute the ps command.
   
   Note that "<xy>" indicates the product version and level.

```bash
> ps axwfo user,pid,ppid,tty,command | grep postgres
fsepuser 19174 18027 pts/1 _ grep postgres
fsepuser 20517 1 ? /opt/fsepv<xy>/server64/bin/postgres -D /disk01/data
fsepuser 20512 20517 ? _ postgres: logger process
fsepuser 20520 20517 ? _ postgres: checkpoint process
fsepuser 20521 20517 ? _ postgres: writer process
fsepuser 20522 20517 ? _ postgres: wal writer process
fsepuser 20523 20517 ? _ postgres: autovacuum launcher process
fsepuser 20524 20517 ? _ postgres: archiver process
fsepuser 20525 20517 ? _ postgres: stats collector process
fsepuser 18673 20517 ? _ postgres: fsepuser postgres 192.168.100.1(49448) idle
fsepuser 16643 20517 ? _ postgres: fsepuser db01 192.168.100.11(49449) UPDATE waiting
fsepuser 16644 20517 ? _ postgres: fsepuser db01 192.168.100.12(49450) idle in transaction
```

Process ID 16643 may be a connection that was established a considerable time ago by the UPDATE statement, or a connection that has occupied resources (waiting).

2. Close connections from clients that have been in the waiting state for an extended period.

Use `pg_terminate_backend()` to close the connection with the process ID identified in step 1 above.

However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements.

```sql
postgres=# SELECT pg_terminate_backend (16643);
pg_terminate_backend
------------------------
- 88 -
```
- Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on `pg_terminate_backend`.

- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on how to maintain application compatibility.

### 10.4.3 Using pgAdmin

If using pgAdmin, follow the procedure below to close connections.

1. From the [Tools] menu in pgAdmin, click [Server Status].
2. Close client connections that have been in the waiting state for an extended period.

From the transaction start time displayed under [TX Start], select connections that have been in the waiting state for an extended period. Then click the red square button to close the connections.

10.5 Actions in Response to an Access Error

If access is denied, grant privileges allowing the instance administrator to operate the following directories and then re-execute operations. Also, refer to the system log and the server log, and confirm that the file system has not been mounted as read-only due to a disk error. If the file system has been mounted as read-only, mount it properly and then re-execute operations.

- Data storage destination
- Tablespace storage destination
- Transaction log storage destination
- Backup data storage destination

See

Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on the privileges required for the directory.
10.6 Actions in Response to Insufficient Space on the Data Storage Destination

If the data storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.

If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

There are two methods of migrating data:
- 10.6.1 Using a Tablespace
- 10.6.2 Replacing the Disk with a Larger Capacity Disk

10.6.1 Using a Tablespace

FUJITSU Enterprise Postgres enables you to use a tablespace to change the storage destination of database objects, such as tables and indexes, to a different disk.

The procedure is as follows:

1. Create a tablespace
   Use the CREATE TABLESPACE command to create a new tablespace in the prepared disk.
2. Modify the tablespace
   Use the ALTER TABLE command to modify tables for the newly defined tablespace.

See

Refer to “SQL Commands” under “Reference” in the PostgreSQL Documentation for information on the CREATE TABLESPACE command and ALTER TABLE command.

10.6.2 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the data storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:
- 10.6.2.1 Using WebAdmin
- 10.6.2.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the data storage destination.

Note

- Before replacing the disk, stop applications and instances that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

10.6.2.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using WebAdmin.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.
2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablespace directory ") to 7 ("Run recovery") under "If failure occurred in the data storage disk or the transaction log storage disk" in "10.1.1 Using WebAdmin" for information on the procedure. An instance is automatically started when recovery is successful.

7. Resume applications
   Resume applications that are using the database.

8. Restore the files
   Restore the files backed up in step 1.

10.6.2.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using server commands.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.

2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.2 Using Server Commands" for details.

4. Stop the instance
   After backup is complete, stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a data storage destination
   Create a data storage destination. If a tablespace was defined, also create a directory for it.

Example

```bash
$ mkdir /database/inst1
$ chown fsepuser:fsepuser /database/inst1
$ chmod 700 /database/inst1
```

7. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.
8. Recover the database cluster

Use the `pgx_rcvall` command to recover the database cluster.

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
- Specify the backup storage directory in the `-B` option.

**Example**

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1
```

**Note**

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the `pgx_rcvall` command.

If the message "`pgx_rcvall: an error occurred during recovery`" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the `pgx_rcvall` command.

The following message displayed during recovery is output as part of normal operation of `pgx_rcvall` (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

**See**

Refer to "`pgx_rcvall`" in the Reference for information on the `pgx_rcvall` command.

9. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

**Note**

The `pgx_rcvall` command cannot accurately recover a hash index. If you are using a hash index, wait for the `pgx_rcvall` command to end and then execute the `REINDEX` command for the appropriate index.

10. Resume applications

Resume applications that are using the database.

11. Restore files

Restore the files backed up in step 1.

## 10.7 Actions in Response to Insufficient Space on the Backup Data Storage Destination

If space runs out on the backup data storage destination, check if the disk contains any unnecessary files and delete them, and then make a backup as required.

If deleting unnecessary files does not solve the problem, take the following action:

- 10.7.1 Temporarily Saving Backup Data
- 10.7.2 Replacing the Disk with a Larger Capacity Disk
10.7.1 Temporarily Saving Backup Data

This method involves temporarily moving backup data to a different directory, saving it there, and securing disk space on the backup data storage destination so that a backup can be made normally.

Use this method if you need time to prepare a larger capacity disk.

If space runs out on the backup data storage destination, archive logs can no longer be stored in the backup data storage destination. As a result, transaction logs continue to accumulate in the data storage destination or the transaction log storage destination.

If action is not taken soon, the transaction log storage destination will become full, and operations may not be able to continue.

To prevent this, secure space in the backup data storage destination, so that archive logs can be stored.

There are two methods of taking action:
- 10.7.1.1 Using WebAdmin
- 10.7.1.2 Using Server Commands

10.7.1.1 Using WebAdmin

Follow the procedure below to recover the backup data storage disk.

1. Temporarily save backup data
   
   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.
   
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   
   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.
   
   Example
   
   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

2. Back up the database cluster
   
   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

3. Delete temporarily saved backup data
   
   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
   
   The following example deletes backup data that was temporarily saved in /mnt/usb.
   
   Example
   
   ```
   > rm -rf /mnt/usb/backup
   ```

10.7.1.2 Using Server Commands

The following describes the procedure for recovering the backup storage disk.

There are two methods of taking action:
- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>
The procedure is as follows:

**Performing recovery while the instance is active**

1. Stop transaction log mirroring
   Stop transaction log mirroring.
   ```
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   ----------------------------
   (1 row)
   ```

2. Stop output of archive logs
   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.
   To prevent this, use the following methods to stop output of archive logs.
   - Changing the archive_command parameter
     Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.
     If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.
   - Reloading the configuration file
     Run the pg_ctl reload command or the pg_reload_conf SQL function.
     If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

3. Temporarily save backup data
   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

Example

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```

4. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.

5. Resume transaction log mirroring

Execute the pgx_resume_wal_multiplexing SQL function.

Example

```sql
SELECT pgx_resume_wal_multiplexing()
```

6. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following option in the pgx_dmpall command:

- Specify the directory of the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```bash
> pgx_dmpall -D /database/inst1
```

7. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

Example

```bash
> rm -rf /mnt/usb/backup
```

If an instance has been stopped

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Server Commands" for details.

If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Temporarily save backup data

Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

Example

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```
4. Start the instance

Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

5. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pgx_dmpall -D /database/inst1
```

6. Resume applications

Resume applications that are using the database.

7. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

Example

```
> rm -rf /mnt/usb/backup
```

See

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexing_paused and pgx_resume_wal_multiplexing.

10.7.2 Replacing the Disk with a Larger Capacity Disk

This method involves replacing the disk at the backup data storage destination with a larger capacity disk, so that it does not run out of free space again. After replacing the disk, back up data to obtain a proper backup.

There are two methods of performing backup:

- 10.7.2.1 Using WebAdmin
- 10.7.2.2 Using Server Commands

Note

Before replacing the disk, stop applications that are using the database.

10.7.2.1 Using WebAdmin

Follow the procedure below to recover the backup storage disk.

1. Back up files

If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.
2. Temporarily save backup data

Save the backup data to a different directory.

The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

Example

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```

3. Replace with a larger capacity disk

Replace the disk. Then, recover the volume configuration information.

4. Run backup

Log in to WebAdmin, and perform recovery operations. Refer to steps 2 ("Recover the backup data") and 3 ("Run backup") under "If failure occurred on the backup storage disk" in "10.1.1 Using WebAdmin".

5. Restore files

Restore the files backed up in step 1.

6. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

Example

```bash
> rm -rf /mnt/usb/backup
```

10.7.2.2 Using Server Commands

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:
- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>1</td>
<td>Back up files</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Temporarily save backup data</td>
<td>Y</td>
</tr>
<tr>
<td>3</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td>Y</td>
</tr>
<tr>
<td>4</td>
<td>Stop output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>5</td>
<td>Stop applications</td>
<td>N</td>
</tr>
<tr>
<td>6</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>7</td>
<td>Replace with a larger capacity disk</td>
<td>Y</td>
</tr>
<tr>
<td>8</td>
<td>Create a backup storage directory</td>
<td>Y</td>
</tr>
<tr>
<td>9</td>
<td>Resume output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>10</td>
<td>Resume transaction log mirroring</td>
<td>Y</td>
</tr>
</tbody>
</table>
The procedure is as follows:

If an instance has not been stopped

1. Back up files

   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data

   Save the backup data to a different directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

   Example

   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

3. Confirm that transaction log mirroring has stopped

   Use the following SQL function to confirm that transaction log mirroring has stopped.

   ```
   postgres=# SELECT pgx_is_wal_multiplexing_paused();
   pgx_is_wal_multiplexing_paused
   -------------------
   t                   
   (1 row)
   ```

   If transaction log mirroring has not stopped, then stop it using the following SQL function.

   ```
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   ------------------------------
   (1 row)
   ```

4. Stop output of archive logs

   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage destination disk or the transaction log storage destination disk becomes full, there is a risk that operations may not be able to continue.

   To prevent this, use the following methods to stop output of archive logs.
- Changing the archive_command parameter
  Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.
  If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

- Reloading the configuration file
  Run the pg_ctl reload command or the pg_reload_conf SQL function.
  If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination
   Create a backup data storage destination.
   **Example**
   ```
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```
   Refer to "3.2.2 Using Server Commands" for details.

7. Resume output of archive logs
   Return the archive_command setting to its original value, and reload the configuration file.

8. Resume transaction log mirroring
   Execute the pgx_resume_wal_multiplexing SQL function.
   **Example**
   ```
   SELECT pgx_resume_wal_multiplexing()
   ```

9. Run backup
   Use the pgx_dmpall command to back up the database cluster.
   Specify the following value in the pgx_dmpall command:
   ```
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   **Example**
   ```
   > pgx_dmpall -D /database/inst1
   ```

10. Restore files
    Restore the files backed up in step 1.

11. Delete temporarily saved backup data
    If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.
    The following example deletes backup data that was temporarily saved in /mnt/usb.
    **Example**
    ```
    > rm -rf /mnt/usb/backup
    ```
If an instance has been stopped

1. Back up files

   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data

   Save the backup data to a different directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/

   Example

   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

3. Stop applications

   Stop applications that are using the database.

4. Stop the instance

   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.

   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk

   Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination

   Create a backup data storage destination.

   Example

   ```
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```

   Refer to "3.2.2 Using Server Commands" for details.

7. Start the instance

   Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

8. Run backup

   Use the pgx_dmpall command to back up the database cluster.

   Specify the following value in the pgx_dmpall command:

   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

   Example

   ```
   > pgx_dmpall -D /database/inst1
   ```

9. Resume applications

   Resume applications that are using the database.

10. Restore files

    Restore the files backed up in step 1.
11. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

Example

```
> rm -rf /mnt/usb/backup
```

See

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to “Write Ahead Log” under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexing_paused and pgx_resume_wal_multiplexing.

10.8 Actions in Response to Insufficient Space on the Transaction Log Storage Destination

If the transaction log storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.

If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

10.8.1 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the transaction log storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:

- 10.8.1.1 Using WebAdmin
- 10.8.1.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the transaction log storage destination.

Note

- Before replacing the disk, stop applications that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

10.8.1.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using WebAdmin.

1. Back up files

   If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the transaction log storage destination.

2. Back up the database cluster

   Back up the latest data storage destination resources and transaction log storage destination resources (refer to "3.2.1 Using WebAdmin" for details).
3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops
   instances if recovery of the database cluster is performed without stopping the instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a tablespace directory
   If a tablespace was defined after backing up, create a directory for it.

7. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.

8. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 (“Create a tablespace directory”) to 7 (“Run Recovery”) under
   “If failure occurred in the data storage disk or the transaction log storage disk” in "10.1.1 Using WebAdmin" for information
   on the procedure. An instance is automatically started when recovery is successful.

9. Resume applications
   Resume applications that are using the database.

10. Restore files
    Restore the files backed up in step 1.

10.8.1.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using server commands.

1. Back up files
   If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the
   transaction log storage destination.

2. Back up the database cluster
   Use server commands to back up the latest data storage destination resources and transaction log storage destination resources. Refer
   to “3.2.2 Using Server Commands” for information on how to perform backup.

3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   After backup is complete, stop the instance. Refer to “2.1.2 Using Server Commands” for information on how to stop an instance.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance”.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a transaction log storage destination
   Create a transaction log storage destination. If a tablespace was defined, also create a directory for it.
Example

```
# mkdir /tranlog/inst1
# chown fsepuser:fsepuser /tranlog/inst1
# chmod 700 /tranlog/inst1
```

7. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

8. Recover the database cluster

Use the pgx_rcvall command to recover the database cluster.

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Specify the backup storage directory in the -B option.

Example

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1
```

Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

See

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

9. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

Note

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

10. Resume applications

Resume applications that are using the database.

11. Restore files

Restore the files backed up in step 1.
10.9 Errors in More Than One Storage Disk

If an error occurs in the storage destination disks or resources are corrupted, determine the cause of the error from system logs and server logs and remove the cause.

If errors occur in either of the following combinations, you cannot recover the database.

Recreate the instance, and rebuild the runtime environment.

<table>
<thead>
<tr>
<th>Data storage disk</th>
<th>Transaction log storage disk</th>
<th>Backup data storage disk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>-</td>
<td>Error</td>
</tr>
<tr>
<td>-</td>
<td>Error</td>
<td>Error</td>
</tr>
</tbody>
</table>

See

Refer to "Setup" in the Installation and Setup Guide for Server for information on how to create an instance and build the runtime environment.

10.10 Actions in Response to Instance Startup Failure

If an instance fails to start, refer to the system log and the server log, and determine the cause of the failure.

If using WebAdmin, remove the cause of the error. Then, click [Solution] and [Recheck the status] and confirm that the instance is in the normal state.

The following sections describe common causes of errors and the actions to take.

10.10.1 Errors in the Configuration File

If you have directly edited the configuration file using a text editor or changed the settings using WebAdmin, refer to the system log and the server log, confirm that no messages relating to the files below have been output.

- postgresql.conf
- pg_hba.conf

See

Refer to the following for information on the parameters in the configuration file:

- "Configuring Parameters" in the Installation and Setup Guide for Server
- "Appendix A Parameters"
- "Server Configuration" and "Client Authentication" under "Server Administration" in the PostgreSQL Documentation

10.10.2 Errors Caused by Power Failure or Mounting Issues

If mounting is cancelled after restarting the server, for example, because the disk device for each storage destination disk was not turned on, or because automatic mounting has not been set, then starting an instance will fail.

Refer to "10.14.2 Errors Caused by Power Failure or Mounting Issues", and take actions accordingly.

10.10.3 Other Errors

This section describes the recovery procedure to be used if you cannot take any action or the instance cannot start even after you have referred to the system log and the server log.
There are two methods of recovery:

- **10.10.3.1 Using WebAdmin**
- **10.10.3.2 Using Server Commands**

Note that recovery will not be possible if there is an error at the backup data storage destination. If the problem cannot be resolved, contact Fujitsu technical support.

### 10.10.3.1 Using WebAdmin

Follow the procedure below to perform recovery.

1. **Delete the data storage destination directory and the transaction log storage destination directory**
   
   Back up the data storage destination directory and the transaction log storage destination directory before deleting them.

2. **Reconfirm the status**
   
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.
   
   Click [Recheck the status] to reconfirm the storage destination resources.

3. **Run recovery**
   
   Restore the database cluster after WebAdmin detects an error.
   
   Refer to "10.2.1 Using WebAdmin" for details.

### 10.10.3.2 Using Server Commands

Follow the procedure below to recover the database.

1. **Delete the data storage destination directory and the transaction log storage destination directory**
   
   Save the data storage destination directory and the transaction log storage destination directory, and then delete them.

2. **Execute recovery**
   
   Use the `pgx_rcvall` command to recover the database cluster.
   
   Refer to "10.2.2 Using the pgx_rcvall Command" for details.

### 10.11 Actions in Response to Failure to Stop an Instance

If an instance fails to stop, refer to the system log and the server log, and determine the cause of the failure.

If the instance cannot stop despite taking action, perform the following operation to stop the instance.

There are two methods of recovery:

- **10.11.1 Using WebAdmin**
- **10.11.2 Using Server Commands**

#### 10.11.1 Using WebAdmin

In the [Instances] tab, click 🗑️ and select the Fast stop mode or the Immediate stop mode to stop the instance. Forcibly terminate the server process from WebAdmin if the instance cannot be stopped.

Refer to "2.1.1 Using WebAdmin" for information on the stop modes.

#### 10.11.2 Using Server Commands

There are three methods:
- Stopping the Instance Using the Fast Mode
  If backup is in progress, then terminate it, roll back all executing transactions, forcibly close client connections, and then stop the instance.

- Stopping the Instance Using the Immediate Mode
  Forcibly terminate the instance immediately. A crash recovery is run when the instance is restarted.

- Forcibly Stopping the Server Process
  Reliably stops the server process when the other methods are unsuccessful.

### 10.11.2.1 Stopping the Instance Using the Fast Mode

Specify "-m fast" in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "10.11.2.2 Stopping the Instance Using the Immediate Mode" or "10.11.2.3 Forcibly Stopping the Server Process".

**Example**

```
> pg_ctl stop -D /database/inst1 -m fast
```

### 10.11.2.2 Stopping the Instance Using the Immediate Mode

Specify "-m immediate " in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "10.11.2.3 Forcibly Stopping the Server Process".

**Example**

```
> pg_ctl stop -D /database/inst1 -m immediate
```

### 10.11.2.3 Forcibly Stopping the Server Process

If both the Fast mode and the Immediate mode fail to stop the instance, use the kill command or the kill parameter of the pg_ctl command to forcibly stop the server process.

The procedure is as follows:

1. Execute the ps command
   Note that "<xy>" indicates the product version and level.

   ```
   > ps axwfo user,pid,ppid,tty,command | grep postgres
   fsepuser 19174 18027 pts/1     \_ grep postgres
   fsepuser 20517 1 ? /opt/fsep<xy>/server64/bin/postgres -D /database/inst1
   fsepuser 20518 20517 ? \_ postgres: logger process
   fsepuser 20520 20517 ? \_ postgres: checkpointer process
   fsepuser 20521 20517 ? \_ postgres: writer process
   fsepuser 20522 20517 ? \_ postgres: wal writer process
   fsepuser 20523 20517 ? \_ postgres: autovacuum launcher process
   fsepuser 20524 20517 ? \_ postgres: archiver process
   fsepuser 20525 20517 ? \_ postgres: stats collector process
   ```

   The process ID (20517) indicates the server process.

2. Forcibly stop the server process
   As instance manager, forcibly stop the server process.
Using the `pg_ctl` command

```
> pg_ctl kill SIGQUIT 20517
```

Using the `kill` command

```
> kill -s SIGQUIT 20517
```

### 10.12 Actions in Response to Failure to Create a Streaming Replication Standby Instance

When creating a streaming replication standby instance using WebAdmin, if the instance creation fails, refer to the system log and the server log, and determine the cause of the failure.

When an error occurs in the creation of the standby instance using WebAdmin, it is unlikely that the partially created standby instance can be resumed to complete the operation.

In such a scenario, fix the cause of the error, delete the partially created standby instance, and then create a new standby instance. This recommendation is based on the following assumptions:

- As the instance is yet to be created completely, there are no applications connecting to the database.
- The standby instance is in error state and is not running.
- There are no backups for the standby instance and as a result, it cannot be recovered.

Refer to "Deleting Instances" in the Installation and Setup Guide for details on how to delete an instance.

### 10.13 Actions in Response to Error in a Distributed Transaction

If a system failure (such as server failure) occurs in an application that uses distributed transactions (such as .NET TransactionScope), then transactions may be changed to the in-doubt state. At that point, resources accessed by the transaction will be locked, and rendered unusable by other transactions.

The following describes how to check for in-doubt transactions, and how to resolve them.

#### How to check for in-doubt transactions

The following shows how to check for them:

If the server fails

1. An in-doubt transaction will have occurred if a message similar to the one below is output to the log when the server is restarted.

   **Example**

   ```
   LOG: Restoring prepared transaction 2103.
   ```

2. Refer to system view `pg_prepared_xacts` to obtain information about the prepared transaction.

   If the transaction identifier of the prepared transaction in the list (in the transaction column of `pg_prepared_xacts`) is the same as the identifier of the in-doubt transaction obtained from the log output when the server was restarted, then that row is the information about the in-doubt transaction.

   **Example**

   ```
   postgres=# select * from pg_prepared_xacts;
   transaction |   gid     |   prepared |  owner   | database
   -------------+-----------+------------+----------+----------
   2103 | 374cc221-f6dc-4b73-9d62-d4fec9b430cd | 2015-05-06 16:28:48.471+08 | postgres |
   postgres (1 row)
   ```

   Information about the in-doubt transaction is output to the row with the transaction ID 2103 in the transaction column.
If the client fails

If there are no clients connected and there is a prepared transaction in pg_prepared_xacts, then you can determine that the transaction is in the in-doubt state.

If at least one client is connected and there is a prepared transaction in pg_prepared_xacts, you cannot determine whether there is a transaction in the in-doubt state. In this case, use the following query to determine the in-doubt transaction from the acquired database name, user name, the time PREPARE TRANSACTION was executed, and the information about the table name accessed.

```sql
select gid,x.database,owner,prepared,l.relation::regclass as relation from pg_prepared_xacts x
left join pg_locks l on l.virtualtransaction = '-1/'||x.transaction and l.locktype='relation';
```

If it still cannot be determined from this information, wait a few moments and then check pg_prepared_xacts again.

If there is a transaction that has continued since the last time you checked, then it is likely that it is the one in the in-doubt state.

**Point**

As you can see from the explanations in this section, there is no one way to definitively determine in-doubt transactions.

Consider collecting other supplementary information (for example, logging on the client) or performing other operations (for example, allocating database users per job).

---

**How to resolve in-doubt transactions**

From the system view pg_prepared_xacts mentioned above, obtain the global transaction identifier (in the gid column of pg_prepared_xacts) for the in-doubt transaction, and issue either a ROLLBACK PREPARED statement or COMMIT PREPARED statement to resolve the in-doubt transaction.

**Example**

- Rolling back in-doubt transactions

  ```sql
  postgres=# rollback prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';
  ROLLBACK PREPARED
  ```

- Committing in-doubt transactions

  ```sql
  postgres=# commit prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';
  COMMIT PREPARED
  ```

---

**10.14 I/O Errors Other than Disk Failure**

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output.

A few examples of such errors are given below. The appropriate action for each error is explained respectively.

- 10.14.1 Network Error with an External Disk
- 10.14.2 Errors Caused by Power Failure or Mounting Issues

**10.14.1 Network Error with an External Disk**

This is an error that occurs in the network path to/from an external disk.

Determine the cause of the error by checking the information in the system log and the server log, the disk access LED, network wiring, and network card status. Take appropriate action to remove the cause of the error, for example, replace problematic devices.
10.14.2 Errors Caused by Power Failure or Mounting Issues

These are errors that occur when the disk device is not turned on, automatic mounting of the disk was not set, or mounting was accidentally cancelled.

In this case, check the information in the system log and the server log, the disk access LED, and whether the disk is mounted correctly. If problems are detected, take appropriate action.

If mounting has been cancelled, it is possible that mounting was accidentally cancelled, or automatic mounting at the time of starting the operating system is not set. In this case, set the mounting to be performed automatically.

10.15 Anomaly Detection and Resolution

The following operations performed via the command line interface will result in an anomaly in WebAdmin:

- Changes to the port and backup_destination parameters in postgresql.conf
- Changes to Mirroring Controller configuration of cluster replication added via WebAdmin

This section describes when WebAdmin checks for such anomalies, and what takes place when an anomaly is detected.

10.15.1 Port Number and Backup Storage Path Anomalies

An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of its corresponding parameter in postgresql.conf - port and backup_destination, respectively.

WebAdmin checks for anomalies when an instance is selected for viewing or any instance operation is performed. Anomalies will be identified for the selected instance only.

The following occurs when an anomaly is detected in port number and/or backup storage path:

- All instance operation buttons are disabled, except for “Edit instance”, “Refresh instance”, and “Delete Mirroring Controller”
- A red error status indicator is displayed on the instance icon
- For an anomaly specific to backup storage path, a red error status indicator is displayed on the [Backup storage] disk icon, and [Backup storage status] is set to “Error”
- The message, “WebAdmin has detected an anomaly with...”, is displayed in the [Message] section along with an associated [Solution] button

Click [Solution]. The [Anomaly Error] dialog box is displayed.
Select the required option, click [OK], and then resolve the anomaly error.

**Note**
Critical errors encountered during anomaly resolution will be displayed, however, rollback of the instance to its previous state is not supported.

### 10.15.2 Mirroring Controller Anomalies

The following conditions will cause a Mirroring Controller anomaly:

- The Mirroring Controller management folder or configuration files have been deleted
- The permissions to the Mirroring Controller management folder or configuration files have been changed such that:
  - The instance administrator’s access to Mirroring Controller configuration is denied
  - Users other than an instance administrator have access privileges to Mirroring Controller configuration files

WebAdmin checks for anomalies when Mirroring Controller status check is performed.

The following occurs when a Mirroring Controller anomaly is detected:

- All Mirroring Controller functionality is disabled for the replication cluster, except for “Delete Mirroring Controller”
- [Mirroring Controller status] is set to “Error”
- Either of the following messages is displayed in the [Message] section
  - “Failed to access the Mirroring Controller management folder or configuration files ‘path’. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again.”
  - “Failed to find the Mirroring Controller management folder or configuration files ‘path’. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again.”
Appendix A Parameters

This appendix describes the parameters to be set in the postgresql.conf file of FUJITSU Enterprise Postgres.

The postgresql.conf file is located in the data storage destination.

- **core_directory (string)**
  
  This parameter specifies the directory where the corefile is to be output. If this parameter is omitted, the data storage destination is used by default. This parameter can only be set when started on starting an instance. It cannot be changed dynamically, while an instance is active.

- **core_contents (string)**
  
  This parameter specifies the contents to be included in the corefile.
  
  - *full*: Outputs all contents of the server process memory to the corefile.
  
  - *none*: Does not output a corefile.
  
  - *minimum*: Outputs only non-shared memory server processes to the corefile. This reduces the size of the corefile. However, in some cases, this file may not contain sufficient information for examining the factor that caused the corefile to be output.
  
  If this parameter is omitted, "minimum" is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- **keystore_location (string)**
  
  This parameter specifies the directory that stores the keystore file. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- **tablespace_encryption_algorithm (string)**
  
  This parameter specifies the encryption algorithm for tablespaces that will be created. Valid values are AES128, AES256, and none. If you specify "none", encryption is not performed. The default value is "none". To perform encryption, it is recommended that you specify AES256. Only superusers can change this setting.

- **backup_destination (string)**
  
  This parameter specifies the absolute path of the directory where pgx_dmpall will store the backup data. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.
  
  Place this directory on a different disk from the data directory to be backed up and the tablespace directory. Ensure that users do not store arbitrary files in this directory, because the contents of this directory are managed by the database system.

- **search_path (string)**
  
  When using the SUBSTR function compatible with Oracle databases, set "oracle" and "pg_catalog" in the search_path parameter. You must specify "oracle" before "pg_catalog".

```makefile
search_path = '"$user", public, oracle, pg_catalog'
```

- **track_waits (string)**
  
  This parameter enables collection of statistics for pgx_stat_lwlock and pgx_stat_latch.
- on: Enables collection of statistics.
- off: Disables collection of statistics.

If this parameter is omitted, "on" is assumed.
Only superusers can change this setting.

- track_sql (string)
  This parameter enables collection of statistics for pgx_stat_sql.
  - on: Enables collection of statistics.
  - off: Disables collection of statistics.

If this parameter is omitted, "on" is assumed.
Only superusers can change this setting.

Parameters for the in-memory feature

- reserve_buffer_ratio (numerical value)
  This parameter specifies the proportion of shared memory to be used for a stable buffer table.
  - Minimum value: 0
  - Maximum value: 80

If this parameter is omitted, 0 will be used.

- vci.cost_threshold (numerical value)
  This parameter specifies the lowest cost that selects an execution plan that uses a VCI. If the cost of the best execution plan that does not use a VCI is lower than this value, that execution plan will be selected.
  - Minimum value: 0
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

If this parameter is omitted or a value outside this range is specified, 18000 will be used.

- vci.control_max_workers (numerical value)
  This parameter specifies the number of background workers that manage VCI. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.
  - Minimum value: 1
  - Maximum value: 8388607

If this parameter is omitted or a value outside this range is specified, 8 will be used.

- vci.enable (string)
  This parameter enables or disables VCI.
  - on: Enables VCI.
  - off: Disables VCI.

If this parameter is omitted, "on" will be used.

- vci.log_query (string)
  This parameter enables or disables log output when VCI is not used due to insufficient memory specified by vci.max_local_ros.
  - on: Enables log output.
  - off: Disables log output.

If this parameter is omitted, "off" will be used.
- **vci.maintenance_work_mem** (numerical value)

  This parameter specifies the maximum memory size used for maintenance of VCI (when executing CREATE INDEX, for example).
  - Minimum value: 1 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 256 MB will be used.

- **vci.max_local_ros** (numerical value)

  This parameter specifies the maximum memory size used for VCI scan.
  - Minimum value: 64 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 64 MB will be used.

---

**Information**

The maximum value that can be expressed as a 4-byte signed integer changes according to the operating system. Follow the definition of the operating system in use.

---

- **vci.max_parallel_degree** (numerical value)

  This parameter specifies the maximum number of background workers used for parallel scan. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.

  A value from -8388607 to 8388607 can be specified.
  - Integer (1 or greater): Parallel scan is performed using the specified degree of parallelism.
  - 0: Stops the parallel scan process.
  - Negative number: The specified value minus the maximum number of CPUs obtained from the environment is used as the degree of parallelism and parallel scan is performed.

  If this parameter is omitted or a value outside this range is specified, "0" will be used.

- **vci.shared_work_mem** (numerical value)

  This parameter specifies the maximum memory size used for VCI parallel scan.
  - Minimum value: 32 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 1 GB will be used.

---

See

Refer to "Server Configuration" under "Server Administration" in the PostgreSQL Documentation for information on other postgresql.conf parameters.
Appendix B System Administration Functions

This appendix describes the system administration functions of FUJITSU Enterprise Postgres.

See

Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on other system administration functions.

B.1 WAL Mirroring Control Functions

The following table lists the functions that can be used for backup and recovery based on WAL mirroring.

Table B.1 WAL mirroring control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_pause_wal_multiplexing()</td>
<td>void</td>
<td>Stops WAL multiplexing</td>
</tr>
<tr>
<td>pgx_resume_wal_multiplexing()</td>
<td>void</td>
<td>Resumes WAL multiplexing</td>
</tr>
<tr>
<td>pgx_is_wal_multiplexing_paused()</td>
<td>boolean</td>
<td>Returns true if WAL multiplexing has stopped</td>
</tr>
</tbody>
</table>

If WAL multiplexing has not been configured, these functions return an error. Setting the backup_destination parameter in postgresql.conf configures WAL multiplexing.

Only superusers can execute these functions.

B.2 Transparent Data Encryption Control Functions

The following table lists the functions that can be used for transparent data encryption.

Table B.2 Transparent data encryption control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_open_keystore(passphrase)</td>
<td>void</td>
<td>Opens the keystore</td>
</tr>
<tr>
<td>pgx_set_master_key(passphrase)</td>
<td>void</td>
<td>Sets the master encryption key</td>
</tr>
<tr>
<td>pgx_set_keystore_passphrase(oldPassphrase, newPassphrase)</td>
<td>void</td>
<td>Changes the keystore passphrase</td>
</tr>
</tbody>
</table>

The pgx_open_keystore function uses the specified passphrase to open the keystore. When the keystore is opened, the master encryption key is loaded into the database server memory. In this way, you can access the encrypted data and create encrypted tablespaces. If the keystore is already open, this function returns an error.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block.

The pgx_set_master_key function generates a master encryption key and stores it in the keystore. If the keystore does not exist, this function creates a keystore. If the keystore already exists, this function modifies the master encryption key. If the keystore has not been opened, this function opens it.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.
The `pgx_set_keystore_passphrase` function changes the keystore passphrase. Specify the current passphrase in `oldPassphrase`, and a new passphrase in `newPassphrase`.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.

### B.3 Data Masking Control Functions

The table below lists the functions that can be used for data masking.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pgx_alter_confidential_policy</code></td>
<td>boolean</td>
<td>Changes masking policies</td>
</tr>
<tr>
<td><code>pgx_create_confidential_policy</code></td>
<td>boolean</td>
<td>Creates masking policies</td>
</tr>
<tr>
<td><code>pgx_drop_confidential_policy</code></td>
<td>boolean</td>
<td>Deletes masking policies</td>
</tr>
<tr>
<td><code>pgx_enable_confidential_policy</code></td>
<td>boolean</td>
<td>Enables or disables masking policies</td>
</tr>
<tr>
<td><code>pgx_update_confidential_values</code></td>
<td>boolean</td>
<td>Changes replacement characters when full masking is specified for masking type</td>
</tr>
</tbody>
</table>

#### B.3.1 `pgx_alter_confidential_policy`

**Description**

Changes masking policies

**Format**

The format varies depending on the content to be changed. The format is shown below.

- **Common format**

  ```
  common_arg:
  [schema_name := 'schemaName',]
  table_name := 'tableName',
  policy_name := 'policyName'
  ```

- **Add a masking target to a masking policy**

  ```
  pgx_alter_confidential_policy(
  commonArg,
  [action := 'ADD_COLUMN', ]
  column_name := 'colName'
  [, function_type := 'FULL'] |
  [, function_type := 'PARTIAL', partialOpt] |
  [, function_type := 'REGEXP', regexpOpt] |
  )
  ```

  ```
  partialOpt:
  function_parameters := 'maskingFmt'
  ```

  ```
  regexpOpt:
  regexp_pattern := 'regexpPattern',
  regexp_replacement := 'regexpReplacementChar',
  [, regexp_flags := 'regexpFlags']
  ```
- Delete a masking target from a masking policy

```python
pgx_alter_confidential_policy(
    commonArg,
    action        := 'DROP_COLUMN',
    column_name    := 'colName'
)
```

- Change the masking condition

```python
pgx_alter_confidential_policy(
    commonArg,
    action        := 'MODIFY_EXPRESSION',
    expression    := 'expr'
)
```

- Change the content of a masking policy set for a masking target

```python
pgx_alter_confidential_policy(
    commonArg,
    action        := 'MODIFY_COLUMN',
    column_name    := 'colName'
    [, function_type    := 'FULL'] |
    [, function_type    := 'PARTIAL', partialOpt] |
    [, function_type    := 'REGEXP', regexpOpt]
)
```

```python
partialOpt:
    function_parameters    := 'maskingFmt'
```

```python
regexpOpt:
    regexp_pattern        := 'regexpPattern',
    regexp_replacement    := 'regexpReplacementChar',
    [, regexp_flags        := 'regexpFlags']
```

- Change the masking policy description

```python
pgx_alter_confidential_policy(
    commonArg,
    action        := 'SET_POLICY_DESCRIPTION',
    policy_description    := 'policyDesc'
)
```

- Change the masking target description

```python
pgx_alter_confidential_policy(
    commonArg,
    action        := 'SET_COLUMN_DESCRIPTION',
    column_name    := 'colName',
    column_description    := 'colDesc'
)
```

**Argument**

The argument varies depending on the content to be changed. Details are as follows.

- Common arguments
<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
<td>Mandatory</td>
<td></td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
<td></td>
</tr>
</tbody>
</table>

- Add a masking target to a masking policy

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'ADD_COLUMN'</td>
<td>'ADD_COLUMN'</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
<td></td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'FULL': Full masking</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'PARTIAL': Partial masking</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'REGEXP': Regular expression masking</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Partial masking</td>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Regular expression masking</td>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
<td>NULL</td>
</tr>
</tbody>
</table>

- Delete a masking target from a masking policy

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'DROP_COLUMN'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
<td></td>
</tr>
</tbody>
</table>

- Change the masking condition

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'MODIFY_EXPRESSION'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition to be changed</td>
<td>Mandatory</td>
<td></td>
</tr>
</tbody>
</table>

- Change the content of a masking policy set for a masking target
<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'MODIFY_COLUMN'</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
</tr>

<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
<td>NULL</td>
</tr>
</tbody>
</table>

- Change the masking policy description

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'SET_POLICY_DESCRIPTION'</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>policy_description</td>
<td>varchar(1024)</td>
<td>Masking policy description</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Change the masking target description

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>

<td>-</td>
<td>Y</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified

**Return value**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

**Execution example 1**

Adding masking policy p1 to masking target c2

```sql
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```

**Execution example 2**

Deleting masking target c1 from masking policy p1

```sql
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'DROP_COLUMN', column_name := 'c1');
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```
Execution example 3
Changing the masking condition for masking policy p1

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'MODIFY_EXPRESSION', expression := 'false');
pgx_alter_confidential_policy
--------------------------------
t(1 row)
```

Execution example 4
Changing the content of masking policy p1 set for masking target c2

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'MODIFY_COLUMN', column_name := 'c2', function_type := 'FULL');
pgx_alter_confidential_policy
--------------------------------
t(1 row)
```

Execution example 5
Changing the description of masking policy p1

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'SET_POLICY_DESCRIPTION', policy_description := 'this policy is an example.');
pgx_alter_confidential_policy
--------------------------------
t(1 row)
```

Execution example 6
Changing the description of masking target c2

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'SET_COLUMN_DESCRIPTION', column_name := 'c2', column_description := 'c2 column is FULL.');</p>
```
```
pgx_alter_confidential_policy
--------------------------------
t(1 row)
```

Description
- The arguments for the pgx_alter_confidential_policy system management function can be specified in any order.
- The action parameters below can be specified. When action parameters are omitted, ADD_COLUMN is applied.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COLUMN</td>
<td>Adds a masking target to a masking policy.</td>
</tr>
<tr>
<td>DROP_COLUMN</td>
<td>Deletes a masking target to a masking policy.</td>
</tr>
<tr>
<td>MODIFY_EXPRESSION</td>
<td>Changes expression.</td>
</tr>
<tr>
<td>MODIFY_COLUMN</td>
<td>Changes the content of a masking policy set for a masking target.</td>
</tr>
<tr>
<td>SET_POLICY_DESCRIPTION</td>
<td>Changes policy_description.</td>
</tr>
<tr>
<td>SET_COLUMN_DESCRIPTION</td>
<td>Changes column_description.</td>
</tr>
</tbody>
</table>

- The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.
- The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.

- regexp_pattern
- regexp_replacement
- regexp_flags

See

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

B.3.2 pgx_create_confidential_policy

Description

Creates masking policies

Format

The format varies depending on the masking type. The format is shown below.

```
pgx_create_confidential_policy{
    [schema_name := 'schemaName',]
    table_name := 'tableName',
    policy_name := 'policyName',
    expression := 'expr'
    [, enable := 'policyStatus']
    [, policy_description := 'policyDesc']
    [, column_name := 'colName'
        [, function_type := 'FULL'] |
        [, function_type := 'PARTIAL', partialOpt] |
        [, function_type := 'REGEXP', regexpOpt]
        [, column_description := 'colDesc']
    ]
}
```

**partialOpt:**

```
function_parameters := 'maskingFmt'
```

**regexpOpt:**

```
regexp_pattern := 'regexpPattern',
regexp_replacement := 'regexpReplacementChar',
[, regexp_flags := 'regexpFlags']
```

Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which the masking policy is created</td>
<td>'public'</td>
</tr>
<tr>
<td></td>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which the masking policy is created</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Masking type for which an argument can be specified</td>
<td>Argument</td>

<td>-</td>
<td>-</td>
<td>-</td>
<td>N</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Y</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified
### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

#### Execution example 1

Creating masking policy p1 that does not contain a masking target

```sql
postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1', expression := '1=1');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

#### Execution example 2

Creating masking policy p1 that contains masking target c1 of which the masking type is full masking

```sql
postgres=# select pgx_create_confidential_policy(schema_name := 'public', table_name := 't1', policy_name := 'p1', expression := '1=1', enable := 't', policy_description := 'this policy is an example.', column_name := 'c1', function_type := 'FULL', column_description := 'c1 column is FULL.');//
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

#### Execution example 3

Creating masking policy p1 that contains masking target c2 of which the masking type is partial masking

```sql
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1', expression := '1=1', column_name := 'c2', function_type := 'PARTIAL', function_parameters := 'VVVFVVVVFVV, VVV-VVVV-VVVV, *, 4, 11');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

#### Execution example 4

Creating masking policy p1 that contains masking target c3 of which the masking type is regular expression masking

```sql
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1', expression := '1=1', column_name := 'c3', function_type := 'REGEXP', regexp_pattern := '(.*)(@.*)', regexp_replacement := 'xxx\2', regexp_flags := 'g');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

#### Description

- The arguments for the `pgx_create_confidential_policy` system management function can be specified in any order.
- If `column_name` is omitted, only masking policies that do not contain masking target will be created.
- One masking policy can be created for each table. Use the `pgx_alter_confidential_policy` system management function to add a masking target to a masking policy.
- The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.

- The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.
  - regexp_pattern
  - regexp_replacement
  - regexp_flags

**Note**

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

**See**

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

### B.3.3 pgx_drop_confidential_policy

**Description**

Deletes masking policies

**Format**

```
pgx_drop_confidential_policy(
    [schema_name := 'schemaName', ]
    table_name := 'tableName',
    policy_name := 'policyName'
)
```

**Argument**

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is deleted</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is deleted</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted
Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Deleting masking policy p1

```sql
postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
pgx_drop_confidential_policy
-----------------------------
t
(1 row)
```

Description

The arguments for the pgx_drop_confidential_policy system management function can be specified in any order.

Note

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

See

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.3.4 pgx_enable_confidential_policy

Description

Enables or disables masking policies

Format

```sql
pgx_enable_confidential_policy(
 [schema_name := 'schemaName', ]
 table_name := 'tableName',
 policy_name := 'policyName',
 enable := 'policyStatus'
)
```

Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is enabled or disabled</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is enabled or disabled</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 't': Enabled</td>
<td></td>
</tr>
</tbody>
</table>
Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
<tr>
<td>enable</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted

Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Enabling masking policy p1

```
postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');

pgx_enable_confidential_policy
--------------------------
t
(1 row)
```

Description

The arguments for the pgx_enable_confidential_policy system management function can be specified in any order.

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.3.5 pgx_update_confidential_values

Description

Changes replacement characters when full masking is specified for masking type

Format

```
pgx_update_confidential_values{
    [number_value := 'numberValue']
    [, char_value := 'charValue']
    [, varchar_value := 'varcharValue']
    [, date_value := 'dateValue']
    [, ts_value := 'tsValue']
}
```
Argument
Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Replacement character in numeric type</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>Replacement character in char type</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>Replacement character in varchar type</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>Replacement character in date type</td>
</tr>
<tr>
<td>ts_value</td>
<td>timestamp</td>
<td>Replacement character in timestamp type</td>
</tr>
</tbody>
</table>

Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example
Using '*' as a replacement character in char type and varchar type

```
postgres=# select pgx_update_confidential_values(char_value := '*', varchar_value := '*');
pgx_update_confidential_values
---------------------------------
t
(1 row)
```

Description
- The arguments for the pgx_update_confidential_values system management function can be specified in any order.
- Specify one or more arguments for the pgx_update_confidential_values system management function. A replacement character is not changed for an omitted argument.

See
Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.4 VCI Data Load Control Function
The table below lists the function that loads VCI data to buffer cache.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_prewarm_vci(vci_index regclass)</td>
<td>int8</td>
<td>Loads the VCI data to buffer cache.</td>
</tr>
</tbody>
</table>

pgx_prewarm_vci loads the specified VCI data to buffer cache and returns the number of blocks of the loaded VCI data.

The aggregation process using VCI may take time immediately after an instance is started, because the VCI data has not been loaded to buffer cache. Therefore, the first aggregation process can be sped up by executing pgx_prewarm_vci after an instance is started.

The amount of memory required for preloading is the number of blocks returned by pgx_prewarm_vci multiplied by the size of one block.

This function can only be executed if the user has reference privilege to the VCI index and execution privilege to the pg_prewarm function.
Appendix C System Views

This appendix describes how to use the system views in FUJITSU Enterprise Postgres.

See

Refer to "System Views" under "Internals" in the PostgreSQL Documentation for information on other system views.

C.1 pgx_tablespaces

The pgx_tablespaces catalog provides information related to the encryption of tablespaces.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>References</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spctablespace</td>
<td>oid</td>
<td>pg_tablespace.oid</td>
<td>Tablespace OID</td>
</tr>
<tr>
<td>spcencalgo</td>
<td>text</td>
<td></td>
<td>Tablespace encryption algorithm</td>
</tr>
</tbody>
</table>

The spcencalgo string displays one of the following values:
- none: Tablespace is not encrypted
- AES128: AES with key length of 128 bits
- AES256: AES with key length of 256 bits

C.2 pgx_stat_lwlock

The pgx_stat_lwlock view displays statistics related to lightweight locks, with each type of content displayed on a separate line.

Table C.1 pgx_stat_lwlock view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lwlock_name</td>
<td>name</td>
<td>Name of the lightweight lock</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused by the lightweight lock</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the lightweight lock</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistics was reset</td>
</tr>
</tbody>
</table>

C.3 pgx_stat_latch

The pgx_stat_latch view displays statistics related to latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line.

Table C.2 pgx_stat_latch view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>latch_name</td>
<td>name</td>
<td>Name of the latch</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused a wait</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the latch</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.4 pgx_stat_walwriter

The pgx_stat_walwriter view display statistics related to WAL writing, in a single line.
Table C.3 *pgx_stat_walwriter* view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirty_writes</td>
<td>bigint</td>
<td>Number of times old WAL buffers were written to the disk because the WAL buffer was full when WAL records were added</td>
</tr>
<tr>
<td>writes</td>
<td>bigint</td>
<td>Number of WAL writes</td>
</tr>
<tr>
<td>write_blocks</td>
<td>bigint</td>
<td>Number of WAL write blocks</td>
</tr>
<tr>
<td>total_write_time</td>
<td>double precision</td>
<td>Number of milliseconds spent on WAL writing</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.5 *pgx_stat_sql*

The *pgx_stat_sql* view displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line.

Table C.4 *pgx_stat_sql* view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>selects</td>
<td>bigint</td>
<td>Number of SELECT statements executed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In database multiplexing mode, this number includes the SELECT statements executed in Mirroring Controller. Mirroring Controller executes the SELECT statement using the interval specified for the heartbeat_interval of the server definition file (milliseconds).</td>
</tr>
<tr>
<td>inserts</td>
<td>bigint</td>
<td>Number of INSERT statements executed</td>
</tr>
<tr>
<td>deletes</td>
<td>bigint</td>
<td>Number of DELETE statements executed</td>
</tr>
<tr>
<td>updates</td>
<td>bigint</td>
<td>Number of UPDATE statements executed</td>
</tr>
<tr>
<td>selects_with_parallelism</td>
<td>bigint</td>
<td>Number of times parallel scan was used in SELECT statements</td>
</tr>
<tr>
<td>inserts_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>deletes_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>updates_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>copies_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>declares</td>
<td>bigint</td>
<td>Number of DECLARE statements executed (number of cursor OPENs)</td>
</tr>
<tr>
<td>fetches</td>
<td>bigint</td>
<td>Number of FETCH statements executed</td>
</tr>
<tr>
<td>checkpoints</td>
<td>bigint</td>
<td>Number of CHECKPOINT statements executed</td>
</tr>
<tr>
<td>clusters</td>
<td>bigint</td>
<td>Number of CLUSTER statements executed</td>
</tr>
<tr>
<td>copies</td>
<td>bigint</td>
<td>Number of COPY statements executed</td>
</tr>
<tr>
<td>reindexes</td>
<td>bigint</td>
<td>Number of REINDEX statements executed</td>

</tbody>
</table>
Appendix D  Tables Used by Data Masking

This appendix explains tables used by the data masking feature.

Note

These tables are updated by the data masking control function, so do not use SQL statements to directly update these tables.

D.1  pgx Confidential_columns

This table provides information on masking target for which masking policies are set.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
</tr>
<tr>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>- 'FULL': Full masking</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'PARTIAL': Partial masking</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'REGEXP': Regular expression masking</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
</tr>
<tr>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
</tr>
<tr>
<td>column_description</td>
<td>varchar(1024)</td>
<td>Masking target description</td>
</tr>
</tbody>
</table>

Execution example

```
postgres=# select * from pgx_confidential_columns;
<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>column_name</th>
<th>function_type</th>
<th>function_parameters</th>
<th>regexp_pattern</th>
<th>regexp_replacement</th>
<th>regexp_flags</th>
<th>column_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>c1</td>
<td>FULL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>c2</td>
<td>PARTIAL</td>
<td>VVVFVVVVVVVV, VVVVVVVVV</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

D.2  pgx Confidential_policies

This table provides information on masking policies.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
</tbody>
</table>

- 131 -
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 't': Enabled</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'f': Disabled</td>
</tr>
<tr>
<td>policy_description</td>
<td>varchar(1024)</td>
<td>Masking policy description</td>
</tr>
</tbody>
</table>

**Execution example**

```
postgres=# select * from pgx_confidential_policies;
schema_name | table_name | policy_name | expression | enable | policy_description
-------------+------------+-------------+------------+--------+--------------------
public      | t1         | p1          | 1=1        | t      |                    
(1 row)
```

**D.3 pgx_confidential_values**

This table provides information on replacement characters when full masking is specified for masking type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Numeric</td>
<td>0</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>char type</td>
<td>Spaces</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>varchar type</td>
<td>Spaces</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>date type</td>
<td>'1970-01-01'</td>
</tr>
<tr>
<td>timestamp_value</td>
<td>timestamp</td>
<td>timestamp type</td>
<td>'1970-01-01 00:00:00'</td>
</tr>
</tbody>
</table>

**Execution example**

```
postgres=# select * from pgx_confidential_values;
number_value | char_value | varchar_value | date_value | ts_value
--------------|------------|---------------|------------|---------------------
0            |           |               | 1970-01-01 | 1970-01-01 00:00:00
(1 row)
```
Appendix E  Activating and Stopping the Web Server Feature of WebAdmin

To use WebAdmin for creating and managing a FUJITSU Enterprise Postgres instance on a server where FUJITSU Enterprise Postgres is installed, you must first activate the Web server feature of WebAdmin.

- Using WebAdmin in a single-server configuration
  You must start the Web server on the target server.
- Using WebAdmin in a multiserver configuration
  You must start the Web server on all servers on which WebAdmin has been installed.

This appendix describes how to activate and stop the Web server feature of WebAdmin.

Note that "<xy>" in paths indicates the product version and level.

See

Refer to "Installing WebAdmin in a Multiserver Configuration" in the Installation and Setup Guide for Server for information on multiserver installation.

E.1 Activating the Web Server Feature of WebAdmin

Follow the procedure below to activate the Web server feature of WebAdmin.

1. Change to superuser
   Acquire superuser privileges on the system.

   Example

   ```
   $ su -
   Password:******
   ```

2. Activate the Web server feature of WebAdmin
   Execute the WebAdminStart command to activate the Web server feature of WebAdmin.

   Example

   If WebAdmin is installed in /opt/fsep<v>webadmin:

   ```
   # cd /opt/fsep<v>webadmin/sbin
   # ./WebAdminStart
   ```

E.2 Stopping the Web Server Feature of WebAdmin

This section describes how to stop the Web server feature of WebAdmin.

Follow the procedure below to stop the Web server feature of WebAdmin.

1. Change to superuser
   Acquire superuser privileges on the system.

   Example

   ```
   $ su -
   Password:******
   ```

2. Stop the Web server feature of WebAdmin
   Execute the WebAdminStop command to stop the Web server feature of WebAdmin.
Example

If WebAdmin is installed in /opt/fsepv<xy>webadmin:

```bash
# cd /opt/fsepv<xy>webadmin/sbin
# ./WebAdminStop
```
This appendix describes how to use the Wallet feature of WebAdmin.

When a remote instance or a standby instance is created, it is necessary to provide user name and password for authentication with the remote machine or the database instance.

The Wallet feature in WebAdmin is a convenient way to create and store these credentials.

Once created, these credentials can be repeatedly used in one or more instances.

Note

It is not mandatory to create a credential in the Wallet. It is possible to create a remote instance or a standby instance without creating any credential in the Wallet.

If no credential is created beforehand, a user name and password can be entered in the instance creation page. When creating a "Remote" instance, if operating system credentials are entered without using a credential stored in the Wallet, WebAdmin automatically creates a credential with the given user name and password, and stores it in the user’s wallet for future use.

F.1 Creating a Credential

1. In the [My Wallet] tab, click . The [New credential] page will be displayed.

2. Enter the information for the credentials.

Enter the following items:

- [Credential name]: Name of the credential
  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- [User name]: The operating system user name or database instance user name that will be used later
- [Password]: Password for the user
- [Confirm password]: Reenter the password.

3. Click to store the credential.

F.2 Using a Credential

Once a credential is created in the Wallet, it can be used during remote instance creation or standby instance creation. The following page uses the credential that was created in the previous section.

When "Cred1" is selected in [Operating system credential], the user name and password are automatically populated from the credential.
Appendix G Collecting Failure Investigation Data

If the cause of an error that occurs while building the environment or during operations is unclear, data must be collected for initial investigation.

This appendix describes how to collect data for initial investigation.

Use FJQSS (Information Collection Tool) to collect data for initial investigation.

Refer to the FJQSS manual for information on how to use FJQSS.

Note

- When using FJQSS to collect data for initial investigation, you must set the following environment variables:
  - Environment variables required for using FUJITSU Enterprise Postgres
    Refer to "Configure the environment variables" under the procedure for creating an instance in "Using the initdb Command" in the Installation and Setup Guide for Server for information on the values to be set in the environment variables.
    - PGDATA
      Set the data storage destination.
    - PGPORT
      Set the instance port number. This does not need to be set if the default port number (27500) has not been changed.
    - PGUSER
      Set the database superuser.
      Set the database superuser so that client authentication is possible.
      FJQSS establishes a TCP/IP connection with the template1 database and collects data from the database.
    - FSEP_HOME
      Set the FUJITSU Enterprise Postgres installation directory.

In addition, when using database multiplexing, set the following environment variables:

- MCCONTROLDIR
  Refer to "Mirroring Controller Resources" in the Cluster Operation Guide for information on the Mirroring Controller management directory.

Preface

Purpose of this document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Solaris platform. This document is the FUJITSU Enterprise Postgres Operation Guide.

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres. Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Oracle Solaris

Structure of this document
This document is structured as follows:

Chapter 1 Operating FUJITSU Enterprise Postgres
Describes how to operate FUJITSU Enterprise Postgres.

Chapter 2 Starting an Instance and Creating a Database
Describes how to start a FUJITSU Enterprise Postgres instance, and how to create a database.

Chapter 3 Backing Up the Database
Describes how to back up the database.

Chapter 4 Configuring Secure Communication Using Secure Sockets Layer
Describes communication data encryption between the client and the server.

Chapter 5 Protecting Storage Data Using Transparent Data Encryption
Describes how to encrypt the data to be stored in the database.

Chapter 6 Data Masking
Describes the data masking feature.

Chapter 7 Periodic Operations
Describes the periodic database operations that must be performed on FUJITSU Enterprise Postgres.

Chapter 8 Streaming Replication Using WebAdmin
Describes how to create a streaming replication cluster using WebAdmin.

Chapter 9 Installing and Operating the In-memory Feature
Describes how to install and operate the in-memory feature.

Chapter 10 Actions when an Error Occurs
Describes how to perform recovery when disk failure or data corruption occurs.

Appendix A Parameters
Describes the FUJITSU Enterprise Postgres parameters.

Appendix B System Administration Functions
Describes the system administration functions of FUJITSU Enterprise Postgres.

Appendix C System Views
Describes how to use the system view in FUJITSU Enterprise Postgres.
Appendix D Tables Used by Data Masking

Describes the tables used by the data masking feature.

Appendix E Activating and Stopping the Web Server Feature of WebAdmin

Describes how to activate and stop WebAdmin (Web server feature).

Appendix F WebAdmin Wallet

Describes how to use the Wallet feature of WebAdmin.

Appendix G Collecting Failure Investigation Data

Describes how to collect information for initial investigation.

Export restrictions

Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Operating FUJITSU Enterprise Postgres

This chapter describes how to operate FUJITSU Enterprise Postgres.

1.1 Operating Methods

There are two methods of managing FUJITSU Enterprise Postgres operations:

- Operation management using GUI tools
- Operation management using commands

See Before performing switchover or failover operation using database multiplexing, refer to "Database Multiplexing Mode" in the Cluster Operation Guide.

Operation management using GUI tools

This involves managing operations using the WebAdmin and pgAdmin GUI tools.

- Management using WebAdmin
  
  This removes the requirement for complex environment settings and operational design for backup and recovery that is usually required for running a database. It enables you to easily and reliably monitor the state of the database, create a streaming replication cluster, back up the database, and restore it even if you do not have expert knowledge of databases.

- Management using pgAdmin
  
  When developing applications and maintaining the database, you can use pgAdmin to perform simple operations on database objects, such as:
  - Rebuild indexes and update statistics
  - Create, delete, and update database objects

In addition, from pgAdmin of FUJITSU Enterprise Postgres, you can use the expanded features provided by FUJITSU Enterprise Postgres on the PostgreSQL SQL commands.

See Refer to pgAdmin Help for information on the expanded features of pgAdmin provided by FUJITSU Enterprise Postgres.

Operation management using commands

You can use commands for configuring and operating the database and managing operations.

Note You cannot combine WebAdmin and server commands to perform the following operations:

- Use commands to operate an instance created using WebAdmin.
- Use WebAdmin to recover a database backed up using commands.

For instances created with WebAdmin, however, backup can be obtained with the pgx_dmpall command. Also, WebAdmin can perform recovery by using the backup obtained with the pgx_dmpall command.

- To operate an instance created using the initdb command in WebAdmin, the instance needs to be imported using WebAdmin.
- You can perform backup and restoration in pgAdmin, but the backup data obtained with WebAdmin and pgx_dmpall is not compatible with the backup data obtained with pgAdmin.

- Refer to pgAdmin Help for other notes on pgAdmin.

---

**Features used in each phase**

The following table lists the features used in each phase for GUI-based operations and command-based operations.

<table>
<thead>
<tr>
<th>Operation</th>
<th>GUI-based operation</th>
<th>Command-based operation</th>
</tr>
</thead>
<tbody>
<tr>

<td>WebAdmin</td>
<td>pgx_rcvall command</td>
</tr>
</tbody>
</table>

*1: Operations can be monitored using operation management middleware (such as Systemwalker Centric Manager).
*2: A warning is displayed when disk usage reaches 80%.
*3: This command searches for pg_stat_activity in the standard statistics views and monitors the state.

---

1.2 Activating WebAdmin

This section describes how to activate and log in to WebAdmin.

1.2.1 Logging in to WebAdmin

This section describes how to log in to WebAdmin.

**User environment**

It is recommended to use the following browsers with WebAdmin:

- Internet Explorer 11
- Microsoft Edge (Build 38)

WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.
Activation URL for WebAdmin

In the browser address bar, type the activation URL of the WebAdmin window in the following format:

`http://hostNameOrIpAddress:portNumber/`

- `hostNameOrIpAddress`: The host name or IP address of the server where WebAdmin is installed.
- `portNumber`: The port number of WebAdmin. The default port number is 27515.

**Example**

For a server with IP address "192.0.2.0" and port number "27515"

`http://192.0.2.0:27515/`

The activation URL window shown below is displayed. From this window you can launch WebAdmin or access the product documentation.

---

**Note**

- You must activate the Web server feature of WebAdmin before using WebAdmin.
- Refer to "Appendix E Activating and Stopping the Web Server Feature of WebAdmin" for information on how to activate the Web server feature of WebAdmin.

---

Log in to WebAdmin

Click [Launch WebAdmin] in the activation URL window to activate WebAdmin and display the login window.
To log in, specify the following values:

- **[User ID]**: User ID (OS user account) of the instance administrator
- **[Password]**: Password corresponding to the user ID

**Point**

Use the OS user account as the user ID of the instance administrator. Refer to “Creating an Instance Administrator” in the Installation and Setup Guide for Server for details.

### 1.3 Starting pgAdmin

This section describes how to start pgAdmin, how to add an instance required for managing a database, and how to connect to and disconnect from the instance.

You can use pgAdmin on the Windows client.

#### 1.3.1 Starting pgAdmin

This section explains how to start pgAdmin if you are using it from the product "FUJITSU Enterprise Postgres Client (AAbit) x.y SPz" (where AA is "32" or "64", x,y and z are the version numbers (x,y SPz)).

**Windows Server(R) 2012**

From the [Start] screen, start [pgAdmin III (AAbit) (x.y SPz)].

**Windows(R) 8.1 or Windows Server(R) 2012 R2**

From the [Apps] view, start [pgAdmin III (AAbit) (x.y SPz)].

**Windows(R) 10 or Windows Server(R) 2016**

Click [Start] >> [All apps] >> [FUJITSU Enterprise Postgres Client(AAbit)] and start [pgAdmin III (AAbit) (x.y SPz)].

**Other operating systems**

Click [Start] >> [All Programs] >> [FUJITSU Enterprise Postgres Client(AAbit) x.y SPz] and start [pgAdmin III (AAbit) (x.y SPz)].
The following window is displayed when pgAdmin starts.

Note
- You must start the instance to be connected to before using pgAdmin.
- Refer to “2.1 Starting and Stopping an Instance” for information on how to start an instance.
- Adobe(R) Reader(R) X is required for browsing the manual from [FUJITSU Enterprise Postgres Help] in pgAdmin.

1.3.2 Adding an Instance

This section describes how to add an instance to be connected to.

1. From the [File] menu in pgAdmin, click [Add Server].
2. In the [New Server Registration] window, specify a value for each item.

![New Server Registration window](image)

((Properties) tab)

- **[Name]**: Name of the instance to be managed
- **[Host]**: Host name or IP address of the server where FUJITSU Enterprise Postgres is installed
- **[Port]**: Port number of the instance
- **[Username]**: User name of the instance administrator
- **[Password]**: Password for the user name specified in [Username]

When you add an instance using pgAdmin, the instance is automatically connected to immediately after the addition is completed.

**Note**

If you select [Store password], a file storing the FUJITSU Enterprise Postgres connection password is created in the following location. Set the appropriate access permissions for the password file to protect it from unauthorized access.

- `%APPDATA%\postgresql\pgpass.conf`

### 1.3.3 Connecting/Disconnecting an Instance

This section describes how to connect pgAdmin to an instance, and how to disconnect it.
Note

To connect to an instance created using WebAdmin, you must first configure the settings in the [Client authentication] window of WebAdmin to permit connection from pgAdmin.

See

Connecting to an instance

Starting pgAdmin does not connect it to any instance.

To connect to an instance, right-click the instance in [Object browser] and select [Connect].

If a password was not saved when the instance was added, the following password entry window is displayed.
Disconnecting from an instance

To disconnect from an instance, right-click the server in [Object browser] in the pgAdmin window and select [Disconnect server].

1.4 Operations Using Commands

You can operate and manage the database using the following commands:

- **Server commands**
  
  This group of commands includes commands for creating a database cluster and controlling the database. You can run these commands on the server where the database is operating.

  To use these commands, you must configure the environment variables.

  **See**

  - Refer to "PostgreSQL Server Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on server commands.
  
  - Refer to "Configure the environment variables" under the procedure for creating an instance in "Using the initdb Command" in the Installation and Setup Guide for Server for information on the values to be set in the environment variables.

- **Client commands**

  This group of commands includes the psql command and commands for extracting the database cluster to a script file. These commands can be executed on the client that can connect to the database, or on the server on which the database is running.

  To use these commands, you need to configure the environment variables.

  **See**

  - Refer to "PostgreSQL Client Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on client commands.

  - Refer to "Configuring Environment Variables" in the Installation and Setup Guide for Client for information on the values to be set in the environment variables.

1.5 Operating Environment of FUJITSU Enterprise Postgres

This section describes the operating environment and the file composition of FUJITSU Enterprise Postgres.
1.5.1 Operating Environment

The following figure shows the configuration of the FUJITSU Enterprise Postgres operating environment. The tables given below list the roles of the OS resources and FUJITSU Enterprise Postgres resources.

*1: To distribute the I/O load, place the transaction log on a different disk from the data storage destination.

### Table 1.1 OS resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared memory</td>
<td>Used when a database process exchanges information with an external process.</td>
</tr>
<tr>
<td>Semaphore</td>
<td></td>
</tr>
</tbody>
</table>

### Table 1.2 FUJITSU Enterprise Postgres client resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection service file</td>
<td>Specifies information, such as the host name, user name, and password, for connecting to FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>Password file</td>
<td>Securely manages the password for connecting to FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>CA certificate file</td>
<td>CA (certificate authority) certificate used for server authentication when encrypting communication data</td>
</tr>
</tbody>
</table>
Table 1.3 Server resources of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>Database storage area on the database storage disk. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>System catalog</td>
<td>Contains information required for the system to run, including the database definition information and the operation information created by the user</td>
</tr>
<tr>
<td>Default tablespace</td>
<td>Contains table files and index files stored by default</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Contains log information in case of a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
<tr>
<td>Work file</td>
<td>Work file used when executing applications or commands</td>
</tr>
<tr>
<td>postgresql.conf</td>
<td>Contains information that defines the operating environment of FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>pg_hba.conf</td>
<td>FUJITSU Enterprise Postgres uses this file to authenticate individual client hosts</td>
</tr>
<tr>
<td>Server certificate file</td>
<td>Contains information about the server certificate to be used when encrypting communication data and authenticating a server</td>
</tr>
<tr>
<td>Server private key file</td>
<td>Contains information about the server private key to be used when encrypting communication data and authenticating a server</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster</td>
</tr>
<tr>
<td>Backup</td>
<td>Stores the data required for recovering the database when an error, such as disk failure, occurs</td>
</tr>
<tr>
<td>Database backup</td>
<td>Contains the backup data for the database</td>
</tr>
<tr>
<td>Archive log</td>
<td>Contains the log information for recovery.</td>
</tr>
<tr>
<td>Core file</td>
<td>FUJITSU Enterprise Postgres process core file that is output when an error occurs during an FUJITSU Enterprise Postgres process</td>
</tr>
<tr>
<td>Key management server or key management storage</td>
<td>Server or storage where the master encryption key file is located</td>
</tr>
<tr>
<td>Master encryption key file</td>
<td>Contains the master encryption key to be used when encrypting storage data. The master encryption key file is managed on the key management server or key management storage.</td>
</tr>
</tbody>
</table>

1.5.2 File Composition

FUJITSU Enterprise Postgres consists of the following files for controlling and storing the database. The table below shows the relationship between the number of such files and their location within a single instance.

Table 1.4 Number of files within a single instance and how to specify their location

<table>
<thead>
<tr>
<th>File type</th>
<th>Required</th>
<th>Quantity</th>
<th>How to specify the location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program files</td>
<td>Y</td>
<td>Multiple</td>
<td>Note that &quot;&lt;xy&gt;&quot; indicates the product version and level. /opt/fsepv&lt;xy&gt;server64</td>
</tr>
<tr>
<td>Database cluster</td>
<td>Y</td>
<td>1</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using pgAdmin or the DDL statement.</td>
</tr>
<tr>
<td>Backup</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Core file</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin, server commands, or postgresql.conf.</td>
</tr>
<tr>
<td>Server certificate file (+1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>File type</td>
<td>Required</td>
<td>Quantity</td>
<td>How to specify the location</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>----------</td>
<td>----------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>Server private key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Master encryption key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify the directory created as the key store using postgresql.conf.</td>
</tr>
<tr>
<td>Connection service file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>Password file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>CA certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
</tbody>
</table>

Y: Mandatory  
N: Optional  
*1: Set manually when using the applicable feature.

**Note**

- Do not use an NFS for UNIX-type files used in FUJITSU Enterprise Postgres except when creating a database space in a storage device on a network.
- If anti-virus software is used, set scan exception settings for directories so that none of the files that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the files that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop FUJITSU Enterprise Postgres and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

### 1.6 Notes on Compatibility of Applications Used for Operations

When you upgrade FUJITSU Enterprise Postgres to a newer version, there may be some affect on applications due to improvements or enhancements in functionality. Take this into account when creating applications so that you can maintain compatibility after upgrading to a newer version of FUJITSU Enterprise Postgres.

**See**

Refer to "Notes on Application Compatibility" in the Application Development Guide for details.
Chapter 2 Starting an Instance and Creating a Database

This chapter describes basic operations, from starting an instance to creating a database.

2.1 Starting and Stopping an Instance

This section describes how to start and stop an instance.

- 2.1.1 Using WebAdmin
- 2.1.2 Using Server Commands

Point

To automatically start or stop an instance when the operating system on the database server is started or stopped, refer to "Configuring Automatic Start and Stop of an Instance” in the Installation and Setup Guide for Server and configure the settings.

Note

The collected statistics are initialized if an instance is stopped in the “Immediate” mode or if it is abnormally terminated. To prepare for such initialization of statistics, consider regular collection of the statistics by using the SELECT statement. Refer to "The Statistics Collector” in "Server Administration” in the PostgreSQL Documentation for information on the statistics.

2.1.1 Using WebAdmin

WebAdmin enables you to start or stop an instance and check its operating status.

Starting an instance

Start an instance by using the [Instances] tab in WebAdmin.

is displayed when an instance is stopped.

To start a stopped instance, click .

Stopping an instance

Stop an instance by using the [Instances] tab in WebAdmin.

is displayed when an instance is active.

To stop an active instance, click .

Stop mode

Select the mode in which to stop the instance. The following describes the operations of the modes:

<table>
<thead>
<tr>
<th>Stop mode</th>
<th>Connected clients</th>
<th>Backup being executed using the command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart mode (*1)</td>
<td>Waits for all connected clients to be disconnected.</td>
<td>Waits for backups being executed using the command to finish.</td>
</tr>
<tr>
<td>Fast mode</td>
<td>Rolls back all transactions being executed and forcibly disconnects clients.</td>
<td>Terminates backups being executed using the command.</td>
</tr>
<tr>
<td>Immediate mode</td>
<td>All server processes are terminated immediately. Crash recovery is executed the next time the instance is started.</td>
<td></td>
</tr>
</tbody>
</table>
*1: When the processing to stop the instance in the Smart mode has started and you want to stop immediately, use the following procedure:

1. Restart the Web server feature of WebAdmin.
2. In the [Instances] tab, click .
3. In the [Instances] tab, click , and select the Immediate mode to stop the instance.

Checking the operating status of an instance

You can check the operating status of an instance by using the [Instances] tab. The following indicators are used to show the status of a resource.

<table>
<thead>
<tr>
<th>Status indicator</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Green Circle" /></td>
<td>The resource is operating normally.</td>
</tr>
<tr>
<td><img src="image" alt="Blue Circle" /></td>
<td>The resource is stopped.</td>
</tr>
<tr>
<td><img src="image" alt="Red Circle" /></td>
<td>There is an error in the resource.</td>
</tr>
<tr>
<td><img src="image" alt="Orange Circle" /></td>
<td>An operation is in progress on this resource or the status is being checked.</td>
</tr>
<tr>
<td><img src="image" alt="Yellow Exclamation" /></td>
<td>The resource is not operating optimally and needs intervention.</td>
</tr>
</tbody>
</table>

If an instance stops abnormally, remove the cause of the stoppage and start the instance by using WebAdmin.

Figure 2.1 Status when an instance is active
Figure 2.2 Status when an instance is stopped

Note

- When operating WebAdmin, click to update the status. WebAdmin will reflect the latest status of the operation or the instance resources from the server.

- If an error occurs while communicating with the server, there may be no response from WebAdmin. When this happens, close the browser and then log in again. If this does not resolve the issue, check the system log of the server and confirm whether a communication error has occurred.

2.1.2 Using Server Commands

Server commands enable you to start or stop an instance and check its operating status.

To use server commands, configure the environment variables.

See

Refer to “Configure the environment variables” in the procedure to create instances in “Using the initdb Command” in the Installation and Setup Guide for Server for information on configuring the environment variables.

Starting an instance

Use the pg_ctl command to start an instance.
Specify the following values in the `pg_ctl` command:

- Specify "start" as the mode.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- It is recommended to specify the -w option, which causes the command to return after waiting for the instance to start. If the -w option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

If an application, command, or process tries to connect to the database while the instance is starting up, the message "FATAL: the database system is starting up(11189)" is output. However, this message may also be output if the instance is started with the -w option specified.

This message is output by the `pg_ctl` command to check if the instance has started successfully. Therefore, ignore this message if there are no other applications, commands, or processes that connect to the database.

**Example**

```
> pg_ctl start -w -D /database/inst1
```

**Stopping an instance**

Use the `pg_ctl` command to stop an instance.

Specify the following values in the `pg_ctl` command:

- Specify "stop" as the mode.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

```
> pg_ctl stop -D /database/inst1
```

**Checking the operating status of an instance**

Use the `pg_ctl` command to check the operating status of an instance.

Specify the following values in the `pg_ctl` command:

- Specify "status" as the mode.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

When the instance is active:

```
> pg_ctl status -D /database/inst1
pg_ctl: server is running (PID: 1234)
```

When the instance is inactive:

```
> pg_ctl status -D /database/inst1
pg_ctl: no server running.
```
2.2 Creating a Database

This section explains how to create a database.

- 2.2.1 Using pgAdmin
- 2.2.2 Using Client Commands

2.2.1 Using pgAdmin

Follow the procedure below to define a database using pgAdmin.

1. In the pgAdmin window, right-click [Databases] in [Object browser], and then click [New Database] to display a new database window.

Refer to “pg_ctl” under “Reference” in the PostgreSQL Documentation for information on pg_ctl command.

[Image of pgAdmin window showing database creation process]
2. Specify appropriate values for the following items in the new database window.
   - [Properties] tab

   The following example illustrates creation of the database "db01".

   ![New Database Window](image)

   - [Name]: Name of the database to be managed

3. Click [OK] to create the database.

2.2.2 Using Client Commands

Follow the procedure below to define a database using client commands.

An example of operations on the server is shown below.

1. Use psql command to connect to the postgres database.
   Execute psql postgres.

   ```
   > psql postgres
   psql (9.6.2)
   Type "help" for help.
   ```

2. Create the database.
   To create the database, execute the CREATE DATABASE databaseName; statement.

   ```
   postgres=# CREATE DATABASE db01;
   CREATE DATABASE
   ```
3. Confirm that the database is created.
   Execute the \l+ command, and confirm that the name of the database created in step 2 is displayed.

   ```bash
   postgres=# \l+
   ```

4. Disconnect from the postgres database.
   Execute \q to terminate the psql command.

   ```bash
   postgres=# \q
   ```

You can create a database using the createdb command.

See

Refer to "Creating a Database" in "Tutorial" in the PostgreSQL Documentation for information on creating a database using the createdb command.
Chapter 3 Backing Up the Database

This chapter describes how to back up the database.

Backup methods

The following backup methods enable you to recover data to a backup point or to the state immediately preceding disk physical breakdown or data logical failure.

- Backup using WebAdmin

  This method enables you to back up data through intuitive window operations using the GUI.

  WebAdmin is used for recovery.

- Backup using the pgx_dmpall command

  Execute the pgx_dmpall command with a script to perform automatic backup.

  To back up data automatically, you must register the process in the automation software of the operating system. Follow the procedure given in the documentation for your operating system.

  The pgx_rcvall command is used for recovery.

Approximate backup time

The formula for deriving the approximate backup time when you use WebAdmin or the pgx_dmpall command is as follows:

\[
\text{backupTime} = \frac{\text{dataStorageDestinationUsage}}{\text{diskWritePerformance}} \times 1.5
\]

- **dataStorageDestinationUsage**: Disk usage at the data storage destination

- **diskWritePerformance**: Maximum data volume (bytes/second) that can be written per second in the system environment where operation is performed

- 1.5: Coefficient to factor in tasks other than disk write (which is the most time-consuming step)

Note

- Backup operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

- Use the selected backup method continuously.

There are several differences, such as the data format, across the backup methods. For this reason, the following restrictions apply:

- It is not possible to use one method for backup and another for recovery.

- It is not possible to convert one type of backup data to a different type of backup data.

- There are several considerations for the backup of the keystore and backup of the database in case the data stored in the database is encrypted. Refer to the following for details:

  - 5.6.4 Backing Up and Recovering the Keystore
  - 5.7 Backing Up and Restoring/Recovering the Database

- If you have defined a tablespace, back it up. If you do not back it up, directories for the tablespace are not created during recovery, which may cause the recovery to fail. If the recovery fails, refer to the system log, create the tablespace, and then perform the recovery process again.

Information

The following methods can also be used to perform backup. Performing a backup using these methods allows you to restore to the point when the backup was performed.
- Backup using an SQL-based dump
  Dump the data by using SQL. This backup method also enables data migration.
- File system level backup
  This backup method requires you to stop the instance and use OS commands to backup database resources as files.
- Backup by continuous archiving
  This is the standard backup method for PostgreSQL.

Refer to "Backup and Restore" in "Server Administration" in the PostgreSQL Documentation for information on these backup methods.

### 3.1 Periodic Backup

It is recommended that you perform backup periodically.

Backing up data periodically using WebAdmin or the pgx_dmpall command has the following advantages:

- This method reduces disk usage, because obsolete archive logs (transaction logs copied to the backup data storage destination) are deleted. It also minimizes the recovery time when an error occurs.

#### Backup cycle

The time interval when backup is performed periodically is called the backup cycle. For example, if backup is performed every morning, the backup cycle is 1 day.

The backup cycle depends on the jobs being run, but on FUJITSU Enterprise Postgres it is recommended that operations are run with a backup cycle of at least once per day.

### 3.2 Backup Methods

This section describes the methods for backing up the database.

- 3.2.1 Using WebAdmin
- 3.2.2 Using Server Commands

#### 3.2.1 Using WebAdmin

You can use WebAdmin to perform backup and check the backup status.

**Note**

- If backup is disabled for an instance, you will not be able to back up or restore the instance. Refer to "Creating an Instance" > “[Backup]" in the Installation and Setup Guide for Server for details.
- If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.
- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.
- It is recommended to set the wal_level parameter of postgresql.conf to "replica" prior to enabling the backup.

#### Backup operation

Follow the procedure below to back up the database.

1. Select the database to back up

   In the [Instances] tab, select the instance to be backed up and click .
2. Back up the database

The [Backup] dialog box is displayed. To perform backup, click [Yes].
An instance is automatically started when backup is performed.

Backup status

If an error occurs and backup fails, [Error] is displayed adjacent to [Data storage status] or [Backup storage status] in the [Instances] tab. An error message is also displayed in the message list.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, [Solution] appears to the right of the error message. Clicking this button displays information explaining how to resolve the cause of the error. Remove the cause of failure, and perform backup again.

Note

If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.

3.2.2 Using Server Commands

Use the pgx_dmpall command and pgx_rcvall command to perform backup and check the backup result.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Follow the procedure below.
Refer to "Preparing Directories to Deploy Resources" in the Installation and Setup Guide for Server for information on the location of directories required for backup and for points to take into account.

1. Prepare the backup data storage disk
   For backup, prepare a separate disk unit from the database storage disk and mount it using the operating system commands.

2. Create a directory where the backup data will be stored
   Create an empty directory.
   Set appropriate permissions so that only the instance administrator can access the directory.
   Example
   
   ```
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```

3. Specify the settings required for backup
   Stop the instance, and set the following parameters in the postgresql.conf file.
   Start the instance after editing the postgresql.conf file.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backup_destination</td>
<td>Name of the directory where the backup data will be stored</td>
<td>Specify the name of the directory where the backup data will be stored. Appropriate privileges that allow only the instance administrator to access the directory must already be set. Place the backup data storage destination directory outside the data storage destination directory, the tablespace directory, and the transaction log storage destination directory.</td>
</tr>
<tr>
<td>wal_level</td>
<td>minimal, replica (*1), or logical</td>
<td>Specify the output level for the transaction log. *1: replica is a setting for streaming replication.</td>
</tr>
<tr>
<td>archive_mode</td>
<td>on</td>
<td>Specify the archive log mode. Specify [on] (execute).</td>
</tr>
</tbody>
</table>
   | archive_command   | ‘/installationDirectory/bin/pgx_xlogcopy.cmd “%p” ’ 
   |                   | "backupDataStorageDestinationDirectory/archived_xlog/%f” | Specify the path name of the command that will save the transaction log and the storage destination. |

Refer to "Appendix A Parameters" and "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

**Backup operation**

Use the pgx_dmpall command to perform backup. You can even embed the pgx_dmpall command in OS automation software to perform backup.
The backup data is stored in the directory specified in the backup_destination parameter of postgresql.conf.

Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

--- Example ---

> pgx_dmpall -D /database/inst1

--- Note ---

Backup stores the data obtained during the backup and the backup data of the data obtained during previous backup.

If the data to be stored in the database is encrypted, refer to the following and back up the keystore:

- 5.6.4 Backing Up and Recovering the Keystore

--- Backup status ---

Use the pgx_rcvall command to check the backup status.

Specify the following values in the pgx_rcvall command:

- The -l option indicates backup data information.
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

> pgx_rcvall -l -D /database/inst1

<table>
<thead>
<tr>
<th>Date</th>
<th>Status</th>
<th>Dir</th>
</tr>
</thead>
</table>

If an error occurs and backup fails, a message is output to the system log.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, remove the cause of failure and perform backup again.

--- See ---

Refer to "pgx_dmpall" and "pgx_rcvall" in the Reference for information on the pgx_dmpall command and pgx_rcvall command.

--- Setting a restore point ---

In case you want to recover your database to a certain point in time, you can name this particular point in time, which is referred to as the restore point, by using the psql command.

By setting a restore point before executing an application, it becomes easy to identify up to which point in time the data will be reverted.

A restore point can be set to any point in time after a backup is executed. However, if a restore point is set before a backup is executed, the database cannot be recovered to that point in time. This is because restore points are recorded in the archive logs, and the archive logs are discarded when backups are executed.

--- Example ---

The following example uses the psql command to connect to the database and execute the SQL statement to set a restore point.

However, when considering continued compatibility of applications, do not use functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.
postgres=# SELECT pg_create_restore_point('batch_20150503_1');
LOG:  restore point "batch_20150503_1" created at 0/20000E8
STATEMENT: select pg_create_restore_point('batch_20150503_1');
pg_create_restore_point
--------------------
0/20000E8
(1 row)

Refer to "10.3.2 Using the pgx_rcvall Command" for information on using a restore point to recover the database.

**Note**

- Name restore points so that they are unique within the database. Add the date and time of setting a restore point to distinguish it from other restore points, as shown below:
  
  - YYMMDD_HHMMSS
    - YYMMDD: Indicates the date
    - HHMMSS: Indicates the time

- There is no way to check restore points you have set. Keep a record in, for example, a file.

**See**

Refer to "System Administration Functions" under "Functions and Operators" in the PostgreSQL Documentation for information on pg_create_restore_point.
Chapter 4 Configuring Secure Communication Using Secure Sockets Layer

If communication data transferred between a client and a server contains confidential information, encrypting the communication data can protect it against threats, such as eavesdropping on the network.

4.1 Configuring Communication Data Encryption

To encrypt communication data transferred between a client and a server, configure communication data encryption as described below. Communication data encryption not only protects the communication content, but it also guards against man-in-the-middle (MITM) attacks (for example, data and password theft through server impersonation).

Table 4.1 Configuration procedure

<table>
<thead>
<tr>
<th>Configuration procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Issue a certificate</td>
</tr>
<tr>
<td>2) Deploy a server certificate file and a server private key file</td>
</tr>
<tr>
<td>3) Distribute a CA certificate file to the client</td>
</tr>
<tr>
<td>4) Configure the operating environment for the database server</td>
</tr>
<tr>
<td>5) Configure the operating environment for the client</td>
</tr>
</tbody>
</table>

The following figure illustrates the environment for communication data encryption.

Figure 4.1 Environment for communication data encryption
4.1.1 Issuing a Certificate

For authenticating servers, you must acquire a certificate issued by the certificate authority (CA). FUJITSU Enterprise Postgres supports X.509 standard PEM format files. If the certificate authority issues a file in DER format, use a tool such as the openssl command to convert the DER format file to PEM format.

The following provides an overview of the procedure. Refer to the procedure published by the public or independent certificate authority (CA) that provides the certificate file for details.

a. Create a server private key file
b. Disable the passphrase for the server private key file
c. Create a CSR (signing request for obtaining a server certificate) from the server private key file
d. Apply to the certificate authority (CA) for a server certificate
e. Obtain a server certificate file and a CA certificate file from the certificate authority (CA)
f. Store the server certificate file and the CA certificate file

Note: If you lose or destroy the certificates, you will need to have them re-issued.

The above procedure enables you to prepare the following files:
- Server private key file
- Server certificate file
- CA certificate file

4.1.2 Deploying a Server Certificate File and a Server Private Key File

Create a directory on the local disk of the database server and store the server certificate file and the server private key file in it.

Use the operating system features to set access privileges for the server certificate file and the server private key file so that only the database administrator has load privileges.

Back up the server certificate file and the server private key file in the event that data corruption occurs and store them securely.

4.1.3 Distributing a CA Certificate File to the Client

Create a directory on the local disk of the client and place the distributed CA certificate file there. Use the operating system features to set load privileges to protect the CA certificate file against accidental deletion.

4.1.4 Configuring the Operating Environment for the Database Server

Refer to "Secure TCP/IP Connections with SSL" under "Server Administration" in the PostgreSQL Documentation for details.

4.1.5 Configuring the Operating Environment for the Client

Refer to the following sections in the Application Development Guide for details, depending on your application development environment:
- "Settings for Encrypting Communication Data" under "Setup" in "JDBC Driver"
- "Settings for Encrypting Communication Data" under "Setup" in "C Library (libpq)"
- "Settings for Encrypting Communication Data" under "Setup" in "Embedded SQL in C"
4.1.6 Performing Database Multiplexing

When you perform communication that uses database multiplexing and a Secure Socket Layer server certificate, certificates with the same "Common Name" must be used. To ensure this, take one of the following actions:

- Create one server certificate, replicate it, and place a copy on each server used for database multiplexing.
- Create a server certificate with the same "Common Name" for each server used for database multiplexing.

See

Refer to "Using the Application Connection Switch Feature" in the Application Development Guide for information on how to specify applications on the client.
Chapter 5 Protecting Storage Data Using Transparent Data Encryption

This chapter describes how to encrypt data to be stored in the database.

5.1 Protecting Data Using Encryption

With PostgreSQL, data in a database is protected from access by unauthorized database users through the use of authentication and access controls. However, the OS file is not protected from attackers who bypass the database server's authentication and access controls.

With FUJITSU Enterprise Postgres, data inside the OS file is encrypted, so valuable information is protected even if the file or disk is stolen.

Data to be stored in a database is encrypted when it is written to the data file, and decrypted when it is read.

This is performed automatically by the instance, so the user and the application need not be aware of key management and encryption or decryption. This process is called TDE (Transparent Data Encryption).

The characteristics of TDE are described below.

Encryption mechanisms

Two-layer encryption key and the keystore

In each tablespace, there is a tablespace encryption key that encrypts and decrypts all the data within. The tablespace encryption key is encrypted by the master encryption key and saved.

Only one master encryption key exists in a database cluster. It is encrypted based on a passphrase specified by the user and stored in a keystore. FUJITSU Enterprise Postgres provides a file-based keystore. Attackers who do not know the passphrase cannot read the master encryption key from the keystore.

Strong encryption algorithms

TDE uses the Advanced Encryption Standard (AES) as its encryption algorithm. AES was adopted as a standard in 2002 by the United States Federal Government, and is used throughout the world.

Zero overhead storage areas

Encryption does not change the size of data stored in tables, indexes, or WAL. There is, therefore, no need for additional estimates or disks.

Scope of encryption

All user data within the specified tablespace

The tablespace is the unit for specifying encryption. All tables, indexes, temporary tables, and temporary indexes created in the encrypted tablespace are encrypted. There is no need for the user to consider which tables and strings to encrypt.

Backup data

The pgx_dmpall command and pg_basebackup command create backup data by copying the OS file. Backups of the encrypted data are, therefore, also encrypted. Information is protected from leakage even if the backup medium is stolen.

WAL and temporary files

WAL, which is created by updating encrypted tables and indexes, is encrypted with the same security strength as the update target. When large merges and sorts are performed, the encrypted data is written to a temporary file in encrypted format.

Streaming replication support

You can combine streaming replication and transparent data encryption. The data and WAL encrypted on the primary server is transferred to the standby server in its encrypted format and stored.

Note

The following are not encrypted:
5.2 Setting the Master Encryption Key

To use transparent data encryption, you must create a keystore and set the master encryption key.

1. In the keystore_location parameter of postgresql.conf, specify the directory to store the keystore.
   Specify a different location for each database cluster.

   ```
   keystore_location = '/key/store/location'
   ```

   Refer to "Appendix A Parameters" for information on postgresql.conf.

   After editing the postgresql.conf file, either start or restart the instance.
   - Using WebAdmin
     Refer to "2.1.1 Using WebAdmin", and restart the instance.
   - Using the pg_ctl command
     Specify the following in the pg_ctl command:
     - Specify "restart" as the mode.
     - Specify the data storage destination directory in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
     - Specify the -w option. This means that the command returns after waiting for the instance to start. If the -w option is not specified, it may not be possible to determine if the starting of the instance completed successfully or if it failed.

     Example

     ```
     > pg_ctl restart -w -D /database/inst1
     ```

2. Execute an SQL function, such as the one below, to set the master encryption key. This must be performed by the superuser. Execute it as the database superuser.

   ```
   SELECT pgx_set_master_key('passphrase');
   ```

   The value "passphrase" is the passphrase that will be used to open the keystore. The master encryption key is protected by this passphrase, so avoid specifying a short simple string that is easy to guess.

   Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.

   Note

   Note that if you forget the passphrase, you will not be able to access the encrypted data. There is no method to retrieve a forgotten passphrase and decrypt data. Do not, under any circumstances, forget the passphrase.

   The pgx_set_master_key function creates a file with the name keystore.ks in the keystore storage destination. It also creates a master encryption key from random bit strings, encrypts it with the specified passphrase, and stores it in keystore.ks. At this point, the keystore is open.

5.3 Opening the Keystore

To create encrypted tablespaces and access the encrypted data, you must first open the keystore. When you open the keystore, the master encryption key is loaded into the database server memory and becomes usable for encryption and decryption.
You need to open the keystore each time you start the instance. To open the keystore, the database superuser must execute the following SQL function.

```sql
SELECT pgx_open_keystore('passphrase');
```

The value "passphrase" is the passphrase specified during creation of the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_open_keystore function.

Note that, in the following cases, the passphrase must be entered when starting the instance, because the encrypted WAL must be decrypted for recovery. In this case, the above-mentioned pgx_open_keystore function cannot be executed.

- If performing crash recovery at the time of starting the instance
- If performing recovery using continuous archiving

For the above cases, specify the --keystore-passphrase option in the pg_ctl command, and then start the instance. This will display the prompt for the passphrase to be entered, as shown below.

```bash
> pg_ctl --keystore-passphrase start
Enter the passphrase:
The server is starting
>
```

Point

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the database server starts. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.

## 5.4 Encrypting a Tablespace

The keystore must be open before you can create an encrypted tablespace.

When creating a tablespace that will be encrypted, configure the encryption algorithm in the runtime parameters. For example, to create a tablespace with the name secure_tablespace using AES with a key length of 256 bits as the encryption algorithm, configure as shown below.

```sql
-- Specify the encryption algorithm for the tablespace to be created below
SET tablespace_encryption_algorithm = 'AES256';
CREATE TABLESPACE secure_tablespace LOCATION '/My/Data/Dir';
-- Specify that the tablespace to be created below is not to be encrypted
SET tablespace_encryption_algorithm = 'none';
```

Or

```sql
CREATE TABLESPACE secure_tablespace LOCATION '/My/Data/Dir' WITH (tablespace_encryption_algorithm = 'AES256');
```

You can use AES with a key length of 128 bits or 256 bits as the encryption algorithm. It is recommended that you use 256-bit AES. Refer to "Appendix A Parameters" for information on how to specify the runtime parameters.

If user provides both GUC and command line options while creating the tablespace, the preference is given to the command line option.

The pg_default and pg_global tablespaces cannot be encrypted.

Create tables and indexes in the encrypted tablespace that you created. Relations created in the encrypted tablespace are automatically encrypted.

Example

Example 1: Specifying an encrypted tablespace when creating it

```sql
CREATE TABLE my_table (...)
    TABLESPACE secure_tablespace;
```
Example 2: Not explicitly specifying a tablespace when creating it and instead using the default tablespace

```sql
SET default_tablespace = 'secure_tablespace';
CREATE TABLE my_table (...);
```

The process is the same for encrypting temporary tables and temporary indexes. In other words, either explicitly specify the TABLESPACE clause or list encrypted tablespaces in the temp_tablespaces parameter, and then execute CREATE TEMPORARY TABLE or CREATE INDEX.

If you specify an encrypted tablespace in the TABLESPACE clause of the CREATE DATABASE statement when creating a database, relations that you create in the database without explicitly specifying a tablespace will be encrypted. Furthermore, the system catalog is also encrypted, so the source code of user-defined functions is also protected.

**Note**

An encrypted tablespace cannot be created from the window used for creating the pgAdmin tablespace, or from the query tool. To create an encrypted tablespace, click [PSQL Console] from the [Plugins] menu and create an encrypted tablespace in the psql console window.

### 5.5 Checking an Encrypted Tablespace

The pgx_tablespaces system view displays information about whether each tablespace has been encrypted, and about the encryption algorithm. Refer to "C.1 pgx_tablespaces" for information on strings.

You can discover which tablespaces have been encrypted by executing the following SQL statements.

However, when considering continued compatibility of applications, do not reference system catalogs (pg_tablespace) directly in SQL statements.

```sql
SELECT spcname, spcencalgo
FROM pg_tablespace ts, pgx_tablespaces tsx
WHERE ts.oid = tsx.spctablespace;
```

**Example**

```sql
postgres=# SELECT spcname, spcencalgo FROM pg_tablespace ts, pgx_tablespaces tsx WHERE ts.oid =
tsx.spctablespace;

<table>
<thead>
<tr>
<th>spcname</th>
<th>spcencalgo</th>
</tr>
</thead>
<tbody>
<tr>
<td>pg_default</td>
<td>none</td>
</tr>
<tr>
<td>pg_global</td>
<td>none</td>
</tr>
<tr>
<td>secure_tablespace</td>
<td>AES256</td>
</tr>
</tbody>
</table>
```

**See**

Refer to "Notes on Application Compatibility" in the Application Development Guide for information on how to maintain application compatibility.

### 5.6 Managing the Keystore

This section describes how to manage the keystore and the master encryption key to guard against the threat of theft.
5.6.1 Changing the Master Encryption Key

Using the same encryption key for an extended period gives attackers an opportunity to decipher the encrypted data. It is recommended that you change the key at regular intervals, or whenever the key is exposed to risk.

Adhere to the industry's best practices for encryption algorithms and key management when considering how often the key should be changed. For example, the NIST in the United States has published "NIST Special Publication 800-57". The PCI DSS also refers to this publication. This publication recommends changing the master encryption key once a year.

To change the master encryption key, execute the pgx_set_master_key function, which is the same function used for configuring the key. Refer to "5.2 Setting the Master Encryption Key" for details.

After changing the master encryption key, you must immediately back up the keystore.

5.6.2 Changing the Keystore Passphrase

In security policies for organizations, it is usually a requirement that the passphrase be changed whenever a security administrator who knows the passphrase is removed from duties due to transfer or retirement. It is also recommended that the passphrase be changed if it is ever exposed to risks due to deception such as social engineering.

To change the keystore passphrase, execute the following SQL function as a superuser.

```
SELECT pgx_set_keystore_passphrase('oldPassphrase', 'newPassphrase');
```

After changing the passphrase, you must immediately back up the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_keystore_passphrase function.

5.6.3 Enabling Automatic Opening of the Keystore

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the instance starts. Execute the pgx_keystore command to enable automatic opening of the keystore.

```
> pgx_keystore --enable-auto-open /key/store/location/keystore.ks
Enter the passphrase:
Automatic opening of the keystore is now enabled
```

Refer to "pgx_keystore" in the Reference for information on pgx_keystore command.

When automatic opening is enabled, an automatically opening keystore is created in the same directory as the original keystore. The file name of the automatically opening keystore is keystore.aks. The file keystore.aks is an obfuscated copy of the decrypted content of the keystore.ks file. As long as this file exists, there is no need to enter the passphrase to open the keystore when starting the instance.

Do not delete the original keystore file, keystore.ks. It is required for changing the master encryption key and the passphrase. When you change the master encryption key and the passphrase, keystore.aks is recreated from the original keystore file, keystore.ks.

Protect keystore.ks, keystore.aks, and the directory that stores the keystore so that only the user who starts the instance can access them.

Configure the permission of the files so that only the user who starts the instance can access the SQL functions and commands that create these files. Accordingly, manually configure the same permission mode if the files are restored.

```
# chown -R fsepuser:fsepuser /key/store/location
# chmod 700 /key/store/location
# chmod 600 /key/store/location/keystore.ks
# chmod 600 /key/store/location/keystore.aks
```

- 32 -
An automatically opening keystore will only open on the computer where it was created.

To disable automatic opening of the keystore, delete keystore.aks.

**Note**

- To use WebAdmin for recovery, you must enable automatic opening of the keystore.
- Refer to "5.7 Backing Up and Restoring/Recovering the Database" after enabling or reconfiguring encryption to back up the database.
- Specify a different directory from those below as the keystore storage destination:
  - Data storage destination
  - Tablespace storage destination
  - Transaction log storage destination
  - Backup data storage destination

### 5.6.4 Backing Up and Recovering the Keystore

Back up the keystore at the following times in case it is corrupted or lost. Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen. A passphrase is not required to open an automatically opening keystore, so store this type of keystore in a safe location.

- When the master encryption key is first configured
- When the master encryption key is changed
- When the database is backed up
- When the keystore passphrase is changed

**Point**

Do not overwrite an old keystore when backing up a keystore. This is because during database recovery, you must restore the keystore to its state at the time of database backup. When the backup data of the database is no longer required, delete the corresponding keystore.

**Example**

- Back up the database and the keystore on May 1, 2015.

```
> pgx_dmpall -D /database/inst1
> cp -p /key/store/location/keystore.ks /keybackup/keystore_20150501.ks
```

Specify the following in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Change the master encryption key, and back up the keystore on May 5, 2015.

```
> psql -c "SELECT pgx_set_master_key('passphrase')" postgres
> cp -p /key/store/location/keystore.ks /keybackup/keystore_20150505.ks
```

Specify the following in the psql command:

- Specify the SQL function that sets the master encryption key in the -c option.
- Specify the name of the database to be connected to as the argument.
If the keystore is corrupted or lost, restore the keystore containing the latest master encryption key. If there is no keystore containing the latest master encryption key, restore the keystore to its state at the time of database backup, and recover the database from the database backup. This action recovers the keystore to its latest state.

**Example**

- Restore the keystore containing the latest master encryption key as of May 5, 2015.

  ```
  > cp -p /keybackup/keystore_20150505.ks /key/store/location/keystore.ks
  ```

- If there is no backup of the keystore containing the latest master encryption key, recover the keystore by restoring the keystore that was backed up along with the database on 1 May 2015.

  ```
  > cp -p /keybackup/keystore_20150501.ks /key/store/location/keystore.ks
  > pgx_rcvall -B /backup/inst1 -D /database/inst1 --keystore-passphrase
  ```

Specify the following in the `pgx_rcvall` command:

- Specify the data storage directory in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
- Specify the backup data storage directory in the `-B` option.
- The `--keystore-passphrase` option prompts you to enter the passphrase to open the keystore.

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

It is recommended that you do not back up the automatically opening keystore file, keystore.aks. If the database backup medium and the backup medium storing the automatically opening keystore are both stolen, the attacker will be able to read the data even without knowing the passphrase.

If the automatically opening keystore is corrupted or lost, you must again enable automatic opening. The keystore.aks file will be recreated from keystore.ks at this time.

**See**

Refer to "`pgx_rcvall`" and "`pgx_dmpall`" in the Reference for information on the `pgx_rcvall` and `pgx_dmpall` commands.

Refer to "`psql`" under “Reference” in the PostgreSQL Documentation for information on the `psql` command.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the `pgx_set_master_key` function.

Refer to “5.6.3 Enabling Automatic Opening of the Keystore” for information on how to enable automatic opening of the keystore.

### 5.7 Backing Up and Restoring/Recovering the Database

FUJITSU Enterprise Postgres enables you to use the five backup and recovery methods described below. Regardless of the method you use, you must back up the keystore at the same time.

Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen.

**Backup and recovery using WebAdmin**

- **Backup**
  
  WebAdmin backs up encrypted data.
  
  Back up the key store after backing up the database.

- **Recovery**
  
  Restore the keystore to its state at the time of database backup. Refer to "5.6.4 Backing Up and Recovering the Keystore" for details.
Enable automatic opening of the keystore in accordance with the procedure described in "5.6.3 Enabling Automatic Opening of the Keystore". Then, use WebAdmin to recover the database.

**Backup and recovery using the pgx_dmpall and pgx_rcvall commands**

- **Backup**
  
  The pgx_dmpall command backs up the encrypted data.
  
  Back up the key store after backing up the database.

- **Recovery**
  
  Restore the keystore to its state at the time of the database backup.
  
  Configure automatic opening of the key store as necessary.

  If automatic opening of the keystore is not enabled, execute the pgx_rcvall command with the --keystore-passphrase option specified. This will display the prompt for the passphrase to be entered.

**Example**

- Back up the database and the keystore on May 1, 2015.

  ```
  > pgx_dmpall -D /database/inst1
  > cp -p /key/store/location/keystore.ks /keybackup/keystore_20150501.ks
  ```

  Specify the following in the pgx_dmpall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Recover the database and the keystore from the backup taken on May 1, 2015.

  ```
  > cp -p /keybackup/keystore_20150501.ks /key/store/location/keystore.ks
  > pgx_keystore --enable-auto-open /key/store/location/keystore.ks (Execute only when enabling automatic opening)
  > pgx_rcvall -B /backup/inst1 -D /database/inst1 --keystore-passphrase
  ```

  Specify the following in the pgx_rcvall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
  
  - Specify the backup data storage directory in the -B option.
  
  - The --keystore-passphrase option prompts you to enter the passphrase to open the keystore.

**Dump and restore using SQL**

- **Backup**
  
  The files output by the pg_dump and pg_dumpall commands are not encrypted. You should, therefore, encrypt the files using OpenSSL commands or other means before saving them, as described in "5.8 Importing and Exporting the Database" below.
  
  Back up the key store after backing up the database.

- **Restore**
  
  If the backup data has been encrypted using, for example OpenSSL commands, decrypt that data.
  
  The data generated by the pg_dumpall command includes a specification to encrypt tablespaces by For this reason, the pg_restore command encrypts tablespaces during restoration.
File system level backup and restore

- Backup
  Stop the instance and backup the data directory and the tablespace directory using the file copy command of the operating system. The files of encrypted tablespaces are backed up in the encrypted state.
  Back up the key store after performing the backup.
- Restore
  Restore the keystore to its state at the time of the database backup.
  Stop the instance and restore the data directory and the tablespace directory using the file copy command of the operating system.

Continuous archiving and point-in-time recovery

- Backup
  The pg_basebackup command backs up the encrypted data as is.
  Back up the key store after performing the backup.
- Recovery
  Restore the keystore to its state at the time of the database backup.
  Configure automatic opening of the key store as necessary.
  If automatic opening of the keystore is not enabled, execute the pg_ctl command to start the instance with the --keystore-passphrase option specified. This will display the prompt for the passphrase to be entered.

See

- Refer to "pg_ctl" under "Reference" in the PostgreSQL Documentation for information on the pg_ctl command.
- Refer to "Reference" in the PostgreSQL Documentation for information on the following commands:
  - psql
  - pg_dump
  - pg_restore
  - pg_basebackup
- Refer to the Reference for information on the following commands:
  - pgx_rcvall
  - pgx_dmpall
  - pg_dumpall

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

5.8 Importing and Exporting the Database

The files output by the COPY TO command are not encrypted. Therefore, when transferring files to other systems, you should encrypt files using OpenSSL commands or other means and use scp or sftp to encrypt the data being transferred.

Use a safe method to delete obsolete plain text files.

You can use the following methods to safely delete files:
  - dd command
Example

# Export the contents of the table my_table to a CSV file.
> psql -c "COPY my_table TO '/tmp/my_table.csv' (FORMAT CSV)" postgres

# Encrypt the exported file.
> openssl enc -e -aes256 -in my_table.csv -out my_table.csv.enc
(The user is prompted to enter the passphrase to be used for encryption)

# After overwriting the file three times with random data and zero-clearing it, delete the file. For <size>, specify a value equal to or greater than the size of the file targeted for deletion.
> dd if=/dev/urandom of=my_table.csv bs=1 count=<size>
> dd if=/dev/urandom of=my_table.csv bs=1 count=<size>
> dd if=/dev/urandom of=my_table.csv bs=1 count=<size>
> dd if=/dev/zero of=my_table.csv bs=1 count=<size>
> rm my_table.csv
(Transfer encrypted files to other systems)

# Decrypt the encrypted files on other systems.
> openssl enc -d -aes256 -in my_table.csv.enc -out my_table.csv
(The user is prompted to enter the passphrase to be used for decryption)

If you use COPY FROM to import data to tables and indexes in an encrypted tablespace, the imported data is automatically encrypted before being stored.

5.9 Encrypting Existing Data

You cannot encrypt existing unencrypted tablespaces. In addition, you cannot change encrypted tablespaces so that they do not encrypt. As an alternative, transfer the tables and indexes to other tablespaces. You can use the following SQL commands for this.

```
ALTER TABLE table_name SET TABLESPACE new_tablespace;
ALTER INDEX index_name SET TABLESPACE new_tablespace;
ALTER DATABASE database_name SET TABLESPACE new_tablespace;
```

See

Refer to “SQL Commands” under “Reference” in the PostgreSQL Documentation for information on SQL commands.

5.10 Operations in Cluster Systems

This section describes how to use transparent data encryption on cluster systems such as high-availability systems, streaming replication, and database multiplexing.

5.10.1 HA Clusters that do not Use Database Multiplexing

Take the following points into account when using transparent data encryption in an HA cluster environment that does not use database multiplexing.

Placement and automatic opening of the keystore file

There are two alternatives for placing the keystore file:
- Sharing the keystore file
- Placing a copy of the keystore file
Sharing the keystore file

This involves using the same keystore file on the primary server and the standby server.

As the standby server is not active while the primary server is running, this file would not be accessed simultaneously, and therefore, it can be shared.

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location.

Enable the automatic opening of the keystore on both the primary and standby servers.

Placing a copy of the keystore file

This involves placing a copy of the primary server keystore file on the standby server.

You can do this if you cannot prepare a shared server or disk device that can be accessed from both the primary and standby servers.

However, if you change the master encryption key and the passphrase on the primary server, you must copy the keystore file to the standby server again.

To manage the keystore file in a more secure manner, prepare the key management server or the key management storage isolated in a secure location for both the primary and standby servers, and place the keystore files there.

Enable the automatic opening of the keystore on both the primary and standby servers. Note that copying the automatically opening keystore file (keystore.aks) to the standby server does not enable the automatic opening of the keystore.

See

Refer to the Cluster Operation Guide for information on building a cluster system environment using failover operation.

5.10.2 Database Multiplexing Mode

Note the following when using transparent data encryption in environments that use streaming replication, or database multiplexing with streaming replication.

Placing the keystore file

Place a copy of the primary server keystore file on the standby server.

This is required as the keystore file cannot be shared, and both servers may need to access it simultaneously.

Point

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location. A keystore used by both the primary and standby servers can be managed on the same key management server or key management storage.

However, create different directories for the keystores to be used by the primary server and the standby server. Then copy the keystore for the primary server to the directory used on the standby server.

Automatically opening the keystore

You must enable automatic opening of the keystore.

To do this, enable automatic opening of the keystore in all servers that make up database multiplexing. The settings for automatic opening of the keystore include information unique to each server, so simply copying the file does not enable it.

Changing the passphrase

Changes to the passphrase are reflected in all servers that make up database multiplexing, so no special operation is required.
Building and starting a standby server

Before using the `pg_basebackup` command or `pgx_rcvall` command to build a standby server, copy the keystore file from the primary server to the standby server. When using an automatically opening keystore, use the copied keystore file to enable automatic opening on the standby server.

Open the keystore each time you start the standby server. This step is necessary for decrypting and restoring encrypted WAL received from the primary server. To open the keystore, specify the --keystore-passphrase option in the `pg_ctl` command or `pgx_rcvall` command and enter the passphrase, or use an automatically opening keystore.

Changing the master encryption key and the passphrase

Change the master encryption key and the passphrase on the primary server. You need not copy the keystore from the primary server to the standby server. You need not even restart the standby server or reopen the keystore. Changes to the master encryption key and the passphrase are reflected in the keystore on the standby server.

See

Refer to "pgx_rcvall " in the Reference for information on `pgx_rcvall` command.
Refer to "pg_ctl" under "Reference" in the PostgreSQL Documentation for information on `pg_ctl` command.
Refer to "pg_basebackup" under "Reference" in the PostgreSQL Documentation for information on `pg_basebackup` command.
Refer to "High Availability, Load Balancing, and Replication" under "Server Administration" in the PostgreSQL Documentation for information on how to set up streaming replication.

5.11 Security-Related Notes

- Decrypted data is cached in the database server memory (shared buffer). As a result, unencrypted data is stored in a core file, which is a process memory dump. You should, therefore, safely delete the memory dump.

You can safely delete files by using the following command:

- `dd` command

- Unencrypted data may be written from the database server memory to the operating system's swap area. To prevent leakage of information from the swap area, consider either disabling the use of swap area or encrypting the swap area using a full-disk encryption product.

- The content of the server log file is not encrypted. Therefore, in some cases the value of a constant specified in a SQL statement is output to the server log file. To prevent this, consider setting a parameter such as `log_min_error_statement`.

- When executing an SQL function that opens the keystore and modifies the master encryption key, ensure that the SQL statement containing the passphrase is not output to the server log file. To prevent this, consider setting a parameter such as `log_min_error_statement`. If you are executing this type of SQL function on a different computer from the database server, encrypt the communication between the client and the database server with SSL.

5.12 Tips for Installing Built Applications

With transparent data encryption, you can easily encrypt all the data in an application without modifying the application. Database administrators install built applications in the following manner. However, this procedure stores data to the default tablespace, so take necessary action if processing differs from the original design.

1. (Normal procedure) Create an owner and a database for the built application.

   ```sql
   CREATE USER crm_admin ...;
   CREATE DATABASE crm_db ...;
   ```

2. (Procedure for encryption) Create an encrypted tablespace to store the data for the built application.

   ```sql
   SET tablespace_encryption_algorithm = 'AES256';
   CREATE TABLESPACE crm_tablespace LOCATION '/crm/data';
   ```
3. (Procedure for encryption) Configure an encrypted tablespace as the default tablespace for the owner of the built application.

```
ALTER USER crm_admin SET default_tablespace = 'crm_tablespace';
ALTER USER crm_admin SET temp_tablespaces = 'crm_tablespace';
```

4. (Normal procedure) Install the built application. The application installer prompts you to enter the host name and the port number of the database server, the user name, and the database name. The installer uses the entered information to connect to the database server and execute the SQL script. For applications that do not have an installer, the database administrator must manually execute the SQL script.

Normally, the application's SQL script includes logic definition SQL statements, such as CREATE TABLE, CREATE INDEX, and GRANT or REVOKE, converted from the entity-relationship diagram. It does not include SQL statements that create databases, users, and tablespaces. Configuring the default tablespace of the users who will execute the SQL script deploys the objects generated by the SQL script to the tablespace.
Chapter 6 Data Masking

Data masking is a feature that can change the returned data for queries generated by applications, so that it can be referenced by users. For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

Note

When using this feature, it is recommended that the changed data be transferred to another medium for users to reference. This is because, if users directly access the database to extract the masked data, there is a possibility that they can deduce the original data by analyzing the masking policy or query result to the masking target column.

6.1 Masking Policy

Masking policy is a method of changing data under specific conditions when it is returned for a query from an application. One masking policy can be created per table. You can configure masking target, masking type, masking condition and masking format in a masking policy.

Note

When a masking policy is defined, the search performance for the corresponding table may deteriorate.
6.1.1 Masking Target

Masking target refers to a column to which a masking policy will be applied. When referring to a masking target or a function that includes a masking target, the execution result will be changed and obtained.

The following commands can change the execution result:
- SELECT
- COPY
- pg_dump
- pg_dumpall

**Note**
- If a masking target is specified to INSERT...SELECT target columns, processing will be performed using data before change.
- If a masking target other than SELECT target columns is specified, processing will be performed using data before change.
- If a masking target is specified in a function where the data type will be converted, an error will occur.

6.1.2 Masking Type

Masking type is a method to change column data that is returned from queries. Specify the masking type in the function_type parameter. The following masking types can be specified and selected depending on the masking target data type.

**Full masking**
All the data in the specified column is changed. The changed value returned to the application that made the query varies depending on the column data type.
For example, 0 is used for a numeric type column and a space is used for a character type column.

**Partial masking**
The data in the specified column is partially changed.
For example, digits except the last four digits of an employee number can be changed to "*".

**Regular expression masking**
The data in the specified column is changed via a search that uses a regular expression.
For example, for strings such as email address that can have variable length, "*" can be used to change characters preceding "@" by using a regular expression. Regular expression masking can only be used for character type data.

**Note**
- If multiple valid masking targets are specified for a function, the masking type for the left-most masking target will be applied.
  For example, if "SELECT GREATEST(c1, c2) FROM t1" is executed for numeric type masking target c1 and c2, the masking type for c1 will be applied.
- When masking the data that includes multibyte characters, do not specify partial masking for masking type. The result may not be as expected.

6.1.3 Masking Condition

Masking condition refers to the conditions configured to perform masking. Specify the masking condition in the expression parameter. Changed or actual data can be displayed for different users by defining masking condition. An expression that returns a boolean type result needs to be specified in masking condition and masking is performed only when TRUE is returned. Refer to "Value Expressions" in the PostgreSQL Documentation for information on the expressions that can be specified. Note that expressions that include a column cannot
be specified. For example, when masking data only for "postgres" users, specify 'current_user = "postgres"' in the masking condition.

**Information**

Specify '1=1' so the masking condition is always evaluated to be TRUE and masking is performed all the time.

### 6.1.4 Masking Format

Masking format is a combination of change method and displayed characters when the masking condition is met. Masking format varies depending on the masking type. The following describes the masking format.

#### Full masking

With full masking, all characters are changed to values as determined by the database. Changed characters can be referenced in the pgx_confidential_values table. Also, replacement characters can be changed using the pgx_update_confidential_values system management function.

**See**

Refer to "6.3 Data Types for Masking" for information on the data types for which data masking can be performed.

#### Partial masking

With partial masking, data is changed according to the content in the function_parameters parameter. The method of specifying function_parameters varies depending on the data type.

<table>
<thead>
<tr>
<th>Category</th>
<th>Method of specifying function_parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td>[replacementCharacter, startPosition, endPosition]</td>
</tr>
<tr>
<td></td>
<td>- replacementCharacter: Specify the number to display. Specify a value from 0 to 9.</td>
</tr>
<tr>
<td></td>
<td>- startPosition: Specify the start position of masking. Specify a positive integer.</td>
</tr>
<tr>
<td></td>
<td>- endPosition: Specify the end position of masking. Specify a positive integer that is greater than startPosition.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong></td>
</tr>
<tr>
<td></td>
<td>Specify as below to change the values from the 1st to 5th digits to 9.</td>
</tr>
<tr>
<td></td>
<td>function_parameters := '9, 1, 5'</td>
</tr>
<tr>
<td></td>
<td>In this example, if the original data is &quot;123456789&quot;, it will be changed to &quot;999996789&quot;.</td>
</tr>
<tr>
<td>Character type</td>
<td>[inputFormat, outputFormat, replacementCharacter, startPosition, endPosition]</td>
</tr>
<tr>
<td></td>
<td>- inputFormat: Specify the current format of the data. Specify &quot;V&quot; for characters that will potentially be masked, and specify &quot;F&quot; for values such as spaces or hyphens that will not be masked.</td>
</tr>
<tr>
<td></td>
<td>- outputFormat: Define the method to format the displayed data. Specify &quot;V&quot; for characters that will potentially be masked. Any character to be output can be specified for each character &quot;F&quot; in inputFormat. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- replacementCharacter: Specify any single character. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- startPosition: Specify the position of &quot;V&quot; as the start position of masking. For example, to specify the position of the 4th &quot;V&quot; from the left, specify 4. Specify a positive integer.</td>
</tr>
</tbody>
</table>
### Method of specifying function\_parameters

- **endPosition**: Specify the position of "V" as an end position of masking. When working out the end position, do not include positions of "F". For example, to specify the position of the 11th "V" from the left, specify 11. Specify a positive integer that is greater than startPosition.

**Example**

Specify as below to mask a telephone number other than the first three digits using \*.

```plaintext
function\_parameters := 'VVVFVVVVFVVV, VVV-VVVV-VVVV, *, 4, 11'
```

In this example, if the original data is "012-3156-7890", it will be changed to "012-****-****".

### Date/timestamp type

<table>
<thead>
<tr>
<th>\textbf{MDYHMS}</th>
</tr>
</thead>
<tbody>
<tr>
<td>M: Masks month. To mask month, enter the month from 1 to 12 after a lowercase letter m. Specify an uppercase letter M to not mask month.</td>
</tr>
<tr>
<td>D: Masks date. To mask date, enter the date from 1 to 31 after a lowercase letter d. If a value bigger than the last day of the month is entered, the last day of the month will be displayed. Specify an uppercase letter D to not mask date.</td>
</tr>
<tr>
<td>Y: Masks year. To mask year, enter the year from 1 to 9999 after a lowercase letter y. Specify an uppercase letter Y to not mask year.</td>
</tr>
<tr>
<td>H: Masks hour. To mask hour, enter the hour from 0 to 23 after a lowercase letter h. Specify an uppercase letter H to not mask hour.</td>
</tr>
<tr>
<td>M: Masks minute. To mask minute, enter the minute from 0 to 59 after a lowercase letter m. Specify an uppercase letter M to not mask minute.</td>
</tr>
<tr>
<td>S: Masks second. To mask second, enter the second from 0 to 59 after a lowercase letter s. Specify an uppercase letter S to not mask second.</td>
</tr>
</tbody>
</table>

**Example**

Specify as below to mask hour, minute, and second and display 00:00:00.

```plaintext
function\_parameters := 'MDYh0m0s0'
```

In this example, if the original data is "2010-10-10 10:10:10", it will be changed to "2010-10-10 00:00:00".

---

**See**

- Refer to "B.3.2 pgx\_create\_confidential\_policy" for information on function\_parameters.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

---

**Regular expression masking**

With regular expression masking, data is changed according to the content of the regexp\_pattern, regexp\_replacement and regexp\_flags parameters. For regexp\_pattern, specify the search pattern using a regular expression. For regexp\_replacement, specify the replacement character to use when data matches the search pattern. For regexp\_flags, specify the regular expression flags.

**Example**

Specify as below to change all three characters starting from b to X.

```plaintext
regexp\_pattern := 'b.'
```
In this example, if the original data is "foobarbaz", it will be changed to "fooXX".

See

- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

Note

- When column data type is character(n) or char(n) and if the string length after change exceeds n, the extra characters will be truncated and only characters up to the nth character will be displayed.
- When column data type is character varying(n) or varchar(n) and if the string length after change exceeds the length before the change, the extra characters will be truncated and only characters up to the length before change will be displayed.

6.2 Usage Method

Preparation

The following preparation is required to use this feature.

1. Set the postgresql.conf file parameters.
   Prepend "pgx_datamasking" to the shared_preload_libraries parameter.
2. Restart the instance.
3. Run CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

Example

```
postgres=# CREATE EXTENSION pgx_datamasking;
CREATE EXTENSION
```

Note

You must always prepend "pgx_datamasking" to the "shared_preload_libraries" parameter.

Information

- Specify "false" for pgx_datamasking.enable to not use this feature. Data will not be masked even if a masking policy is configured. This feature becomes available again once "true" is specified for pgx_datamasking.enable. This setting can be made
by specifying a SET statement or specifying a parameter in the postgresql.conf file. Example

```
postgres=# SET pgx_datamasking.enable=false;
```

- Hereafter, also perform this preparatory task for the "template1" database, so that this feature can be used by default when creating a new database.

---

### Usage

To perform masking, a masking policy needs to be configured. The masking policy can be created, changed, confirmed, enabled, disabled or deleted during operation.

The procedures to perform these tasks are explained below with examples.

1. Creating a masking policy
2. Changing a masking policy
3. Confirming a masking policy
4. Enabling and disabling a masking policy
5. Deleting a masking policy

---

### Note

Only database superusers can configure masking policies.

---

### 6.2.1 Creating a Masking Policy

An example of the operation on the server is shown below.

1. Create a masking policy

   Execute the `pgx_create_confidential_policy` system management function to create a masking policy.
   
   The following values are configured in this example.
   - Masking target: Numeric type c1
   - Masking type: FULL
   - Masking condition: '1=1'

   ```
   postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1', expression := '1=1', column_name := 'c1', function_type := 'FULL');
   ```

2. Confirm the displayed data

   Confirm that the masking target data (column c1) has been correctly changed.

   ```
   postgres=# select * from t1;
   c1 | c2
   ---------------
   0 | 012-3456-7890
   0 | 012-3456-7891
   0 | 012-3456-7892
   (3 row)
   ```

---

See

- Refer to "B.3.2 pgx_create_confidential_policy" for information on the `pgx_create_confidential_policy` system management function.
6.2.2 Changing a Masking Policy

1. An example of the operation on the server is shown below.

2. Change a masking policy
   Execute the pgx_alter_confidential_policy system management function to change a masking policy.
   The following values are changed in this example.
   - Content of change: Add a masking target
   - Masking target: Character type c2
   - Masking type: PARTIAL
   - Masking condition: ‘VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11’

   ```sql
   postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1',
   action := 'ADD_COLUMN', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
   'VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11');
   ...
   (1 row)
   ```

3. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   ```sql
   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
       | 012-****-****
       | 012-****-****
       | 012-****-****
   (3 row)
   ```

6.2.3 Confirming a Masking Policy

An example of the operation on the server is shown below.

1. Confirm information about a masking target where a masking policy is set
   Refer to the pgx_confidential_columns table to confirm the masking target where the masking policy is set.

   ```sql
   postgres=# select * from pgx_confidential_columns;
   ...+
   `````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````
2. Confirm information about the masking policy content
   Refer to pgx_confidential_policies to confirm the masking policy content.

<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>expression</th>
<th>enable</th>
<th>policy_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>1=1</td>
<td>t</td>
<td></td>
</tr>
</tbody>
</table>

3. Enable a masking policy
   Execute the pgx_enable_confidential_policy system management function to enable a masking policy.

<table>
<thead>
<tr>
<th>table_name</th>
<th>policy_name</th>
<th>enable</th>
<th>policy_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t1</td>
<td>p1</td>
<td>t</td>
<td></td>
</tr>
</tbody>
</table>

4. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.
6.2.5 Deleting a Masking Policy

An example of the operation on the server is shown below.

1. Delete a masking policy
   Execute the pgx_drop_confidential_policy system management function to delete a masking policy.

   ```
   postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
   pgx_drop_confidential_policy
   --------------------------
   t
   (1 row)
   ```

2. Confirm the displayed data
   Confirm that the original data is displayed by deleting the masking policy.

   ```
   postgres=# select * from t1;
   c1    |      c2
   ------+---------------
   1     | 012-3456-7890
   2     | 012-3456-7891
   3     | 012-3456-7892
   (3 row)
   ```

6.3 Data Types for Masking

The data types for which data masking can be performed are shown below.

<table>
<thead>
<tr>
<th>Category</th>
<th>Data type</th>
<th>Full masking</th>
<th>Partial masking</th>
<th>Regular expression masking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td></td>

</table>
Chapter 7 Periodic Operations

This chapter describes the operations that must be performed periodically when running daily database jobs.

7.1 Configuring and Monitoring the Log

FUJITSU Enterprise Postgres enables you to output database errors and warnings to a log file. This information is useful for identifying if errors have occurred and the causes of those errors.

By default, this information is output to the system log. It is recommended that you configure FUJITSU Enterprise Postgres to collect logs from its log files (for example, log_destination) before operating FUJITSU Enterprise Postgres.

Periodically monitor the log files to check if any errors have occurred.

- Refer to "Error Reporting and Logging" under "Server Administration" in the PostgreSQL Documentation for information on logs.
- Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on log settings when operating with WebAdmin.

7.2 Monitoring Disk Usage and Securing Free Space

When a database is used for an extended period, free space on the disk is continuously consumed and in some cases the disk space runs out. When this happens, database jobs may stop and no longer run.

You should, therefore, periodically monitor the usage of disk space, and delete obsolete files located in the disk.

Monitor the disk usage of the disk where the following directories are located:
- Data storage destination directory
- Transaction log storage destination (if the transaction log is stored in a different directory from the data storage destination directory)
- Backup data storage destination directory
- Tablespace storage destination directory

7.2.1 Monitoring Disk Usage

To check the disk usage, use the following operating system commands:
- df command

You can even use SQL statements to check tables and indexes individually.

Refer to "Determining Disk Usage" under "Server Administration" in the PostgreSQL Documentation for information on this method.

Information

If you are using WebAdmin for operations, a warning is displayed when disk usage reaches 80%.

7.2.2 Securing Free Disk Space

Secure free disk space by using the following operating system commands to delete unnecessary files, other than the database, from the same disk unit.
- rm command

You can also secure disk space by performing the following tasks periodically:
7.3 Automatically Closing Connections

If an application stops responding and abnormally terminates for any reason, the connection from the application may remain active on the database server. If this situation continues for an extended period, other applications attempting to connect to the database server may encounter an error, or an error indicating that the tables are unavailable may occur.

It is, therefore, recommended that idle connections be closed automatically at regular intervals.

To configure the time required until automatic disconnection, set the following using the ndd command of the operating system:

- tcp_keepalive_interval
  Interval (in milliseconds) between keepalive probes.
- tcp_ip_abort_interval
  Retransmission timeout value for a TCP connection (in milliseconds).

This needs to be set considering the impact on the entire system.

See
Refer to the relevant manual of your operating system for information on the parameters.

7.4 Monitoring the Connection State of an Application

FUJITSU Enterprise Postgres does not immediately delete the updated or deleted data. If the VACUUM determines there are no transactions that reference the database, FUJITSU Enterprise Postgres collects obsolete data.

However, obsolete data is not collected if there are connections that have remained active for an extended period or connections occupying resources. In this case the database may expand, causing performance degradation.

See
Refer to "Routine Vacuuming" under "Server Administration" in the PostgreSQL Documentation for information on the VACUUM command.

In such cases, you can minimize performance degradation of the database by monitoring problematic connections.

The following two methods are supported for monitoring connections that have been in the waiting status for an extended period:

- 7.4.1 Using the View (pg_stat_activity)
- 7.4.2 Using pgAdmin

7.4.1 Using the View (pg_stat_activity)

Use the view (pg_stat_activity) to identify and monitor connections where the client has been in the waiting status for an extended period.

Example

The example below shows connections where the client has been in the waiting status for at least 60 minutes.
However, when considering continued compatibility of applications, do not reference system catalogs directly in the following SQL statements.

```
postgres=# select * from pg_stat_activity where state='idle in transaction' and current_timestamp >
cast(query_start + interval '60 minutes' as timestamp);
-[ RECORD 1 ]-------------------------------
datid          | 13003          
datname        | db01           
pid            | 4638           
usesysid       | 10             
usename        | fsep           
application_name | api01         
client_addr    | 192.33.44.15   
client_hostname|
client_port    | 27500          
backend_start  | 2015-04-24 09:09:21.730641+09 
xact_start     | 2015-04-24 09:09:23.858727+09 
query_start    | 2015-04-24 09:09:23.858727+09 
state_change   | 2015-04-24 09:09:23.858834+09 
waiting        | f              
state          | idle in transaction 
backend_xid    |               
backend_xmin   |               
query          | begin;         
```

See

- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

- Refer to "The Statistics Collector" under "Server Administration" in the PostgreSQL Documentation for information on `pg_stat_activity`.

### 7.4.2 Using pgAdmin

This section describes the procedure for monitoring connections using [Server Status] in pgAdmin.
1. From the [Tools] menu in pgAdmin, click [Server Status].
2. Identify client connections that have been in the waiting state for an extended period.

From the transaction start time displayed under [TX start], identify connections that have been in the waiting state for an extended period.

7.5 Reorganizing Indexes

Normally, a database defines indexes in tables, but if data is frequently updated, indexes can no longer use free space in the disk efficiently. This situation can also cause a gradual decline in database access performance.

To rearrange used space on the disk and prevent the database access performance from declining, it is recommended that you periodically execute the REINDEX command to reorganize indexes.

Check the disk usage of the data storage destination using the method described in "7.2 Monitoring Disk Usage and Securing Free Space".

Refer to "Routine Reindexing" under "Server Administration" in the PostgreSQL Documentation for information on reorganizing indexes by periodically executing the REINDEX command.
Typically, reorganize indexes once a month at a suitable time such as when conducting database maintenance. Use SQL statements to check index usage. If this usage is increasing on a daily basis, adjust the frequency of recreating the index as compared to the free disk space.

The following example shows the SQL statements and the output.

However, when considering continued compatibility of applications, do not reference system catalogs and functions directly in the following SQL statements. Refer to “Notes on Application Compatibility” in the Application Development Guide for details.

**[SQL statements]**

```sql
SELECT
    nspname AS schema_name,
    relname AS index_name,
    round(100 * pg_relation_size(indexrelid) / pg_relation_size(indrelid)) / 100 AS index_ratio,
    pg_size_pretty(pg_relation_size(indexrelid)) AS index_size,
    pg_size_pretty(pg_relation_size(indrelid)) AS table_size
FROM pg_index I
LEFT JOIN pg_class C ON (C.oid = I.indexrelid)
LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE
    C.relkind = 'i' AND
    pg_relation_size(indrelid) > 0
ORDER BY pg_relation_size(indexrelid) DESC, index_ratio DESC;
```

**[Output]**

<table>
<thead>
<tr>
<th>schema_name</th>
<th>index_name</th>
<th>index_ratio</th>
<th>index_size</th>
<th>table_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>pgbench_accounts_pkey</td>
<td>0.16</td>
<td>2208 KB</td>
<td>13 MB</td>
</tr>
<tr>
<td>pg_catalog</td>
<td>pg_depend_depending_index</td>
<td>0.6</td>
<td>224 KB</td>
<td>368 KB</td>
</tr>
<tr>
<td>pg_catalog</td>
<td>pg_depend_reference_index</td>
<td>0.58</td>
<td>216 KB</td>
<td>368 KB</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Refer to “Notes on Application Compatibility” in the Application Development Guide for information on maintaining application compatibility.

### 7.6 Monitoring Database Activity

FUJITSU Enterprise Postgres enables you to collect information related to database activity. By monitoring this information, you can check changes in the database status.

This information includes wait information for resources such as internal locks, and is useful for detecting performance bottlenecks. Furthermore, you should collect this information in case you need to request Fujitsu technical support for an investigation.
1. Collect statistics at fixed intervals during work hours.
   Accumulate the collected information into a file.
   Wherever possible, collect data from the various statistics views using a single transaction, because it enables you to take a snapshot of system performance at a given moment.
   Refer to "7.6 Monitoring Database Activity" for information on the system views that can be collected.

2. Reset statistics after work hours, that is, after jobs have finished.
   Refer to "7.6.3 Information Reset" for information on how to reset statistics.

3. Save the file with collected information.
   Keep the file with collected information for at least two days, in order to check daily changes in performance and to ensure that the information is not deleted until you have sent a query to Fujitsu technical support.

   Where jobs run 24 hours a day, reset statistics and save the file with collected information when the workload is low, for example, at night.

**Note**

Statistics cumulatively add the daily database value, so if you do not reset them, the values will exceed the upper limit, and therefore will not provide accurate information.

The subsections below explain the following:
- Information that can be collected
- Collection configuration
- Information reset

### 7.6.1 Information that can be Collected

Information that can be collected is categorized into the following two types:
- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

**Information common to PostgreSQL**
Information added by FUJITSU Enterprise Postgres

You can collect the following information added by FUJITSU Enterprise Postgres.

Table 7.1 Information added by FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>View name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>Displays statistic related to lightweight lock, with each type of content displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.2 pgx_stat_lwlock&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>Displays statistics related latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.3 pgx_stat_latch&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_walwriter</td>
<td>Displays statistics related to WAL writing, in a single line. Refer to &quot;C.4 pgx_stat_walwriter&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_sql</td>
<td>Displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line. Refer to &quot;C.5 pgx_stat_sql&quot; for details.</td>
</tr>
</tbody>
</table>

7.6.2 Collection Configuration

The procedure for configuring collection depends on the information content.

- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

Information common to PostgreSQL

See

Refer to "The Statistics Collector" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on information common to PostgreSQL.

Information added by FUJITSU Enterprise Postgres

Information added by FUJITSU Enterprise Postgres is collected by default.

To enable or disable information collection, change the configuration parameters in postgresql.conf. The following table lists the views for which you can enable or disable information collection, and the configuration parameters.

<table>
<thead>
<tr>
<th>View name</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>track_waits (*1)</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>track_sql</td>
</tr>
</tbody>
</table>

Remarks: You cannot change the collection status for pgx_stat_walwriter.
*1: When executing the SQL statement with EXPLAIN ANALYZE, processing time may increase because of this information collection. It is recommended to set this parameter to "off" when executing EXPLAIN ANALYZE to check the processing time. Refer to "Appendix A Parameters" for information on the parameters.

### 7.6.3 Information Reset

This section describes how to reset information.

**Information added by FUJITSU Enterprise Postgres**

You can reset information added by FUJITSU Enterprise Postgres by using the `pg_stat_reset_shared` function in the same way as for information common to PostgreSQL.

Configure the following parameters in the `pg_stat_reset_shared` function:

<table>
<thead>
<tr>
<th>Function</th>
<th>Type of return value</th>
<th>Description</th>
</tr>
</thead>
</table>
| `pg_stat_reset_shared(text)` | `void`               | Reset some cluster-wide statistics counters to zero, depending on the argument (requires superuser privileges). Calling `pg_stat_reset_shared('lwlock')` will zero all counters shown in `pgx_stat_lwlock`. Similarly, in the following cases, all values of the pertinent statistics counter are reset:  
  - If `pg_stat_reset_shared('latch')` is called: All values displayed in `pgx_stat_latch`  
  - If `pg_stat_reset_shared('walwriter')` is called: All values displayed in `pgx_stat_walwriter`  
  - If `pg_stat_reset_shared('sql')` is called: All values displayed in `pgx_stat_sql` |

See

Refer to "Statistics Functions" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on other parameters of the `pg_stat_reset_shared` function.
Chapter 8 Streaming Replication Using WebAdmin

This chapter describes how to create a streaming replication cluster using WebAdmin.

8.1 Streaming Replication

Streaming replication allows the creation of one or more standby instances, which connect to the master instances and replicate the data using WAL records. The standby instance can be used for read-only operations.

WebAdmin can be used to create a streaming replication cluster. WebAdmin allows the creation of a cluster in the following configurations:

- Master-Standby Configuration: This configuration creates a master and standby instance together.
- Standby Only Configuration: This configuration creates a standby instance from an already existing instance.

**Point**

- A standby instance can be created from a standalone instance, a master instance, or even from another standby instance.
- If a streaming replication cluster is created using WebAdmin, the network with the host name (or IP address) specified in [Host name] will be used across sessions of WebAdmin, and also used as the log transfer network.
- To use a network other than the job network as the log transfer network, specify the host name other than the job network one in [Host name].

**See**

When a standby instance is created from an existing instance, it is necessary to set the values for the replication-related variables before a standby instance can be created. Refer to “Configuring Parameters” in the Installation and Setup Guide for Server for details.

8.1.1 Creating a Standby Instance

Follow the procedure below to create a standby instance.

1. In the [Instances] tab, select the instance from which a standby instance is to be created.

2. Click
3. Enter the information for the standby instance to be created. In the example below, a standby instance is created from instance “inst1”. The instance name, host address and port of the selected instance are already displayed for easy reference.

Enter the following items:

- [Location]: Whether to create the instance in the server that the current user is logged in to, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.

- [Replication credential]: The user name and password required for the standby instance to connect to the master instance. The user name and password can be entered or selected from the Wallet. Refer to "Appendix F WebAdmin Wallet" for information on creating wallet entries.

- [Instance name]: Name of the standby database instance to create. The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters

- [Instance port]: Port number of the standby database instance.

- [Host IP address]: The IP address of the server machine where the standby instance is to be created. This information is needed to configure the standby instance to be connected to the master.
- [Data storage path]: Directory where the database data will be stored
- [Backup storage path]: Directory where the database backup will be stored
- [Transaction log path]: Directory where the transaction log will be stored
- [Encoding]: Database encoding system
- [Replication mode]: Replication mode of the standby instance to be created ("Asynchronous" or "Synchronous")
- [Application name]: The reference name of the standby instance used to identify it to the master instance.

4. Click 🔄 to create the standby instance.

5. Once the standby instance is created successfully, select "inst1s" in the [Instances] tab. The following page will be displayed:

![Image of instance settings](image)

**Note**
- Backups are not possible for standby instances in WebAdmin. As a result, and are disabled and no value is shown for [Backup storage status] and [Backup time].
- If using WebAdmin to manage Mirroring Controller, the message below may be output to the server log or system log in the standby instance. No action is required, as the instance is running normally.

```plaintext
ERROR: pgx_rcvall failed (16491)
ERROR: pgx_rcvall: backup of the database has not yet been performed, or an incorrect backup storage directory was specified
```

### 8.1.2 Promoting a Standby Instance

Streaming replication between a master and standby instance can be discontinued using WebAdmin.

Follow the procedure below to promote a standby instance to a standalone instance, thereby discontinuing the streaming replication.
1. In the [Instances] tab, select the standby instance that needs to be promoted.

2. Click  

3. Click [Yes] from the confirmation dialog box.

The standby instance will be promoted and will become a standalone instance, which is not part of a streaming replication cluster.

Once the standby instance is promoted to become a standalone instance, the backup storage status will be "Error". This is because no backups are available when the instance is newly promoted to a standalone instance. The status will be reset if a new backup is performed by clicking [Solution] or  

### 8.1.3 Converting an Asynchronous Replication to Synchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert an Asynchronous standby instance to Synchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.

2. Click  

3. In the [Streaming replication] section, edit the value for [Synchronous standby names].

   - Add the "Application name" of the standby instance you want to be in Synchronous mode.

4. Click  

5. Select the master instance and click  

6. Select the standby instance. [Instance type] will now show the updated status.

**Note**

- Converting an Asynchronous standby instance to Synchronous can cause the master instance to queue the incoming transactions until the standby instance is ready. For this reason, it is recommended that this operation be performed during a scheduled maintenance period.

- When adding a synchronous standby instance, FUJITSU Enterprise Postgres will only keep the first entry in [Synchronous standby names] in synchronous state.

- To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.

### 8.1.4 Converting a Synchronous Replication to Asynchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous Mode. This mode can be changed even after the standby instance was successfully created.

Follow the procedure below to convert a Synchronous standby instance to Asynchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.

2. Click  

3. In the [Streaming replication] section, edit the value for [Synchronous standby names].

   - Remove the "Application name" of the standby instance you want to be in Asynchronous mode.

4. Click  

5. Select the master instance and click  

6. Select the standby instance. [Instance type] will now show the updated status.
To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.
Chapter 9 Installing and Operating the In-memory Feature

The in-memory feature enables fast aggregation using Vertical Clustered Index (VCI) and memory-resident feature.

VCI has a data structure suitable for aggregation, and features parallel scan and disk compression, which enable faster aggregation through reduced disk I/O.

The memory-resident feature reduces disk I/O that occurs during aggregation. It consists of the preload feature that reads VCI data to memory in advance, and the stable buffer feature that suppresses VCI data eviction from memory. The stable buffer feature secures the proportion specified by parameter in the shared memory for VCI.

This chapter describes how to install and operate the in-memory feature.

Note

This feature can only be used in Advanced Edition.

9.1 Installing Vertical Clustered Index (VCI)

This section describes the installation of VCI.

1. Evaluating whether to Install VCI
2. Estimating Resources
3. Setting up

9.1.1 Evaluating whether to Install VCI

VCI uses available resources within the server to increase scan performance.

It speeds up processing in many situations, and can be more effective in the following situations:

- Single table processing
- Processing that handles many rows in the table
- Processing that handles some columns in the table
- Processing that performs very heavy aggregation such as simultaneous aggregation of sum and average

VCI will not be used in the following cases, so it is necessary to determine its effectiveness in advance:

- The data type of the target table or column contains VCI restrictions.
- The SQL statement does not meet the VCI operating conditions
- VCI is determined to be slower based on cost estimation

Note

If performing operations that use VCI, the full_page_writes parameter setting in postgresql.conf must be enabled (on). For this reason, if this parameter is disabled (off), operations that use VCI return an error. In addition, to perform operations for tables that do not create a VCI when the full_page_writes parameter setting is temporarily disabled (off), do not create a VCI or perform operations to tables that created a VCI during that time.

See

- Refer to "9.1.4 Data that can Use VCI" for information on VCI restrictions.
Refer to "Scan Using a Vertical Clustered Index (VCI)", "Operating Conditions" in the Application Development Guide for information on VCI operating conditions.

### 9.1.2 Estimating Resources

Estimate resources before setting up VCI.

Select the aggregation that you want to speed up and identify the required column data. The additional resources below are required according to the number of columns.

- **Memory**
  
  Secure additional capacity required for the disk space for the column for which VCI is to be created.

- **Disk**
  
  Secure additional disks based on the disk space required for the column for which VCI is to be created, as VCI stores column data as well as existing table data on the disk. It is recommended to provide a separate disk in addition to the existing one, and specify it as the tablespace to avoid impact on any other jobs caused by I/O.

#### Information

The operations on VCI can continue even if the memory configured for VCI is insufficient by using VCI data on the disk.

#### See

Refer to "Estimating Memory Requirements" and "Estimating Database Disk Space Requirements" in the Installation and Setup Guide for Server for information on how to estimate required memory and disk space.

### 9.1.3 Setting up

This section describes how to set up VCI.

**Setup flow**

1. Setting Parameters
2. Installing the Extensions
3. Creating VCI
4. Confirming that VCI has been Created

#### 9.1.3.1 Setting Parameters

Edit `postgresql.conf` to set the required parameters for VCI. After that, start or restart the instance.

The following table lists the parameters that need or are recommended to be configured in advance:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at server start.</td>
<td>Y</td>
</tr>
<tr>
<td>session_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at connection start.</td>
<td>Y</td>
</tr>
<tr>
<td>reserve_buffer_ratio</td>
<td>Percentage of shared memory to be used for stable buffer table</td>
<td>Proportion of shared memory to be used for a stable buffer table.</td>
<td>N</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Setting value</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>vci.control_max_workers</td>
<td>Number of background workers that manage VCI.</td>
<td>Number of background workers that manage VCI. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of background workers used for parallel scan.</td>
<td>Maximum number of background workers used for parallel scan. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
</tbody>
</table>

### Example

```sql
shared_preload_libraries = 'vci, pg_prewarm'
session_preload_libraries = 'vci, pg_prewarm'
reserve_buffer_ratio = 20
vci.control_max_workers = 8
vci.max_parallel_degree = 4
max_worker_processes = 18  # Example: If the initial value was 6, 6 + 8 + 4 = 18
```

### Note

An error occurs if you use VCI to start instances when procfs is not mounted. Ensure that procfs is mounted before starting instances.

### See

- Refer to "Appendix A Parameters" for information on all parameters for VCI. Refer also to default value for each parameter and details such as specification range in the same chapter. Refer to "Server Configuration" under "Server Administration" in the PostgreSQL documentation for information on shared_preload_libraries, session_preload_libraries, and max_worker_processes.

#### 9.1.3.2 Installing the Extensions

Execute the CREATE EXTENSION statement to install the VCI and pg_prewarm extensions. Both extensions need to be installed for each database.

- Installing VCI
  ```sql
db01=# CREATE EXTENSION vci;
```

- Installing pg_prewarm
  ```sql
db01=# CREATE EXTENSION pg_prewarm;
```

### Note

- Only superusers can install VCI extensions.
- VCI extensions can only be installed in public schema.
- Some operations cannot be performed for VCI extensions. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.

#### 9.1.3.3 Creating a VCI

Execute the CREATE INDEX statement with the "USING vci" clause to create a VCI for the desired columns and the "WITH (stable_buffer=true)" clause to enable the stable buffer feature.
To use a separate disk for the VCI, specify the TABLESPACE clause.

```
db01=# CREATE INDEX idx_vci ON table01 USING vci (col01, col02) WITH (stable_buffer=true);
```

**Note**

- Some table types cannot be specified on the ON clause of CREATE INDEX. Refer to "9.1.4.1 Relation Types" for details.
- Some data types cannot be specified on the column specification of CREATE INDEX. Refer to "9.1.4.2 Data Types" for details.
- Some operations cannot be performed for VCI. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
- The same column cannot be specified more than once on the column specification of CREATE INDEX.
- VCI cannot be created for table columns that belong to the template database.
- CREATE INDEX creates multiple views named vci_10digitRelOid_5digitRelAttr_1charRelType alongside VCI itself. These are called VCI internal relations. Do not update or delete them as they are used for VCI aggregation.
- All data for the specified column will be replaced in columnar format when VCI is created, so executing CREATE INDEX on an existing table with data inserted takes more time compared with a general index (B-tree). Jobs can continue while CREATE INDEX is running.

### 9.1.3.4 Confirming that the VCI has been Created

Execute the SELECT statement to reference the pg_indexes catalog, and confirm that the VCI was created for the target columns.

**Example**

```
db01=# SELECT indexdef FROM pg_indexes WHERE indexdef LIKE '%vci%';
indexdef
----------------------------------------------------------
CREATE INDEX idx_vci ON table01 USING vci (col01, col02)
(1 row)
```

### 9.1.4 Data that can Use VCI

This section describes on which relation types and for which data types VCIs can be created.

#### 9.1.4.1 Relation Types

VCIs cannot be created on some relation types.

The ON clause of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify relations on which VCIs cannot be created.

- Relations on which VCIs can be created
  - Normal tables
  - UNLOGGED TABLEs
- Relations on which VCIs cannot be created
  - Materialized views
  - Temporary tables
  - Views
  - Temporary views
  - Foreign tables
### 9.1.4.2 Data Types

VCIs cannot be created for some data types.

The column specification of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify a column with data type on which VCIs cannot be created.

<table>

### 9.2 Operating VCI

This section describes how to operate VCI.

#### 9.2.1 Commands that cannot be Used for VCI

Some operations cannot be performed for VCI extensions and VCI itself.

This section describes SQL commands that cannot be executed for the VCI extensions and VCI itself, and client application commands.

**SQL commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER EXTENSION</td>
<td>UPDATE</td>
<td>The VCI extension cannot be specified.</td>
</tr>
</tbody>
</table>
### Command | Subcommand | Description
--- | --- | ---
SET SCHEMA | | This operation is not required for VCI.
ADD | | 
DROP | | 

**CREATE EXTENSION**

<table>
<thead>
<tr>
<th>Subcommand</th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td></td>
<td>The subcommands on the left cannot be performed if the VCI extension is specified. This operation is not required for VCI.</td>
</tr>
</tbody>
</table>

**DROP EXTENSION**

| | | Description |
| - | | The VCI extension cannot be specified. (Restriction in this edition.) |

### Operations that cannot be performed on relations containing a VCI

<table>
<thead>
<tr>
<th>Command</th>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER INDEX</td>
<td>SET</td>
<td>The subcommands on the left cannot be performed if a VCI is specified. If the operation is required, delete the VCI using DROP INDEX, and re-create it using CREATE INDEX after completing the operation.</td>
</tr>
<tr>
<td></td>
<td>SET TABLESPACE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ALL IN TABLESPACE</td>
<td></td>
</tr>
<tr>
<td>ALTER OPERATOR CLASS</td>
<td>RENAME TO</td>
<td>The subcommands on the left cannot be performed if a VCI is specified. This operation is not supported in VCI.</td>
</tr>
<tr>
<td></td>
<td>OWNER TO</td>
<td></td>
</tr>
<tr>
<td>ALTER OPERATOR FAMILY</td>
<td>ADD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DROP</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RENAME TO</td>
<td></td>
</tr>
<tr>
<td></td>
<td>OWNER TO</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SET SCHEMA</td>
<td></td>
</tr>
<tr>
<td>ALTER TABLE</td>
<td>ALL IN TABLESPACE name [ OWNED BY roleName ] SET TABLESPACE newTablespace</td>
<td>A tablespace that contains a VCI cannot be specified. If the operation is required, delete the VCI using DROP INDEX, and re-create it using CREATE INDEX after completing the operation.</td>
</tr>
</tbody>
</table>

<p>| | DROP [ COLUMN ] [ IF EXISTS ] colName [ RESTRICT | CASCADE ] | A column that contains a VCI cannot be specified. If the operation is required, delete the VCI using DROP INDEX, and re-create it using CREATE INDEX after completing the operation. |
| | ALTER [ COLUMN ] colName [ SET DATA | TYPE dataType | COLLATE collation | [ USING expr ] ] | |
| | CLUSTER ON indexName | A VCI cannot be specified. This operation is not supported in VCI. |
| | REPLICA IDENTITY {DEFAULT | USING INDEX indexName | FULL | NOTHING} | |
| | SET WITH OIDS | If WITHOUT OIDS is specified for a table that contains a VCI, the SET WITH OIDS clause cannot be used. If the operation is required, delete the VCI using DROP INDEX, and re-create it using CREATE INDEX after completing the operation. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET WITHOUT OIDS</td>
<td></td>
<td>If WITH OIDS is specified for a table that contains a VCI, the SET WITHOUT OIDS clause cannot be used. If the operation is required, delete the VCI using DROP INDEX, and re-create it using CREATE INDEX after completing the operation.</td>
</tr>
<tr>
<td>CLUSTER</td>
<td>-</td>
<td>A table that contains a VCI and VCI cannot be specified. If the operation is required, delete the VCI using DROP INDEX, and re-create it using CREATE INDEX after completing the operation.</td>
</tr>
<tr>
<td>CREATE INDEX</td>
<td>UNIQUE</td>
<td>The subcommands on the left cannot be performed if a VCI is specified. This operation is not supported in VCI.</td>
</tr>
<tr>
<td></td>
<td>CONCURRENTLY</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ ASC</td>
<td>DESC ]</td>
</tr>
<tr>
<td></td>
<td>[ NULLS { FIRST</td>
<td>LAST } ]</td>
</tr>
<tr>
<td></td>
<td>WITH</td>
<td></td>
</tr>
<tr>
<td></td>
<td>WHERE</td>
<td></td>
</tr>
<tr>
<td>CREATE OPERATOR CLASS</td>
<td>-</td>
<td>A VCI cannot be specified. This operation is not supported in VCI.</td>
</tr>
<tr>
<td>CREATE OPERATOR FAMILY</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>CREATE TABLE</td>
<td>EXCLUDE</td>
<td>The subcommands on the left cannot be performed if a VCI is specified. This operation is not supported in VCI.</td>
</tr>
<tr>
<td>DROP INDEX</td>
<td>CONCURRENTLY</td>
<td>The subcommands on the left cannot be performed if a VCI is specified. This operation is not supported in VCI.</td>
</tr>
<tr>
<td>REINDEX</td>
<td>-</td>
<td>A VCI cannot be specified. This command is not required as VCI uses daemon's automatic maintenance to prevent disk space from increasing.</td>
</tr>
</tbody>
</table>

**Client application command**

- Operations that cannot be performed on relations containing a VCI

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterdb</td>
<td>Clustering cannot be performed for tables that contain a VCI.</td>
</tr>
<tr>
<td>reindexdb</td>
<td>VCIs cannot be specified on the --index option.</td>
</tr>
</tbody>
</table>

**9.2.2 Data Preload Feature**

The first aggregation using VCI immediately after an instance is started may take time, because the VCI data has not been loaded to buffer. Therefore, use the preload feature to load the VCI data to buffer in advance when performing VCI aggregation after an instance is started. When using the preload feature, execute the function `pgx_prewarm_vci` to each VCI created with CREATE INDEX.

```sql
db01=# SELECT pgx_prewarm_vci('idx_vci');
```
Refer to "B.4 VCI Data Load Control Function" for information on pgx_prewarm_vci.
Chapter 10 Actions when an Error Occurs

This chapter describes the actions to take when an error occurs in the database or an application, while FUJITSU Enterprise Postgres is operating.

Depending on the type of error, it may be necessary to recover the database cluster. The recovery process recovers the following resources:

- Data storage destination
- Transaction log storage destination (if the transaction log is stored in a separate disk from the data storage destination)
- Backup data storage destination

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output. The recovery actions differ for these error messages.

Check the status of the disk, and select one of the following actions:

- If the disk is defective
  Refer to "10.1 Recovering from Disk Failure (Hardware)", and take actions accordingly.

- If the disk is not defective
  Refer to "10.14 I/O Errors Other than Disk Failure", and take actions accordingly.

A few examples of errors generated even if the disk is not defective include:

- Network error with an external disk
- Errors caused by power failure or mounting issues

Determining the cause of an error

If an error occurs, refer to the WebAdmin message and the server log, and determine the cause of the error.

See

Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on server logs.

Approximate recovery time

The formulas for deriving the approximate recovery time of resources in each directory are given below.

- Data storage destination or transaction log storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheDataStorageDestination} + \text{usageByTheTransactionLogStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]

- usageByTheDataStorageDestination: Disk space used by the database cluster
- usageByTheTransactionLogStorageDestination: Disk space used by the transaction log stored outside the database cluster
- diskWritePerformance: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

- Backup data storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheBackupDataStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]

- usageByTheBackupDataStorageDestination: Disk space used by the backup data
- diskWritePerformance: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

## 10.1 Recovering from Disk Failure (Hardware)

This section describes how to recover database clusters to a point immediately before failure, if a hardware failure occurs in the data storage disk or the backup data storage disk.

There are two methods of recovery:
- 10.1.1 Using WebAdmin
- 10.8.1.2 Using Server Commands

### Point

Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

### 10.1.1 Using WebAdmin

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

#### Note

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

### If failure occurred in the data storage disk or the transaction log storage disk

Follow the procedure below to recover the data storage disk or the transaction log storage disk.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.

3. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

4. Create a tablesapce directory
   If a tablespace was defined after backup, create a directory for it.

5. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.
6. Recover the database cluster

Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

7. Run recovery

In the [Restore Instance] dialog box, click [Yes].

Instance restore is performed. An instance is automatically started when recovery is successful.

---

**Note**

WebAdmin does not support recovery of hash index. If you are using a hash index, then after recovery, execute the REINDEX command to rebuild it. Use of hash indexes is not recommended.

---

8. Resume applications

Resume applications that are using the database.

---

**Point**

WebAdmin may be unable to detect disk errors, depending on how the error occurred.

If this happens, refer to "10.10.3 Other Errors" to perform recovery.

---

**If failure occurred on the backup data storage disk**

Follow the procedure below to recover the backup data storage disk.
1. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

2. Recover the backup data
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

3. Run backup
   Perform backup to enable recovery of the backup data. In the [Backup] dialog box, click [Yes]. The backup is performed. An instance is automatically started when backup is performed.

-  Point -

If you click [Recheck the status], the resources in the data storage destination and the backup data storage destination are reconfirmed. As a result, the following occurs:

- If an error is not detected
  The status of the data storage destination and the backup data storage destination returns to normal, and it is possible to perform operations as usual.

- If an error is detected
  An error message is displayed in the message list again. Click [Solution], and resolve the problem by following the resolution for the cause of the error displayed in the dialog box.
10.1.2 Using Server Command

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

If failure occurred on the data storage disk or the transaction log storage directory

Follow the procedure below to recover the data storage disk or the transaction log storage directory.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance, refer to "2.1.2 Using Server Commands" for details.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

4. Create a storage destination directory
   - If failure occurred on the data storage disk
     Create a data storage destination directory. If a tablespace was defined, also create a directory for it.
   - If failure occurred on the translation log storage disk
     Create a transaction log storage destination directory.

Example

To create a data storage destination directory:

```bash
$ mkdir /database/inst1
$ chown fsepuser:fsepuser /database/inst1
$ chmod 700 /database/inst1
```

See

Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on how to create a storage directory.

5. Recover the keystore, and enable automatic opening of the keystore

   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

6. Recover the database cluster

   Recover the database cluster using the backup data.

   Specify the following in the pgx_rcvall command:

   - Specify the data storage location in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup data storage location in the -B option.

Example

```bash
> pgx_rcvall -D /database/inst1 -B /backup/inst1
```
If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

| FATAL: The database system is starting |

7. Start the instance
   - Start the instance.
   - Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

8. Resume applications
   - Resume applications that are using the database.

### If failure occurred on the backup data storage disk

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td>N</td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>5</td>
<td>Recover the failed disk</td>
<td>Y</td>
</tr>
<tr>
<td>6</td>
<td>Create a backup data storage destination directory</td>
<td>Y</td>
</tr>
<tr>
<td>7</td>
<td>Resume output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>8</td>
<td>Resume transaction log mirroring</td>
<td>Y</td>
</tr>
<tr>
<td>9</td>
<td>Start the instance</td>
<td>N</td>
</tr>
<tr>
<td>10</td>
<td>Run backup</td>
<td>Y</td>
</tr>
<tr>
<td>11</td>
<td>Resume applications</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Required
N: Not required

The procedure is as follows:
If an instance has not been stopped

1. Confirm that transaction log mirroring has stopped

   Use the following SQL function to confirm that transaction log mirroring has stopped.

   ```sql
   postgres=# SELECT pgx_is_wal_multiplexing_paused();
   pgx_is_wal_multiplexing_paused
   ---------------------
   t
   (1 row)
   ```

   If transaction log mirroring has not stopped, then stop it using the following SQL function.

   ```sql
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG:  multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   ------------------------------
   (1 row)
   ```

2. Stop output of archive logs

   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

   To prevent this, use the following methods to stop output of archive logs.
   - Changing `archive_command`
     Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.
     If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.
   - Reload the configuration file
     Execute the `pg_ctl reload` command or the `pg_reload_conf` SQL function to reload the configuration file.

   If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in `archive_command` and reload the configuration file.

3. Recover the failed disk

   Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

   Create a backup data storage destination.

   **Example**
   ```bash
   $ mkdir /database/inst1
   $ chown fsepuser:fsepuser /database/inst1
   $ chmod 700 /database/inst1
   ```

   Refer to "3.2.2 Using Server Commands" for information on how to create a backup data storage destination.

5. Resume output of archive logs

   Return the `archive_command` setting to its original value, and reload the configuration file.

6. Resume transaction log mirroring

   Execute the `pgx_resume_wal_multiplexing` SQL function.

   **Example**
   ```sql
   SELECT pgx_resume_wal_multiplexing()
   ```
7. Run backup

Use the `pgx_dmpall` command to back up the database cluster.

Specify the following value in the `pgx_dmpall` command:

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pgx_dmpall -D /database/inst1
```

If an instance has been stopped

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Server Commands" for details.

If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

Create a backup data storage destination.

Example

```
# mkdir /backup/inst1
# chown fsepuser:fsepuser /backup/inst1
# chmod 700 /backup/inst1
```

Refer to "3.2.2 Using Server Commands" for details.

5. Start the instance

Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

6. Run backup

Use the `pgx_dmpall` command to back up the database cluster.

Specify the following value in the `pgx_dmpall` command:

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the PGDATA environment variable is used by default.

Example

```
> pgx_dmpall -D /database/inst1
```

7. Resume applications

Resume applications that are using the database.

---

See

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the `pgx_rcvall` command and `pgx_dmpall` command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on `archive_command`.
- Refer to "B.1 WAL Mirroring Control Functions" for information on `pgx_resume_wal_multiplexing`.
10.2 Recovering from Data Corruption

If data in a disk is logically corrupted and the database does not operate properly, you can recover the database cluster to its state at the time of backup.

There are two methods of recovery:

- 10.2.1 Using WebAdmin
- 10.2.2 Using the pgx_rcvall Command

**Note**

- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.

10.2.1 Using WebAdmin

If using WebAdmin, recover the data to the point immediately prior to data corruption by using the backup data.

Refer to "10.1.1 Using WebAdmin" for details.

10.2.2 Using the pgx_rcvall Command

Recover the database cluster by specifying in the pgx_rcvall command the date and time of the backup you want to read from. Then re-execute the transaction as required to recover the data.

Follow the procedure below to recover the data storage disk.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the backup date and time
   Execute the pgx_rcvall command to confirm the backup data saved in the backup data storage destination, and determine a date and time prior to data corruption.

   Specify the following values in the pgx_rcvall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   - Specify the backup storage directory in the -B option.
   - The -l option displays the backup data information.

**Example**

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1 -l
Date     Status     Dir
2015-05-20 10:00:00 COMPLETE /backup/inst1/2015-05-20_10-00-00
```
4. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster

Use the pgx_rcvall command to recover the database cluster.

Specify the following values in the pgx_rcvall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup storage directory in the -B option.
- Specify the recovery date and time in the -e option.

Example

In the following examples, "May 20, 2015 10:00:00" is specified as the recovery time.

> pgx_rcvall -D /database/inst1 -B /backup/inst1 -e '2015-05-20 10:00:00'

Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.

The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

FATAL: The database system is starting

6. Start the instance

Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

If necessary, re-execute transaction processing from the specified recovery time, and then resume database operations.

Note

The pgx_rcvall command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the REINDEX command for the appropriate index.

7. Resume applications

Resume applications that are using the database.

See

Refer to "pgx_rcvall" in the Reference for information on the pgx_rcvall command.

10.3 Recovering from an Incorrect User Operation

This section describes how to recover database clusters when data has been corrupted due to erroneous user operations.

There are two methods of recovery:

- 10.3.1 Using WebAdmin
- **10.3.2 Using the pgx_recvall Command**

**Note**

- Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

- If you recover data to a point in the past, a new time series (database update history) will start from that recovery point. When recovery is complete, the recovery point is the latest point in the new time series. When you subsequently recover data to the latest state, the database update is re-executed on the new time series.

- An effective restore point is one created on a time series for which you have made a backup. That is, if you recover data to a point in the past, you cannot use any restore points set after that recovery point. Therefore, once you manage to recover your target past data, make a backup.

---

**10.3.1 Using WebAdmin**

You can use WebAdmin to recover data to a backup point.

**Note**

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

Follow the procedure below to recover the data in the data storage disk.

1. **Stop applications**
   Stop applications that are using the database.

2. **Stop the instance**
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.

3. **Recover the keystore, and enable automatic opening of the keystore**
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.

4. **Recover the database cluster**
   Log in to WebAdmin, and in the [Instances] tab, select the instance to be recovered and click 🎉.

5. **Recover to the backup point**
   In the [Restore Instance] dialog box, click [Yes].
   Recovery is performed. An instance is automatically started when recovery is successful.

**Note**

WebAdmin cannot accurately recover a hash index. If you are using a hash index, then after recovery, execute the REINDEX command for the appropriate index.
6. Resume database operations

If necessary, re-execute transaction processing from the backup point to when an erroneous operation was performed, and then resume database operations.

10.3.2 Using the pgx_rcvall Command

The pgx_rcvall command recovers database clusters to the restore point created with the server command. Refer to "Setting a restore point" in "3.2.2 Using Server Commands" for information on how to create a restore point.

Follow the procedure below to recover the data in the data storage disk.

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.

If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Confirm the restore point

Execute the pgx_rcvall command to confirm the backup data saved in the backup data storage destination, and use a restore point recorded in an arbitrary file, as explained in "3.2.2 Using Server Commands", to determine a restore point prior to the erroneous operation.

Specify the following values in the pgx_rcvall command:
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage destination in the -B option.
- The -l option displays the backup data information.

Example

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1 -l
Date            Status         Dir
2015-05-01 10:00:00 COMPLETE /backup/inst1/2015-05-01_10-00-00
```

4. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

5. Recover the database cluster

Use the pgx_rcvall command to recover the database cluster.

Specify the following values in the pgx_rcvall command:
- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage destination in the -B option.
- The -n option recovers the data to the specified restore point.

Example

The following example executes the pgx_rcvall command with the restore point "batch_20150503_1".

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1 -n batch_20150503_1
```
Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the `pgx_rcvall` command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the `pgx_rcvall` command.

The following message displayed during recovery is output as part of normal operation of `pgx_rcvall` (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

6. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

Note

The `pgx_rcvall` command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the `REINDEX` command for the appropriate index.

7. Restart operation of the database

If necessary, re-execute transaction processing from the specified recovery time to the point when an erroneous operation was performed, and then resume database operations.

See

Refer to "pgx_rcvall" in the Reference for information on the `pgx_rcvall` command.

10.4 Actions in Response to an Application Error

If there is a connection from a client that has been in the waiting state for an extended period, you can minimize performance degradation of the database by closing the problematic connection.

The following methods are available for identifying a connection to be closed:
- `view(pg_stat_activity)` (refer to "10.4.1 When using the view (pg_stat_activity)"
- `ps` command (refer to "10.4.2 Using the ps Command")
- `pgAdmin` (refer to "10.4.3 Using pgAdmin")

Use the system management function (`pg_terminate_backend`) to disconnect connections.

10.4.1 When using the view (pg_stat_activity)

When using the view (pg_stat_activity), follow the procedure below to close a connection.

1. Use `psql` command to connect to the postgres database.

```
> psql postgres
psql (9.6.2)
Type *help* for help.
```

2. Close connections from clients that have been in the waiting state for an extended period.

Use `pg_terminate_backend()` to close connections that have been trying to connect for an extended period.
However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements. Refer to “Notes on Application Compatibility” in the Application Development Guide for details.

Example

The following example closes connections where the client has been in the waiting state for at least 60 minutes.

```
select pid, usename, application_name, client_hostname, pg_terminate_backend(pid) from pg_stat_activity where state='idle in transaction' and current_timestamp > cast(query_start + interval '60 minutes' as timestamp);
```

- [ RECORD 1 ]---------------
  pid     | 4684
  username | fsepuser
  application_name | apl1
  client_addr | 192.11.11.1
  pg_terminate_backend | t

See

- Refer to “System Administration Functions” under “The SQL Language” in the PostgreSQL Documentation for information on `pg_terminate_backend`.
- Refer to “Notes on Application Compatibility” in the Application Development Guide for information on how to maintain application compatibility.

10.4.2 Using the `ps` Command

Follow the procedure below to close a connection using a standard Unix tool (ps command).

1. Execute the ps command to list the PID of the relevant processes.
   Note that "<xy>" indicates the product version and level.

   ```
   > ps -ef | grep postgres
   fsepuser 20517 1 ? /opt/fsep<xy>server64/bin/postgres
   fsepuser 16643 20517 ? /opt/fsep<xy>server64/bin/postgres
   fsepuser 16644 20517 ? /opt/fsep<xy>server64/bin/postgres
   ```

2. Execute the pargs command specifying the PID of the relevant processes.
   (repeat for each PID returned by the ps command)

   ```
   > pargs 16643
   argv[0]: postgres: fsepuser db01 192.168.100.11(49449) UPDATE waiting
   ```

   In the example above, the process ID 16643 may be a connection that was established a considerable time ago by the UPDATE statement, or a connection that has occupied resources (waiting).

3. Close connections from clients that have been in the waiting state for an extended period.

   Use `pg_terminate_backend()` to close the connection with the process ID identified in step 1 above.

   The example below disconnects the process with ID 16643.

   However, when considering continued compatibility of applications, do not reference or use system catalogs and functions directly in SQL statements.

   ```
   postgres=# SELECT pg_terminate_backend (16643);
   pg_terminate_backend
   -------------------
   t
   (1 row)
See

- Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on pg_terminate_backend.

- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on how to maintain application compatibility.

10.4.3 Using pgAdmin

If using pgAdmin, follow the procedure below to close connections.

1. From the [Tools] menu in pgAdmin, click [Server Status].
2. Close client connections that have been in the waiting state for an extended period.

From the transaction start time displayed under [TX start], select connections that have been in the waiting state for an extended period. Then click the red square button to close the connections.

10.5 Actions in Response to an Access Error

If access is denied, grant privileges allowing the instance administrator to operate the following directories and then re-execute operations. Also, refer to the system log and the server log, and confirm that the file system has not been mounted as read-only due to a disk error. If the file system has been mounted as read-only, mount it properly and then re-execute operations.

- Data storage destination
- Tablespace storage destination
- Transaction log storage destination
- Backup data storage destination

Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on the privileges required for the directory.
10.6 Actions in Response to Insufficient Space on the Data Storage Destination

If the data storage destination runs out of space, check if the disk contains any unnecessary files and delete them so that operations can continue.

If deleting unnecessary files does not solve the problem, you must migrate data to a disk with larger capacity.

There are two methods of migrating data:
- 10.6.1 Using a Tablespace
- 10.6.2 Replacing the Disk with a Larger Capacity Disk

10.6.1 Using a Tablespace

FUJITSU Enterprise Postgres enables you to use a tablespace to change the storage destination of database objects, such as tables and indexes, to a different disk.

The procedure is as follows:
1. Create a tablespace
   Use the CREATE TABLESPACE command to create a new tablespace in the prepared disk.
2. Modify the tablespace
   Use the ALTER TABLE command to modify tables for the newly defined tablespace.

See

Refer to “SQL Commands” under “Reference” in the PostgreSQL Documentation for information on the CREATE TABLESPACE command and ALTER TABLE command.

10.6.2 Replacing the Disk with a Larger Capacity Disk

Before replacing the disk with a larger capacity disk, migrate resources at the data storage destination using the backup and recovery features.

There are two methods of performing backup and recovery:
- 10.6.2.1 Using WebAdmin
- 10.6.2.2 Using Server Commands

The following sections describe procedures that use each of these methods to replace the disk and migrate resources at the data storage destination.

Note

- Before replacing the disk, stop applications and instances that are using the database.
- It is recommended that you back up the database cluster following recovery. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

10.6.2.1 Using WebAdmin

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using WebAdmin.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.
2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablespace directory") to 7 ("Run recovery") under "If failure occurred in the data storage disk or the transaction log storage disk" in "10.1.1 Using WebAdmin" for information on the procedure. An instance is automatically started when recovery is successful.

7. Resume applications
   Resume applications that are using the database.

8. Restore the files
   Restore the files backed up in step 1.

10.6.2.2 Using Server Commands

Follow the procedure below to replace the disk and migrate resources at the data storage destination by using server commands.

1. Back up files
   If the disk at the data storage destination contains any required files, back up the files. It is not necessary to back up the data storage destination.

2. Stop applications
   Stop applications that are using the database.

3. Back up the database cluster
   Back up the latest resources at the data storage destination. Refer to "3.2.2 Using Server Commands" for details.

4. Stop the instance
   After backup is complete, stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a data storage destination
   Create a data storage destination. If a tablespace was defined, also create a directory for it.

Example

```
$ mkdir /database/inst1
$ chown fsepuser:fsepuser /database/inst1
$ chmod 700 /database/inst1
```

7. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.
8. Recover the database cluster

Use the `pgx_rcvall` command to recover the database cluster.

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
- Specify the backup storage directory in the `-B` option.

**Example**

```bash
> pgx_rcvall -D /database/inst1 -B /backup/inst1
```

**Note**

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the `pgx_rcvall` command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the `pgx_rcvall` command.

The following message displayed during recovery is output as part of normal operation of `pgx_rcvall` (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

**See**

Refer to "pgx_rcvall" in the Reference for information on the `pgx_rcvall` command.

9. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

**Note**

The `pgx_rcvall` command cannot accurately recover a hash index. If you are using a hash index, wait for the `pgx_rcvall` command to end and then execute the REINDEX command for the appropriate index.

10. Resume applications

Resume applications that are using the database.

11. Restore files

Restore the files backed up in step 1.

### 10.7 Actions in Response to Insufficient Space on the Backup Data Storage Destination

If space runs out on the backup data storage destination, check if the disk contains any unnecessary files and delete them, and then make a backup as required.

If deleting unnecessary files does not solve the problem, take the following action:

- **10.7.1 Temporarily Saving Backup Data**
- **10.7.2 Replacing the Disk with a Larger Capacity Disk**
10.7.1 Temporarily Saving Backup Data

This method involves temporarily moving backup data to a different directory, saving it there, and securing disk space on the backup data storage destination so that a backup can be made normally.

Use this method if you need time to prepare a larger capacity disk.

If space runs out on the backup data storage destination, archive logs can no longer be stored in the backup data storage destination. As a result, transaction logs continue to accumulate in the data storage destination or the transaction log storage destination.

If action is not taken soon, the transaction log storage destination will become full, and operations may not be able to continue.

To prevent this, secure space in the backup data storage destination, so that archive logs can be stored.

There are two methods of taking action:

- 10.7.1.1 Using WebAdmin
- 10.7.1.2 Using Server Commands

10.7.1.1 Using WebAdmin

Follow the procedure below to recover the backup data storage disk.

1. Temporarily save backup data

   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

   Example

   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

2. Back up the database cluster

   Back up the latest resources at the data storage destination. Refer to "3.2.1 Using WebAdmin" for details.

3. Delete temporarily saved backup data

   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

   The following example deletes backup data that was temporarily saved in /mnt/usb.

   Example

   ```
   > rm -rf /mnt/usb/backup
   ```

10.7.1.2 Using Server Commands

The following describes the procedure for recovering the backup storage disk.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Stop transaction log mirroring</td>
<td>Y</td>
</tr>
<tr>
<td>No</td>
<td>Step</td>
<td>Instance stopped</td>
</tr>
<tr>
<td>----</td>
<td>-----------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td>Y    N</td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td>N    Y</td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td>N    Y</td>
</tr>
<tr>
<td>5</td>
<td>Temporarily save backup data</td>
<td>Y    Y</td>
</tr>
<tr>
<td>6</td>
<td>Resume output of archive logs</td>
<td>Y    N</td>
</tr>
<tr>
<td>7</td>
<td>Resume transaction log mirroring</td>
<td>Y    N</td>
</tr>
<tr>
<td>8</td>
<td>Start an instance</td>
<td>N    Y</td>
</tr>
<tr>
<td>9</td>
<td>Run backup</td>
<td>Y    Y</td>
</tr>
<tr>
<td>10</td>
<td>Resume applications</td>
<td>N    Y</td>
</tr>
<tr>
<td>11</td>
<td>Delete temporarily saved backup data</td>
<td>Y    Y</td>
</tr>
</tbody>
</table>

Y: Required  
N: Not required

The procedure is as follows:

**Performing recovery while the instance is active**

1. Stop transaction log mirroring  
   Stop transaction log mirroring.

   ```sql
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   --------------------------
   (1 row)
   ```

2. Stop output of archive logs  
   Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.
   
   To prevent this, use the following methods to stop output of archive logs.

   - Changing the `archive_command` parameter  
     Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.

   If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

   - Reloading the configuration file  
     Run the `pg_ctl reload` command or the `pg_reload_conf` SQL function.

   If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in `archive_command` and reload the configuration file.

3. Temporarily save backup data  
   Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

**Example**

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```

4. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.

5. Resume transaction log mirroring

Execute the `pgx_resume_wal_multiplexing` SQL function.

**Example**

```sql
SELECT pgx_resume_wal_multiplexing()
```

6. Run backup

Use the `pgx_dmpall` command to back up the database cluster.

Specify the following option in the `pgx_dmpall` command:

- Specify the directory of the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

**Example**

```bash
> pgx_dmpall -D /database/inst1
```

7. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

**Example**

```bash
> rm -rf /mnt/usb/backup
```

### If an instance has been stopped

1. Stop applications

Stop applications that are using the database.

2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Server Commands" for details.

If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Temporarily save backup data

Move backup data to a different directory and temporarily save it, and secure space in the backup data storage destination directory.

The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform recovery. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

**Example**

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```
4. Start the instance

   Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

5. Run backup

   Use the pgx_dmpall command to back up the database cluster.

   Specify the following value in the pgx_dmpall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

   Example
   
   ```
   > pgx_dmpall -D /database/inst1
   ```

6. Resume applications

   Resume applications that are using the database.

7. Delete temporarily saved backup data

   If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

   The following example deletes backup data that was temporarily saved in /mnt/usb.

   Example
   
   ```
   > rm -rf /mnt/usb/backup
   ```

---

**See**

- Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall command and pgx_dmpall command.
- Refer to "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on archive_command.
- Refer to "B.1 WAL Mirroring Control Functions" for information on the pgx_is_wal_multiplexing_paused and pgx_resume_wal_multiplexing.

---

**10.7.2 Replacing the Disk with a Larger Capacity Disk**

This method involves replacing the disk at the backup data storage destination with a larger capacity disk, so that it does not run out of free space again. After replacing the disk, back up data to obtain a proper backup.

There are two methods of performing backup:

- **10.7.2.1 Using WebAdmin**
- **10.7.2.2 Using Server Commands**

---

**Note**

Before replacing the disk, stop applications that are using the database.

---

**10.7.2.1 Using WebAdmin**

Follow the procedure below to recover the backup storage disk.

1. Back up files

   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.
2. Temporarily save backup data

Save the backup data to a different directory.

The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.

The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

**Example**

```bash
> mkdir /mnt/usb/backup/
> mv /backup/inst1/* /mnt/usb/backup/
```

3. Replace with a larger capacity disk

Replace the disk. Then, recover the volume configuration information.

4. Run backup

Log in to WebAdmin, and perform recovery operations. Refer to steps 2 ("Recover the backup data") and 3 ("Run backup") under "If failure occurred on the backup storage disk" in "10.1.1 Using WebAdmin".

5. Restore files

Restore the files backed up in step 1.

6. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

**Example**

```bash
> rm -rf /mnt/usb/backup
```

### 10.7.2.2 Using Server Commands

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:

- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>1</td>
<td>Back up files</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Temporarily save backup data</td>
<td>Y</td>
</tr>
<tr>
<td>3</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td>Y</td>
</tr>
<tr>
<td>4</td>
<td>Stop output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>5</td>
<td>Stop applications</td>
<td>N</td>
</tr>
<tr>
<td>6</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>7</td>
<td>Replace with a larger capacity disk</td>
<td>Y</td>
</tr>
<tr>
<td>8</td>
<td>Create a backup storage directory</td>
<td>Y</td>
</tr>
<tr>
<td>9</td>
<td>Resume output of archive logs</td>
<td>Y</td>
</tr>
<tr>
<td>10</td>
<td>Resume transaction log mirroring</td>
<td>Y</td>
</tr>
</tbody>
</table>
The procedure is as follows:

**If an instance has not been stopped**

1. Back up files
   - If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data
   - Save the backup data to a different directory.
   - The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   - The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/backup.

   **Example**
   
   ```
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

3. Confirm that transaction log mirroring has stopped
   - Use the following SQL function to confirm that transaction log mirroring has stopped.

   ```
   postgres=# SELECT pgx_is_wal_multiplexing_paused();
   pgx_is_wal_multiplexing_paused
   -------------------
   t
   (1 row)
   ```
   - If transaction log mirroring has not stopped, then stop it using the following SQL function.

   ```
   postgres=# SELECT pgx_pause_wal_multiplexing();
   LOG: multiplexing of transaction log files has been stopped
   pgx_pause_wal_multiplexing
   -------------------------------
   (1 row)
   ```

4. Stop output of archive logs
   - Transaction logs may accumulate during replacement of backup storage disk, and if the data storage destination disk or the transaction log storage destination disk becomes full, there is a risk that operations may not be able to continue.
   - To prevent this, use the following methods to stop output of archive logs.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>11</td>
<td>Start the instance</td>
<td>N</td>
</tr>
<tr>
<td>12</td>
<td>Run backup</td>
<td>Y</td>
</tr>
<tr>
<td>13</td>
<td>Resume applications</td>
<td>N</td>
</tr>
<tr>
<td>14</td>
<td>Restore files</td>
<td>Y</td>
</tr>
<tr>
<td>15</td>
<td>Delete temporarily saved backup data</td>
<td>Y</td>
</tr>
</tbody>
</table>
Changing the archive_command parameter

Specify a command that will surely complete normally, such as "echo skipped archiving WAL file %f" or "/bin/true", so that archive logs will be regarded as having been output.

If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

Reloading the configuration file

Run the pg_ctl reload command or the pg_reload_conf SQL function.

If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in archive_command and reload the configuration file.

5. Replace with a larger capacity disk

Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination

Create a backup data storage destination.

Example

```bash
# mkdir /backup/inst1
# chown fsepuser:fsepuser /backup/inst1
# chmod 700 /backup/inst1
```

Refer to "3.2.2 Using Server Commands" for details.

7. Resume output of archive logs

Return the archive_command setting to its original value, and reload the configuration file.

8. Resume transaction log mirroring

Execute the pgx_resume_wal_multiplexing SQL function.

Example

```sql
SELECT pgx_resume_wal_multiplexing();
```

9. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

Example

```bash
> pgx_dmpall -D /database/inst1
```

10. Restore files

Restore the files backed up in step 1.

11. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

Example

```bash
> rm -rf /mnt/usb/backup
```
If an instance has been stopped

1. Back up files
   If the disk at the backup data storage destination contains any required files, back up the files. It is not necessary to back up the backup data storage destination.

2. Temporarily save backup data
   Save the backup data to a different directory.
   The reason for saving the backup data is so that the data in the data storage destination can be recovered even if it is corrupted before you perform the next step. If there is no disk at the save destination and you consider that there is no risk of corruption at the data storage destination, delete the backup data.
   The following example saves backup data from the backup data storage destination directory (/backup/inst1) under /mnt/usb/
   storage.
   Example
   ```bash
   > mkdir /mnt/usb/backup/
   > mv /backup/inst1/* /mnt/usb/backup/
   ```

3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a backup data storage destination
   Create a backup data storage destination.
   Example
   ```bash
   # mkdir /backup/inst1
   # chown fsepuser:fsepuser /backup/inst1
   # chmod 700 /backup/inst1
   ```
   Refer to "3.2.2 Using Server Commands" for details.

7. Start the instance
   Start the instance. Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

8. Run backup
   Use the pgx_dmpall command to back up the database cluster.
   Specify the following value in the pgx_dmpall command:
   - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
   Example
   ```bash
   > pgx_dmpall -D /database/inst1
   ```

9. Resume applications
   Resume applications that are using the database.

10. Restore files
    Restore the files backed up in step 1.
11. Delete temporarily saved backup data

If backup completes normally, the temporarily saved backup data becomes unnecessary and is deleted.

The following example deletes backup data that was temporarily saved in /mnt/usb.

Example

```
> rm -rf /mnt/usb/backup
```
3. Stop applications
   Stop applications that are using the database.

4. Stop the instance
   Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops
   instances if recovery of the database cluster is performed without stopping the instance.

5. Replace with a larger capacity disk
   Replace the disk. Then, recover the volume configuration information.

6. Create a tablescape directory
   If a tablescape was defined after backing up, create a directory for it.

7. Recover the keystore, and enable automatic opening of the keystore
   Do the following if the data in the database has been encrypted:
   - Restore the keystore to its state at the time of the database backup.
   - Enable automatic opening of the keystore.

8. Recover the database cluster
   Log in to WebAdmin, and perform recovery operations. Refer to steps 4 ("Create a tablescape directory ") to 7 ("Run Recovery")
   under " If failure occurred in the data storage disk or the transaction log storage disk " in "10.1.1 Using WebAdmin" for information
   on the procedure. An instance is automatically started when recovery is successful.

9. Resume applications
   Resume applications that are using the database.

10. Restore files
    Restore the files backed up in step 1.

10.8.1.2 Using Server Commands
    Follow the procedure below to replace the disk and migrate resources at the transaction log storage destination by using server commands.

    1. Back up files
       If the disk at the transaction log storage destination contains any required files, back up the files. It is not necessary to back up the
       transaction log storage destination.

    2. Back up the database cluster
       Use server commands to back up the latest data storage destination resources and transaction log storage destination resources. Refer
       to "3.2.2 Using Server Commands" for information on how to perform backup.

    3. Stop applications
       Stop applications that are using the database.

    4. Stop the instance
       After backup is complete, stop the instance. Refer to "2.1.2 Using Server Commands" for information on how to stop an instance.
       If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

    5. Replace with a larger capacity disk
       Replace the disk. Then, recover the volume configuration information.

    6. Create a transaction log storage destination
       Create a transaction log storage destination. If a tablescape was defined, also create a directory for it.
Example

```
# mkdir /tranlog/inst1
# chown fsepuser:fsepuser /tranlog/inst1
# chmod 700 /tranlog/inst1
```

7. Recover the keystore, and enable automatic opening of the keystore

When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

8. Recover the database cluster

Use the `pgx_rcvall` command to recover the database cluster.

- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.
- Specify the backup storage directory in the `-B` option.

Example

```
> pgx_rcvall -D /database/inst1 -B /backup/inst1
```

**Note**

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the `pgx_rcvall` command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the `pgx_rcvall` command.

The following message displayed during recovery is output as part of normal operation of `pgx_rcvall` command (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

**See**

Refer to "pgx_rcvall" in the Reference for information on the `pgx_rcvall` command.

9. Start the instance

Start the instance.

Refer to "2.1.2 Using Server Commands" for information on how to start an instance.

**Note**

The `pgx_rcvall` command cannot accurately recover a hash index. If you are using a hash index, wait for the instance to start and then execute the `REINDEX` command for the appropriate index.

10. Resume applications

Resume applications that are using the database.

11. Restore files

Restore the files backed up in step 1.
10.9 Errors in More Than One Storage Disk

If an error occurs in the storage destination disks or resources are corrupted, determine the cause of the error from system logs and server logs and remove the cause.

If errors occur in either of the following combinations, you cannot recover the database.

Recreate the instance, and rebuild the runtime environment.

<table>
<thead>
<tr>
<th>Data storage disk</th>
<th>Transaction log storage disk</th>
<th>Backup data storage disk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>-</td>
<td>Error</td>
</tr>
<tr>
<td>-</td>
<td>Error</td>
<td>Error</td>
</tr>
</tbody>
</table>

See

Refer to "Setup" in the Installation and Setup Guide for Server for information on how to create an instance and build the runtime environment.

10.10 Actions in Response to Instance Startup Failure

If an instance fails to start, refer to the system log and the server log, and determine the cause of the failure.

If using WebAdmin, remove the cause of the error. Then, click [Solution] and [Recheck the status] and confirm that the instance is in the normal state.

The following sections describe common causes of errors and the actions to take.

10.10.1 Errors in the Configuration File

If you have directly edited the configuration file using a text editor or changed the settings using WebAdmin, refer to the system log and the server log, confirm that no messages relating to the files below have been output.

- postgresql.conf
- pg_hba.conf

See

Refer to the following for information on the parameters in the configuration file:

- "Configuring Parameters" in the Installation and Setup Guide for Server
- "Appendix A Parameters"
- "Server Configuration" and "Client Authentication" under "Server Administration" in the PostgreSQL Documentation

10.10.2 Errors Caused by Power Failure or Mounting Issues

If mounting is cancelled after restarting the server, for example, because the disk device for each storage destination disk was not turned on, or because automatic mounting has not been set, then starting an instance will fail.

Refer to "10.14.2 Errors Caused by Power Failure or Mounting Issues", and take actions accordingly.

10.10.3 Other Errors

This section describes the recovery procedure to be used if you cannot take any action or the instance cannot start even after you have referred to the system log and the server log.
There are two methods of recovery:

- 10.10.3.1 Using WebAdmin
- 10.10.3.2 Using Server Commands

Note that recovery will not be possible if there is an error at the backup data storage destination. If the problem cannot be resolved, contact Fujitsu technical support.

### 10.10.3.1 Using WebAdmin

Follow the procedure below to perform recovery.

1. Delete the data storage destination directory and the transaction log storage destination directory
   - Back up the data storage destination directory and the transaction log storage destination directory before deleting them.
2. Reconfirm the status
   - Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.
   - Click [Recheck the status] to reconfirm the storage destination resources.
3. Run recovery
   - Restore the database cluster after WebAdmin detects an error.
   - Refer to "10.2.1 Using WebAdmin" for details.

### 10.10.3.2 Using Server Commands

Follow the procedure below to recover the database.

1. Delete the data storage destination directory and the transaction log storage destination directory
   - Save the data storage destination directory and the transaction log storage destination directory, and then delete them.
2. Execute recovery
   - Use the pgx_rcvall command to recover the database cluster.
   - Refer to "10.2.2 Using the pgx_rcvall Command" for details.

### 10.11 Actions in Response to Failure to Stop an Instance

If an instance fails to stop, refer to the system log and the server log, and determine the cause of the failure.

If the instance cannot stop despite taking action, perform the following operation to stop the instance.

There are two methods of recovery:

- 10.11.1 Using WebAdmin
- 10.11.2 Using Server Commands

### 10.11.1 Using WebAdmin

In the [Instances] tab, click  and select the Fast stop mode or the Immediate stop mode to stop the instance. Forcibly terminate the server process from WebAdmin if the instance cannot be stopped.

Refer to "2.1.1 Using WebAdmin" for information on the stop modes.

### 10.11.2 Using Server Commands

There are three methods:
- Stopping the Instance Using the Fast Mode
  If backup is in progress, then terminate it, roll back all executing transactions, forcibly close client connections, and then stop the instance.

- Stopping the Instance Using the Immediate Mode
  Forcibly terminate the instance immediately. A crash recovery is run when the instance is restarted.

- Forcibly Stopping the Server Process
  Reliably stops the server process when the other methods are unsuccessful.

10.11.2.1 Stopping the Instance Using the Fast Mode

Specify "-m fast" in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "10.11.2.2 Stopping the Instance Using the Immediate Mode" or "10.11.2.3 Forcibly Stopping the Server Process".

Example

```
> pg_ctl stop -D /database/inst1 -m fast
```

10.11.2.2 Stopping the Instance Using the Immediate Mode

Specify "-m immediate" in the pg_ctl command to stop the instance.

If the instance fails to stop when you use this method, stop the instance as described in "10.11.2.3 Forcibly Stopping the Server Process".

Example

```
> pg_ctl stop -D /database/inst1 -m immediate
```

10.11.2.3 Forcibly Stopping the Server Process

If both the Fast mode and the Immediate mode fail to stop the instance, use the kill command or the kill parameter of the pg_ctl command to forcibly stop the server process.

The procedure is as follows:

1. Execute the ps command
   Note that "<xy>" indicates the product version and level.

```
> ps -eo user,pid,ppid,tty,args | grep postgres
fsepuser 20517 1 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 20518 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 19174 18027 pts/2 grep postgres
fsepuser 20520 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 20521 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 20522 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 20523 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 20524 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
fsepuser 20525 20517 ? /opt/fsepv<xy>/server64/bin/postgres -D /database/inst1
```

The process ID (20517) indicates the server process.

2. Forcibly stop the server process
   As instance manager, forcibly stop the server process.
Using the `pg_ctl` command

```plaintext
> pg_ctl kill SIGQUIT 20517
```

Using the `kill` command

```plaintext
> kill -s SIGQUIT 20517
```

### 10.12 Actions in Response to Failure to Create a Streaming Replication Standby Instance

When creating a streaming replication standby instance using WebAdmin, if the instance creation fails, refer to the system log and the server log, and determine the cause of the failure.

When an error occurs in the creation of the standby instance using WebAdmin, it is unlikely that the partially created standby instance can be resumed to complete the operation.

In such a scenario, fix the cause of the error, delete the partially created standby instance, and then create a new standby instance. This recommendation is based on the following assumptions:

- As the instance is yet to be created completely, there are no applications connecting to the database.
- The standby instance is in error state and is not running.
- There are no backups for the standby instance and as a result, it cannot be recovered.

Refer to "Deleting Instances" in the Installation and Setup Guide for details on how to delete an instance.

### 10.13 Actions in Response to Error in a Distributed Transaction

If a system failure (such as server failure) occurs in an application that uses distributed transactions (such as .NET TransactionScope), then transactions may be changed to the in-doubt state. At that point, resources accessed by the transaction will be locked, and rendered unusable by other transactions.

The following describes how to check for in-doubt transactions, and how to resolve them.

**How to check for in-doubt transactions**

The following shows how to check for them:

**If the server fails**

1. An in-doubt transaction will have occurred if a message similar to the one below is output to the log when the server is restarted.

   **Example**

   ```plaintext
   LOG: Restoring prepared transaction 2103.
   ```

2. Refer to system view `pg_prepared_xacts` to obtain information about the prepared transaction.

   If the transaction identifier of the prepared transaction in the list (in the transaction column of `pg_prepared_xacts`) is the same as the identifier of the in-doubt transaction obtained from the log output when the server was restarted, then that row is the information about the in-doubt transaction.

   **Example**

   ```sql
   postgres=# select * from pg_prepared_xacts;
   transaction |   gid     |   prepared |  owner   | database
   -------------+-----------+------------+----------+----------
   2103 | f6dc-4b73-9d62-d4f9e9b430cd | 2015-05-06 16:28:48.471+08 | postgres
   postgres (1 row)
   ```

   Information about the in-doubt transaction is output to the row with the transaction ID 2103 in the transaction column.
If the client fails

If there are no clients connected and there is a prepared transaction in pg_prepared_xacts, then you can determine that the transaction is in the in-doubt state.

If at least one client is connected and there is a prepared transaction in pg_prepared_xacts, you cannot determine whether there is a transaction in the in-doubt state. In this case, use the following query to determine the in-doubt transaction from the acquired database name, user name, the time PREPARE TRANSACTION was executed, and the information about the table name accessed.

```
select gid,x.database,owner,prepared,l.relation::regclass as relation from pg_prepared_xacts x
left join pg_locks l on l.virtualtransaction = '-1/'||x.transaction and l.locktype='relation';
```

If it still cannot be determined from this information, wait a few moments and then check pg_prepared_xacts again.

If there is a transaction that has continued since the last time you checked, then it is likely that it is the one in the in-doubt state.

**Point**

As you can see from the explanations in this section, there is no one way to definitively determine in-doubt transactions. Consider collecting other supplementary information (for example, logging on the client) or performing other operations (for example, allocating database users per job).

---

**How to resolve in-doubt transactions**

From the system view pg_prepared_xacts mentioned above, obtain the global transaction identifier (in the gid column of pg_prepared_xacts) for the in-doubt transaction, and issue either a ROLLBACK PREPARED statement or COMMIT PREPARED statement to resolve the in-doubt transaction.

**Example**

- Rolling back in-doubt transactions

  `postgres=# rollback prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';`

  **ROLLBACK PREPARED**

- Committing in-doubt transactions

  `postgres=# commit prepared '374cc221-f6dc-4b73-9d62-d4fec9b430cd';`

  **COMMIT PREPARED**

---

**10.14 I/O Errors Other than Disk Failure**

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output.

A few examples of such errors are given below. The appropriate action for each error is explained respectively.

- 10.14.1 Network Error with an External Disk
- 10.14.2 Errors Caused by Power Failure or Mounting Issues

**10.14.1 Network Error with an External Disk**

This is an error that occurs in the network path to/from an external disk.

Determine the cause of the error by checking the information in the system log and the server log, the disk access LED, network wiring, and network card status. Take appropriate action to remove the cause of the error, for example, replace problematic devices.
10.14.2 Errors Caused by Power Failure or Mounting Issues

These are errors that occur when the disk device is not turned on, automatic mounting of the disk was not set, or mounting was accidentally cancelled.

In this case, check the information in the system log and the server log, the disk access LED, and whether the disk is mounted correctly. If problems are detected, take appropriate action.

If mounting has been cancelled, it is possible that mounting was accidentally cancelled, or automatic mounting at the time of starting the operating system is not set. In this case, set the mounting to be performed automatically.

10.15 Anomaly Detection and Resolution

The following operations performed via the command line interface will result in an anomaly in WebAdmin:

- Changes to the port and backup_destination parameters in postgresql.conf
- Changes to Mirroring Controller configuration of cluster replication added via WebAdmin

This section describes when WebAdmin checks for such anomalies, and what takes place when an anomaly is detected.

10.15.1 Port Number and Backup Storage Path Anomalies

An anomaly occurs when the value of [Port number] and/or [Backup storage path] in WebAdmin is different from the value of its corresponding parameter in postgresql.conf - port and backup_destination, respectively.

WebAdmin checks for anomalies when an instance is selected for viewing or any instance operation is performed. Anomalies will be identified for the selected instance only.

The following occurs when an anomaly is detected in port number and/or backup storage path:

- All instance operation buttons are disabled, except for “Edit instance”, “Refresh instance”, and “Delete Mirroring Controller”
- A red error status indicator is displayed on the instance icon
- For an anomaly specific to backup storage path, a red error status indicator is displayed on the [Backup storage] disk icon, and [Backup storage status] is set to “Error”
- The message, “WebAdmin has detected an anomaly with...”, is displayed in the [Message] section along with an associated [Solution] button

Click [Solution]. The [Anomaly Error] dialog box is displayed.
Select the required option, click [OK], and then resolve the anomaly error.

Note

Critical errors encountered during anomaly resolution will be displayed, however, rollback of the instance to its previous state is not supported.

10.15.2 Mirroring Controller Anomalies

The following conditions will cause a Mirroring Controller anomaly:

- The Mirroring Controller management folder or configuration files have been deleted
- The permissions to the Mirroring Controller management folder or configuration files have been changed such that:
  - The instance administrator’s access to Mirroring Controller configuration is denied
  - Users other than an instance administrator have access privileges to Mirroring Controller configuration files

WebAdmin checks for anomalies when Mirroring Controller status check is performed.

The following occurs when a Mirroring Controller anomaly is detected:

- All Mirroring Controller functionality is disabled for the replication cluster, except for “Delete Mirroring Controller”
- [Mirroring Controller status] is set to “Error”
- Either of the following messages is displayed in the [Message] section
  - “Failed to access the Mirroring Controller management folder or configuration files ‘path’. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again.”
  - “Failed to find the Mirroring Controller management folder or configuration files ‘path’. Mirroring Controller functionality has been disabled. Consider deleting Mirroring Controller and adding it again.”
Appendix A Parameters

This appendix describes the parameters to be set in the postgresql.conf file of FUJITSU Enterprise Postgres.

The postgresql.conf file is located in the data storage destination.

- core_directory (string)

  This parameter specifies the directory where the corefile is to be output. If this parameter is omitted, the data storage destination is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- core_contents (string)

  This parameter specifies the contents to be included in the corefile.
  - full: Outputs all contents of the server process memory to the corefile.
  - none: Does not output a corefile.
  - minimum: Outputs only non-shared memory server processes to the corefile. This reduces the size of the corefile. However, in some cases, this file may not contain sufficient information for examining the factor that caused the corefile to be output.

  If this parameter is omitted, "minimum" is used by default. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- keystore_location (string)

  This parameter specifies the directory that stores the keystore file. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

- tablespace_encryption_algorithm (string)

  This parameter specifies the encryption algorithm for tablespaces that will be created. Valid values are AES128, AES256, and none. If you specify "none", encryption is not performed. The default value is "none". To perform encryption, it is recommended that you specify AES256. Only superusers can change this setting.

- backup_destination (string)

  This parameter specifies the absolute path of the directory where pgx_dmpall will store the backup data. Specify a different location from other database clusters. This parameter can only be set when specified on starting an instance. It cannot be changed dynamically, while an instance is active.

  Place this directory on a different disk from the data directory to be backed up and the tablespace directory. Ensure that users do not store arbitrary files in this directory, because the contents of this directory are managed by the database system.

- search_path (string)

  When using the SUBSTR function compatible with Oracle databases, set "oracle" and "pg_catalog" in the search_path parameter. You must specify "oracle" before "pg_catalog".

  Example

  search_path = '"$user", public, oracle, pg_catalog'

  Information

  - The search_path feature specifies the priority of the schema search path. The SUBSTR function in Oracle database is defined in the oracle schema.

  - Refer to "Statement Behavior" under "Server Administration" in the PostgreSQL Documentation for information on search_path.

- track_waits (string)

  This parameter enables collection of statistics for pgx_stat_lwlock and pgx_statLatch.
- on: Enables collection of statistics.
- off: Disables collection of statistics.

If this parameter is omitted, "on" is assumed.
Only superusers can change this setting.

- track_sql (string)
  This parameter enables collection of statistics for pgx_stat_sql.
  - on: Enables collection of statistics.
  - off: Disables collection of statistics.

If this parameter is omitted, "on" is assumed.
Only superusers can change this setting.

Parameters for the in-memory feature

- reserve_buffer_ratio (numerical value)
  This parameter specifies the proportion of shared memory to be used for a stable buffer table.
  - Minimum value: 0
  - Maximum value: 80

If this parameter is omitted, 0 will be used.

- vci.cost_threshold (numerical value)
  This parameter specifies the lowest cost that selects an execution plan that uses a VCI. If the cost of the best execution plan that does not use a VCI is lower than this value, that execution plan will be selected.
  - Minimum value: 0
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

If this parameter is omitted or a value outside this range is specified, 18000 will be used.

- vci.control_max_workers (numerical value)
  This parameter specifies the number of background workers that manage VCI. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.
  - Minimum value: 1
  - Maximum value: 8388607

If this parameter is omitted or a value outside this range is specified, 8 will be used.

- vci.enable (string)
  This parameter enables or disables VCI.
  - on: Enables VCI.
  - off: Disables VCI.

If this parameter is omitted, "on" will be used.

- vci.log_query (string)
  This parameter enables or disables log output when VCI is not used due to insufficient memory specified by vci.max_local_ros.
  - on: Enables log output.
  - off: Disables log output.

If this parameter is omitted, "off" will be used.
- vci.maintenance_work_mem (numerical value)

  This parameter specifies the maximum memory size used for maintenance of VCI (when executing CREATE INDEX, for example).
  - Minimum value: 1 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 256 MB will be used.

- vci.max_local_ros (numerical value)

  This parameter specifies the maximum memory size used for VCI scan.
  - Minimum value: 64 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 64 MB will be used.

---

**Information**

The maximum value that can be expressed as a 4-byte signed integer changes according to the operating system. Follow the definition of the operating system in use.

---

- vci.max_parallel_degree (numerical value)

  This parameter specifies the maximum number of background workers used for parallel scan. The number of workers for the entire instance is limited by max_worker_processes, so add the value specified here to max_worker_processes.

  A value from -8388607 to 8388607 can be specified.
  - Integer (1 or greater): Parallel scan is performed using the specified degree of parallelism.
  - 0: Stops the parallel scan process.
  - Negative number: The specified value minus the maximum number of CPUs obtained from the environment is used as the degree of parallelism and parallel scan is performed.

  If this parameter is omitted or a value outside this range is specified, "0" will be used.

- vci.shared_work_mem (numerical value)

  This parameter specifies the maximum memory size used for VCI parallel scan.
  - Minimum value: 32 MB
  - Maximum value: Maximum value that can be expressed as a 4-byte signed integer

  If this parameter is omitted or a value outside this range is specified, 1 GB will be used.

---

**See**

Refer to "Server Configuration" under "Server Administration" in the PostgreSQL Documentation for information on other postgresql.conf parameters.
Appendix B  System Administration Functions

This appendix describes the system administration functions of FUJITSU Enterprise Postgres.

See

Refer to "System Administration Functions" under "The SQL Language" in the PostgreSQL Documentation for information on other system administration functions.

B.1  WAL Mirroring Control Functions

The following table lists the functions that can be used for backup and recovery based on WAL mirroring.

Table B.1 WAL mirroring control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_pause_wal_multiplexing()</td>
<td>void</td>
<td>Stops WAL multiplexing</td>
</tr>
<tr>
<td>pgx_resume_wal_multiplexing()</td>
<td>void</td>
<td>Resumes WAL multiplexing</td>
</tr>
<tr>
<td>pgx_is_wal_multiplexing_paused()</td>
<td>boolean</td>
<td>Returns true if WAL multiplexing has stopped</td>
</tr>
</tbody>
</table>

If WAL multiplexing has not been configured, these functions return an error. Setting the backup_destination parameter in postgresql.conf configures WAL multiplexing.

Only superusers can execute these functions.

B.2  Transparent Data Encryption Control Functions

The following table lists the functions that can be used for transparent data encryption.

Table B.2 Transparent data encryption control functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_open_keystore(passphrase)</td>
<td>void</td>
<td>Opens the keystore</td>
</tr>
<tr>
<td>pgx_set_master_key(passphrase)</td>
<td>void</td>
<td>Sets the master encryption key</td>
</tr>
<tr>
<td>pgx_set_keystore_passphrase(oldPassphrase, newPassphrase)</td>
<td>void</td>
<td>Changes the keystore passphrase</td>
</tr>
</tbody>
</table>

The pgx_open_keystore function uses the specified passphrase to open the keystore. When the keystore is opened, the master encryption key is loaded into the database server memory. In this way, you can access the encrypted data and create encrypted tablespaces. If the keystore is already open, this function returns an error.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block.

The pgx_set_master_key function generates a master encryption key and stores it in the keystore. If the keystore does not exist, this function creates a keystore. If the keystore already exists, this function modifies the master encryption key. If the keystore has not been opened, this function opens it.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.
The `pgx_set_keystore_passphrase` function changes the keystore passphrase. Specify the current passphrase in `oldPassphrase`, and a new passphrase in `newPassphrase`.

The passphrase is a string of 8 to 200 bytes.

Only superusers can execute this function. Also, this function cannot be executed within a transaction block. Processing is not affected by whether the keystore is open.

### B.3 Data Masking Control Functions

The table below lists the functions that can be used for data masking.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pgx_alter_confidential_policy</code></td>
<td>boolean</td>
<td>Changes masking policies</td>
</tr>
<tr>
<td><code>pgx_create_confidential_policy</code></td>
<td>boolean</td>
<td>Creates masking policies</td>
</tr>
<tr>
<td><code>pgx_drop_confidential_policy</code></td>
<td>boolean</td>
<td>Deletes masking policies</td>
</tr>
<tr>
<td><code>pgx_enable_confidential_policy</code></td>
<td>boolean</td>
<td>Enables or disables masking policies</td>
</tr>
<tr>
<td><code>pgx_update_confidential_values</code></td>
<td>boolean</td>
<td>Changes replacement characters when full masking is specified for masking type</td>
</tr>
</tbody>
</table>

#### B.3.1 pgx_alter_confidential_policy

**Description**

Changes masking policies

**Format**

The format varies depending on the content to be changed. The format is shown below.

- **Common format**
  
  ```
  common_arg:
  [schema_name := 'schemaName',]
  table_name := 'tableName',
  policy_name := 'policyName'
  ```

- **Add a masking target to a masking policy**

  ```
  pgx_alter_confidential_policy(
    commonArg,
    [action := 'ADD_COLUMN', ]
    column_name := 'colName'
    [, function_type := 'FULL'] |
    [, function_type := 'PARTIAL', partialOpt] |
    [, function_type := 'REGEXP', regexpOpt]
  )
  ```

  **partialOpt:**

  ```
  function_parameters := 'maskingFmt'
  ```

  **regexpOpt:**

  ```
  regexp_pattern := 'regexpPattern',
  regexp_replacement := 'regexpReplacementChar',
  [, regexp_flags := 'regexpFlags']
  ```
- Delete a masking target from a masking policy

```python
pgx_alter_confidential_policy(
    commonArg,
    action := 'DROP_COLUMN',
    column_name := 'colName'
)
```

- Change the masking condition

```python
pgx_alter_confidential_policy(
    commonArg,
    action := 'MODIFY_EXPRESSION',
    expression := 'expr'
)
```

- Change the content of a masking policy set for a masking target

```python
pgx_alter_confidential_policy(
    commonArg,
    action := 'MODIFY_COLUMN',
    column_name := 'colName'
[, function_type := 'FULL'] |
[, function_type := 'PARTIAL', partialOpt] | |
[, function_type := 'REGEXP', regexpOpt]
)
```

- Change the masking policy description

```python
pgx_alter_confidential_policy(
    commonArg,
    action := 'SET_POLICY_DESCRIPTION',
    policy_description := 'policyDesc'
)
```

- Change the masking target description

```python
pgx_alter_confidential_policy(
    commonArg,
    action := 'SET_COLUMN_DESCRIPTION',
    column_name := 'colName',
    column_description := 'colDesc'
)
```

**Argument**

The argument varies depending on the content to be changed. Details are as follows.

- Common arguments
<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
<td>'public'</td>
</tr>
<tr>
<td></td>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Add a masking target to a masking policy

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'ADD_COLUMN'</td>
<td>'ADD_COLUMN'</td>
</tr>
<tr>
<td></td>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
</tr>
<tr>
<td></td>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Partial masking</td>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Regular expression masking</td>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
<td>NULL</td>
</tr>
</tbody>
</table>

- Delete a masking target from a masking policy

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'DROP_COLUMN'</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Change the masking condition

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>action</td>
<td>varchar(63)</td>
<td>'MODIFY_EXPRESSION'</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition to be changed</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- Change the content of a masking policy set for a masking target
### Masking type for which an argument can be specified

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>varchar(63)</td>
<td>'MODIFY_COLUMN'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
</tr>
<tr>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
<td>NULL</td>
</tr>
</tbody>
</table>

#### Partial masking

- **Full masking**
- **Partial masking**
- **Regular expression masking**

- **Change the masking policy description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>varchar(63)</td>
<td>'SET_POLICY_DESCRIPTION'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_description</td>
<td>varchar(1024)</td>
<td>Masking policy description</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

- **Change the masking target description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>varchar(63)</td>
<td>'SET_COLUMN_DESCRIPTION'</td>
<td>Mandatory</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>column_description</td>
<td>varchar(1024)</td>
<td>Masking target description</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>ADD_COLUMN</th>
<th>DROP_COLUMN</th>
<th>MODIFY_EXPRESSION</th>
<th>MODIFY_COLUMN</th>
<th>SET_POLICY_DESCRIPTION</th>

<td>regexp_flags</td>
<td>-</td>
<td>Y</td>
<td>-</td>
<td>-</td>
<td>Y</td>
<td>-</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified

### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

### Execution example 1
Adding masking policy p1 to masking target c2

```
pgx_alter_confidential_policy
--------------------------------
t(1 row)
```

### Execution example 2
Deleting masking target c1 from masking policy p1

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action := 'DROP_COLUMN', column_name := 'c1');
pgx_alter_confidential_policy
--------------------------------
t(1 row)
```
Execution example 3
Changing the masking condition for masking policy p1

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'MODIFY_EXPRESSION', expression := 'false');
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```

Execution example 4
Changing the content of masking policy p1 set for masking target c2

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'MODIFY_COLUMN', column_name := 'c2', function_type := 'FULL');
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```

Execution example 5
Changing the description of masking policy p1

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'SET_POLICY_DESCRIPTION', policy_description := 'this policy is an example.');
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```

Execution example 6
Changing the description of masking target c2

```
postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1', action :=
'SET_COLUMN_DESCRIPTION', column_name := 'c2', column_description := 'c2 column is FULL.');
pgx_alter_confidential_policy
--------------------------------
t
(1 row)
```

Description
- The arguments for the `pgx_alter_confidential_policy` system management function can be specified in any order.
- The action parameters below can be specified. When action parameters are omitted, ADD_COLUMN is applied.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COLUMN</td>
<td>Adds a masking target to a masking policy.</td>
</tr>
<tr>
<td>DROP_COLUMN</td>
<td>Deletes a masking target from a masking policy.</td>
</tr>
<tr>
<td>MODIFY_EXPRESSION</td>
<td>Changes expression.</td>
</tr>
<tr>
<td>MODIFY_COLUMN</td>
<td>Changes the content of a masking policy set for a masking target.</td>
</tr>
<tr>
<td>SET_POLICY_DESCRIPTION</td>
<td>Changes policy_description.</td>
</tr>
<tr>
<td>SET_COLUMN_DESCRIPTION</td>
<td>Changes column_description.</td>
</tr>
</tbody>
</table>

- The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.
The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.

- regexp_pattern
- regexp_replacement
- regexp_flags

See

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

B.3.2 pgx_create_confidential_policy

Description

Creates masking policies

Format

The format varies depending on the masking type. The format is shown below.

```sql
pgx_create_confidential_policy(
    [schema_name := 'schemaName',]
    table_name := 'tableName',
    policy_name := 'policyName',
    expression := 'expr'
    [, enable := 'policyStatus']
    [, policy_description := 'policyDesc']
    [, column_name := 'colName'
        [, function_type := 'FULL'] |
        [, function_type := 'PARTIAL', partialOpt] |
        [, function_type := 'REGEXP', regexpOpt]
        [, column_description := 'colDesc']
    ]
)
```

partialOpt:
function_parameters := 'maskingFmt'

regexpOpt:
regexp_pattern := 'regexpPattern',
regexp_replacement := 'regexpReplacementChar',
[, regexp_flags := 'regexpFlags']

Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Masking type for which an argument can be specified</th>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which the masking policy is created</td>
<td>'public'</td>
</tr>
<tr>
<td></td>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which the masking policy is created</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
### Masking type for which an argument can be specified

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition</td>
<td>Mandatory</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
<td>'t'</td>
</tr>
<tr>
<td>policy_description</td>
<td>varchar(1024)</td>
<td>Masking policy description</td>
<td>NULL</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
<td>NULL</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
<td>'FULL'</td>
</tr>
<tr>
<td>column_description</td>
<td>varchar(1024)</td>
<td>Masking target description</td>
<td>NULL</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Partial masking</th>
<th>function_parameters</th>
<th>Masking format for partial masking</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular expression masking</td>
<td>regexp_pattern</td>
<td>Search pattern for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_replacement</td>
<td>Replacement character/string for regular expression masking</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td>regexp_flags</td>
<td>Regular expression flags</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Full masking</td>
</tr>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
<tr>
<td>expression</td>
<td>N</td>
</tr>
<tr>
<td>enable</td>
<td>Y</td>
</tr>
<tr>
<td>policy_description</td>
<td>Y</td>
</tr>
<tr>
<td>column_name</td>
<td>Y</td>
</tr>
<tr>
<td>function_type</td>
<td>Y</td>
</tr>
<tr>
<td>column_description</td>
<td>Y</td>
</tr>
<tr>
<td>function_parameters</td>
<td>-</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>-</td>
</tr>
<tr>
<td>regexp_replacement</td>
<td>-</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>-</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted; -: Ignored when specified
Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example 1
Creating masking policy p1 that does not contain a masking target

```
postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
expression := '1=1');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Execution example 2
Creating masking policy p1 that contains masking target c1 of which the masking type is full masking

```
postgres=# select pgx_create_confidential_policy(schema_name := 'public', table_name := 't1',
policy_name := 'p1', expression := '1=1', enable := 't', policy_description := 'this policy is an example.', column_name := 'c1', function_type := 'FULL', column_description := 'c1 column is FULL.');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Execution example 3
Creating masking policy p1 that contains masking target c2 of which the masking type is partial masking

```
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
'VVVFVVVFPVVV, VVV-VVVV-VVVV, *, 4, 11');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Execution example 4
Creating masking policy p1 that contains masking target c3 of which the masking type is regular expression masking

```
postgres=# select pgx_create_confidential_policy( table_name := 't1', policy_name := 'p1',
expression := '1=1', column_name := 'c3', function_type := 'REGEXP', regexp_pattern := '(.*)(@.*)',
regexp_replacement := 'xxx\2', regexp_flags := 'g');
pgx_create_confidential_policy
---------------------------------
t
(1 row)
```

Description
- The arguments for the `pgx_create_confidential_policy` system management function can be specified in any order.
- If column_name is omitted, only masking policies that do not contain masking target will be created.
- One masking policy can be created for each table. Use the `pgx_alter_confidential_policy` system management function to add a masking target to a masking policy.
The function_parameters argument is enabled when the function_type is PARTIAL. If the function_type is other than PARTIAL, it will be ignored.

The arguments below are enabled when the function_type is REGEXP. If the function_type is other than REGEXP, these arguments will be ignored.

- regexp_pattern
- regexp_replacement
- regexp_flags

Note

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

See

- Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.
- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.

B.3.3 pgx_drop_confidential_policy

Description

Deletes masking policies

Format

```sql
pgx_drop_confidential_policy(
    [schema_name := 'schemaName', ]
    table_name := 'tableName',
    policy_name := 'policyName'
)
```

Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is deleted</td>
<td>‘public’</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is deleted</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted
Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Deleting masking policy p1

```
postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
pgx_drop_confidential_policy
-----------------------------
t
(1 row)
```

Description

The arguments for the `pgx_drop_confidential_policy` system management function can be specified in any order.

Note

If a table for which a masking policy is to be applied is deleted, delete the masking policy as well.

See

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.3.4 `pgx_enable_confidential_policy`

Description

Enables or disables masking policies

Format

```
pgx_enable_confidential_policy(
[  [schema_name := 'schemaName', ]
  table_name := 'tableName',
  policy_name := 'policyName',
  enable := 'policyStatus'
]
)
```

Argument

Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is enabled or disabled</td>
<td>'public'</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is enabled or disabled</td>
<td>Mandatory</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
<td>Mandatory</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
<td>Mandatory</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 't': Enabled</td>
<td></td>
</tr>
</tbody>
</table>
Details about whether arguments can be omitted are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Mandatory or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Y</td>
</tr>
<tr>
<td>table_name</td>
<td>N</td>
</tr>
<tr>
<td>policy_name</td>
<td>N</td>
</tr>
<tr>
<td>enable</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Can be omitted; N: Cannot be omitted

Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example

Enabling masking policy p1

```
postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');

pgx_enable_confidential_policy
---------------------------------
t
(1 row)
```

Description

The arguments for the `pgx_enable_confidential_policy` system management function can be specified in any order.

See

Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.3.5 `pgx_update_confidential_values`

Description

Changes replacement characters when full masking is specified for masking type

Format

```
pgx_update_confidential_values(
    [number_value := 'numberValue'],
    [, char_value := 'charValue'],
    [, varchar_value := 'varcharValue'],
    [, date_value := 'dateValue'],
    [, ts_value := 'tsValue']
)
```
Argument
Details are as follows.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Replacement character in numeric type</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>Replacement character in char type</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>Replacement character in varchar type</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>Replacement character in date type</td>
</tr>
<tr>
<td>ts_value</td>
<td>timestamp</td>
<td>Replacement character in timestamp type</td>
</tr>
</tbody>
</table>

Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>Ended normally</td>
</tr>
<tr>
<td>FALSE</td>
<td>Ended abnormally</td>
</tr>
</tbody>
</table>

Execution example
Using '*' as a replacement character in char type and varchar type

```
postgres=# select pgx_update_confidential_values(char_value := '*', varchar_value := '*');
pgx_update_confidential_values
-----------------------------
t
(1 row)
```

Description
- The arguments for the pgx_update_confidential_values system management function can be specified in any order.
- Specify one or more arguments for the pgx_update_confidential_values system management function. A replacement character is not changed for an omitted argument.

See
Refer to "String Constants" in the PostgreSQL Documentation for information on the strings to specify for arguments.

B.4 VCI Data Load Control Function

The table below lists the function that loads VCI data to buffer cache.

<table>
<thead>
<tr>
<th>Name</th>
<th>Return type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_prewarm_vci(vci_index regclass)</td>
<td>int8</td>
<td>Loads the VCI data to buffer cache.</td>
</tr>
</tbody>
</table>

pgx_prewarm_vci loads the specified VCI data to buffer cache and returns the number of blocks of the loaded VCI data.
The aggregation process using VCI may take time immediately after an instance is started, because the VCI data has not been loaded to buffer cache. Therefore, the first aggregation process can be sped up by executing pgx_prewarm_vci after an instance is started.
The amount of memory required for preloading is the number of blocks returned by pgx_prewarm_vci multiplied by the size of one block.
This function can only be executed if the user has reference privilege to the VCI index and execution privilege to the pg_prewarm function.
Appendix C  System Views

This appendix describes how to use the system views in FUJITSU Enterprise Postgres.

See

Refer to "System Views" under "Internals" in the PostgreSQL Documentation for information on other system views.

C.1  pgx_tablespaces

The pgx_tablespaces catalog provides information related to the encryption of tablespaces.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>References</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spctablespace</td>
<td>oid</td>
<td>pg_tablespace.oid</td>
<td>Tablespace OID</td>
</tr>
<tr>
<td>spcencalgo</td>
<td>text</td>
<td></td>
<td>Tablespace encryption algorithm</td>
</tr>
</tbody>
</table>

The spcencalgo string displays one of the following values:

- none: Tablespace is not encrypted
- AES128: AES with key length of 128 bits
- AES256: AES with key length of 256 bits

C.2  pgx_stat_lwlock

The pgx_stat_lwlock view displays statistics related to lightweight locks, with each type of content displayed on a separate line.

Table C.1 pgx_stat_lwlock view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lwlock_name</td>
<td>name</td>
<td>Name of the lightweight lock</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused by the lightweight lock</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of millisecons spent in waits caused by the lightweight lock</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistics was reset</td>
</tr>
</tbody>
</table>

C.3  pgx_stat_latch

The pgx_stat_latch view displays statistics related to latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line.

Table C.2 pgx_stat_latch view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>latch_name</td>
<td>name</td>
<td>Name of the latch</td>
</tr>
<tr>
<td>total_waits</td>
<td>bigint</td>
<td>Number of waits caused a wait</td>
</tr>
<tr>
<td>total_wait_time</td>
<td>double precision</td>
<td>Number of milliseconds spent in waits caused by the latch</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

C.4  pgx_stat_walwriter

The pgx_stat_walwriter view display statistics related to WAL writing, in a single line.
### Table C.3 pgx_stat_walwriter view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirty_writes</td>
<td>bigint</td>
<td>Number of times old WAL buffers were written to the disk because the WAL buffer was full when WAL records were added</td>
</tr>
<tr>
<td>writes</td>
<td>bigint</td>
<td>Number of WAL writes</td>
</tr>
<tr>
<td>write_blocks</td>
<td>bigint</td>
<td>Number of WAL write blocks</td>
</tr>
<tr>
<td>total_write_time</td>
<td>double precision</td>
<td>Number of milliseconds spent on WAL writing</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>

### C.5 pgx_stat_sql

The pgx_stat_sql view displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line.

### Table C.4 pgx_stat_sql view

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>selects</td>
<td>bigint</td>
<td>Number of SELECT statements executed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In database multiplexing mode, this number includes the SELECT statements executed in Mirroring Controller. Mirroring Controller executes the SELECT statement using the interval specified for the heartbeat_interval of the server definition file (milliseconds).</td>
</tr>
<tr>
<td>inserts</td>
<td>bigint</td>
<td>Number of INSERT statements executed</td>
</tr>
<tr>
<td>deletes</td>
<td>bigint</td>
<td>Number of DELETE statements executed</td>
</tr>
<tr>
<td>updates</td>
<td>bigint</td>
<td>Number of UPDATE statements executed</td>
</tr>
<tr>
<td>selects_with_parallelism</td>
<td>bigint</td>
<td>Number of times parallel scan was used in SELECT statements</td>
</tr>
<tr>
<td>inserts_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>deletes_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>updates_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>copies_with_parallelism</td>
<td>bigint</td>
<td>Not used</td>
</tr>
<tr>
<td>declares</td>
<td>bigint</td>
<td>Number of DECLARE statements executed (number of cursor OPENs)</td>
</tr>
<tr>
<td>fetches</td>
<td>bigint</td>
<td>Number of FETCH statements executed</td>
</tr>
<tr>
<td>checkpoints</td>
<td>bigint</td>
<td>Number of CHECKPOINT statements executed</td>
</tr>
<tr>
<td>clusters</td>
<td>bigint</td>
<td>Number of CLUSTER statements executed</td>
</tr>
<tr>
<td>copies</td>
<td>bigint</td>
<td>Number of COPY statements executed</td>
</tr>
<tr>
<td>reindexes</td>
<td>bigint</td>
<td>Number of REINDEX statements executed</td>
</tr>
<tr>
<td>truncates</td>
<td>bigint</td>
<td>Number of TRUNCATE statements executed</td>
</tr>
<tr>
<td>locks</td>
<td>bigint</td>
<td>Number of times a lock occurred</td>
</tr>
<tr>
<td>stats_reset</td>
<td>timestamp with timezone</td>
<td>Last time at which this statistic was reset</td>
</tr>
</tbody>
</table>
This appendix explains tables used by the data masking feature.

**Note**
These tables are updated by the data masking control function, so do not use SQL statements to directly update these tables.

### D.1 pgx_confidential_columns

This table provides information on masking target for which masking policies are set.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>column_name</td>
<td>varchar(63)</td>
<td>Masking target name</td>
</tr>
<tr>
<td>function_type</td>
<td>varchar(63)</td>
<td>Masking type</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'FULL': Full masking</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'PARTIAL': Partial masking</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'REGEXP': Regular expression masking</td>
</tr>
<tr>
<td>function_parameters</td>
<td>varchar(1024)</td>
<td>Masking format for partial masking</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>varchar(1024)</td>
<td>Search pattern for regular expression masking</td>
</tr>
<tr>
<td>regexp_replacement</td>
<td>varchar(1024)</td>
<td>Replacement character/string for regular expression masking</td>
</tr>
<tr>
<td>regexp_flags</td>
<td>varchar(20)</td>
<td>Regular expression flags</td>
</tr>
<tr>
<td>column_description</td>
<td>varchar(1024)</td>
<td>Masking target description</td>
</tr>
</tbody>
</table>

**Execution example**

```
postgres=# select * from pgx_confidential_columns;

schema_name | table_name | policy_name | column_name | function_type | function_parameters | regexp_pattern | regexp_replacement | regexp_flags | column_description
-------------|------------|-------------|-------------|---------------|---------------------|----------------|--------------------|-------------|-----------------------------|
public      | t1         | p1          | c1          | FULL          |                     |                |                    |             |                             |
|            |            |             |             |               |                     |                |                    |             |                             |
|            |            |             |             | PARTIAL       | VVVVVVVVVVVVVVVVVVV, VVVV-VVVV-VVVV, |                |                    |             |                             |
|            |            |             |             |               |                     |                |                    |             |                             |
(2 row)
```

### D.2 pgx_confidential_policies

This table provides information on masking policies.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>varchar(63)</td>
<td>Schema name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>table_name</td>
<td>varchar(63)</td>
<td>Name of table for which a masking policy is applied</td>
</tr>
<tr>
<td>policy_name</td>
<td>varchar(63)</td>
<td>Masking policy name</td>
</tr>
<tr>
<td>expression</td>
<td>varchar(1024)</td>
<td>Masking condition</td>
</tr>
<tr>
<td>enable</td>
<td>boolean</td>
<td>Masking policy status</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 't': Enabled</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 'f': Disabled</td>
</tr>
<tr>
<td>policy_description</td>
<td>varchar(1024)</td>
<td>Masking policy description</td>
</tr>
</tbody>
</table>

Execution example

```
postgres=# select * from pgx_confidential_policies;

<table>
<thead>
<tr>
<th>schema_name</th>
<th>table_name</th>
<th>policy_name</th>
<th>expression</th>
<th>enable</th>
<th>policy_description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>t1</td>
<td>p1</td>
<td>1=1</td>
<td>t</td>
<td></td>
</tr>
</tbody>
</table>
```

(1 row)

D.3 pgx_confidential_values

This table provides information on replacement characters when full masking is specified for masking type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_value</td>
<td>integer</td>
<td>Numeric</td>
<td>0</td>
</tr>
<tr>
<td>char_value</td>
<td>varchar(1)</td>
<td>char type</td>
<td>Spaces</td>
</tr>
<tr>
<td>varchar_value</td>
<td>varchar(1)</td>
<td>varchar type</td>
<td>Spaces</td>
</tr>
<tr>
<td>date_value</td>
<td>date</td>
<td>date type</td>
<td>'1970-01-01'</td>
</tr>
<tr>
<td>timestamp_value</td>
<td>timestamp</td>
<td>timestamp type</td>
<td>'1970-01-01 00:00:00'</td>
</tr>
</tbody>
</table>

Execution example

```
postgres=# select * from pgx_confidential_values;

<table>
<thead>
<tr>
<th>number_value</th>
<th>char_value</th>
<th>varchar_value</th>
<th>date_value</th>
<th>ts_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
<td>1970-01-01</td>
<td>1970-01-01 00:00:00</td>
</tr>
</tbody>
</table>
```

(1 row)
Appendix E Activating and Stopping the Web Server Feature of WebAdmin

To use WebAdmin for creating and managing a FUJITSU Enterprise Postgres instance on a server where FUJITSU Enterprise Postgres is installed, you must first activate the Web server feature of WebAdmin.

- Using WebAdmin in a single-server configuration
  You must start the Web server on the target server.
- Using WebAdmin in a multiserver configuration
  You must start the Web server on all servers on which WebAdmin has been installed.

This appendix describes how to activate and stop the Web server feature of WebAdmin.

Note that "<xy>" in paths indicates the product version and level.

See

Refer to "Installing WebAdmin in a Multiserver Configuration" in the Installation and Setup Guide for Server for information on multiserver installation.

E.1 Activating the Web Server Feature of WebAdmin

Follow the procedure below to activate the Web server feature of WebAdmin.

1. Change to superuser
   Acquire superuser privileges on the system.

   Example
   ```bash
   $ su -
   Password:********
   ```

2. Activate the Web server feature of WebAdmin
   Execute the WebAdminStart command to activate the Web server feature of WebAdmin.

   Example
   ```bash
   If WebAdmin is installed in /opt/fsepv<xy>/webadmin:
   # cd /opt/fsepv<xy>/webadmin/sbin
   # ./WebAdminStart
   ```

E.2 Stopping the Web Server Feature of WebAdmin

This section describes how to stop the Web server feature of WebAdmin.

Follow the procedure below to stop the Web server feature of WebAdmin.

1. Change to superuser
   Acquire superuser privileges on the system.

   Example
   ```bash
   $ su -
   Password:********
   ```

2. Stop the Web server feature of WebAdmin
   Execute the WebAdminStop command to stop the Web server feature of WebAdmin.
Example

If WebAdmin is installed in /opt/fserv<xy>webadmin:

```
# cd /opt/fserv<xy>webadmin/sbin
# ./WebAdminStop
```
Appendix F WebAdmin Wallet

This appendix describes how to use the Wallet feature of WebAdmin.

When a remote instance or a standby instance is created, it is necessary to provide user name and password for authentication with the remote machine or the database instance.

The Wallet feature in WebAdmin is a convenient way to create and store these credentials.

Once created, these credentials can be repeatedly used in one or more instances.

Note

It is not mandatory to create a credential in the Wallet. It is possible to create a remote instance or a standby instance without creating any credential in the Wallet.

If no credential is created beforehand, a user name and password can be entered in the instance creation page. When creating a "Remote" instance, if operating system credentials are entered without using a credential stored in the Wallet, WebAdmin automatically creates a credential with the given user name and password, and stores it in the user’s wallet for future use.

F.1 Creating a Credential

1. In the [My Wallet] tab, click . The [New credential] page will be displayed.
2. Enter the information for the credentials.

Enter the following items:
- [Credential name]: Name of the credential
  The name must meet the conditions below:
  - Maximum of 16 characters
  - The first character must be an ASCII alphabetic character
  - The other characters must be ASCII alphanumeric characters
- [User name]: The operating system user name or database instance user name that will be used later
- [Password]: Password for the user
- [Confirm password]: Reenter the password.

3. Click 🀄 to store the credential.

### F.2 Using a Credential

Once a credential is created in the Wallet, it can be used during remote instance creation or standby instance creation.

The following page uses the credential that was created in the previous section.

![Credential page](image)

When “Cred1” is selected in [Operating system credential], the user name and password are automatically populated from the credential.
Appendix G Collecting Failure Investigation Data

If the cause of an error that occurs while building the environment or during operations is unclear, data must be collected for initial investigation.

This appendix describes how to collect data for initial investigation.

Use FJQSS (Information Collection Tool) to collect data for initial investigation.

See

Refer to the FJQSS manual for information on how to use FJQSS.

Note

- When using FJQSS to collect data for initial investigation, you must set the following environment variables:
  - Environment variables required for using FUJITSU Enterprise Postgres
    Refer to "Configure the environment variables" under the procedure for creating an instance in "Using the initdb Command" in the Installation and Setup Guide for Server for information on the values to be set in the environment variables.
  - PGDATA
    Set the data storage destination.
  - PGPORT
    Set the instance port number. This does not need to be set if the default port number (27500) has not been changed.
  - PGUSER
    Set the database superuser.
    Set the database superuser so that client authentication is possible.
    FJQSS establishes a TCP/IP connection with the template1 database and collects data from the database.
  - FSEP_HOME
    Set the FUJITSU Enterprise Postgres installation directory.

In addition, when using database multiplexing, set the following environment variables:

- MCCONTROLDIR
  Refer to "Mirroring Controller Resources" in the Cluster Operation Guide for information on the Mirroring Controller management directory.

Preface

Purpose of this document
The FUJITSU Enterprise Postgres database system extends the PostgreSQL features and runs on the Windows platform.
This document is the FUJITSU Enterprise Postgres Operation Guide.

Intended readers
This document is intended for those who install and operate FUJITSU Enterprise Postgres.
Readers of this document are assumed to have general knowledge of:
- PostgreSQL
- SQL
- Windows

Structure of this document
This document is structured as follows:

Chapter 1 Operating FUJITSU Enterprise Postgres
Describes how to operate FUJITSU Enterprise Postgres.

Chapter 2 Starting an Instance and Creating a Database
Describes how to start a FUJITSU Enterprise Postgres instance, and how to create a database.

Chapter 3 Backing Up the Database
Describes how to back up the database.

Chapter 4 Configuring Secure Communication Using Secure Sockets Layer
Describes communication data encryption between the client and the server.

Chapter 5 Protecting Storage Data Using Transparent Data Encryption
Describes how to encrypt the data to be stored in the database.

Chapter 6 Data Masking
Describes the data masking feature.

Chapter 7 Periodic Operations
Describes the periodic database operations that must be performed on FUJITSU Enterprise Postgres.

Chapter 8 Streaming Replication Using WebAdmin
Describes how to create a streaming replication cluster using WebAdmin.

Chapter 9 Installing and Operating the In-memory Feature
Describes how to install and operate the in-memory feature.

Chapter 10 Actions when an Error Occurs
Describes how to perform recovery when disk failure or data corruption occurs.

Appendix A Parameters
Describes the FUJITSU Enterprise Postgres parameters.

Appendix B System Administration Functions
Describes the system administration functions of FUJITSU Enterprise Postgres.

Appendix C System Views
Describes how to use the system view in FUJITSU Enterprise Postgres.
Appendix D Tables Used by Data Masking
Describes the tables used by the data masking feature.

Appendix E Activating and Stopping the Web Server Feature of WebAdmin
Describes how to activate and stop WebAdmin (Web server feature).

Appendix F WebAdmin Wallet
Describes how to use the Wallet feature of WebAdmin.

Appendix G Collecting Failure Investigation Data
Describes how to collect information for initial investigation.

Export restrictions
Exportation/release of this document may require necessary procedures in accordance with the regulations of your resident country and/or US export control laws.

Chapter 1 Operating FUJITSU Enterprise Postgres

This chapter describes how to operate FUJITSU Enterprise Postgres.

1.1 Operating Methods

There are two methods of managing FUJITSU Enterprise Postgres operations:

- Operation management using GUI tools
- Operation management using commands

**See**

Before performing switchover or failover operation using database multiplexing, refer to "Database Multiplexing Mode" in the Cluster Operation Guide.

---

**Operation management using GUI tools**

This involves managing operations using the WebAdmin and pgAdmin GUI tools.

- Management using WebAdmin
  This removes the requirement for complex environment settings and operational design for backup and recovery that is usually required for running a database. It enables you to easily and reliably monitor the state of the database, create a streaming replication cluster, back up the database, and restore it even if you do not have expert knowledge of databases.

- Management using pgAdmin
  When developing applications and maintaining the database, you can use pgAdmin to perform simple operations on database objects, such as:
  - Rebuild indexes and update statistics
  - Create, delete, and update database objects

In addition, from pgAdmin of FUJITSU Enterprise Postgres, you can use the expanded features provided by FUJITSU Enterprise Postgres on the PostgreSQL SQL commands.

**See**

Refer to pgAdmin Help for information on the expanded features of pgAdmin provided by FUJITSU Enterprise Postgres.

---

**Operation management using commands**

You can use commands for configuring and operating the database and managing operations.

**Note**

You cannot combine WebAdmin and server commands to perform the following operations:

- Use commands to operate an instance created using WebAdmin.
- Use WebAdmin to recover a database backed up using commands.

For instances created with WebAdmin, however, backup can be obtained with the pgx_dmpall command. Also, WebAdmin can perform recovery by using the backup obtained with the pgx_dmpall command.

- To operate an instance created using the initdb command in WebAdmin, the instance needs to be imported using WebAdmin.
- You can perform backup and restoration in pgAdmin, but the backup data obtained with WebAdmin and pgx_dmpall is not compatible with the backup data obtained with pgAdmin.
- Refer to pgAdmin Help for other notes on pgAdmin.

Features used in each phase
The following table lists the features used in each phase for GUI-based operations and command-based operations.

<table>
<thead>
<tr>
<th>Operation</th>
<th>GUI-based operation</th>
<th>Command-based operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup</td>

<tr>
<td></td>
<td>WebAdmin</td>
<td>pgx_rcvall command</td>
</tr>
</tbody>
</table>

*1: Operations can be monitored using operation management middleware (such as Systemwalker Centric Manager).
*2: A warning is displayed when disk usage reaches 80%.
*3: This command searches for pg_stat_activity in the standard statistics views and monitors the state.

1.2 Activating WebAdmin
This section describes how to activate and log in to WebAdmin.

1.2.1 Logging in to WebAdmin
This section describes how to log in to WebAdmin.

User environment
It is recommended to use the following browsers with WebAdmin:
- Internet Explorer 11
- Microsoft Edge (Build 38)
WebAdmin will work with other browsers, such as Firefox and Chrome, however, the look and feel may be slightly different.

**Activation URL for WebAdmin**

In the browser address bar, type the activation URL of the WebAdmin window in the following format:

```
http://hostNameOrIpAddress:portNumber/
```

- **hostNameOrIpAddress**: The host name or IP address of the server where WebAdmin is installed.
- **portNumber**: The port number of WebAdmin. The default port number is 27515.

**Example**

For a server with IP address "192.0.2.0" and port number "27515"

```
http://192.0.2.0:27515/
```

The activation URL window shown below is displayed. From this window you can launch WebAdmin or access the product documentation.

---

**FUJITSU Enterprise Postgres**

![Launch WebAdmin](image)

![Explore Documentation](image)

© FUJITSU LIMITED 2017

---

**Note**

- You must activate the Web server feature of WebAdmin before using WebAdmin.
- Refer to "Appendix E Activating and Stopping the Web Server Feature of WebAdmin" for information on how to activate the Web server feature of WebAdmin.

---

**Log in to WebAdmin**

Click [Launch WebAdmin] in the activation URL window to activate WebAdmin and display the login window.
To log in, specify the following values:
- [User ID]: User ID (OS user account) of the instance administrator
- [Password]: Password corresponding to the user ID

**Point**

Use the OS user account as the user ID of the instance administrator. Refer to "Creating an Instance Administrator" in the Installation and Setup Guide for Server for details.

### 1.3 Starting pgAdmin

This section describes how to start pgAdmin, how to add an instance required for managing a database, and how to connect to and disconnect from the instance.

You can use pgAdmin on the Windows client.

#### 1.3.1 Starting pgAdmin

This section explains how to start pgAdmin if you are using it from the product "FUJITSU Enterprise Postgres Client (AAbit) x.y SPz" (where AA is "32" or "64", x.y and z are the version numbers (x.y SPz)).

**Windows Server(R) 2012**

From the [Start] screen, start [pgAdmin III (AAbit) (x.y SPz)].

**Windows(R) 8.1 or Windows Server(R) 2012 R2**

From the [Apps] view, start [pgAdmin III (AAbit) (x.y SPz)].

**Windows(R) 10 or Windows Server(R) 2016**

Click [Start] >> [All apps] >> [FUJITSU Enterprise Postgres Client(AAbit)] and start [pgAdmin III (AAbit) (x.y SPz)].
Other operating systems

Click [Start] >> [All Programs] >> [FUJITSU Enterprise Postgres Client (AAbit) x.y SPz] and start [pgAdmin III (AAbit) (x.y SPz)].

The following window is displayed when pgAdmin starts.

![pgAdmin III](image)

**Note**

- You must start the instance to be connected to before using pgAdmin.
- Refer to “2.1 Starting and Stopping an Instance” for information on how to start an instance.
- Adobe(R) Reader(R) X is required for browsing the manual from [FUJITSU Enterprise Postgres Help] in pgAdmin.

### 1.3.2 Adding an Instance

This section describes how to add an instance to be connected to.

1. From the [File] menu in pgAdmin, click [Add Server].
2. In the [New Server Registration] window, specify a value for each item.

![New Server Registration window]

- **[Name]:** Name of the instance to be managed
- **[Host]:** Host name or IP address of the server where FUJITSU Enterprise Postgres is installed
- **[Port]:** Port number of the instance
- **[Username]:** User name of the instance administrator
- **[Password]:** Password for the user name specified in [Username]

When you add an instance using pgAdmin, the instance is automatically connected to immediately after the addition is completed.

---

**Note**

If you select [Store password], a file storing the FUJITSU Enterprise Postgres connection password is created in the following location. Set the appropriate access permissions for the password file to protect it from unauthorized access.

- `%APPDATA%\postgresql\pgpass.conf`

---

### 1.3.3 Connecting/Disconnecting an Instance

This section describes how to connect pgAdmin to an instance, and how to disconnect it.
To connect to an instance created using WebAdmin, you must first configure the settings in the [Client authentication] window of WebAdmin to permit connection from pgAdmin.

Connecting to an instance

Starting pgAdmin does not connect it to any instance.

To connect to an instance, right-click the instance in [Object browser] and select [Connect].

If a password was not saved when the instance was added, the following password entry window is displayed.
Disconnecting from an instance

To disconnect from an instance, right-click the server in [Object browser] in the pgAdmin window and select [Disconnect server].

1.4 Operations Using Commands

You can operate and manage the database using the following commands:

- **Server commands**
  
  This group of commands includes commands for creating a database cluster and controlling the database. You can run these commands on the server where the database is operating.

  To use these commands, you must configure the environment variables.

  See

  - Refer to "PostgreSQL Server Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on server commands.
  
  - Refer to "Configure the environment variables" under the procedure for creating an instance in "Using the initdb Command" in the Installation and Setup Guide for Server for information on the values to be set in the environment variables.

- **Client commands**

  This group of commands includes the psql command and commands for extracting the database cluster to a script file. These commands can be executed on the client that can connect to the database, or on the server on which the database is running.

  To use these commands, you need to configure the environment variables.

  See

  - Refer to "PostgreSQL Client Applications" under "Reference" in the PostgreSQL Documentation, or "Reference" for information on client commands.
  
  - Refer to "Configuring Environment Variables" in the Installation and Setup Guide for Client for information on the values to be set in the environment variables.

1.5 Operating Environment of FUJITSU Enterprise Postgres

This section describes the operating environment and the file composition of FUJITSU Enterprise Postgres.
1.5.1 Operating Environment

The following figure shows the configuration of the FUJITSU Enterprise Postgres operating environment. The tables given below list the roles of the OS resources and FUJITSU Enterprise Postgres resources.

Table 1.1 OS resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared memory</td>
<td>Used when a database process exchanges information with an external process.</td>
</tr>
<tr>
<td>Semaphore</td>
<td></td>
</tr>
</tbody>
</table>

Table 1.2 FUJITSU Enterprise Postgres client resources

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection service file</td>
<td>Specifies information, such as the host name, user name, and password, for connecting to FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>Password file</td>
<td>Securely manages the password for connecting to FUJITSU Enterprise Postgres</td>
</tr>
<tr>
<td>CA certificate file</td>
<td>CA (certificate authority) certificate used for server authentication when encrypting communication data</td>
</tr>
</tbody>
</table>

*1. To distribute the I/O load, place the transaction log on a different disk from the data storage destination.
### Table 1.3 Server resources of FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>Type</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database cluster</td>
<td>Database storage area on the database storage disk. It is a collection of databases managed by an instance.</td>
</tr>
<tr>
<td>System catalog</td>
<td>Contains information required for the system to run, including the database definition information and the operation information created by the user.</td>
</tr>
<tr>
<td>Default tablespace</td>
<td>Contains table files and index files stored by default.</td>
</tr>
<tr>
<td>Transaction log</td>
<td>Contains log information in case of a crash recovery or rollback. This is the same as the WAL (Write Ahead Log).</td>
</tr>
<tr>
<td>Work file</td>
<td>Work file used when executing applications or commands</td>
</tr>
<tr>
<td>postgresql.conf</td>
<td>Contains information that defines the operating environment of FUJITSU Enterprise Postgres.</td>
</tr>
<tr>
<td>pg_hba.conf</td>
<td>FUJITSU Enterprise Postgres uses this file to authenticate individual client hosts.</td>
</tr>
<tr>
<td>Server certificate file</td>
<td>Contains information about the server certificate to be used when encrypting communication data and authenticating a server.</td>
</tr>
<tr>
<td>Server private key file</td>
<td>Contains information about the server private key to be used when encrypting communication data and authenticating a server.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Stores table files and index files in a separate area from the database cluster.</td>
</tr>
<tr>
<td>Backup</td>
<td>Stores the data required for recovering the database when an error, such as disk failure, occurs.</td>
</tr>
<tr>
<td>Database backup</td>
<td>Contains the backup data for the database.</td>
</tr>
<tr>
<td>Archive log</td>
<td>Contains the log information for recovery.</td>
</tr>
<tr>
<td>Core file</td>
<td>FUJITSU Enterprise Postgres process core file that is output when an error occurs during an FUJITSU Enterprise Postgres process.</td>
</tr>
<tr>
<td>Key management server or key management storage</td>
<td>Server or storage where the master encryption key file is located.</td>
</tr>
<tr>
<td>Master encryption key file</td>
<td>Contains the master encryption key to be used when encrypting storage data. The master encryption key file is managed on the key management server or key management storage.</td>
</tr>
</tbody>
</table>

#### 1.5.2 File Composition

FUJITSU Enterprise Postgres consists of the following files for controlling and storing the database. The table below shows the relationship between the number of such files and their location within a single instance.

**Table 1.4 Number of files within a single instance and how to specify their location**

<table>
<thead>
<tr>
<th>File type</th>
<th>Required</th>
<th>Quantity</th>
<th>How to specify the location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program files</td>
<td>Y</td>
<td>Multiple</td>
<td>Note that &quot;&lt;xy&gt;&quot; indicates the product version and level. By default, the following location is used: %Program Files%\Fujitsu\sepv.&lt;xy&gt;server64</td>
</tr>
<tr>
<td>Database cluster</td>
<td>Y</td>
<td>1</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using pgAdmin or the DDL statement.</td>
</tr>
<tr>
<td>Backup</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin or server commands.</td>
</tr>
<tr>
<td>Core file</td>
<td>Y</td>
<td>Multiple</td>
<td>Specify using WebAdmin, server commands, or postgresql.conf.</td>
</tr>
</tbody>
</table>
### File type

<table>
<thead>
<tr>
<th>File type</th>
<th>Required</th>
<th>Quantity</th>
<th>How to specify the location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Server private key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using postgresql.conf.</td>
</tr>
<tr>
<td>Master encryption key file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify the directory created as the key store using postgresql.conf.</td>
</tr>
<tr>
<td>Connection service file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>Password file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
<tr>
<td>CA certificate file (*1)</td>
<td>N</td>
<td>1</td>
<td>Specify using environment variables.</td>
</tr>
</tbody>
</table>

Y: Mandatory  
N: Optional  
*1: Set manually when using the applicable feature.

---

**Note**

If anti-virus software is used, set scan exception settings for directories so that none of the files that comprise FUJITSU Enterprise Postgres are scanned for viruses. Alternatively, if the files that comprise FUJITSU Enterprise Postgres are to be scanned for viruses, stop FUJITSU Enterprise Postgres and perform the scan when tasks that use FUJITSU Enterprise Postgres are not operating.

### 1.6 Notes on Compatibility of Applications Used for Operations

When you upgrade FUJITSU Enterprise Postgres to a newer version, there may be some affect on applications due to improvements or enhancements in functionality.

Take this into account when creating applications so that you can maintain compatibility after upgrading to a newer version of FUJITSU Enterprise Postgres.

**See**

Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

### 1.7 Notes on Upgrading Database Instances

When upgrading FUJITSU Enterprise Postgres 9.4 or newer database instances to 9.6 using pg_upgrade, there are certain steps you need to follow.

Before using pg_upgrade, remove the following extensions from all databases in the instance, except "template0":

- `pg_stat_statements`
- `pgx_io`
- `pgx_paging`
- `pgx_network`
- `pgx_network_err`
- `pgx_cpu`
- `pgx_memory`
- pgx_swap
- pgx_disk
- pgx_process
- pgx_log
- oracle_compatible

For all databases except "template0", execute the following command to remove these extensions:

```
DROP EXTENSION extensionName;
```

Once the pg_upgrade operation is complete, for all databases except "template0", execute the following command to re-create these extensions as required:

```
CREATE EXTENSION extensionName;
```

**Note**

- It is strongly recommended to back up the database using pg_dump before performing pg_upgradе or using "DROP EXTENSION".
- If there are any columns created in the user tables using a data type from these extensions, then the "DROP EXTENSION" command will also drop these columns. Therefore, it is essential that alternate upgrade mechanisms are considered instead of pg_upgradе, in such scenarios. These may include pg_dump/pg_restore.
Chapter 2 Starting an Instance and Creating a Database

This chapter describes basic operations, from starting an instance to creating a database.

2.1 Starting and Stopping an Instance

This section describes how to start and stop an instance.

- 2.1.1 Using WebAdmin
- 2.1.2 Using Commands

Point

To automatically start or stop an instance when the operating system on the database server is started or stopped, refer to "Configuring Automatic Start and Stop of an Instance" in the Installation and Setup Guide for Server and configure the settings.

Note

The collected statistics are initialized if an instance is stopped in the "Immediate" mode or if it is abnormally terminated. To prepare for such initialization of statistics, consider regular collection of the statistics by using the SELECT statement. Refer to "The Statistics Collector" in "Server Administration" in the PostgreSQL Documentation for information on the statistics.

2.1.1 Using WebAdmin

WebAdmin enables you to start or stop an instance and check its operating status.

Starting an instance

Start an instance by using the [Instances] tab in WebAdmin.

- is displayed when an instance is stopped.

To start a stopped instance, click .

Stopping an instance

Stop an instance by using the [Instances] tab in WebAdmin.

- is displayed when an instance is active.

To stop an active instance, click .

Stop mode

Select the mode in which to stop the instance. The following describes the operations of the modes:

<table>
<thead>
<tr>
<th>Stop mode</th>
<th>Connected clients</th>
<th>Backup being executed using the command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart mode (*1)</td>
<td>Waits for all connected clients to be disconnected.</td>
<td>Waits for backups being executed using the command to finish.</td>
</tr>
<tr>
<td>Fast mode</td>
<td>Rolls back all transactions being executed and forcibly disconnects clients.</td>
<td>Terminates backups being executed using the command.</td>
</tr>
<tr>
<td>Immediate mode</td>
<td>All server processes are terminated immediately. Crash recovery is executed the next time the instance is started.</td>
<td></td>
</tr>
</tbody>
</table>
*1: When the processing to stop the instance in the Smart mode has started and you want to stop immediately, use the following procedure:

1. Restart the Web server feature of WebAdmin.
2. In the [Instances] tab, click .
3. In the [Instances] tab, click , and select the Immediate mode to stop the instance.

Checking the operating status of an instance

You can check the operating status of an instance by using the [Instances] tab. The following indicators are used to show the status of a resource.

<table>
<thead>
<tr>
<th>Status indicator</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Green Circle" /></td>
<td>The resource is operating normally.</td>
</tr>
<tr>
<td><img src="image2" alt="Blue Circle" /></td>
<td>The resource is stopped.</td>
</tr>
<tr>
<td><img src="image3" alt="Red Circle" /></td>
<td>There is an error in the resource.</td>
</tr>
<tr>
<td><img src="image4" alt="Yellow Circle" /></td>
<td>An operation is in progress on this resource or the status is being checked.</td>
</tr>
<tr>
<td><img src="image5" alt="Exclamation Mark" /></td>
<td>The resource is not operating optimally and needs intervention.</td>
</tr>
</tbody>
</table>

If an instance stops abnormally, remove the cause of the stoppage and start the instance by using WebAdmin.

Figure 2.1 Status when an instance is active
2.1.2 Using Commands

The Windows service-related commands enable you to start or stop an instance and to check its operating state.

If you are to use Windows services, you should register instances in Windows services.

**Note**
- When operating WebAdmin, click to update the status. WebAdmin will reflect the latest status of the operation or the instance resources from the server.
- If an error occurs while communicating with the server, there may be no response from WebAdmin. When this happens, close the browser and then log in again. If this does not resolve the issue, check the event log of the server and confirm whether a communication error has occurred.
- The following message is output during startup of an instance when the startup process is operating normally, therefore, the user does not need to be aware of this message:

```
FATAL: the database system is starting up
```
See

Refer to “When an instance was created with WebAdmin” in “Configuring Automatic Start and Stop of an Instance” in the Installation Guide for Server for information on registering instances in Windows services.

Note

While it is also possible for you to execute the pg_ctl command to start and stop instances without having to register instances in Windows services, it is recommended that you use Windows services to start and stop instances for the following reason:

- If you use the pg_ctl command to start an instance, the instance will be started as a user process. Therefore, when you close the [Command Prompt] window in which you executed the command, Windows forces the postgres process to stop.

Starting an instance

You can start an instance by specifying the service name in the net start command or sc start command.

Also, you can use the following procedure to start an instance in the Windows services window:

1. Display the [Services] window
   - Windows Server(R) 2012 and Windows Server(R) 2012 R2:
     In the [Start] screen, select [Administrative Tools], and then click [Services].
   - All other operating systems:
     In the [Start] menu, select [Administrative Tools], and then click [Services].

2. Start a service
   Select the instance name that you wish to start from the services list, and click [Start Service].

Stopping an instance

You can stop an instance by specifying the service name in the net stop command or sc stop command.

Also, you can use the following procedure to stop an instance in the Windows services window:

1. Display the [Services] window
   - Windows Server(R) 2012 and Windows Server(R) 2012 R2:
     In the [Start] screen, select [Administrative Tools], and then click [Services].
   - All other operating systems:
     In the [Start] menu, select [Administrative Tools], and then click [Services].

2. Stop the service
   Select the instance name that you wish to stop from the services list, and click [Stop Service]. If you stop a service while applications and commands are running, FUJITSU Enterprise Postgres will force those applications and commands to close and will stop normally.

Checking the operating state of an instance

Use the following procedure to check if an instance is operating correctly immediately after performing the operation to start an instance:

1. Display the [Services] window
   In the [Start] menu, select [Administrative Tools], and then click [Services].

2. Check the state of the service
   In the services list, check the state of the services for the applicable FUJITSU Enterprise Postgres.
To check the operating state of an instance during operation, use the `pg_ctl` command.

Specify the following in the `pg_ctl` command:
- Specify "status" as the mode.
- Specify the data storage destination directory in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

**Example**

When the instance is active:

```bash
> pg_ctl status -D D:\database\inst1
pg_ctl: server is running (PID: 1234)
```

When the instance is inactive:

```bash
> pg_ctl status -D D:\database\inst1
pg_ctl: no server running
```

**Information**

You can also use the `net start` command or `sc query` command to check the operating state of an instance.

**See**

Refer to "pg_ctl" in "Reference" in the PostgreSQL Documentation for information on the `pg_ctl` command.

### 2.2 Creating a Database

This section explains how to create a database.

- 2.2.1 Using pgAdmin
- 2.2.2 Using Client Commands

#### 2.2.1 Using pgAdmin

Follow the procedure below to define a database using pgAdmin.
1. In the pgAdmin window, right-click [Databases] in [Object browser], and then click [New Database] to display a new database window.
2. Specify appropriate values for the following items in the new database window.
   - [Properties] tab
     
     The following example illustrates creation of the database "db01".

     ![New Database Window](image)

     - [Name]: Name of the database to be managed

3. Click [OK] to create the database.

### 2.2.2 Using Client Commands

Follow the procedure below to define a database using client commands.

An example of operations on the server is shown below.

1. Use `psql` command to connect to the postgres database.
   
   Execute `psql` postgres.

   ```
   > psql postgres
   psql (9.6.2)
   Type "help" for help.
   ```

2. Create the database.
   
   To create the database, execute the `CREATE DATABASE databaseName;` statement.

   ```
   postgres=# CREATE DATABASE db01;
   CREATE DATABASE
   ```
3. Confirm that the database is created. Execute the \l+ command, and confirm that the name of the database created in step 2 is displayed.

   ```
   postgres=# \l+
   ```

4. Disconnect from the postgres database. Execute \q to terminate the psql command.

   ```
   postgres=# \q
   ```

You can create a database using the createdb command.

See

Refer to "Creating a Database" in "Tutorial" in the PostgreSQL Documentation for information on creating a database using the createdb command.
Chapter 3 Backing Up the Database

This chapter describes how to back up the database.

Backup methods

The following backup methods enable you to recover data to a backup point or to the state immediately preceding disk physical breakdown or data logical failure.

- Backup using WebAdmin
  This method enables you to back up data through intuitive window operations using the GUI.
  WebAdmin is used for recovery.

- Backup using the pgx_dmpall command
  Execute the pgx_dmpall command with a script to perform automatic backup.
  To back up data automatically, you must register the process in the automation software of the operating system. Follow the procedure given in the documentation for your operating system.
  The pgx_rcvall command is used for recovery.

Approximate backup time

The formula for deriving the approximate backup time when you use WebAdmin or the pgx_dmpall command is as follows:

\[
\text{backupTime} = \frac{\text{dataStorageDestinationUsage}}{\text{diskWritePerformance}} \times 1.5
\]

- \(\text{dataStorageDestinationUsage}\): Disk usage at the data storage destination
- \(\text{diskWritePerformance}\): Maximum data volume (bytes/second) that can be written per second in the system environment where operation is performed
- 1.5: Coefficient to factor in tasks other than disk write (which is the most time-consuming step)

Note

- Backup operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.
- Use the selected backup method continuously.

There are several differences, such as the data format, across the backup methods. For this reason, the following restrictions apply:

- It is not possible to use one method for backup and another for recovery.
- It is not possible to convert one type of backup data to a different type of backup data.

- There are several considerations for the backup of the keystore and backup of the database in case the data stored in the database is encrypted. Refer to the following for details:
  - 5.6.4 Backing Up and Recovering the Keystore
  - 5.7 Backing Up and Restoring/Recovering the Database
- If you have defined a tablespace, back it up. If you do not back it up, directories for the tablespace are not created during recovery, which may cause the recovery to fail. If the recovery fails, refer to the event log, create the tablespace, and then perform the recovery process again.
- If performing backups with WebAdmin, the following password file is temporarily created during backup for WebAdmin to connect to the database:
  - userProfileFolder\localSettingsFolder\Fujitsu\fsep\version\instanceName\pgpass.conf

Therefore, when you are backing up corefiles created in the core_directory parameter of postgresql.conf, or log files created in the log_directory parameter of postgresql.conf, ensure not to back up the password files located in the same directories at the same time.
The following methods can also be used to perform backup. Performing a backup using these methods allows you to restore to the point when the backup was performed.

- **Backup using an SQL-based dump**
  Dump the data by using SQL. This backup method also enables data migration.

- **File system level backup**
  This backup method requires you to stop the instance and use OS commands to backup database resources as files.

- **Backup by continuous archiving**
  This is the standard backup method for PostgreSQL.

Refer to "Backup and Restore" in "Server Administration" in the PostgreSQL Documentation for information on these backup methods.

### 3.1 Periodic Backup

It is recommended that you perform backup periodically.

Backing up data periodically using WebAdmin or the pgx_dmpall command has the following advantages:

- This method reduces disk usage, because obsolete archive logs (transaction logs copied to the backup data storage destination) are deleted. It also minimizes the recovery time when an error occurs.

**Backup cycle**

The time interval when backup is performed periodically is called the backup cycle. For example, if backup is performed every morning, the backup cycle is 1 day.

The backup cycle depends on the jobs being run, but on FUJITSU Enterprise Postgres it is recommended that operations are run with a backup cycle of at least once per day.

### 3.2 Backup Methods

This section describes the methods for backing up the database.

- **3.2.1 Using WebAdmin**
- **3.2.2 Using Server Commands**

#### 3.2.1 Using WebAdmin

You can use WebAdmin to perform backup and check the backup status.

**Note**

- If backup is disabled for an instance, you will not be able to back up or restore the instance. Refer to "Creating an Instance” > “[Backup]” in the Installation and Setup Guide for Server for details.

- If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to “5.6.3 Enabling Automatic Opening of the Keystore” for details.

- WebAdmin uses the labels "Data storage path", "Backup storage path" and "Transaction log path" to indicate "data storage destination", "backup data storage destination" and "transaction log storage destination" respectively. In this manual these terms are used interchangeably.

- It is recommended to set the wal_level parameter of postgresql.conf to "replica" prior to enabling the backup.
Backup operation

Follow the procedure below to back up the database.

1. Select the database to back up

   In the [Instances] tab, select the instance to be backed up and click  

2. Back up the database

   The [Backup] dialog box is displayed. To perform backup, click [Yes].
   An instance is automatically started when backup is performed.

Backup status

If an error occurs and backup fails, [Error] is displayed adjacent to [Data storage status] or [Backup storage status] in the [Instances] tab.
An error message is also displayed in the message list.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, [Solution] appears to the right of the error message. Clicking this button displays information explaining how to resolve the cause of the error. Remove the cause of failure, and perform backup again.

Note

If the data to be stored in the database is to be encrypted, it is necessary to enable the automatic opening of the keystore before doing so. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.
3.2.2 Using Server Commands

Use the pgx_dmpall command and pgx_rcvall command to perform backup and check the backup result.

Preparing for backup

You must prepare for backup before actually starting the backup process.

Follow the procedure below.

1. Prepare the backup data storage disk
   For backup, prepare a separate disk unit from the database storage disk and mount it using the operating system commands.

2. Create a directory where the backup data will be stored
   Create an empty directory.
   In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the directory.

3. Specify the settings required for backup
   Stop the instance, and set the following parameters in the postgresql.conf file.
   Start the instance after editing the postgresql.conf file.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backup_destination</td>
<td>Name of the directory where the backup data will be stored</td>
<td>Specify the name of the directory where the backup data will be stored. Appropriate privileges that allow only the instance administrator to access the directory must already be set. Place the backup data storage destination directory outside the data storage destination directory, the tablespace directory, and the transaction log storage destination directory.</td>
</tr>
<tr>
<td>wal_level</td>
<td>minimal, replica (*1), or logical</td>
<td>Specify the output level for the transaction log.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>*1: replica is a setting for streaming replication.</td>
</tr>
<tr>
<td>archive_mode</td>
<td>on</td>
<td>Specify the archive log mode.</td>
</tr>
<tr>
<td>archive_command</td>
<td><code>cmd /c &quot;&quot;installationDirectory\bin\pgx_xlogcopy.cmd&quot; &quot;%p&quot;&quot; backupDataStorageDestinationDirectory\archived_xlog\%f&quot;&quot;</code></td>
<td>Specify the path name of the command that will save the transaction log and the storage destination.</td>
</tr>
</tbody>
</table>
Refer to "Appendix A Parameters" and "Write Ahead Log" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

### Backup operation

Use the `pgx_dmpall` command to perform backup. You can even embed the `pgx_dmpall` command in OS automation software to perform backup.

The backup data is stored in the directory specified in the `backup_destination` parameter of `postgresql.conf`.

Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Note the following when specifying the path:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Specify <code>\</code> as the path delimiter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Enclose the path in double quotes (<code>&quot;</code>) if it contains spaces.</td>
</tr>
</tbody>
</table>

### Example

```
> pgx_dmpall -D D:\\database\\inst1
```

### Note

Backup stores the data obtained during the backup and the backup data of the data obtained during previous backup.

If the data to be stored in the database is encrypted, refer to the following and back up the keystore:

- 5.6.4 Backing Up and Recovering the Keystore

### Backup status

Use the `pgx_rcvall` command to check the backup status.

Specify the following values in the `pgx_rcvall` command:

- The `-l` option indicates backup data information.
- Specify the data storage destination in the `-D` option. If the `-D` option is omitted, the value of the `PGDATA` environment variable is used by default.

```
> pgx_rcvall -l -D D:\\database\\inst1
```

<table>
<thead>
<tr>
<th>Date</th>
<th>Status</th>
<th>Dir</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015-05-01 13:30:40</td>
<td>COMPLETE</td>
<td>E:\backup\inst1\2015-05-01_13-30-40</td>
</tr>
</tbody>
</table>

If an error occurs and backup fails, a message is output to the event log.

In this case, the backup data is not optimized. Ensure that you check the backup result whenever you perform backup. If backup fails, remove the cause of failure and perform backup again.

### See

Refer to "`pgx_dmpall`" and "`pgx_rcvall`" in the Reference for information on the `pgx_dmpall` command and `pgx_rcvall` command.
Setting a restore point

In case you want to recover your database to a certain point in time, you can name this particular point in time, which is referred to as the restore point, by using the psqI command.

By setting a restore point before executing an application, it becomes easy to identify up to which point in time the data will be reverted. A restore point can be set to any point in time after a backup is executed. However, if a restore point is set before a backup is executed, the database cannot be recovered to that point in time. This is because restore points are recorded in the archive logs, and the archive logs are discarded when backups are executed.

Example

The following example uses the psqI command to connect to the database and execute the SQL statement to set a restore point.

However, when considering continued compatibility of applications, do not use functions directly in SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

```
postgres=# SELECT pg_create_restore_point('batch_20150503_1');
LOG: restore point "batch_20150503_1" created at 0/20000E8
STATEMENT: select pg_create_restore_point('batch_20150503_1');
pg_create_restore_point
-------------------------
0/20000E8
(1 row)
```

Refer to "10.3.2 Using the pgx_rcvall Command" for information on using a restore point to recover the database.

Note

- Name restore points so that they are unique within the database. Add the date and time of setting a restore point to distinguish it from other restore points, as shown below:

  - YYMMDD_HHMMSS
    - YYMMDD: Indicates the date
    - HHMMSS: Indicates the time

- There is no way to check restore points you have set. Keep a record in, for example, a file.

See

Refer to "System Administration Functions" under "Functions and Operators" in the PostgreSQL Documentation for information on pg_create_restore_point.
If communication data transferred between a client and a server contains confidential information, encrypting the communication data can protect it against threats, such as eavesdropping on the network.

### 4.1 Configuring Communication Data Encryption

To encrypt communication data transferred between a client and a server, configure communication data encryption as described below. Communication data encryption not only protects the communication content, but it also guards against man-in-the-middle (MITM) attacks (for example, data and password theft through server impersonation).

**Table 4.1 Configuration procedure**

<table>
<thead>
<tr>
<th>Configuration procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Issue a certificate</td>
</tr>
<tr>
<td>2) Deploy a server certificate file and a server private key file</td>
</tr>
<tr>
<td>3) Distribute a CA certificate file to the client</td>
</tr>
<tr>
<td>4) Configure the operating environment for the database server</td>
</tr>
<tr>
<td>5) Configure the operating environment for the client</td>
</tr>
</tbody>
</table>

The following figure illustrates the environment for communication data encryption.

**Figure 4.1 Environment for communication data encryption**
4.1.1 Issuing a Certificate

For authenticating servers, you must acquire a certificate issued by the certificate authority (CA). FUJITSU Enterprise Postgres supports X.509 standard PEM format files. If the certificate authority issues a file in DER format, use a tool such as the openssl command to convert the DER format file to PEM format.

The following provides an overview of the procedure. Refer to the procedure published by the public or independent certificate authority (CA) that provides the certificate file for details.

a. Create a server private key file
b. Disable the passphrase for the server private key file
c. Create a CSR (signing request for obtaining a server certificate) from the server private key file
d. Apply to the certificate authority (CA) for a server certificate
e. Obtain a server certificate file and a CA certificate file from the certificate authority (CA)
f. Store the server certificate file and the CA certificate file
   Note: If you lose or destroy the certificates, you will need to have them re-issued.

The above procedure enables you to prepare the following files:
- Server private key file
- Server certificate file
- CA certificate file

4.1.2 Deploying a Server Certificate File and a Server Private Key File

Create a directory on the local disk of the database server and store the server certificate file and the server private key file in it. Use the operating system features to set access privileges for the server certificate file and the server private key file so that only the database administrator has load privileges.

Back up the server certificate file and the server private key file in the event that data corruption occurs and store them securely.

4.1.3 Distributing a CA Certificate File to the Client

Create a directory on the local disk of the client and place the distributed CA certificate file there. Use the operating system features to set load privileges to protect the CA certificate file against accidental deletion.

4.1.4 Configuring the Operating Environment for the Database Server

Refer to "Secure TCP/IP Connections with SSL" under "Server Administration" in the PostgreSQL Documentation for details.

4.1.5 Configuring the Operating Environment for the Client

Refer to the following sections in the Application Development Guide for details, depending on your application development environment:
- "Settings for Encrypting Communication Data" under "Setup" in "JDBC Driver"
- "Settings for Encrypting Communication Data" under "Setup" in "C Library (libpq)"
- "Settings for Encrypting Communication Data" under "Setup" in "Embedded SQL in C"
4.1.6 Performing Database Multiplexing

When you perform communication that uses database multiplexing and a Secure Socket Layer server certificate, certificates with the same "Common Name" must be used. To ensure this, take one of the following actions:

- Create one server certificate, replicate it, and place a copy on each server used for database multiplexing.
- Create a server certificate with the same "Common Name" for each server used for database multiplexing.

Refer to "Using the Application Connection Switch Feature" in the Application Development Guide for information on how to specify applications on the client.
Chapter 5 Protecting Storage Data Using Transparent Data Encryption

This chapter describes how to encrypt data to be stored in the database.

5.1 Protecting Data Using Encryption

With PostgreSQL, data in a database is protected from access by unauthorized database users through the use of authentication and access controls. However, the OS file is not protected from attackers who bypass the database server's authentication and access controls.

With FUJITSU Enterprise Postgres, data inside the OS file is encrypted, so valuable information is protected even if the file or disk is stolen.

Data to be stored in a database is encrypted when it is written to the data file, and decrypted when it is read.

This is performed automatically by the instance, so the user and the application need not be aware of key management and encryption or decryption. This process is called TDE (Transparent Data Encryption).

The characteristics of TDE are described below.

Encryption mechanisms

Two-layer encryption key and the keystore

In each tablespace, there is a tablespace encryption key that encrypts and decrypts all the data within. The tablespace encryption key is encrypted by the master encryption key and saved.

Only one master encryption key exists in a database cluster. It is encrypted based on a passphrase specified by the user and stored in a keystore. FUJITSU Enterprise Postgres provides a file-based keystore. Attackers who do not know the passphrase cannot read the master encryption key from the keystore.

Strong encryption algorithms

TDE uses the Advanced Encryption Standard (AES) as its encryption algorithm. AES was adopted as a standard in 2002 by the United States Federal Government, and is used throughout the world.

Faster encryption and decryption based on hardware

TDE minimizes the overhead of encryption and decryption by using the AES-NI (Advanced Encryption Standard New Instructions) built into Intel(R) Xeon(R) processors since the 5600 series. This means that even in situations where previously the minimum encryption target was selected as a tradeoff between performance and security, it is now possible to encrypt all the data of an application.

You can reference a list of processors equipped with AES-NI on the following page at Intel Corporation's website:

http://ark.intel.com/search/advanced/?s=t&AESTech=true

Zero overhead storage areas

Encryption does not change the size of data stored in tables, indexes, or WAL. There is, therefore, no need for additional estimates or disks.

Scope of encryption

All user data within the specified tablespace

The tablespace is the unit for specifying encryption. All tables, indexes, temporary tables, and temporary indexes created in the encrypted tablespace are encrypted. There is no need for the user to consider which tables and strings to encrypt.

Backup data

The pgx_dmpall command and pg_basebackup command create backup data by copying the OS file. Backups of the encrypted data are, therefore, also encrypted. Information is protected from leakage even if the backup medium is stolen.

WAL and temporary files

WAL, which is created by updating encrypted tables and indexes, is encrypted with the same security strength as the update target. When large merges and sorts are performed, the encrypted data is written to a temporary file in encrypted format.
Streaming replication support

You can combine streaming replication and transparent data encryption. The data and WAL encrypted on the primary server is transferred to the standby server in its encrypted format and stored.

Note

The following are not encrypted:
- pg_dump and pg_dumpall output files
- Files output by the COPY command
- Notification event payloads that communicate using the LISTEN or NOTIFY command

5.2 Setting the Master Encryption Key

To use transparent data encryption, you must create a keystore and set the master encryption key.

1. In the keystore_location parameter of postgresql.conf, specify the directory to store the keystore.

   Specify a different location for each database cluster.

   keystore_location = 'C:\key\store\location'

   Refer to "Appendix A Parameters" for information on postgresql.conf.

   After editing the postgresql.conf file, either start or restart the instance.
   - Using WebAdmin
     Refer to "2.1.1 Using WebAdmin", and restart the instance.
   - Using commands
     Refer to "2.1.2 Using Commands", and restart the instance.

2. Execute an SQL function, such as the one below, to set the master encryption key. This must be performed by the superuser. Execute it as the database superuser.

   SELECT pgx_set_master_key('passphrase');

   The value "passphrase" is the passphrase that will be used to open the keystore. The master encryption key is protected by this passphrase, so avoid specifying a short simple string that is easy to guess.

   Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.

Note

Note that if you forget the passphrase, you will not be able to access the encrypted data. There is no method to retrieve a forgotten passphrase and decrypt data. Do not, under any circumstances, forget the passphrase.

The pgx_set_master_key function creates a file with the name keystore.ks in the keystore storage destination. It also creates a master encryption key from random bit strings, encrypts it with the specified passphrase, and stores it in keystore.ks. At this point, the keystore is open.

5.3 Opening the Keystore

To create encrypted tablespaces and access the encrypted data, you must first open the keystore. When you open the keystore, the master encryption key is loaded into the database server memory and becomes usable for encryption and decryption.

You need to open the keystore each time you start the instance. To open the keystore, the database superuser must execute the following SQL function.
SELECT pgx_open_keystore('passphrase');

The value "passphrase" is the passphrase specified during creation of the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_open_keystore function.

Note that, in the following cases, the passphrase must be entered when starting the instance, because the encrypted WAL must be decrypted for recovery. In this case, the above-mentioned pgx_open_keystore function cannot be executed.

- If performing crash recovery at the time of starting the instance
- If performing recovery using continuous archiving

For the above cases, select one of the following methods:

- Use an automatically opening keystore
  Select this method if ease of operation has priority over enhanced security. When using an automatically opening keystore, the content of the keystore file is decrypted and a copy of the keystore file is generated. Although the content of this file is obfuscated, the level of security becomes slightly weaker.
  Select this method if performing operations using WebAdmin.

- Enter a passphrase when starting an instance
  Select this method if enhanced security has priority over ease of operation.
  Specify the --keystore-passphrase in the pg_ctl command and start the instance. This displays the prompt that asks for the passphrase to be entered.

  > pg_ctl --keystore-passphrase start
  Enter the passphrase:
  The server is currently initiating

After performing the above operation, use the pg_ctl command to stop the instance.

Then start the instance in Windows services. Refer to "2.1.2 Using Commands" for information on how to start an instance in Windows services.

**Point**

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the database server starts. Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for details.

---

### 5.4 Encrypting a Tablespace

The keystore must be open before you can create an encrypted tablespace.

When creating a tablespace that will be encrypted, configure the encryption algorithm in the runtime parameters. For example, to create a tablespace with the name secure_tablespace using AES with a key length of 256 bits as the encryption algorithm, configure as shown below.

```sql
SET tablespace_encryption_algorithm = 'AES256';
CREATE TABLESPACE secure_tablespace LOCATION 'C:\My\Data\Dir';
```

Or

```sql
CREATE TABLESPACE secure_tablespace LOCATION '\My\Data\Dir' WITH (tablespace_encryption_algorithm = 'AES256');
```

You can use AES with a key length of 128 bits or 256 bits as the encryption algorithm. It is recommended that you use 256-bit AES. Refer to "Appendix A Parameters" for information on how to specify the runtime parameters.
If user provides both GUC and command line options while creating the tablespace, the preference is given to the command line option. The pg_default and pg_global tablespaces cannot be encrypted.

Create tables and indexes in the encrypted tablespace that you created. Relations created in the encrypted tablespace are automatically encrypted.

Example

Example 1: Specifying an encrypted tablespace when creating it

```sql
CREATE TABLE my_table (...)
    TABLESPACE secure_tablespace;
```

Example 2: Not explicitly specifying a tablespace when creating it and instead using the default tablespace

```sql
SET default_tablespace = 'secure_tablespace';
CREATE TABLE my_table (...);
```

The process is the same for encrypting temporary tables and temporary indexes. In other words, either explicitly specify the TABLESPACE clause or list encrypted tablespaces in the temp_tablespaces parameter, and then execute CREATE TEMPORARY TABLE or CREATE INDEX.

If you specify an encrypted tablespace in the TABLESPACE clause of the CREATE DATABASE statement when creating a database, relations that you create in the database without explicitly specifying a tablespace will be encrypted. Furthermore, the system catalog is also encrypted, so the source code of user-defined functions is also protected.

Note

An encrypted tablespace cannot be created from the window used for creating the pgAdmin tablespace, or from the query tool. To create an encrypted tablespace, click [PSQL Console] from the [Plugins] menu and create an encrypted tablespace in the psql console window.

### 5.5 Checking an Encrypted Tablespace

The `pgx_tablespaces` system view displays information about whether each tablespace has been encrypted, and about the encryption algorithm. Refer to "C.1 `pgx_tablespaces`" for information on strings.

You can discover which tablespaces have been encrypted by executing the following SQL statements.

However, when considering continued compatibility of applications, do not reference system catalogs (pg_tablespace) directly in SQL statements.

```sql
SELECT spcname, spcencalgo
FROM pg_tablespace ts, pgx_tablespaces tsx
WHERE ts.oid = tsx.spctablespace;
```

Example

```sql
postgres=# SELECT spcname, spcencalgo FROM pg_tablespace ts, pgx_tablespaces tsx WHERE ts.oid =
    tsx.spctablespace;

  spcname      |     spcencalgo
-------------+--------------
  pg_default  | none         
  pg_global   | none         
  secure_tablespace | AES256
(3 rows)
```
5.6 Managing the Keystore

This section describes how to manage the keystore and the master encryption key to guard against the threat of theft.

5.6.1 Changing the Master Encryption Key

Using the same encryption key for an extended period gives attackers an opportunity to decipher the encrypted data. It is recommended that you change the key at regular intervals, or whenever the key is exposed to risk.

Adhere to the industry's best practices for encryption algorithms and key management when considering how often the key should be changed. For example, the NIST in the United States has published "NIST Special Publication 800-57". The PCI DSS also refers to this publication. This publication recommends changing the master encryption key once a year.

To change the master encryption key, execute the pgx_set_master_key function, which is the same function used for configuring the key. Refer to "5.2 Setting the Master Encryption Key" for details.

After changing the master encryption key, you must immediately back up the keystore.

5.6.2 Changing the Keystore Passphrase

In security policies for organizations, it is usually a requirement that the passphrase be changed whenever a security administrator who knows the passphrase is removed from duties due to transfer or retirement. It is also recommended that the passphrase be changed if it is ever exposed to risks due to deception such as social engineering.

To change the keystore passphrase, execute the following SQL function as a superuser.

```sql
SELECT pgx_set_keystore_passphrase('oldPassphrase', 'newPassphrase');
```

After changing the passphrase, you must immediately back up the keystore.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_keystore_passphrase function.

5.6.3 Enabling Automatic Opening of the Keystore

When using an automatically opening keystore, you do not need to enter the passphrase and you can automatically open the keystore when the instance starts. Execute the pgx_keystore command to enable automatic opening of the keystore.

```
> pgx_keystore --enable-auto-open C:\key\store\location\keystore.ks
Enter the passphrase:
Automatic opening of the keystore is now enabled
```

Refer to "pgx_keystore" in the Reference for information on pgx_keystore command.

When automatic opening is enabled, an automatically opening keystore is created in the same directory as the original keystore. The file name of the automatically opening keystore is keystore.aks. The file keystore.aks is an obfuscated copy of the decrypted content of the keystore.ks file. As long as this file exists, there is no need to enter the passphrase to open the keystore when starting the instance.

Do not delete the original keystore file, keystore.ks. It is required for changing the master encryption key and the passphrase. When you change the master encryption key and the passphrase, keystore.aks is recreated from the original keystore file, keystore.ks.

Protect keystore.ks, keystore.aks, and the directory that stores the keystore so that only the user who starts the instance can access them.
Configure the permission of the files so that only the user who starts the instance can access the SQL functions and commands that create these files. Accordingly, manually configure the same permission mode if the files are restored.

Set the permission mode in [Properties] in Windows(R) Explorer.

See

Refer to [Help and Support] in Windows(R) for information on [Properties].

An automatically opening keystore will only open on the computer where it was created.

To disable automatic opening of the keystore, delete keystore.aks.

Note

- To use WebAdmin for recovery, you must enable automatic opening of the keystore.
- Refer to “5.7 Backing Up and Restoring/Recovering the Database” after enabling or reconfiguring encryption to back up the database.
- Specify a different directory from those below as the keystore storage destination:
  - Data storage destination
  - Tablespace storage destination
  - Transaction log storage destination
  - Backup data storage destination

5.6.4 Backing Up and Recovering the Keystore

Back up the keystore at the following times in case it is corrupted or lost. Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen. A passphrase is not required to open an automatically opening keystore, so store this type of keystore in a safe location.

- When the master encryption key is first configured
- When the master encryption key is changed
- When the database is backed up
- When the keystore passphrase is changed

Point

Do not overwrite an old keystore when backing up a keystore. This is because during database recovery, you must restore the keystore to its state at the time of database backup. When the backup data of the database is no longer required, delete the corresponding keystore.

Example

- Back up the database and the keystore on May 1, 2015.

  > pgx_dmpall -D:D:\database\inst1
  > copy C:\key\store\location\keystore.ks C:\keybackup\keystore_20150501.ks

Specify the following in the pgx_dmpall command:

- Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Change the master encryption key, and back up the keystore on May 5, 2015.

```
> psql -c "SELECT pgx_set_master_key('passphrase')" postgres
> copy C:\key\store\location\keystore.ks C:\keybackup\keystore_20150505.ks
```

Specify the following in the psql command:

- Specify the SQL function that sets the master encryption key in the -c option.
- Specify the name of the database to be connected to as the argument.

If the keystore is corrupted or lost, restore the keystore containing the latest master encryption key. If there is no keystore containing the latest master encryption key, restore the keystore to its state at the time of database backup, and recover the database from the database backup. This action recovers the keystore to its latest state.

---

### Example

- Restore the keystore containing the latest master encryption key as of May 5, 2015.

```
> copy C:\keybackup\keystore_20150505.ks C:\key\store\location\keystore.ks
```

- If there is no backup of the keystore containing the latest master encryption key, recover the keystore by restoring the keystore that was backed up along with the database on 1 May 2015.

```
> copy C:\keybackup\keystore_20150501.ks C:\key\store\location\keystore.ks
> pgx_rcvall -B E:\backup\inst1 -D D:\database\inst1 --keystore-passphrase
```

Specify the following in the pgx_rcvall command:

- Specify the data storage directory in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
- Specify the backup data storage directory in the -B option.
- The --keystore-passphrase option prompts you to enter the passphrase to open the keystore.

---

If you have restored the keystore, repeat the process of enabling automatic opening of the keystore. This ensures that the contents of the automatically opening keystore (keystore.aks) are identical to the contents of the restored keystore.

It is recommended that you do not back up the automatically opening keystore file, keystore.aks. If the database backup medium and the backup medium storing the automatically opening keystore are both stolen, the attacker will be able to read the data even without knowing the passphrase.

If the automatically opening keystore is corrupted or lost, you must again enable automatic opening. The keystore.aks file will be recreated from keystore.ks at this time.

---

### See

Refer to "pgx_rcvall" and "pgx_dmpall" in the Reference for information on the pgx_rcvall and pgx_dmpall commands.

Refer to "psql" under "Reference" in the PostgreSQL Documentation for information on the psql command.

Refer to "B.2 Transparent Data Encryption Control Functions" for information on the pgx_set_master_key function.

Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

---

### 5.7 Backing Up and Restoring/Recovering the Database

FUJITSU Enterprise Postgres enables you to use the five backup and recovery methods described below. Regardless of the method you use, you must back up the keystore at the same time.

---
Note that you must store the database and the keystore on separate data storage media. Storing both on the same data storage medium risks the danger of the encrypted data being deciphered if the medium is stolen.

Backup and recovery using WebAdmin

- Backup
  
  WebAdmin backs up encrypted data.
  
  Back up the key store after backing up the database.

- Recovery
  
  Restore the keystore to its state at the time of database backup. Refer to "5.6.4 Backing Up and Recovering the Keystore" for details.
  
  Enable automatic opening of the keystore in accordance with the procedure described in "5.6.3 Enabling Automatic Opening of the Keystore". Then, use WebAdmin to recover the database.

Backup and recovery using the pgx_dmpall and pgx_rcvall commands

- Backup
  
  The pgx_dmpall command backs up the encrypted data.
  
  Back up the key store after backing up the database.

- Recovery
  
  Restore the keystore to its state at the time of the database backup.
  
  Configure automatic opening of the key store as necessary.
  
  If automatic opening of the keystore is not enabled, execute the pgx_rcvall command with the --keystore-passphrase option specified. This will display the prompt for the passphrase to be entered.

Example

- Back up the database and the keystore on May 1, 2015.

  ```
  > pgx_dmpall -D D:\database\inst1
  > copy C:\key\store\location\keystore.ks C:\keybackup\keystore_20150501.ks
  ```

  Specify the following in the pgx_dmpall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.

- Recover the database and the keystore from the backup taken on May 1, 2015.

  ```
  > copy C:\keybackup\keystore_20150501.ks C:\key\store\location\keystore.ks
  > pgx_keystore --enable-auto-open C:\key\store\location\keystore.ks
  > pgx_rcvall -B E:\backup\inst1 -D D:\database\inst1 --keystore-passphrase
  ```

  Specify the following in the pgx_rcvall command:
  
  - Specify the data storage destination in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
  
  - Specify the backup data storage directory in the -B option.
  
  - The --keystore-passphrase option prompts you to enter the passphrase to open the keystore.
Dump and restore using SQL

- **Backup**
  The files output by the `pg_dump` and `pg_dumpall` commands are not encrypted. You should, therefore, encrypt the files using OpenSSL commands or other means before saving them, as described in “5.8 Importing and Exporting the Database” below.
  Back up the key store after backing up the database.

- **Restore**
  If the backup data has been encrypted using, for example OpenSSL commands, decrypt that data.
  The data generated by the `pg_dumpall` command includes a specification to encrypt tablespaces by default. For this reason, the `pg_restore` command encrypts tablespaces during restoration.

File system level backup and restore

- **Backup**
  Stop the instance and backup the data directory and the tablespace directory using the file copy command of the operating system. The files of encrypted tablespaces are backed up in the encrypted state.
  Back up the key store after performing the backup.

- **Restore**
  Restore the key store to its state at the time of the database backup.
  Stop the instance and restore the data directory and the tablespace directory using the file copy command of the operating system.

Continuous archiving and point-in-time recovery

- **Backup**
  The `pg_basebackup` command backs up the encrypted data as is.
  Back up the key store after performing the backup.

- **Recovery**
  Restore the key store to its state at the time of the database backup.
  Configure automatic opening of the key store as necessary.
  If automatic opening of the key store is not enabled, refer to “5.3 Opening the Keystore” for information on starting an instance by specifying `pg_ctl --keystore-passphrase` start.

See

- Refer to “Reference” in the PostgreSQL Documentation for information on the following commands:
  - `psql`
  - `pg_dump`
  - `pg_restore`
  - `pg_basebackup`
- Refer to the Reference for information on the following commands:
  - `pgx_rcvall`
  - `pgx_dmpall`
  - `pg_dumpall`

If you have restored the key store, repeat the process of enabling automatic opening of the key store. This ensures that the contents of the automatically opening key store (keystore.aks) are identical to the contents of the restored key store.
Refer to "5.6.3 Enabling Automatic Opening of the Keystore" for information on how to enable automatic opening of the keystore.

5.8 Importing and Exporting the Database

The files output by the COPY TO command are not encrypted. Therefore, when transferring files to other systems, you should encrypt files using OpenSSL commands, or use file transfer software that performs encrypted communication for Windows, to encrypt the data being transferred.

Use a safe method to delete obsolete plain text files.

You can use the following methods to safely delete files:

- `fsutil` command

**Example**

```bash
# Export the contents of the table my_table to a CSV file.
> psql -c "COPY my_table TO 'C:\WINDOWS\Temp\my_table.csv' (FORMAT CSV)" postgres

# Encrypt the exported file.
> C:\OpenSSL-Win32\bin\openssl enc -e -aes256 -in C:\WINDOWS\Temp\my_table.csv -out my_table.csv.enc

# Check the size of plain text files, and delete them after zero padding
> dir C:\WINDOWS\Temp\my_table.csv
> fsutil file setzerodata offset=0 length=7 C:\WINDOWS\Temp\my_table.csv
> del C:\WINDOWS\Temp\my_table.csv

# Decrypt the encrypted files on other systems.
> C:\OpenSSL-Win32\bin\openssl dec -d -aes256 -in my_table.csv.enc -out my_table.csv
```

If you use COPY FROM to import data to tables and indexes in an encrypted tablespace, the imported data is automatically encrypted before being stored.

5.9 Encrypting Existing Data

You cannot encrypt existing unencrypted tablespaces. In addition, you cannot change encrypted tablespaces so that they do not encrypt.

As an alternative, transfer the tables and indexes to other tablespaces. You can use the following SQL commands for this.

```sql
ALTER TABLE table_name SET TABLESPACE new_tablespace;
ALTER INDEX index_name SET TABLESPACE new_tablespace;
ALTER DATABASE database_name SET TABLESPACE new_tablespace;
```

See

Refer to "SQL Commands" under "Reference" in the PostgreSQL Documentation for information on SQL commands.

5.10 Operations in Cluster Systems

This section describes how to use transparent data encryption on cluster systems such as high-availability systems, streaming replication, and database multiplexing.

5.10.1 HA Clusters that do not Use Database Multiplexing

Take the following points into account when using transparent data encryption in an HA cluster environment that does not use database multiplexing.
Placement and automatic opening of the keystore file

There are two alternatives for placing the keystore file:

- Sharing the keystore file
- Placing a copy of the keystore file

Sharing the keystore file

This involves using the same keystore file on the primary server and the standby server.

As the standby server is not active while the primary server is running, this file would not be accessed simultaneously, and therefore, it can be shared.

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location.

Enable the automatic opening of the keystore on both the primary and standby servers.

Placing a copy of the keystore file

This involves placing a copy of the primary server keystore file on the standby server.

You can do this if you cannot prepare a shared server or disk device that can be accessed from both the primary and standby servers.

However, if you change the master encryption key and the passphrase on the primary server, you must copy the keystore file to the standby server again.

To manage the keystore file in a more secure manner, prepare the key management server or the key management storage isolated in a secure location for both the primary and standby servers, and place the keystore files there.

Enable the automatic opening of the keystore on both the primary and standby servers. Note that copying the automatically opening keystore file (keystore.aks) to the standby server does not enable the automatic opening of the keystore.

See

Refer to the Cluster Operation Guide for information on building a cluster system environment using failover operation.

5.10.2 Database Multiplexing Mode

Note the following when using transparent data encryption in environments that use streaming replication, or database multiplexing with streaming replication.

Placing the keystore file

Place a copy of the primary server keystore file on the standby server.

This is required as the keystore file cannot be shared, and both servers may need to access it simultaneously.

Point

To manage the keystore file in a more secure manner, place it on the key management server or the key management storage isolated in a secure location. A keystore used by both the primary and standby servers can be managed on the same key management server or key management storage.

However, create different directories for the keystores to be used by the primary server and the standby server. Then copy the keystore for the primary server to the directory used on the standby server.

Automatically opening the keystore

You must enable automatic opening of the keystore.

To do this, enable automatic opening of the keystore in all servers that make up database multiplexing. The settings for automatic opening of the keystore include information unique to each server, so simply copying the file does not enable it.
Changing the passphrase

Changes to the passphrase are reflected in all servers that make up database multiplexing, so no special operation is required.

Building and starting a standby server

Before using the pg_basebackup command or pgx_rcvall command to build a standby server, copy the keystore file from the primary server to the standby server. When using an automatically opening keystore, use the copied keystore file to enable automatic opening on the standby server.

Open the keystore each time you start the standby server. This step is necessary for decrypting and restoring encrypted WAL received from the primary server. To open the keystore, specify the --keystore-passphrase option in the pg_ctl command or pgx_rcvall command and enter the passphrase, or use an automatically opening keystore.

If specifying --keystore-passphrase in the pg_ctl command, refer to "5.3 Opening the Keystore" for details.

Changing the master encryption key and the passphrase

Change the master encryption key and the passphrase on the primary server. You need not copy the keystore from the primary server to the standby server. You need not even restart the standby server or reopen the keystore. Changes to the master encryption key and the passphrase are reflected in the keystore on the standby server.

5.11 Security-Related Notes

- Decrypted data is cached in the database server memory (shared buffer). As a result, unencrypted data is stored in a minidump, which is the process memory dump. You should, therefore, safely delete the memory dump. You can safely delete files by using the following command:
  - fsutil command
- Unencrypted data may be written from the database server memory to the operating system's swap area. To prevent leakage of information from the swap area, consider either disabling the use of swap area or encrypting the swap area using a full-disk encryption product.
- The content of the server log file is not encrypted. Therefore, in some cases the value of a constant specified in a SQL statement is output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement.
- When executing an SQL function that opens the keystore and modifies the master encryption key, ensure that the SQL statement containing the passphrase is not output to the server log file. To prevent this, consider setting a parameter such as log_min_error_statement. If you are executing this type of SQL function on a different computer from the database server, encrypt the communication between the client and the database server with SSL.

5.12 Tips for Installing Built Applications

With transparent data encryption, you can easily encrypt all the data in an application without modifying the application. Database administrators install built applications in the following manner. However, this procedure stores data to the default tablespace, so take necessary action if processing differs from the original design.

1. (Normal procedure) Create an owner and a database for the built application.

   ```sql
   CREATE USER crm_admin ...;
   CREATE DATABASE crm_db ...;
   ```
2. (Procedure for encryption) Create an encrypted tablespace to store the data for the built application.

```
SET tablespace_encryption_algorithm = 'AES256';
CREATE TABLESPACE crm_tablespace LOCATION 'C:\crm\data';
```

3. (Procedure for encryption) Configure an encrypted tablespace as the default tablespace for the owner of the built application.

```
ALTER USER crm_admin SET default_tablespace = 'crm_tablespace';
ALTER USER crm_admin SET temp_tablespaces = 'crm_tablespace';
```

4. (Normal procedure) Install the built application. The application installer prompts you to enter the host name and the port number of the database server, the user name, and the database name. The installer uses the entered information to connect to the database server and execute the SQL script. For applications that do not have an installer, the database administrator must manually execute the SQL script.

Normally, the application's SQL script includes logic definition SQL statements, such as CREATE TABLE, CREATE INDEX, and GRANT or REVOKE, converted from the entity-relationship diagram. It does not include SQL statements that create databases, users, and tablespaces. Configuring the default tablespace of the users who will execute the SQL script deploys the objects generated by the SQL script to the tablespace.
Data masking is a feature that can change the returned data for queries generated by applications, so that it can be referenced by users. For example, for a query of employee data, digits except the last four digits of an eight-digit employee number can be changed to "*" so that it can be used for reference.

**Note**

When using this feature, it is recommended that the changed data be transferred to another medium for users to reference. This is because, if users directly access the database to extract the masked data, there is a possibility that they can deduce the original data by analyzing the masking policy or query result to the masking target column.

### 6.1 Masking Policy

Masking policy is a method of changing data under specific conditions when it is returned for a query from an application. One masking policy can be created per table. You can configure masking target, masking type, masking condition and masking format in a masking policy.

**Figure 6.1 Masking policy**

- **Database**

**Note**

When a masking policy is defined, the search performance for the corresponding table may deteriorate.
6.1.1 Masking Target

Masking target refers to a column to which a masking policy will be applied. When referring to a masking target or a function that includes a masking target, the execution result will be changed and obtained.

The following commands can change the execution result:

- SELECT
- COPY
- pg_dump
- pg_dumpall

**Note**

- If a masking target is specified to INSERT...SELECT target columns, processing will be performed using data before change.
- If a masking target other than SELECT target columns is specified, processing will be performed using data before change.
- If a masking target is specified in a function where the data type will be converted, an error will occur.

6.1.2 Masking Type

Masking type is a method to change column data that is returned from queries. Specify the masking type in the function_type parameter. The following masking types can be specified and selected depending on the masking target data type.

**Full masking**

All the data in the specified column is changed. The changed value returned to the application that made the query varies depending on the column data type.

For example, 0 is used for a numeric type column and a space is used for a character type column.

**Partial masking**

The data in the specified column is partially changed.

For example, digits except the last four digits of an employee number can be changed to ".".

**Regular expression masking**

The data in the specified column is changed via a search that uses a regular expression.

For example, for strings such as email address that can have variable length, "." can be used to change characters preceding "@" by using a regular expression. Regular expression masking can only be used for character type data.

**Note**

- If multiple valid masking targets are specified for a function, the masking type for the left-most masking target will be applied.
  For example, if "SELECT GREATEST(c1, c2) FROM t1" is executed for numeric type masking target c1 and c2, the masking type for c1 will be applied.
- When masking the data that includes multibyte characters, do not specify partial masking for masking type. The result may not be as expected.

6.1.3 Masking Condition

Masking condition refers to the conditions configured to perform masking. Specify the masking condition in the expression parameter. Changed or actual data can be displayed for different users by defining masking condition. An expression that returns a boolean type result needs to be specified in masking condition and masking is performed only when TRUE is returned. Refer to "Value Expressions" in the PostgreSQL Documentation for information on the expressions that can be specified. Note that expressions that include a column cannot
be specified. For example, when masking data only for "postgres" users, specify `current_user = "postgres"` in the masking condition.

---

**Information**

Specify `1=1` so the masking condition is always evaluated to be TRUE and masking is performed all the time.

---

### 6.1.4 Masking Format

Masking format is a combination of change method and displayed characters when the masking condition is met. Masking format varies depending on the masking type. The following describes the masking format.

#### Full masking

With full masking, all characters are changed to values as determined by the database. Changed characters can be referenced in the `pgx_confidential_values` table. Also, replacement characters can be changed using the `pgx_update_confidential_values` system management function.

---

**See**

Refer to "6.3 Data Types for Masking" for information on the data types for which data masking can be performed.

---

#### Partial masking

With partial masking, data is changed according to the content in the `function_parameters` parameter. The method of specifying `function_parameters` varies depending on the data type.

<table>
<thead>
<tr>
<th>Category</th>
<th>Method of specifying <code>function_parameters</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Numeric type</td>
<td><code>'replacementCharacter, startPosition, endPosition'</code></td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify the number to display. Specify a value from 0 to 9.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the start position of masking. Specify a positive integer.</td>
</tr>
<tr>
<td></td>
<td>- <code>endPosition</code>: Specify the end position of masking. Specify a positive integer that is greater than <code>startPosition</code>.</td>
</tr>
</tbody>
</table>

---

**Example**

Specify as below to change the values from the 1st to 5th digits to 9.

```
function_parameters := '9, 1, 5'
```

In this example, if the original data is "123456789", it will be changed to "999996789".

---

<table>
<thead>
<tr>
<th>Category</th>
<th><code>'inputFormat, outputFormat, replacementCharacter, startPosition, endPosition'</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td>- <code>inputFormat</code>: Specify the current format of the data. Specify &quot;V&quot; for characters that will potentially be masked, and specify &quot;F&quot; for values such as spaces or hyphens that will not be masked.</td>
</tr>
<tr>
<td></td>
<td>- <code>outputFormat</code>: Define the method to format the displayed data. Specify &quot;V&quot; for characters that will potentially be masked. Any character to be output can be specified for each character &quot;F&quot; in <code>inputFormat</code>. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>replacementCharacter</code>: Specify any single character. If you want to output a single quotation mark, specify two of them consecutively.</td>
</tr>
<tr>
<td></td>
<td>- <code>startPosition</code>: Specify the position of &quot;V&quot; as the start position of masking. For example, to specify the position of the 4th &quot;V&quot; from the left, specify 4. Specify a positive integer.</td>
</tr>
</tbody>
</table>
**Category** | **Method of specifying function_parameters**
---|---
- `endPosition`: Specify the position of "V" as an end position of masking. When working out the end position, do not include positions of "F". For example, to specify the position of the 11th "V" from the left, specify 11. Specify a positive integer that is greater than `startPosition`.

**Example**

Specify as below to mask a telephone number other than the first three digits using *.

```
function_parameters := 'VVVFVVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11'
```

In this example, if the original data is "012-3156-7890", it will be changed to "012-****-****".

**Date/timestamp type** | `'MDYHMS'`  
---|---
- M: Masks month. To mask month, enter the month from 1 to 12 after a lowercase letter m. Specify an uppercase letter M to not mask month.
- D: Masks date. To mask date, enter the date from 1 to 31 after a lowercase letter d. If a value bigger than the last day of the month is entered, the last day of the month will be displayed. Specify an uppercase letter D to not mask date.
- Y: Masks year. To mask year, enter the year from 1 to 9999 after a lowercase letter y. Specify an uppercase letter Y to not mask year.
- H: Masks hour. To mask hour, enter the hour from 0 to 23 after a lowercase letter h. Specify an uppercase letter H to not mask hour.
- M: Masks minute. To mask minute, enter the minute from 0 to 59 after a lowercase letter m. Specify an uppercase letter M to not mask minute.
- S: Masks second. To mask second, enter the second from 0 to 59 after a lowercase letter s. Specify an uppercase letter S to not mask second.

**Example**

Specify as below to mask hour, minute, and second and display 00:00:00.

```
function_parameters := 'MDYh0m0s0'
```

In this example, if the original data is "2010-10-10 10:10:10", it will be changed to "2010-10-10 00:00:00".

**See**

- Refer to "B.3.2 pgx_create_confidential_policy" for information on function_parameters.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

**Regular expression masking**

With regular expression masking, data is changed according to the content of the `regexp_pattern`, `regexp_replacement` and `regexp_flags` parameters. For `regexp_pattern`, specify the search pattern using a regular expression. For `regexp_replacement`, specify the replacement character to use when data matches the search pattern. For `regexp_flags`, specify the regular expression flags.

**Example**

Specify as below to change all three characters starting from b to X.

```
regexp_pattern := 'b..'
```
regexp_replacement:='X'
regexp_flags:='g'

In this example, if the original data is "foobarbaz", it will be changed to "fooXX".

See

- Refer to "POSIX Regular Expressions" in the PostgreSQL Documentation and check pattern, replacement, and flags for information on the values that can be specified for regexp_pattern, regexp_replacement, and regexp_flags.
- Refer to "6.3 Data Types for Masking" for information on the data types for which masking can be performed.

Note

- When column data type is character(n) or char(n) and if the string length after change exceeds n, the extra characters will be truncated and only characters up to the nth character will be displayed.
- When column data type is character varying(n) or varchar(n) and if the string length after change exceeds the length before the change, the extra characters will be truncated and only characters up to the length before change will be displayed.

6.2 Usage Method

Preparation

The following preparation is required to use this feature.

1. Set the postgresql.conf file parameters.
   Prepend "pgx_datamasking" to the shared_preload_libraries parameter.
2. Restart the instance.
3. Run CREATE EXTENSION for the database that will use this feature.
   The target database is described as "postgres" here.
   Use the psql command to connect to the "postgres" database.

Example

```bash
postgres=# CREATE EXTENSION pgx_datamasking;
CREATE EXTENSION
```

Note

You must always prepend "pgx_datamasking" to the "shared_preload_libraries" parameter.

Information

- Specify "false" for pgx_datamasking.enable to not use this feature. Data will not be masked even if a masking policy is configured. This feature becomes available again once "true" is specified for pgx_datamasking.enable. This setting can be made
by specifying a SET statement or specifying a parameter in the postgresql.conf file.
Example

```
postgres=# SET pgx_datamasking.enable=false;
```

- Hereafter, also perform this preparatory task for the "template1" database, so that this feature can be used by default when creating a new database.

---

### Usage

To perform masking, a masking policy needs to be configured. The masking policy can be created, changed, confirmed, enabled, disabled, or deleted during operation. The procedures to perform these tasks are explained below with examples.

1. Creating a masking policy
2. Changing a masking policy
3. Confirming a masking policy
4. Enabling and disabling a masking policy
5. Deleting a masking policy

---

**Note**

Only database superusers can configure masking policies.

---

### 6.2.1 Creating a Masking Policy

An example of the operation on the server is shown below.

1. Create a masking policy
   - Execute the `pgx_create_confidential_policy` system management function to create a masking policy.
   - The following values are configured in this example.
     - Masking target: Numeric type c1
     - Masking type: FULL
     - Masking condition: '1=1'

   ```
   postgres=# select pgx_create_confidential_policy(table_name := 't1', policy_name := 'p1',
   expression := '1=1', column_name := 'c1', function_type := 'FULL');
   pgx_create_confidential_policy
   -----------------------------
   t
   (1 row)
   ```

   2. Confirm the displayed data
      - Confirm that the masking target data (column c1) has been correctly changed.

   ```
   postgres=# select * from t1;
   c1   |   c2
   ------|-----------------
   0 | 012-3456-7890
   0 | 012-3456-7891
   0 | 012-3456-7892
   (3 row)
   ```

---

- Refer to "B.3.2 pgx_create_confidential_policy" for information on the `pgx_create_confidential_policy` system management function.
- Only one masking policy can be created per table.
- All users can view the masking policy created, so do not grant the login privilege of the database where this feature is set to the users who refer to the changed data. Masking policies are defined in the "pgx_confidential_columns", "pgx_confidential_policies" and "pgx_confidential_values" tables.

### 6.2.2 Changing a Masking Policy

1. An example of the operation on the server is shown below.

2. Change a masking policy
   Execute the pgx_alter_confidential_policy system management function to change a masking policy.
   The following values are changed in this example.
   - Content of change: Add a masking target
   - Masking target: Character type c2
   - Masking type: PARTIAL
   - Masking condition: ‘VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11’

   ```
   postgres=# select pgx_alter_confidential_policy(table_name := 't1', policy_name := 'p1',
   action := 'ADD_COLUMN', column_name := 'c2', function_type := 'PARTIAL', function_parameters :=
   'VVVFVVVFVVVV, VVV-VVVV-VVVV, *, 4, 11');
   pgx_alter_confidential_policy
   --------------------------------
   t
   (1 row)
   ```

3. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   ```
   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
   0 | 012-****-****
   0 | 012-****-****
   0 | 012-****-****
   (3 row)
   ```

### See
- Refer to "B.3.1 pgx_alter_confidential_policy" for information on the pgx_alter_confidential_policy system management function.

### 6.2.3 Confirming a Masking Policy

An example of the operation on the server is shown below.

1. Confirm information about a masking target where a masking policy is set
   Refer to the pgx_confidential_columns table to confirm the masking target where the masking policy is set.

   ```
   postgres=# select * from pgx_confidential_columns;
   | schema_name | table_name | policy_name | column_name | function_type | column_description |
   |-------------+------------+-------------+-------------+---------------+-------------------|
   | public      | t1         | p1          | c1          | FULL          |
   |-------------+------------+-------------+-------------+---------------+-------------------|
   |-------------+------------+-------------+-------------+---------------+-------------------|
   ```
2. Confirm information about the masking policy content
   Refer to pgx_confidential_policies to confirm the masking policy content.

   postgres=# select * from pgx_confidential_policies;
   schema_name | table_name | policy_name | expression | enable | policy_description
   -------------+------------+-------------+------------+--------+--------------------
   public      | t1         | p1          | 1=1        | t      |                    
   (1 row)

6.2.4 Enabling and Disabling a Masking Policy

An example of the operation on the server is shown below.

1. Disable a masking policy
   Execute the pgx_enable_confidential_policy system management function to disable a masking policy.

   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 'f');
   pgx_enable_confidential_policy
   ---------------------------------
   t
   (1 row)

2. Confirm the displayed data
   Confirm that the original data is displayed by disabling the masking policy.

   postgres=# select * from t1;
   c1 | c2
   ----+---------------
   1   | 012-3456-7890
   2   | 012-3456-7891
   3   | 012-3456-7892
   (3 row)

3. Enable a masking policy
   Execute the pgx_enable_confidential_policy system management function to enable a masking policy.

   postgres=# select pgx_enable_confidential_policy(table_name := 't1', policy_name := 'p1', enable := 't');
   pgx_enable_confidential_policy
   ---------------------------------
   t
   (1 row)

4. Confirm the displayed data
   Confirm that the masking target data has been correctly changed.

   postgres=# select * from t1;
   c1 | c2
   ----+---------------
   0   | 012-****-****
   0   | 012-****-****
6.2.5 Deleting a Masking Policy

An example of the operation on the server is shown below.

1. Delete a masking policy
   Execute the pgx_drop_confidential_policy system management function to delete a masking policy.
   
   ```sql
   postgres=# select pgx_drop_confidential_policy(table_name := 't1', policy_name := 'p1');
   pgx_drop_confidential_policy
   -----------------------------
   t
   (1 row)
   ```

2. Confirm the displayed data
   Confirm that the original data is displayed by deleting the masking policy.
   
   ```sql
   postgres=# select * from t1;
   c1 |      c2
   ----+---------------
   1 | 012-3456-7890
   2 | 012-3456-7891
   3 | 012-3456-7892
   (3 row)
   ```

6.3 Data Types for Masking

The data types for which data masking can be performed are shown below.

<table>
<thead>
<tr>
<th>Category</th>
<th>Data type</th>
<th>Masking type</th>
<th>Regular expression masking</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Full masking</td>
<td>Partial masking</td>

Chapter 7 Periodic Operations

This chapter describes the operations that must be performed periodically when running daily database jobs.

7.1 Configuring and Monitoring the Log

FUJITSU Enterprise Postgres enables you to output database errors and warnings to a log file. This information is useful for identifying if errors have occurred and the causes of those errors. By default, this information is output to the event log. It is recommended that you configure FUJITSU Enterprise Postgres to collect logs from its log files (for example, log_destination) before operating FUJITSU Enterprise Postgres. Periodically monitor the log files to check if any errors have occurred.

See

- Refer to "Error Reporting and Logging" under "Server Administration" in the PostgreSQL Documentation for information on logs.
- Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on log settings when operating with WebAdmin.

7.2 Monitoring Disk Usage and Securing Free Space

When a database is used for an extended period, free space on the disk is continuously consumed and in some cases the disk space runs out. When this happens, database jobs may stop and no longer run. You should, therefore, periodically monitor the usage of disk space, and delete obsolete files located in the disk. Monitor the disk usage of the disk where the following directories are located:

- Data storage destination directory
- Transaction log storage destination (if the transaction log is stored in a different directory from the data storage destination directory)
- Backup data storage destination directory
- Tablespace storage destination directory

7.2.1 Monitoring Disk Usage

To check the disk usage, use the following operating system commands:

- fsutil volume diskfree command

You can even use SQL statements to check tables and indexes individually. Refer to "Determining Disk Usage" under "Server Administration" in the PostgreSQL Documentation for information on this method.

Information

If you are using WebAdmin for operations, a warning is displayed when disk usage reaches 80%.

7.2.2 Securing Free Disk Space

Secure free disk space by using the following operating system commands to delete unnecessary files, other than the database, from the same disk unit.

- del command

You can also secure disk space by performing the following tasks periodically:
- To secure space on the data storage destination disk:
  Execute the REINDEX statement. Refer to "7.5 Reorganizing Indexes" for details.
- To secure space on the backup data storage destination disk:
  Execute backup using WebAdmin or the pgx_dmpall command.

7.3 Automatically Closing Connections

If an application stops responding and abnormally terminates for any reason, the connection from the application may remain active on the database server. If this situation continues for an extended period, other applications attempting to connect to the database server may encounter an error, or an error indicating that the tables are unavailable may occur.

It is, therefore, recommended that idle connections be closed automatically at regular intervals.

Set the following parameters in the postgresql.conf file to indicate the time permitted to elapse before a connection is closed.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp_keepalives_idle</td>
<td>Time until keepalive is sent</td>
<td>Sends keepalive to an idle connection at the specified interval in seconds</td>
</tr>
<tr>
<td></td>
<td>(seconds)</td>
<td>If 0, the default value of the system is used.</td>
</tr>
<tr>
<td>tcp_keepalives_interval</td>
<td>keepalive send interval</td>
<td>Sends keepalive at the specified interval</td>
</tr>
<tr>
<td></td>
<td>(seconds)</td>
<td>If 0, the default value of the system is used.</td>
</tr>
</tbody>
</table>

Note
The maximum number of connections allowed is 125, unless the desktop heap setting is changed.

See
Refer to "Connection Settings" under "Server Administration" in the PostgreSQL Documentation for information on the parameters.

7.4 Monitoring the Connection State of an Application

FUJITSU Enterprise Postgres does not immediately delete the updated or deleted data. If the VACUUM determines there are no transactions that reference the database, FUJITSU Enterprise Postgres collects obsolete data.

However, obsolete data is not collected if there are connections that have remained active for an extended period or connections occupying resources. In this case the database may expand, causing performance degradation.

See
Refer to "Routine Vacuuming" under "Server Administration" in the PostgreSQL Documentation for information on the VACUUM command.

In such cases, you can minimize performance degradation of the database by monitoring problematic connections.

The following two methods are supported for monitoring connections that have been in the waiting status for an extended period:

- 7.4.1 Using the View (pg_stat_activity)
- 7.4.2 Using pgAdmin
7.4.1 Using the View (pg_stat_activity)

Use the view (pg_stat_activity) to identify and monitor connections where the client has been in the waiting status for an extended period.

Example

The example below shows connections where the client has been in the waiting status for at least 60 minutes.

However, when considering continued compatibility of applications, do not reference system catalogs directly in the following SQL statements.

```
postgres=# select * from pg_stat_activity where state='idle in transaction' and current_timestamp >
cast(query_start + interval '60 minutes' as timestamp);
- [ RECORD 1 ] ----------------------------------------
datid            | 13003
datname          | db01
pid              | 4638
usesysid         | 10
usename          | fsep
application_name | apl01
client_addr      | 192.33.44.15
client_hostname  |
client_port      | 27500
backend_start    | 2015-04-24 09:09:21.730641+09
xact_start       | 2015-04-24 09:09:23.858727+09
query_start      | 2015-04-24 09:09:23.858727+09
state_change     | 2015-04-24 09:09:23.858834+09
waiting          | f
state            | idle in transaction
backend_xid      |
backend_xmin     |
query            | begin;
```

See

- Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

- Refer to "The Statistics Collector" under "Server Administration" in the PostgreSQL Documentation for information on pg_stat_activity.

7.4.2 Using pgAdmin

This section describes the procedure for monitoring connections using [Server Status] in pgAdmin.
1. From the [Tools] menu in pgAdmin, click [Server Status].
2. Identify client connections that have been in the waiting state for an extended period.

From the transaction start time displayed under [TX start], identify connections that have been in the waiting state for an extended period.

![Confirmation as for the transaction initiating time.](Image)

7.5 Reorganizing Indexes

Normally, a database defines indexes in tables, but if data is frequently updated, indexes can no longer use free space in the disk efficiently. This situation can also cause a gradual decline in database access performance.

To rearrange used space on the disk and prevent the database access performance from declining, it is recommended that you periodically execute the REINDEX command to reorganize indexes.

Check the disk usage of the data storage destination using the method described in "7.2 Monitoring Disk Usage and Securing Free Space".

See Refer to “Routine Reindexing” under “Server Administration” in the PostgreSQL Documentation for information on reorganizing indexes by periodically executing the REINDEX command.
Typically, reorganize indexes once a month at a suitable time such as when conducting database maintenance. Use SQL statements to check index usage. If this usage is increasing on a daily basis, adjust the frequency of recreating the index as compared to the free disk space.

The following example shows the SQL statements and the output.

However, when considering continued compatibility of applications, do not reference system catalogs and functions directly in the following SQL statements. Refer to "Notes on Application Compatibility" in the Application Development Guide for details.

```
[SQL statements]
SELECT
    nspname AS schema_name,
    relname AS index_name,
    round(100 * pg_relation_size(indexrelid) / pg_relation_size(indrelid)) / 100 AS index_ratio,
    pg_size_pretty(pg_relation_size(indexrelid)) AS index_size,
    pg_size_pretty(pg_relation_size(indrelid)) AS table_size
FROM pg_index I
LEFT JOIN pg_class C ON (C.oid = I.indexrelid)
LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE
    C.relkind = 'i' AND
    pg_relation_size(indrelid) > 0
ORDER BY pg_relation_size(indexrelid) DESC, index_ratio DESC;
```

```
[Output]

<table>
<thead>
<tr>
<th>schema_name</th>
<th>index_name</th>
<th>index_ratio</th>
<th>index_size</th>
<th>table_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>pgbench_accounts_pkey</td>
<td>0.16</td>
<td>2208 KB</td>
<td>13 MB</td>
</tr>
<tr>
<td>pg_catalog</td>
<td>pg_depend_debender_index</td>
<td>0.6</td>
<td>224 KB</td>
<td>368 KB</td>
</tr>
<tr>
<td>pg_catalog</td>
<td>pg_depend_reference_index</td>
<td>0.58</td>
<td>216 KB</td>
<td>368 KB</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Refer to "Notes on Application Compatibility" in the Application Development Guide for information on maintaining application compatibility.

### 7.6 Monitoring Database Activity

FUJITSU Enterprise Postgres enables you to collect information related to database activity. By monitoring this information, you can check changes in the database status.

This information includes wait information for resources such as internal locks, and is useful for detecting performance bottlenecks. Furthermore, you should collect this information in case you need to request Fujitsu technical support for an investigation.
1. Collect statistics at fixed intervals during work hours.
   Accumulate the collected information into a file.
   Wherever possible, collect data from the various statistics views using a single transaction, because it enables you to take a snapshot of system performance at a given moment.
   Refer to “7.6.1 Information that can be Collected” for information on the system views that can be collected.

2. Reset statistics after work hours, that is, after jobs have finished.
   Refer to “7.6.3 Information Reset” for information on how to reset statistics.

3. Save the file with collected information.
   Keep the file with collected information for at least two days, in order to check daily changes in performance and to ensure that the information is not deleted until you have sent a query to Fujitsu technical support.

Where jobs run 24 hours a day, reset statistics and save the file with collected information when the workload is low, for example, at night.

**Note**

Statistics cumulatively add the daily database value, so if you do not reset them, the values will exceed the upper limit, and therefore will not provide accurate information.

The subsections below explain the following:
- Information that can be collected
- Collection configuration
- Information reset

### 7.6.1 Information that can be Collected

Information that can be collected is categorized into the following two types:
- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

#### Information common to PostgreSQL
Information added by FUJITSU Enterprise Postgres

You can collect the following information added by FUJITSU Enterprise Postgres.

Table 7.1 Information added by FUJITSU Enterprise Postgres

<table>
<thead>
<tr>
<th>View name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>Displays statistic related to lightweight lock, with each type of content displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.2 pgx_stat_lwlock&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>Displays statistics related latches, with each type of wait information within FUJITSU Enterprise Postgres displayed on a separate line. This information helps to detect bottlenecks. Refer to &quot;C.3 pgx_stat_latch&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_walwriter</td>
<td>Displays statistics related to WAL writing, in a single line. Refer to &quot;C.4 pgx_stat_walwriter&quot; for details.</td>
</tr>
<tr>
<td>pgx_stat_sql</td>
<td>Displays statistics related to SQL statement executions, with each type of SQL statement displayed on a separate line. Refer to &quot;C.5 pgx_stat_sql&quot; for details.</td>
</tr>
</tbody>
</table>

7.6.2 Collection Configuration

The procedure for configuring collection depends on the information content.
- Information common to PostgreSQL
- Information added by FUJITSU Enterprise Postgres

Information common to PostgreSQL

Refer to "The Statistics Collector" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on information common to PostgreSQL.

Information added by FUJITSU Enterprise Postgres

Information added by FUJITSU Enterprise Postgres is collected by default.

To enable or disable information collection, change the configuration parameters in postgresql.conf. The following table lists the views for which you can enable or disable information collection, and the configuration parameters.

<table>
<thead>
<tr>
<th>View name</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgx_stat_lwlock</td>
<td>track_waits (*1)</td>
</tr>
<tr>
<td>pgx_stat_latch</td>
<td>track_waits (*)</td>
</tr>
<tr>
<td>pgx_stat_sql</td>
<td>track_sql</td>
</tr>
</tbody>
</table>

Remarks: You cannot change the collection status for pgx_stat_walwriter.
*1: When executing the SQL statement with EXPLAIN ANALYZE, processing time may increase because of this information collection. It is recommended to set this parameter to "off" when executing EXPLAIN ANALYZE to check the processing time.

Refer to "Appendix A Parameters" for information on the parameters.

### 7.6.3 Information Reset

This section describes how to reset information.

**Information added by FUJITSU Enterprise Postgres**

You can reset information added by FUJITSU Enterprise Postgres by using the `pg_stat_reset_shared` function in the same way as for information common to PostgreSQL.

Configure the following parameters in the `pg_stat_reset_shared` function:

<table>
<thead>
<tr>
<th>Function</th>
<th>Type of return value</th>
<th>Description</th>
</tr>
</thead>
</table>
| `pg_stat_reset_shared(text)`     | void                 | Reset some cluster-wide statistics counters to zero, depending on the argument (requires superuser privileges). Calling `pg_stat_reset_shared('lwlock')` will zero all counters shown in `pgx_stat_lwlock`. Similarly, in the following cases, all values of the pertinent statistics counter are reset:  
  - If `pg_stat_reset_shared('latch')` is called:  
    All values displayed in `pgx_stat_latch`  
  - If `pg_stat_reset_shared('walwriter')` is called:  
    All values displayed in `pgx_stat_walwriter`  
  - If `pg_stat_reset_shared('sql')` is called:  
    All values displayed in `pgx_stat_sql` |

See

Refer to "Statistics Functions" in "Monitoring Database Activity" under "Server Administration" in the PostgreSQL Documentation for information on other parameters of the `pg_stat_reset_shared` function.
Chapter 8 Streaming Replication Using WebAdmin

This chapter describes how to create a streaming replication cluster using WebAdmin.

8.1 Streaming Replication

Streaming replication allows the creation of one or more standby instances, which connect to the master instances and replicate the data using WAL records. The standby instance can be used for read-only operations.

WebAdmin can be used to create a streaming replication cluster. WebAdmin allows the creation of a cluster in the following configurations:

- Master-Standby Configuration: This configuration creates a master and standby instance together.
- Standby Only Configuration: This configuration creates a standby instance from an already existing instance.

**Point**

- A standby instance can be created from a standalone instance, a master instance, or even from another standby instance.
- If a streaming replication cluster is created using WebAdmin, the network with the host name (or IP address) specified in [Host name] will be used across sessions of WebAdmin, and also used as the log transfer network.
- To use a network other than the job network as the log transfer network, specify the host name other than the job network one in [Host name].

**See**

When a standby instance is created from an existing instance, it is necessary to set the values for the replication-related variables before a standby instance can be created. Refer to “Configuring Parameters” in the Installation and Setup Guide for Server for details.

8.1.1 Creating a Standby Instance

Follow the procedure below to create a standby instance.

1. In the [Instances] tab, select the instance from which a standby instance is to be created.
2. Click 🔄
3. Enter the information for the standby instance to be created. In the example below, a standby instance is created from instance “inst1”. The instance name, host address and port of the selected instance are already displayed for easy reference.

Enter the following items:

- [Location]: Whether to create the instance in the server that the current user is logged in to, or in a remote server. The default is "Local", which will create the instance in the server machine where WebAdmin is currently running.

- [Replication credential]: The user name and password required for the standby instance to connect to the master instance. The user name and password can be entered or selected from the Wallet. Refer to "Appendix F WebAdmin Wallet" for information on creating wallet entries.

- [Instance name]: Name of the standby database instance to create.

The name must meet the conditions below:

- Maximum of 16 characters
- The first character must be an ASCII alphabetic character
- The other characters must be ASCII alphanumeric characters
- [Instance port]: Port number of the standby database instance.

- [Host IP address]: The IP address of the server machine where the standby instance is to be created. This information is needed to configure the standby instance to be connected to the master.

- [Data storage path]: Directory where the database data will be stored

- [Backup storage path]: Directory where the database backup will be stored

- [Transaction log path]: Directory where the transaction log will be stored

- [Encoding]: Database encoding system

- [Replication mode]: Replication mode of the standby instance to be created ("Asynchronous" or "Synchronous")

- [Application name]: The reference name of the standby instance used to identify it to the master instance.

4. Click ☑️ to create the standby instance.

5. Once the standby instance is created successfully, select “inst1s” in the [Instances] tab. The following page will be displayed:

![FUJITSU Enterprise Postgres](image)

Note

- Backups are not possible for standby instances in WebAdmin. As a result, ❌ and ❌ are disabled and no value is shown for [Backup storage status] and [Backup time].
If using WebAdmin to manage Mirroring Controller, the message below may be output to the server log or system log in the standby instance. No action is required, as the instance is running normally.

```
ERROR:  pgx_rcvall failed (16491)
ERROR:  pgx_rcvall: backup of the database has not yet been performed, or an incorrect backup storage directory was specified
```

### 8.1.2 Promoting a Standby Instance

Streaming replication between a master and standby instance can be discontinued using WebAdmin. Follow the procedure below to promote a standby instance to a standalone instance, thereby discontinuing the streaming replication.

1. In the [Instances] tab, select the standby instance that needs to be promoted.
2. Click 🎯.
3. Click [Yes] from the confirmation dialog box.

The standby instance will be promoted and will become a standalone instance, which is not part of a streaming replication cluster. Once the standby instance is promoted to become a standalone instance, the backup storage status will be "Error". This is because no backups are available when the instance is newly promoted to a standalone instance. The status will be reset if a new backup is performed by clicking [Solution] or 🌔.

### 8.1.3 Converting an Asynchronous Replication to Synchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous mode. This mode can be changed even after the standby instance was successfully created. Follow the procedure below to convert an Asynchronous standby instance to Synchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.
2. Click 🎯.
3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Add the "Application name" of the standby instance you want to be in Synchronous mode.
4. Click 🎯.
5. Select the master instance and click 🎯.
6. Select the standby instance. [Instance type] will now show the updated status.

**Note**

- Converting an Asynchronous standby instance to Synchronous can cause the master instance to queue the incoming transactions until the standby instance is ready. For this reason, it is recommended that this operation be performed during a scheduled maintenance period.
- When adding a synchronous standby instance, FUJITSU Enterprise Postgres will only keep the first entry in [Synchronous standby names] in synchronous state.
- To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to "Streaming Replication" in "High Availability, Load Balancing, and Replication" in the PostgreSQL Documentation.

### 8.1.4 Converting a Synchronous Replication to Asynchronous

Streaming replication between a master and standby instance can be configured to be in Asynchronous or Synchronous Mode. This mode can be changed even after the standby instance was successfully created.
Follow the procedure below to convert a Synchronous standby instance to Asynchronous.

1. In the [Instances] tab, select the master instance of the relevant cluster.

2. Click [ ].

3. In the [Streaming replication] section, edit the value for [Synchronous standby names].
   - Remove the “Application name” of the standby instance you want to be in Asynchronous mode.

4. Click [ ].

5. Select the master instance and click [ ].

6. Select the standby instance. [Instance type] will now show the updated status.

**Note**

To learn more about the differences between synchronous and asynchronous standby modes and their behavior, refer to “Streaming Replication” in "High Availability, Load Balancing, and Replication” in the PostgreSQL Documentation.
Chapter 9 Installing and Operating the In-memory Feature

The in-memory feature enables fast aggregation using Vertical Clustered Index (VCI) and memory-resident feature.

VCI has a data structure suitable for aggregation, and features parallel scan and disk compression, which enable faster aggregation through reduced disk I/O.

The memory-resident feature reduces disk I/O that occurs during aggregation. It consists of the preload feature that reads VCI data to memory in advance, and the stable buffer feature that suppresses VCI data eviction from memory. The stable buffer feature secures the proportion specified by parameter in the shared memory for VCI.

This chapter describes how to install and operate the in-memory feature.

Note
This feature can only be used in Advanced Edition.

9.1 Installing Vertical Clustered Index (VCI)

This section describes the installation of VCI.

1. Evaluating whether to Install VCI
2. Estimating Resources
3. Setting up

9.1.1 Evaluating whether to Install VCI

VCI uses available resources within the server to increase scan performance.

It speeds up processing in many situations, and can be more effective in the following situations:
- Single table processing
- Processing that handles many rows in the table
- Processing that handles some columns in the table
- Processing that performs very heavy aggregation such as simultaneous aggregation of sum and average

VCI will not be used in the following cases, so it is necessary to determine its effectiveness in advance:
- The data type of the target table or column contains VCI restrictions.
- The SQL statement does not meet the VCI operating conditions
- VCI is determined to be slower based on cost estimation

Note
If performing operations that use VCI, the full_page_writes parameter setting in postgresql.conf must be enabled (on). For this reason, if this parameter is disabled (off), operations that use VCI return an error. In addition, to perform operations for tables that do not create a VCI when the full_page_writes parameter setting is temporarily disabled (off), do not create a VCI or perform operations to tables that created a VCI during that time.

See
- Refer to "9.1.4 Data that can Use VCI" for information on VCI restrictions.
9.1.2 Estimating Resources

Estimate resources before setting up VCI.

Select the aggregation that you want to speed up and identify the required column data. The additional resources below are required according to the number of columns.

- **Memory**
  Secure additional capacity required for the disk space for the column for which VCI is to be created.

- **Disk**
  Secure additional disks based on the disk space required for the column for which VCI is to be created, as VCI stores column data as well as existing table data on the disk. It is recommended to provide a separate disk in addition to the existing one, and specify it as the tablespace to avoid impact on any other jobs caused by I/O.

**Information**

The operations on VCI can continue even if the memory configured for VCI is insufficient by using VCI data on the disk.

**See**

9.1.3 Setting up

This section describes how to set up VCI.

**Setup flow**

1. **Setting Parameters**
2. **Installing the Extensions**
3. **Creating VCI**
4. **Confirming that VCI has been Created**

9.1.3.1 Setting Parameters

Edit postgresql.conf to set the required parameters for VCI. After that, start or restart the instance.

The following table lists the parameters that need or are recommended to be configured in advance:

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Setting value</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at server start.</td>
<td>Y</td>
</tr>
<tr>
<td>session_preload_libraries</td>
<td>Literal 'vci, pg_prewarm'</td>
<td>VCI and shared library to be preloaded at connection start.</td>
<td>Y</td>
</tr>
<tr>
<td>reserve_buffer_ratio</td>
<td>Percentage of shared memory to be used for stable buffer table</td>
<td>Proportion of shared memory to be used for a stable buffer table.</td>
<td>N</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Setting value</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------------------------------</td>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>vci.control_max_workers</td>
<td>Number of background workers that manage VCI</td>
<td>Number of background workers that manage VCI. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.max_parallel_degree</td>
<td>Maximum number of background workers used for parallel scan</td>
<td>Maximum number of background workers used for parallel scan. Add this value to max_worker_processes.</td>
<td>N</td>
</tr>
<tr>
<td>vci.smc_directory</td>
<td>Directory name in which a temporary file is created as the dynamic shared memory</td>
<td>Directory name in which a temporary file is created as the dynamic shared memory during a scan using a VCI.</td>
<td>N</td>
</tr>
</tbody>
</table>

**Example**

```plaintext
shared_preload_libraries = 'vci, pg_prewarm'
session_preload_libraries = 'vci, pg_prewarm'
reserve_buffer_ratio = 20
vci.control_max_workers = 8
vci.max_parallel_degree = 4
max_worker_processes = 18 # Example: If the initial value was 6, 6 + 8 + 4 = 18
vci.smc_directory = 'E:\vci\work'
```

**Note**

If performing operations that use VCI, do not delete the shared library names specified to "shared_preload_libraries" and "session_preload_libraries". If operations that access VCI are performed after the VCI was defined, unexpected behavior may occur.

**See**

- Refer to "Appendix A Parameters" for information on all parameters for VCI. Refer also to default value for each parameter and details such as specification range in the same chapter. Refer to "Server Configuration" under "Server Administration" in the PostgreSQL documentation for information on shared_preload_libraries, session_preload_libraries, and max_worker_processes.

**9.1.3.2 Installing the Extensions**

Execute the CREATE EXTENSION statement to install the VCI and pg_prewarm extensions. Both extensions need to be installed for each database.

- Installing VCI

```sql
db01=# CREATE EXTENSION vci;
```

- Installing pg_prewarm

```sql
db01=# CREATE EXTENSION pg_prewarm;
```

**Note**

- Only superusers can install VCI extensions.
- VCI extensions can only be installed in public schema.
- Some operations cannot be performed for VCI extensions. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
9.1.3.3 Creating a VCI

Execute the CREATE INDEX statement with the "USING vci" clause to create a VCI for the desired columns and the "WITH (stable_buffer=true)" clause to enable the stable buffer feature.

To use a separate disk for the VCI, specify the TABLESPACE clause.

```sql
db01=# CREATE INDEX idx_vci ON table01 USING vci (col01, col02) WITH (stable_buffer=true);
```

**Note**

- Some table types cannot be specified on the ON clause of CREATE INDEX. Refer to "9.1.4.1 Relation Types" for details.
- Some data types cannot be specified on the column specification of CREATE INDEX. Refer to "9.1.4.2 Data Types" for details.
- Some operations cannot be performed for VCI. Refer to "9.2.1 Commands that cannot be Used for VCI" for details.
- The same column cannot be specified more than once on the column specification of CREATE INDEX.
- VCI cannot be created for table columns that belong to the template database.
- CREATE INDEX creates multiple views named vci_10digitRelOid_5digitRelAttr_1charRelType alongside VCI itself. These are called VCI internal relations. Do not update or delete them as they are used for VCI aggregation.
- All data for the specified column will be replaced in columnar format when VCI is created, so executing CREATE INDEX on an existing table with data inserted takes more time compared with a general index (B-tree). Jobs can continue while CREATE INDEX is running.

9.1.3.4 Confirming that the VCI has been Created

Execute the SELECT statement to reference the pg_indexes catalog, and confirm that the VCI was created for the target columns.

**Example**

```sql
db01=# SELECT indexdef FROM pg_indexes WHERE indexdef LIKE '%vci%';
```

9.1.4 Data that can Use VCI

This section describes on which relation types and for which data types VCIs can be created.

9.1.4.1 Relation Types

VCIs cannot be created on some relation types.

The ON clause of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify relations on which VCIs cannot be created.

- Relations on which VCIs can be created
  - Normal tables
  - UNLOGGED TABLEs
- Relations on which VCIs cannot be created
  - Materialized views
  - Temporary tables
  - Views
9.1.4.2 Data Types

VCIs cannot be created for some data types.

The column specification of CREATE INDEX described in "9.1.3.3 Creating a VCI" cannot specify a column with data type on which VCIs cannot be created.

**9.2.2 Data Preload Feature**

The first aggregation using VCI immediately after an instance is started may take time, because the VCI data has not been loaded to buffer. Therefore, use the preload feature to load the VCI data to buffer in advance when performing VCI aggregation after an instance is started.

When using the preload feature, execute the function pgx_prewarm_vci to each VCI created with CREATE INDEX.
db01=# SELECT pgx_prewarm_vci('idx_vci');

See

Refer to "B.4 VCI Data Load Control Function" for information on pgx_prewarm_vci.
Chapter 10 Actions when an Error Occurs

This chapter describes the actions to take when an error occurs in the database or an application, while FUJITSU Enterprise Postgres is operating.

Depending on the type of error, it may be necessary to recover the database cluster. The recovery process recovers the following resources:

- Data storage destination
- Transaction log storage destination (if the transaction log is stored in a separate disk from the data storage destination)
- Backup data storage destination

**Note**

Even if a disk is not defective, the same input-output error messages, as those generated when the disk is defective, may be output. The recovery actions differ for these error messages.

Check the status of the disk, and select one of the following actions:

- If the disk is defective
  Refer to "10.1 Recovering from Disk Failure (Hardware)", and take actions accordingly.
- If the disk is not defective
  Refer to "10.14 I/O Errors Other than Disk Failure", and take actions accordingly.

A few examples of errors generated even if the disk is not defective include:

- Network error with an external disk
- Errors caused by power failure or mounting issues

---

**Determining the cause of an error**

If an error occurs, refer to the WebAdmin message and the event log, and determine the cause of the error.

**See**

Refer to "Configuring Parameters" in the Installation and Setup Guide for Server for information on server logs.

---

**Approximate recovery time**

The formulas for deriving the approximate recovery time of resources in each directory are given below.

- Data storage destination or transaction log storage destination

\[
\text{Recovery time} = \frac{(\text{usageByTheDataStorageDestination} + \text{usageByTheTransactionLogStorageDestination})}{\text{diskWritePerformance}} \times 1.5
\]

- \text{usageByTheDataStorageDestination}: Disk space used by the database cluster
- \text{usageByTheTransactionLogStorageDestination}: Disk space used by the transaction log stored outside the database cluster
- \text{diskWritePerformance}: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed
- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

- Backup data storage destination

\[
\text{Recovery time} = \frac{\text{usageByTheBackupDataStorageDestination}}{\text{diskWritePerformance}} \times 1.5
\]

- \text{usageByTheBackupDataStorageDestination}: Disk space used by the backup data
- **diskWritePerformance**: Measured maximum data volume (bytes/second) that can be written per second in the system environment where the operation is performed

- 1.5: Coefficient assuming the time excluding disk write, which is the most time-consuming step

---

### 10.1 Recovering from Disk Failure (Hardware)

This section describes how to recover database clusters to a point immediately before failure, if a hardware failure occurs in the data storage disk or the backup data storage disk.

There are two methods of recovery:

- 10.1.1 Using WebAdmin
- 10.1.2 Using Server Command

---

#### Point

Back up the database cluster after recovering it. Backup deletes obsolete archive logs (transaction logs copied to the backup data storage destination), freeing up disk space and reducing the recovery time.

---

### 10.1.1 Using WebAdmin

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.

---

#### Note

Recovery operation cannot be performed on an instance that is part of a streaming replication cluster in standby mode.

If disk failure occurs on a standby instance, it may be necessary to delete and re-create the instance.

Recovery operation can be performed on an instance that is part of a streaming replication cluster in "Master" mode. If a recovery operation is performed on a master instance, it will break the replication cluster and streaming replication will stop between the master instance and all its standby instances. In such an event, the standby instances can be promoted to standalone instances or can be deleted and re-created.

---

### If failure occurred in the data storage disk or the transaction log storage disk

Follow the procedure below to recover the data storage disk or the transaction log storage disk.

1. **Stop applications**
   - Stop applications that are using the database.

2. **Stop the instance**
   - Stop the instance. Refer to "2.1.1 Using WebAdmin" for information on how to stop an instance. WebAdmin automatically stops instances if recovery of the database cluster is performed without stopping the instance.

3. **Recover the failed disk**
   - Replace the disk, and then recover the volume configuration information.

4. **Create a tablespace directory**
   - If a tablespace was defined after backup, create a directory for it.

5. **Recover the keystore, and enable automatic opening of the keystore**
   - Do the following if the data in the database has been encrypted:
     - Restore the keystore to its state at the time of the database backup.
     - Enable automatic opening of the keystore.
6. Recover the database cluster

Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

![Image of WebAdmin interface]

7. Run recovery

In the [Restore Instance] dialog box, click [Yes].

Instance restore is performed. An instance is automatically started when recovery is successful.

**Note**

WebAdmin does not support recovery of hash index. If you are using a hash index, then after recovery, execute the REINDEX command to rebuild it. Use of hash indexes is not recommended.

8. Resume applications

Resume applications that are using the database.

**Point**

WebAdmin may be unable to detect disk errors, depending on how the error occurred.

If this happens, refer to "10.10.3 Other Errors" to perform recovery.

**If failure occurred on the backup data storage disk**

Follow the procedure below to recover the backup data storage disk.
1. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

2. Recover the backup data
   Log in to WebAdmin, and in the [Instances] tab, click [Solution] for the error message.

3. Run backup
   Perform backup to enable recovery of the backup data. In the [Backup] dialog box, click [Yes]. The backup is performed. An instance is automatically started when backup is performed.

**Point**

If you click [Recheck the status], the resources in the data storage destination and the backup data storage destination are reconfirmed. As a result, the following occurs:

- If an error is not detected
  The status of the data storage destination and the backup data storage destination returns to normal, and it is possible to perform operations as usual.

- If an error is detected
  An error message is displayed in the message list again. Click [Solution], and resolve the problem by following the resolution for the cause of the error displayed in the dialog box.

### 10.1.2 Using Server Command

Recover the database cluster by following the appropriate recovery procedure below for the disk where the failure occurred.
If failure occurred on the data storage disk or the transaction log storage directory

Follow the procedure below to recover the data storage disk or the transaction log storage directory.

1. Stop applications
   Stop applications that are using the database.

2. Stop the instance
   Stop the instance, refer to "2.1.2 Using Commands" for details.
   If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk
   Replace the disk, and then recover the volume configuration information.

4. Create a storage destination directory
   - If failure occurred on the data storage disk
     Create a data storage destination directory. If a tablespace was defined, also create a directory for it.
   - If failure occurred on the translation log storage disk
     Create a transaction log storage destination directory.

   In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

See

Refer to "Preparing Directories to Deploy Resources" under "Setup" in the Installation and Setup Guide for Server for information on how to create a storage directory.

5. Recover the keystore, and enable automatic opening of the keystore
   When the data in the database has been encrypted, restore the keystore to its state at the time of the database backup. Configure automatic opening of the keystore as necessary.

6. Recover the database cluster
   Recover the database cluster using the backup data.
   Specify the following in the pgx_rcvall command:
     - Specify the data storage location in the -D option. If the -D option is omitted, the value of the PGDATA environment variable is used by default.
     - Specify the backup data storage location in the -B option.

Example

```
> pgx_rcvall -D D:\database\inst1 -B E:\backup\inst1
```

Note

If recovery fails, remove the cause of the error in accordance with the displayed error message and then re-execute the pgx_rcvall command.

If the message "pgx_rcvall: an error occurred during recovery" is displayed, then the log recorded when recovery was executed is output after this message. The cause of the error is output in around the last fifteen lines of the log, so remove the cause of the error in accordance with the message and then re-execute the pgx_rcvall command.
The following message displayed during recovery is output as part of normal operation of pgx_rcvall command (therefore the user does not need not be concerned).

```
FATAL: The database system is starting
```

7. Start the instance

Refer to "2.1.2 Using Commands" for information on how to start an instance.

8. Resume applications

Resume applications that are using the database.

**If failure occurred on the backup data storage disk**

The procedure for recovering the backup data storage disk is described below.

There are two methods of taking action:
- Performing recovery while the instance is active
- Stopping the instance before performing recovery

The following table shows the different steps to be performed depending on whether you stop the instance.

<table>
<thead>
<tr>
<th>No</th>
<th>Step</th>
<th>Instance stopped</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Confirm that transaction log mirroring has stopped</td>
<td>Y</td>
</tr>
<tr>
<td>2</td>
<td>Stop output of archive logs</td>
<td>N</td>
</tr>
<tr>
<td>3</td>
<td>Stop applications</td>
<td>Y</td>
</tr>
<tr>
<td>4</td>
<td>Stop the instance</td>
<td>N</td>
</tr>
<tr>
<td>5</td>
<td>Recover the failed disk</td>
<td>Y</td>
</tr>
<tr>
<td>6</td>
<td>Create a backup data storage destination directory</td>
<td>Y</td>
</tr>
<tr>
<td>7</td>
<td>Resume output of archive logs</td>
<td>N</td>
</tr>
<tr>
<td>8</td>
<td>Resume transaction log mirroring</td>
<td>Y</td>
</tr>
<tr>
<td>9</td>
<td>Start the instance</td>
<td>N</td>
</tr>
<tr>
<td>10</td>
<td>Run backup</td>
<td>Y</td>
</tr>
<tr>
<td>11</td>
<td>Resume applications</td>
<td>N</td>
</tr>
</tbody>
</table>

Y: Required
N: Not required

The procedure is as follows:

**If an instance has not been stopped**

1. Confirm that transaction log mirroring has stopped

Use the following SQL function to confirm that transaction log mirroring has stopped.

```
postgres=# SELECT pgx_is_wal_multiplexing_paused();
pgx_is_wal_multiplexing_paused
-------------------
t
(1 row)
```

If transaction log mirroring has not stopped, then stop it using the following SQL function.
2. Stop output of archive logs

Transaction logs may accumulate during replacement of backup storage disk, and if the data storage disk or the transaction log storage disk becomes full, there is a risk that operations may not be able to continue.

To prevent this, use the following methods to stop output of archive logs.

- **Changing archive_command**
  Specify a command that will surely complete normally, so that archive logs will be regarded as having been output.
  If you specify echo, a message is output to the server log, so it may be used as a reference when you conduct investigations.

- **Reload the configuration file**
  Execute the `pg_ctl reload` command or the `pg_reload_conf` SQL function to reload the configuration file.

If you simply want to stop output of errors without the risk that operations will not be able to continue, specify an empty string ("") in `archive_command` and reload the configuration file.

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

Create a backup data storage destination.

In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the backup data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

Refer to "3.2.2 Using Server Commands" for information on how to create a backup data storage destination.

5. Resume output of archive logs

Return the `archive_command` setting to its original value, and reload the configuration file.

6. Resume transaction log mirroring

Execute the `pgx_resume_wal_multiplexing` SQL function.

**Example**

```
SELECT pgx_resume_wal_multiplexing()
```

7. Run backup

Use the `pgx_dmpall` command to back up the database cluster.

Specify the following value in the `pgx_dmpall` command:

- **Specify the data storage destination in the -D option.** If the -D option is omitted, the value of the PGDATA environment variable is used by default.

**Example**

```
> pgx_dmpall -D D:\database\inst1
```

If an instance has been stopped

1. Stop applications

Stop applications that are using the database.
2. Stop the instance

Stop the instance. Refer to "2.1.2 Using Commands" for details.

If the instance fails to stop, refer to "10.11 Actions in Response to Failure to Stop an Instance".

3. Recover the failed disk

Replace the disk, and then recover the volume configuration information.

4. Create a backup data storage destination

Create a backup data storage destination.

In [Properties] in Windows(R) Explorer, set appropriate permissions so that only the instance administrator can access the backup data storage destination directory. (Refer to [Help and Support] in Windows(R) for information on [Properties].)

Refer to "3.2.2 Using Server Commands" for details.

5. Start the instance

Start the instance. Refer to "2.1.2 Using Commands" for information on how to start an instance.

6. Run backup

Use the pgx_dmpall command to back up the database cluster.

Specify the following value in the pgx_dmpall command:
